Albuquerque, NM 87185-5800

Abstract

This document describes the evaluation of two standard electrical cable tray sizes, one junction box and two electrical cable air drops, all protected with the Hemyc One Hour Electrical Raceway Fire Barrier System (either directly attached or with a 2" stand-off), when exposed to the ASTM E119 time-temperature heating curve for a period of one hour. Results are given in the Conclusion Section of this report.

The details, procedures and observations reported herein are correct and true within the limits of sound engineering practice. All specimens and test sample assemblies were produced, installed and tested under the surveillance of either Sandia National Laboratories, the manufacturer's or the testing laboratory's in-house Quality Assurance Program. This report describes the analysis of a distinct assembly and includes descriptions of the test procedure followed, the assembly tested, and all results obtained.

PURPOSE AND SCOPE

Note: This section has been reproduced in part from the Test Plan contained in Appendix A.

Section 50.48, "Fire Protection," of 10 CFR Part 50 requires that each operating nuclear power plant have a fire protection plan that satisfies General Design Criterion 3 of Appendix A to 10 CFR Part 50. Criterion 3 requires that structures, systems, and components important to safety shall be designed and located to minimize, consistent with other safety requirements, the probability and effect of fires and explosions. Noncombustible and heat resistant materials shall be used wherever practical throughout the unit, particularly in locations such as the containment and control room. Fire detection and fighting systems of appropriate capacity and capability shall be provided and designed to minimize the adverse effects of fires on structures, systems, and components important to safety. Firefighting systems shall be designed to assure that their rupture or inadvertent operation does not significantly impair the safety capability of these structures, systems, and components. Section 50.48 also requires that all plants with operating licenses issued prior to January 1, 1979, satisfy the requirements of Sections III.G, III.J, and III.O of Appendix R to 10 CFR Part 50. (Post 1979 plants (per 10 CFR Part 50.48) have to comply with the provisions of their licenses.)

Section III.G of Appendix R, which addresses fire protection of safe shutdown capability, requires that fire protection features be provided such that one train of systems necessary to achieve hot shutdown conditions remains free of fire damage. One acceptable means of satisfying this requirement is to separate cables and equipment and associated non-safety circuits of redundant systems necessary to achieve and maintain hot shutdown conditions located in the same fire area by a fire barrier having a 3-hour fire rating (Section III.G.2.a). Another means is to enclose cables and equipment and associated non-safety circuits of one redundant train in a fire barrier having a 1-hour fire rating and install fire detectors and an automatic fire suppression system in the fire area (Section III.G.2.c).

The scope of this [project] is to describe the overall plan for investigating the fire resistance rating of [the] Hemyc (1-hour) ... electrical raceway fire barrier system (ERFBS). The primary approach ... [was] to perform [an] ... ASTM E 119 furnace test on a number of electrical cable raceway types that [were] protected by ... the Hemyc ... fire barrier material. The Hemyc test [was] performed for a period of 60-minutes, followed by a hose stream test and post-test visual inspection of the ERFBS. . . .

OBJECTIVE

Note: This section has been reproduced in part from the Test Plan contained in Appendix A.

The objective of this program [was] to assess the fire resistance rating of Hemyc ERFBS by subjecting various test specimens (electrical cable trays, air drops and junction boxes) to standard temperature-time conditions as specified in ASTM E 119 and criterion stipulated in GL 86-10, Supplement 1. The types and characteristics of the ERFBS protecting the test specimens are intended to simulate as-installed configurations.

TEST PROCEDURE

Note: Since the Test Plan (Appendix A) includes an accurate and complete description of the test procedure to be followed, much of these details have not been reproduced in the main body of this report.

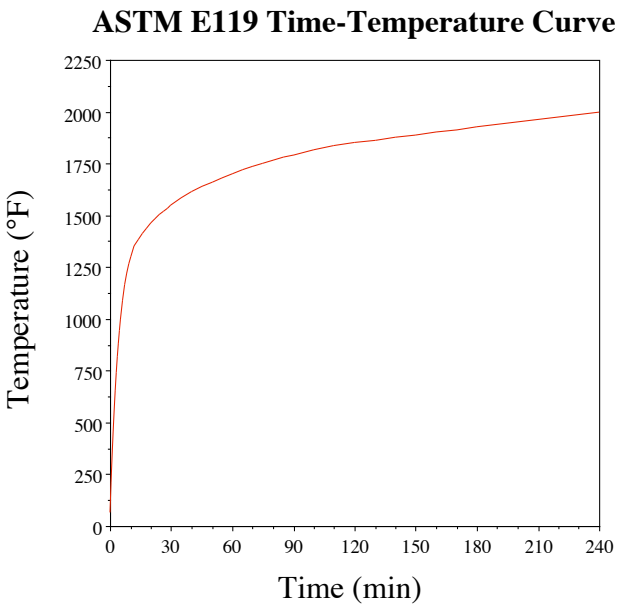
Horizontal Test Furnace

The 12' x 18' x 7' deep horizontal test furnace used in these evaluations was designed to allow the specimen to be uniformly exposed to the specified time-temperature conditions. It is fitted with 12 symmetrically-located premixed air/propane gas burners designed to allow an even heat flux distribution across the exposed surface of a horizontal test specimen. Furnace pressures may be maintained at any value from +0.03" W.C. to -0.05" W.C. The furnace consists of a structural steel frame, lined with sheet metal and insulated with a six inch thick layer of ceramic fiber.

12' x 18' Horizontal Furnace (Overhead View)

The temperature within the furnace is determined to be the mathematical average of thermocouples located symmetrically within the furnace with half positioned twelve inches below the bottom surface of the test deck and the other half located 12" below the bottom of the test specimens. In this manner, an average exposure on the entire assembly can be determined by averaging the readings in real time and adjusting the average temperature to follow the standard time-temperature curve. The materials used in the construction of these thermocouples are those suggested in the E119 test standard. During the performance of a fire exposure test, the furnace temperatures are monitored at least every 15 seconds and displayed for the furnace operator to allow control along the specified time-temperature curve. All data is saved to hard disk at intervals of once per minute unless more often is requested.

The fire exposure is controlled to conform with the standard time-temperature curve shown in Figure 1, as determined by the tables below:



Time (min)	Temperature (°F)
0	68
5	1000
10	1300
20	1462
30	1550
60	1700
90	1792
120	1850
180	1925
240	2000

Figure 1 E119 Temperature Exposure

The furnace interior temperature during a test is controlled such that the area under the time-temperature curve is within 10% of the corresponding area under the standard time-temperature curve for 1 hour or less tests, 7.5% for those less than 2 hours and 5% for those tests of 2 hours or more duration.

Furnace Pressure

The pressure differential between the inside of the furnace (as measured approximately 12" below the exposed surface of the test support slab) and the laboratory ambient air was maintained at 0.00 inches of water column for the duration of the fire exposure test (after the first five minutes, during which furnace stabilization was achieved). This was achieved and controlled by adjusting the inside furnace pressure until slight puffs of intermittent flames extended through unused thermocouple probe holes in the sides of the furnace, indicating a very slight positive pressure at these locations.

Thermocouple Locations

All four electrical cable trays were instrumented with 24 GA. Type K glass/glass insulated thermocouples (Special Limits of Error: ±1.1°C) purchased with calibration certifications and lot traceability. The thermo-junctions were mechanically attached along the mid-height of each tray side rail by clamping them under the heads of #8x32 stainless steel machine bolts placed into holes drilled and threaded to receive them, spaced 6" o.c. Bare #8 AWG, multiple-strand copper conductors were instrumented with similar thermocouples attached every 6 inches along the wire's length. These thermocouples were attached by placing the thermo-junction in direct contact with the surface of the wire and crimping the junction to the copper wire with a copper Buchanan 2011S open end splice cap fastened in place with a Buchanan C-24 "pres-SURE" tool. The instrumented bare #8 AWG conductor was then secured in place along the bottom longitudinal centerline of the tray rungs with plastic cable ties.

Two electrical cable air drop systems were simulated using bare #8 AWG, multiple-strand copper conductors, instrumented with similar thermocouples, installed 6" o.c. and held in place with Buchanan 2011S open end splice caps.

The outer surfaces of the junction box were instrumented with 1/16" diameter Inconel® sheathed, 30 Ga. Type K thermocouples, to allow them to withstand the temperatures which may be experienced by their leads passing between the junction box and outside the heated area. These thermocouples were not purchased with calibration certificates, but instead were numbered and sent to Sandia National Laboratories, which performed a series of multi-temperature point calibrations of them. The results of these calibrations are presented in Appendix D, Quality Assurance.

See Appendix C Thermocouple Locations for exact locations of all test item thermocouples.

Data Acquisition Systems

The outputs of the thermocouples were monitored by 300 channel and 100 channel Yokogawa, Inc., Model Darwin Data Acquisition Units, driven by Macintosh computers. The furnace control thermocouples were monitored by a separate 100 channel Yokogawa, Inc. Model Darwin Data Acquisition Unit and Macintosh computer. The computers were programmed in LabVIEW 5.0 to send the commands to the data acquisition systems to sample the data input lines and to convert the raw data into a usable format (i.e., degrees Fahrenheit) for display on screen and storage as an ASCII tab-delimited text file. Those files were then, after the test, imported into MS Excel for

tabular and graphical display.

Correction Factor

In accordance with ASTM E119, when the indicated resistance period is 1/2 h or over, determined by the average or maximum temperature rise on the unexposed surface or within the test sample, or by failure under load, a correction shall be applied for variation of the furnace exposure from that prescribed, where it will affect the classification, by multiplying the indicated period by two thirds of the difference in area between the curve of average furnace temperature and the standard curve for the first three fourths of the period and dividing the product by the area between the standard curve and a base line of 68°F (20°C) for the same part of the indicated period, the latter area increased by 3240°F•min to compensate for the thermal lag of the furnace thermocouples during the first part of the test. For a fire exposure in the test higher than standard, the indicated resistance period shall be increased by the amount of the correction. For a fire exposure in the test lower than standard, the indicated resistance period shall be similarly decreased for fire exposure below standard. The correction is accomplished by mathematically adding the correction factor, C, to the indicated resistance period.

The correction can be expressed by the following equation:

$$C = \frac{2I(A - A_s)}{3(A_s + L)}$$

where:

C = correction in the same units as I,
I = indicated fire-resistance period,
A = area under the curve of indicated average furnace temperature for the first three fourths of the indicated period,
A_s = area under the standard furnace curve for the same part of the indicated period, and
L = lag correction in the same units as A and A_s (54°F•h or 30°C•h (3240°F•min or 1800°C•min))

Hose Stream Test

Immediately following the fire endurance test, a hose stream test was performed in accordance with USNRC Generic Letter 86-10, Supplement 1, Enclosure 1, Section VI. The hose stream was "applied at random to all exposed surfaces of the test specimen through a 1-1/2" fog nozzle set at a

discharge angle of 15 degrees with a nozzle pressure of not less than 75 psi and a minimum discharge rate of 75 gpm with the tip of the nozzle at a maximum of 10 feet from the test specimen. Duration of the hose stream application is 5 minutes." Prior to the hose stream application, the laboratory ensured the correct angle spray pattern, pressure and flow was achieved through calibrated gauges and other equipment as required.

Assessment Criteria

The test specimens were subjected to the ASTM E 119 temperature-time profile in the test furnace. An assessment of the ERFBS performance was based on two principal factors, as stated in Generic Letter 86-10, Supplement 1:

1. *The time at which the average unexposed side temperature of the fire barrier system, as measured on the exterior surface of the raceway or component, exceeds 139° C (250° F) above its initial temperature. Or the time at which a single temperature reading of a test specimen exceeds 30% of the maximum allowable temperature rise (i.e., 180° C [325° F]) above its initial temperature.*
2. *The fire barrier system remains intact during the fire exposure and water hose stream test without developing any openings through which the cable raceway is visible.*

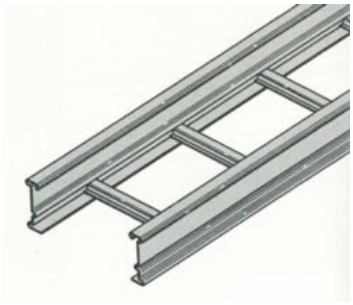
TEST SPECIMEN CONSTRUCTION

Supporting Deck

A 13' x 19' insulated 10 GA. steel deck was designed to accept the test items in this project. The deck was continuously welded and reinforced with 4" structural steel channel, as indicated in the drawings in Appendix B. The placement of all test items in the deck was adjusted to maximize distances between items and between items and furnace walls, and to minimize shadowing effects between items.

Each of the electrical cable trays were designed to pass through the test deck, extend 36" below the insulated lower surface of the deck, turn 90° (through a zero radius turn) to horizontal, extend a total of 60", and then turn 90° upwards (through a sweeping, 12" radius turn) and pass back up and through the supporting deck. The electrical cable air drops were designed to pass through the test deck, extend 36” below the deck insulation, then turn and pass back up and through the supporting deck. There was a 24” separation between the vertical legs of each electrical cable air drop assembly.

All test items were supported by structural elements on the unexposed side of the test deck at distances of 12" and 30" above the deck. No supports were used inside the furnace for the electrical cable trays. The junction box was held in place inside the furnace by a pair of "trapeze" supports, made of Unistrut that was wrapped in 2" thick Kaowool blankets. These blankets were secured to the support members by tape. The junction box, protected by Hemyc ERFBS, was mounted on the wrapped supports and secured by metal bands. Each of the electrical cable air drops was supported at its mid-point by a pair of metal bands secured to the test deck.



The weight of each side rail for the straight tray sections was 1.17 lbs/ft. The tray was constructed of pre-galvanized rails and rungs.

Each 4" x 12" galvanized steel tray system consisted of a 4" x 12" ladderback tray with 9" rung spacing (B-Line Systems, Model 248P09-12-144). The maximum fill depth was 3" and the side rail thickness was 0.048". A straight section passed down through the test deck for a minimum distance of 36", transitioned through a zero-degree radius bend (B-Line Systems, Model 9P8024) into a horizontal section of similar tray, and then transitioned through a sweeping (12" radius) 90° bend (B-Line Systems, Model 4P1290VI12) upwards into another straight section of tray which then passed up and through the test deck. The length of the horizontal section was 60" from vertical section to vertical section (inside dimensions).

Each 4" x 36" galvanized steel tray system consisted of a 4" x 36" ladderback tray with 9" rung spacing (B-Line Systems, Model 248P09-36-144). The maximum fill depth was 3" and the side rail thickness was 0.048". A straight section passed down through the test deck for a minimum distance of 36", transitioned through a zero-degree radius bend (B-Line Systems, Model 9P8024) into a horizontal section of similar tray, and then transitioned through a sweeping (12" radius) 90° bend (B-Line Systems, Model 4P3690VI12) upwards into another straight section of tray which then passed up and through the test deck. The length of the horizontal section was 60" from vertical section to vertical section (internal dimensions).

Raceway	Raceway Weight Per Unit Length (lb/ft)
2A (12" Tray)	3.05
2B (12" Tray)	3.05
2C (36" Tray)	4.07
2D (36" Tray)	4.07
2E (Air Drop)	0.43
2F (Air Drop)	0.48
2G (Junction Box)	26.07 lb

The weights of each raceway were determined prior to mounting them in the deck. Knowing their lengths, the weights per unit length were then calculated.

The Junction box weight is reported as a single item.

CONDUCT OF TEST

Preburn Inspections

As required in the Test Plan, prior to the commencement of the fire endurance test, a thorough check of the test assembly and associated equipment (including calibration of the data recording equipment) and completion of applicable Laboratory QA/QC checklists were performed and documented by the testing laboratory.

Written approval of the construction, assembly, installation and instrumentation was supplied by OPL and signed by Sandia National Laboratories' representative prior to performance of the fire exposure test (a sign-off sheet for this purpose was supplied by the Laboratory).

The test assembly was then placed on the large scale horizontal fire resistance furnace and the thermocouples connected to the data acquisition system and their outputs verified. The test assembly was inspected one last time before the furnace was closed prior to the test. Upon receipt of approval to proceed, the test was initiated. Following the fire exposure test, all data acquisition systems were recalibrated in accordance with the Test Plan.

TEST RESULTS

The thermocouples were connected to the data acquisition systems and their outputs verified on March 24, 2005. The furnace was fired on March 25, 2005, and computer data collection of thermocouple data continued for 60 minutes. The ambient temperature at the start of the test was 73°F, with 89% relative humidity. The furnace was fired at 9:10 AM and the standard time-temperature curve followed for 60 minutes. The pressure differential between the inside of the furnace (as measured 12" below the exposed surface of the test slab) and the laboratory ambient air was maintained at 0.00 inches of water column for the duration of the fire exposure test (after the first five minutes, during which furnace stabilization was achieved).

Persons present to perform or witness the test were as follows:

Deggary Priest	-	Omega Point Laboratories, Inc.
Connie Humphrey	-	Omega Point Laboratories, Inc.
Mike Dey	-	Omega Point Laboratories, Inc.
Cleda Patton	-	Omega Point Laboratories, Inc.
Troy Bronstad	-	Omega Point Laboratories, Inc.
Oscar Estrada	-	Omega Point Laboratories, Inc.
Richard Beasley	-	Omega Point Laboratories, Inc.
Laudencio Castanon	-	Omega Point Laboratories, Inc.
Frank Wyant	-	Sandia National Laboratories
Bruce Levin	-	Sandia National Laboratories
Charles Girard	-	URS Corporation (SNL contractor)
David Lew	-	US Nuclear Regulatory Commission
Mark Salley	-	US Nuclear Regulatory Commission
Roy Woods	-	US Nuclear Regulatory Commission
Alex Klein	-	US Nuclear Regulatory Commission
Randy Brown	-	Promatec
Mike Jordan	-	Promatec
Frank Haese	-	Promatec

Observations made during the test were as follows:

TIME (h:min:s)	OBSERVATIONS
0:00	Furnace ignited at 9:10 AM.
1:30	Some smoke from the top seals on the deck. Tape on JB supports burning.
10:45	JB supports still flaming on the bottom.
12:00	Stitches on the seams are breaking along the sweeping 90° elbow on Item 2B.
28:00	JB supports till flaming on bottom.
60:00	Furnace extinguished. Specimen thermocouples were disconnected and the test assembly lifted from the furnace, observed, photographed and moved to the hose stream test area. The test items with obvious openings included: 2A, 2C, 2E, and 2G.
1:06:49	Hose stream began at a nozzle spray angle of 15°, pressure at 75 psi and from a distance of 10 ft. The entire test assembly was slowly spun and the hose stream operator remained stationary and applied the hose to the test items as they passed in front of him.
1:11:49	Hose stream stopped. The test assembly was then observed, photographed and allowed to drip for several hours before being placed on 8' tall 24" ø pipe stands and undergoing post-test disassembly. There were no significant changes in any of the exterior claddings on the raceways due to the hose stream test.

Observations made after the hose stream test.

Test Item	Observation
2A	Edge joints open on horizontal and vertical sides around zero radius bend.
2B	No significant openings.
2C	Openings around circumferential joint through which the raceway could be seen.
2D	One opening at inside of sweeping 90° elbow, some torn outer fabric.
2E	Openings around circumferential joint through which the raceway could be seen.
2F	No openings.
2G	Openings along edge joints.

Other than small pieces of the deck insulation falling to the laboratory floor, the test assembly showed no visible effect due to the hose stream test. Much steam and dripping hot water remained after the hose stream was stopped.

In accordance with the E119 test standard, a calculation for any correction to the indicated fire resistance period was done. The correction factor was then mathematically added to the indicated fire resistance period, yielding the fire resistance period achieved by this specimen:

ITEM	DESCRIPTION	TEST VALUE
C	correction factor	0.02 min (1 second)
I	indicated fire-resistance period	60 min
A	area under the curve of indicated average furnace temperature for the first three fourths of the indicated period	58 542°F • min
As	area under the standard furnace curve for the same part of the indicated period	58 516°F • min
L	lag correction	3240°F • min
	FIRE RESISTANCE EXPOSURE RECEIVED BY THIS SPECIMEN ==>	60

Note: The standard specifies that the fire resistance be determined to the nearest integral minute. Consequently, if the correction factor is less than 30 seconds, and the test specimen met the criteria for the full indicated fire resistance period, no correction is deemed necessary. That was the case for this project.

CONCLUSIONS

In accordance with the assessment criteria listed in the Test Plan, all raceway systems failed to meet a 1h fire endurance period. The table below summarizes the results for each item.

Raceway	Right Rail Time to $\Delta T_{avg} \geq$ 250°F (min)	Right Rail Time to $\Delta T_{ind} >$ 325°F (min)	Left Rail Time to $\Delta T_{avg} \geq$ 250°F (min)	Left Rail Time to $\Delta T_{ind} >$ 325°F (min)	Bare #8 Time to $\Delta T_{avg} \geq$ 250°F (min)	Bare #8 Time to $\Delta T_{ind} >$ 325°F (min)	Max. Temp. Bare #8 @ 1h (F)	Burn-Through/ Structural Failure Yes/No	Pass Hose Stream Yes/ No	Final Grade Pass/ Fail
2A: 12" Tray (Direct Attach.)	36	34	27	18	32	32	1260	Yes	No	Fail
2B: 12" Tray (w/2" air gap)	37	35	38	35	33	40	1002	No	Yes	Fail
2C: 36" Tray (Direct Attach.)	41	39	34	33	35	35	1330	Yes	No	Fail
2D: 36" Tray (w/2" air gap)	32	31	33	32	28	27	1117	Yes	No	Fail
2E: Air Drop (Direct Attach.)	-	-	-	-	35	32	1712	Yes	No	Fail
2F: Air Drop (w/2" air gap)	-	-	-	-	32	28	1411	No	Yes	Fail
2G: Junct. Box (Direct Attach.)	31*	32*	-	-	-	-	n/a	Yes	No	Fail

Note: Due to the occurrences of openings in most of the tray systems, no significant increase in fire endurance due to the 2" air gap was observed. For the electrical cable air drops, the direct attachment (even with openings) performed better than the 2" air gap.

* Junction box temperatures were measured on the outside surfaces.

Appendix A

TEST PLAN

Plan for Hemyc (1-Hour) and M.T. (3-Hour) Electrical Raceway Fire Barrier Systems Performance Testing

Revision M
April 8, 2005

1 PURPOSE AND SCOPE

Section 50.48, "Fire Protection," of 10 CFR Part 50 requires that each operating nuclear power plant have a fire protection plan that satisfies General Design Criterion 3 of Appendix A to 10 CFR Part 50. Criterion 3 requires that structures, systems, and components important to safety shall be designed and located to minimize, consistent with other safety requirements, the probability and effect of fires and explosions. Noncombustible and heat resistant materials shall be used wherever practical throughout the unit, particularly in locations such as the containment and control room. Fire detection and fighting systems of appropriate capacity and capability shall be provided and designed to minimize the adverse effects of fires on structures, systems, and components important to safety. Firefighting systems shall be designed to assure that their rupture or inadvertent operation does not significantly impair the safety capability of these structures, systems, and components. Section 50.48 also requires that all plants with operating licenses issued prior to January 1, 1979, satisfy the requirements of Sections III.G, III.J, and III.O of Appendix R to 10 CFR Part 50. (Post 1979 plants (per 10 CFR Part 50.48) have to comply with the provisions of their licenses.)

Section III.G of Appendix R, which addresses fire protection of safe shutdown capability, requires that fire protection features be provided such that one train of systems necessary to achieve hot shutdown conditions remains free of fire damage. One acceptable means of satisfying this requirement is to separate cables and equipment and associated non-safety circuits of redundant systems necessary to achieve and maintain hot shutdown conditions located in the same fire area by a fire barrier having a 3-hour fire rating (Section III.G.2.a). Another means is to enclose cables and equipment and associated

non-safety circuits of one redundant train in a fire barrier having a 1-hour fire rating and install fire detectors and an automatic fire suppression system in the fire area (Section III.G.2.c).

The scope of this document is to describe the overall plan for investigating the fire resistance rating of Hemyc (1-hour) and M.T. (3-hour) electrical raceway fire barrier systems (ERFBS). The primary approach will be to perform a series of ASTM E 119 furnace tests on a number of cable raceway types that are protected by either the Hemyc (with and without air gaps) or M.T. fire barrier material. The Hemyc tests will be performed for a period of 60-minutes each, followed by a hose stream test and post-test visual inspection of the ERFBS. The M.T. test will be performed in a similar manner with the principal difference being that it will be conducted for a period of 3-hours. Descriptions of these tests and of the overall approach are provided below.

2 OBJECTIVE

The objective of this program is to assess the fire resistance rating of Hemyc and M.T. ERFBS by subjecting various test specimens (conduit, cable trays, cable drops, and junction boxes) to standard temperature-time conditions as specified in ASTM E 119 and criterion stipulated in GL 86-10, Supplement 1. The types and characteristics of the ERFBS enclosing the test specimens are intended to simulate as-installed configurations.

These tests will also provide additional data in that redundant conduits loaded to their maximum capacities with cables will be included in two of the test runs. Also, a few support structure analogs partially enclosed in the ERFBS will be exposed to the one- and three-hour test conditions.

3 APPROACH

The following sections describe the test specimens and the test conditions to be employed for the performance assessments of the Hemyc and M.T. electrical raceway fire barrier systems.

3.1 Test Specimens

The principal test specimens will include a variety of cable raceway types protected by either the Hemyc 1-hour rated ERFBS or M.T. 3-hour rated ERFBS. In one test, the test specimens will be protected with Hemyc fire barrier material directly attached to the raceway (i.e., without air gaps). The test specimens in the second test will include a mix of test specimen enclosure methods: some protected by Hemyc ERFBS framed with structural supports to provide a 5-cm (2 in) air gap between the ERFBS and the raceway and others protected with Hemyc by direct attachment. For the third test, the test specimens (of the same types included in the first test) will be protected with the M.T. ERFBS (directly attached to the raceways) and subjected to a 3-hour ASTM E 119 furnace exposure.

The types of test specimens and the configurations of the ERFBS selected for these tests are based principally on the application usage information provided to the NRC/NRR by industry (Letter: Emerson, NEI, to Frumkin, NRC/NRR, "Promatec Hemyc 1-Hour and M.T. 3-Hour Fire Barrier Systems," December 28, 2001 and via letter: Marion, NEI, to Hannon, NRC/NRR, "Comments on NRC Hemyc Test Plan," December 6, 2002). Additional correspondence addressing specific details about industry practices in Hemyc applications were also taken into account and, where practical, incorporated into the test plan (e.g., Email: Emerson, NEI, to Salley, NRC/RES, "Hemyc – Predominant Industry Practices," January 18, 2005 [a copy of this message is provided in Appendix B]).

The test protocols presented here are intended to provide bounding states of the protective material performance under standard test conditions. Also, this method is per NRC guidance, as stated in Generic Letter 86-10, Supplement 1, and represents current staff positions on bounding test approaches. Additionally, it is also required that the assembly and installation of the Hemyc and M.T. ERFBS shall be done in accordance with the vendor's specifications and meet all required vendor quality standards.

The test specimens will include the following items:

- 27-mm (1 in) Steel rigid metal conduit (RMC) arranged in a modified "U" configuration such that one vertical leg and one end of the horizontal span of the conduit intersect at a condolet LB access fitting, forming a right angle, while the other end of the horizontal span transitions to the second vertical leg via a conduit radius bend or elbow. Tests will be conducted on both "empty" and "loaded"[1] conduit configurations.
- 63-mm (2½ in) Steel rigid metal conduit (RMC) arranged in a modified "U" configuration such that one vertical leg and one end of the horizontal span of the conduit intersect at a condolet LB access fitting, forming a right angle, while the other end of the horizontal span will transition to the second vertical leg by means of a conduit radius bend or elbow. Both "empty" and "loaded" conduit configurations will be tested.
- 103-mm (4 in) Steel rigid metal conduit (RMC) arranged in a modified "U" configuration such that one vertical leg and one end of the horizontal span of the conduit intersect at a condolet LB access fitting, forming a right angle, while the other end of the horizontal span will transition to the second vertical leg through a conduit radius bend or elbow. Again, "empty" and "loaded" conduit configurations will be tested.
- A 305-mm (12 in) wide 16-gage galvanized steel ladder-back cable tray with 10 cm (4 in) high side rails and 23 cm (9 in) rung spacing. The cable tray will be constructed in a modified "U" configuration such that one vertical leg and one end of the horizontal span of the conduit intersect at a right angle, while the other end of the horizontal span will transition to the second vertical leg by means of a tray vertical curve. Only empty cable trays will undergo testing.
- A 914-mm (36 in) wide 16-gage galvanized steel ladder-back cable tray with 10 cm (4 in) high side rails and 23 cm (9 in) rung spacing. The cable tray will be constructed in a modified "U" configuration such that one vertical leg and one end of the horizontal span of the conduit intersect at a right angle, while the other end of the horizontal span will transition to the second vertical leg by means of a tray vertical curve. The cable trays will be tested without cables.
- Short cable drops consisting of a small bundle of No. 8 AWG bare copper wire suspended from the top of the furnace in a "U" loop configuration to simulate air drops.
- 46 cm x 61 cm x 20 cm (18" x 24" x 8") Steel junction boxes. The junction boxes will be suspended using supports protected by the ERFBS through direct attachment.
- Four separate support structure test elements consisting of two different cross sections (Unistrut® and square steel tube) formed into a right angle ("L")

[1] "Loaded" refers to approximately 30% of cross sectional area fill using bare #8 copper wires.

configuration and partially covered by the ERFBS. These structures are being included in the test program to evaluate the magnitude of heat transmission along their wrapped length and the possible thermal coupling effect on any supported assemblies or intervening items.

A bare #8 stranded copper wire, instrumented with thermocouples along its length, will be routed through each of the conduit test specimens and placed along the horizontal center of the cable tray test specimens and attached to the bottom of the rungs. The thermocouples will be mechanically attached to the bare copper conductor at 150-mm (6 in) spacing intervals. Additional thermocouples will be mechanically attached to the outer surfaces of the conduit test specimens and along the length of both side rails of the cable tray test specimens at 150-mm (6 in) intervals. The ends of the test specimens will be insulated with fiber filler inside and around their perimeters at the furnace-ceiling interface in accordance with the vendor's requirements.

The Hemyc ERFBS consists of blankets constructed of 38-mm (1.5 in) or 50-mm (2 in) thick, 128 kg/m^3 (8 lb/cu ft), JM Cerablanket/B&W Kaowool blanket covered with Refrasil fabric mesh on all surfaces exposed to the fire[2]. The materials are sewn together with "Astroquartz" thread. The cable tray and cable drop test specimens framed to support a 50-mm (2 in) air gap will use the 38-mm thick Hemyc covers and all direct attachment configurations will use the 50-mm thick wraps. All installation shall be in accordance with the vendor's requirements.

The M.T. three-hour ERFBS is virtually identical in concept and uses the same basic materials in construction as Hemyc, but the M.T. also has an internal layer of a heat-activated compound.

PCI Promatec, Inc. has been contracted to fabricate and install the Hemyc and M.T. materials on all of the test specimens.

[2] Previous versions of this test plan called for the use of Siltemp 84CH and 84SR fabric, however the manufacturer of Siltemp is no longer in business and Siltemp is no longer manufactured. Refrasil is an approved material for the fabrication of Promatec protective wrap components and will thus be used as the outer fabric for the Hemyc barriers for these tests.

Table 1 presents the test conditions to be investigated in terms of ERFBS type and configuration for each of the test specimens during the three tests. Conduits will not be tested in the air gap framed configuration and no cable trays will be tested with M.T.

Detailed construction drawings of each of the test specimens are provided in the appendix to this plan. The drawings define the specific details of the design and assembly of each test specimen. Promatec will provide separate drawings detailing the installation of the designated ERFBS. Drawings and descriptions of the dimensions and setup configurations in the furnace and instrumentation details are provided. The fabrication and installation of the ERFBS will be performed in accordance with vendor procedures. Provisions will be made to verify that all material/installation quality requirements are met.

Table 1: Test Matrix

	Test #1	**Test #2**	**Test #3**
	Hemyc (1-Hour, Direct Attachment)	Hemyc (1-Hour, Framed for Air Gap and Direct Attachment)	M.T. (3-Hour, Direct Attachment)
27-mm (1-in) Conduit[1]	X	(Not included)	X
63-mm (2½-in) Conduit[1]	X	(Not included)	X
103-mm (4-in) Conduit[1]	X	(Not included)	X
305-mm (12-in) Tray	(Not included)	X	(Not included)
914-mm (36-in) Tray	(Not included)	X	(Not included)
Junction Box[2]	X	X	X
Cable Drop	(Not included)	X	X
Unistrut Support	X	(Not included)	X
Tube Steel Support	X	(Not included)	X

[1] Conduit test specimens will be tested under both “empty” and “loaded-with-cable” conditions.
[2] Only a single junction box will be included in Test #2 that will be enclosed in Hemyc by Direct Attachment secured with metal bands.

Sandia National Laboratories will procure the required materials for the test specimens. The type of material and equipment obtained will include raceways (conduit, trays,

condolets, and junction boxes), metal to fabricate the support structure specimens, and miscellaneous hardware (nuts, bolts, screws, etc.) plus spare parts. Promatec will be responsible for QA of the Hemyc and M.T. materials and ERFBS installation.

The test laboratory will construct the test specimens in accordance with the detailed construction drawings. The process will include the positive mechanical fastening of the thermocouples to the outer surfaces of the test specimens and checkout for proper operation prior to the installation of the ERFBS. The test laboratory will also be responsible for installation of the instrumented bare #8 copper wire and the additional conductors within the raceways. Table 2 indicates the number of bare #8 conductors to be installed in the "loaded" conduit test specimens. The individual weights of the assembled, but empty, test specimens will be recorded prior to attachment to the test deck. Similarly, the weights of the bare #8 copper wire bundles will also be recorded prior to installation in the selected conduits. The resulting mass per unit length will be used as a first-order basis for determining the influence of cable loading on thermal response of the raceways. The test laboratory will be responsible for QA of the furnace temperatures and test operations. The laboratory will provide logs and record instrument data during the tests.

Table 2: Number of No. 8 Bare Conductors Routed in Loaded Conduit.

Loaded Test Specimens	No. bare #8 stranded wires	Approximate mass per unit length of wire
103-mm (4") Conduit	291	21.72 kg/m (14.58 lb/ft)
63-mm (2½") Conduit	113	8.45 kg/m (5.68 lb/ft)
27-mm (1") Conduit	18	1.38 kg/m (0.95 lb/ft)
Cable Drops	7	0.70 kg/m (0.50 lb/ft)

Photographs and documented written logs of the test specimens, both during and after assembly, shall be prepared by the testing laboratory prior to testing and included as part of the test QA documentation for the final test report.

PCI Promatec, Inc., through a contract with Sandia National Laboratories, will be responsible for fabricating and installing the ERFBS materials on the test specimens following construction, instrumentation and mounting on the test deck.

3.2 Assessment Criteria

The test specimens will be subjected to the ASTM E 119 temperature-time profile in the test furnace. An assessment of the ERFBS performance will be based on two principal factors, as stated in Generic Letter 86-10, Supplement 1:

1. *The time at which the average unexposed side temperature of the fire barrier system, as measured on the exterior surface of the raceway or component, exceeds 139 C (250 F) above its initial temperature. Or the time at which a single temperature reading of a test specimen exceeds 30% of the maximum allowable temperature rise (i.e., 181 C [325 F]) above its initial temperature.*
2. *The fire barrier system remains intact during the fire exposure and water hose stream test without developing any openings through which the cable raceway is visible.*

3.3 Test Facilities

The furnace tests will be conducted at Omega Point Laboratories (OPL), located in Elmendorf, Texas. OPL has a full-scale horizontal furnace that fully satisfies the requirements of this test plan. It is 3.7 m (12 ft) wide by 5.5 m (18 ft) long and 2.1 m (7 ft) deep equipped with twelve propane burners. The furnace has been demonstrated to produce the ASTM E 119 standard time-temperature profile.

The test furnace is located in a 18 m (60 ft) by 61 m (200 ft) by 9 m (30 ft) high building. This building has ample room for test specimen assembly and fire barrier installation activities prior to placement inside the furnace.

3.4 Primary Tests

Three separate test runs will be conducted as part of the primary test series. Two of the tests will test the performance of 1-hour rated Hemyc ERFBS and the third test will assess the performance of 3-hour rated M.T. ERFBS. All of the primary tests will be conducted using the ASTM E 119 standard time-temperature curve (Figure 1). The furnace calibration shall be within ASTM E 119 requirements and the calibration documentation included in the final test report. All thermocouples used in the testing (furnace and test specimens) shall be within ASTM E 119 requirements and the calibration documentation included in the final report.

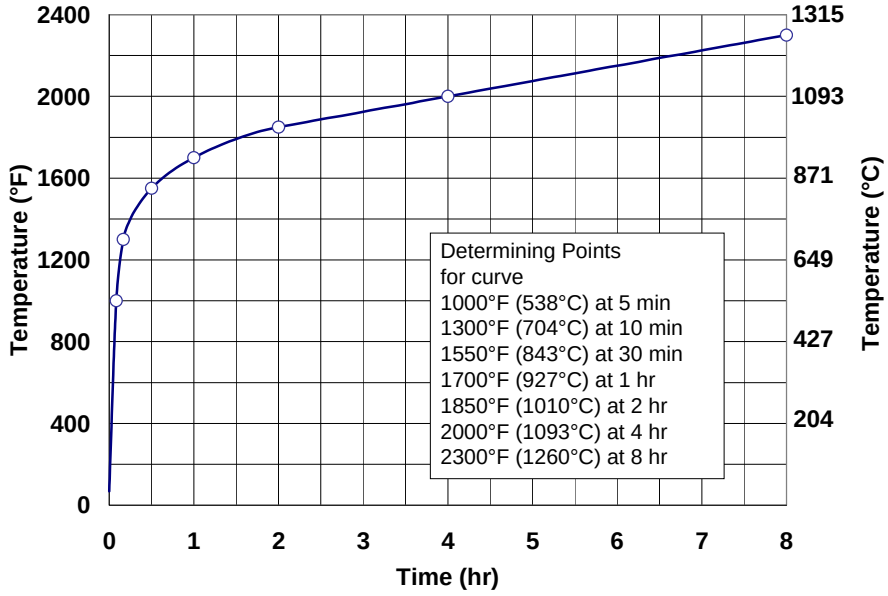


Figure 1. The Standard Time-Temperature Curve (based on data provided in ASTM E 119 – 00a.

As indicated above, these tests will be governed by the conditions provided in this test plan. The test specimens will consist of those items described in Section 3.1. The specific setup and configuration for each test is discussed below.

The Hemyc material will use Refrasil fabric on both the internal and external covering. Stainless steel bands will be used for attachment (i.e., no finger straps will be used). The spacing of the bands will be per Promatec's maximum spacing requirements. Standard 96 – 128 kg/m^3 (6 – 8 lb/ft^3) density ceramic fiber material will be used to construct the Hemyc wraps. The 27-mm (1-in) empty conduit, 63-mm (2½-in) loaded conduit and the 103-mm (4-in) conduit (empty and loaded) will all employ butt joints with 150-mm (6 in) wide collar over wraps. The 27-mm (1-in) loaded conduit and the 63-mm (2½-in) empty conduit will employ 50-mm (2-in) overlap joints. All cable trays will use the overlap joint method. In addition, the cable drop with the 50-mm (2-in) air gap will use the overlap method for sealing the material joints while the cable drop without the air gap will use collars to cover the butt joints.

3.4.1 Test #1

The first test of the series will be conducted on nine test specimens with Hemyc ERFBS directly attached to the raceways (i.e., without framework to provide air gaps between the fire barrier material and raceways). The nominal thickness of the Hemyc will be 50 mm (2 in).

Figure 2 shows one possible configuration of the test specimens inside the furnace. As indicated in the figure, the test specimens include:

- A 103-mm (4 in) conduit without additional cables,
- A 103-mm (4 in) conduit loaded with the maximum (30% of conduit's cross-sectional area) fill of cables,
- A 27-mm (1 in) conduit and condolet LB assembly without cables,
- A 27-mm (1 in) conduit and condolet LB assembly with additional cables (30% fill),
- A 63-mm (2½ in) conduit and condolet LB assembly with no cables,
- A 63-mm (2½ in) conduit and condolet LB assembly with cables (30% fill),
- A 46 cm X 61 cm X 20 cm (18" x 24" x 8") junction box,
- A partially protected Unistrut® support assembly, and
- A partially protected 5 cm x 5 cm (2" x 2") square steel tube support assembly

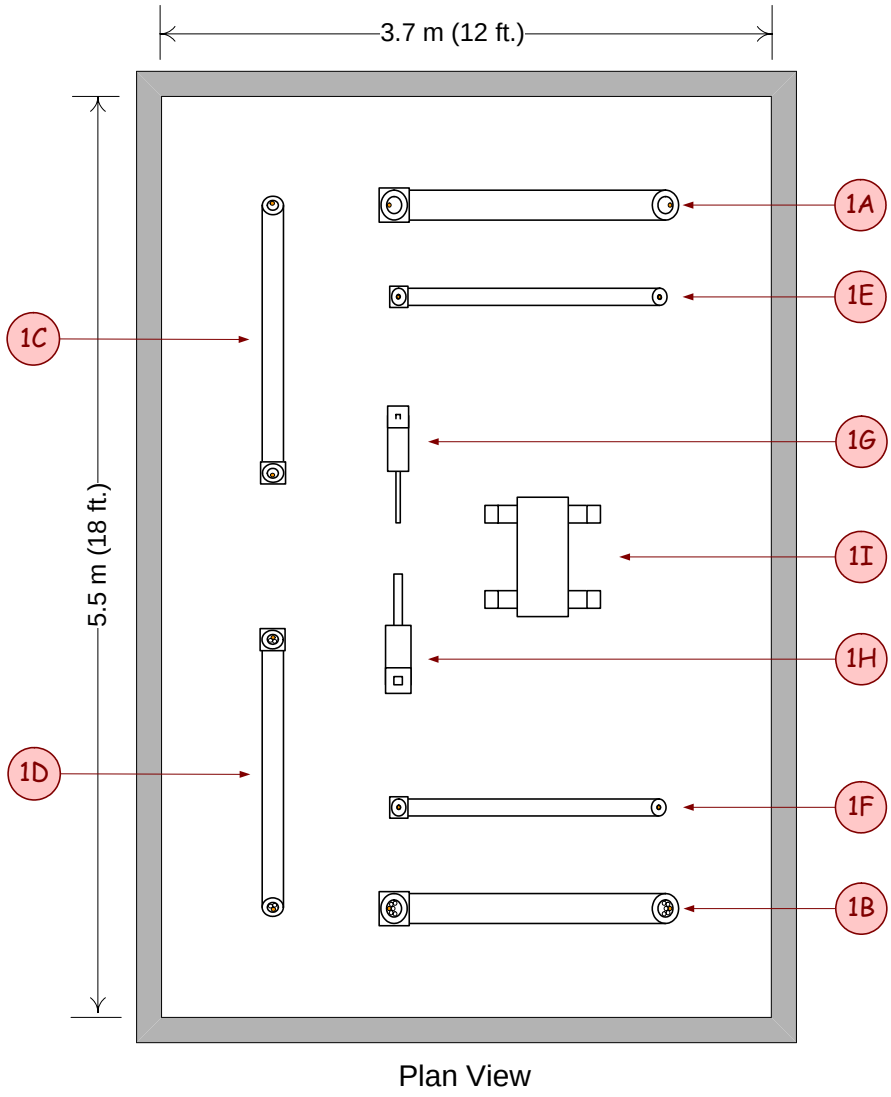

Figure 2. Example of Test Specimen Layout during Test #1 (Hemyc, Direct Attachment Configurations).

This arrangement of the test specimens is intended to maximize thermal exposures and minimize the potential for one specimen to influence the response of another specimen to the thermal environment (i.e., minimize shadowing).

The conduit will be supported from the furnace ceiling in a modified "U" configuration. The metal test deck will be adequately insulated to prevent interaction with the portion of the test specimens located outside the furnace and to protect the metal deck from structural failure during the 1-hour test. Each conduit will include one sharp 90-degree transition from the horizontal span to one of the vertical legs; a condolet fitting will be employed to provide the right angle transition from horizontal to vertical. At the other transition point a radius bend will be used. The two vertical runs of these test articles will be approximately 0.9 m (36 in) along each leg and the horizontal span will be approximately 1.5 m (60 in) (See Figures A1, A2, and A3 in Appendix A). The ERFBS will completely cover the test specimens within the furnace and extend through the test deck for a distance of 15 to 30 cm (6 – 12 in) above the test deck (See Figure A19 in Appendix A). All raceway supports shall be outside the furnace and shall not interfere with the ERFBS during testing.

A Hemyc ERFBS will be directly attached to the support structure analogs such that 30 cm (12 in) of their horizontal sections are exposed to the furnace environment. The junction box will be suspended from the test deck by Unistrut support members and protected with Hemyc through direct attachment (See figure A6 in Appendix A).

The vertical run of the Unistrut will be approximately 0.9 m (36 in) inside the furnace and the horizontal run will be 0.6 m (24 in) (See figure A8 in Appendix A).

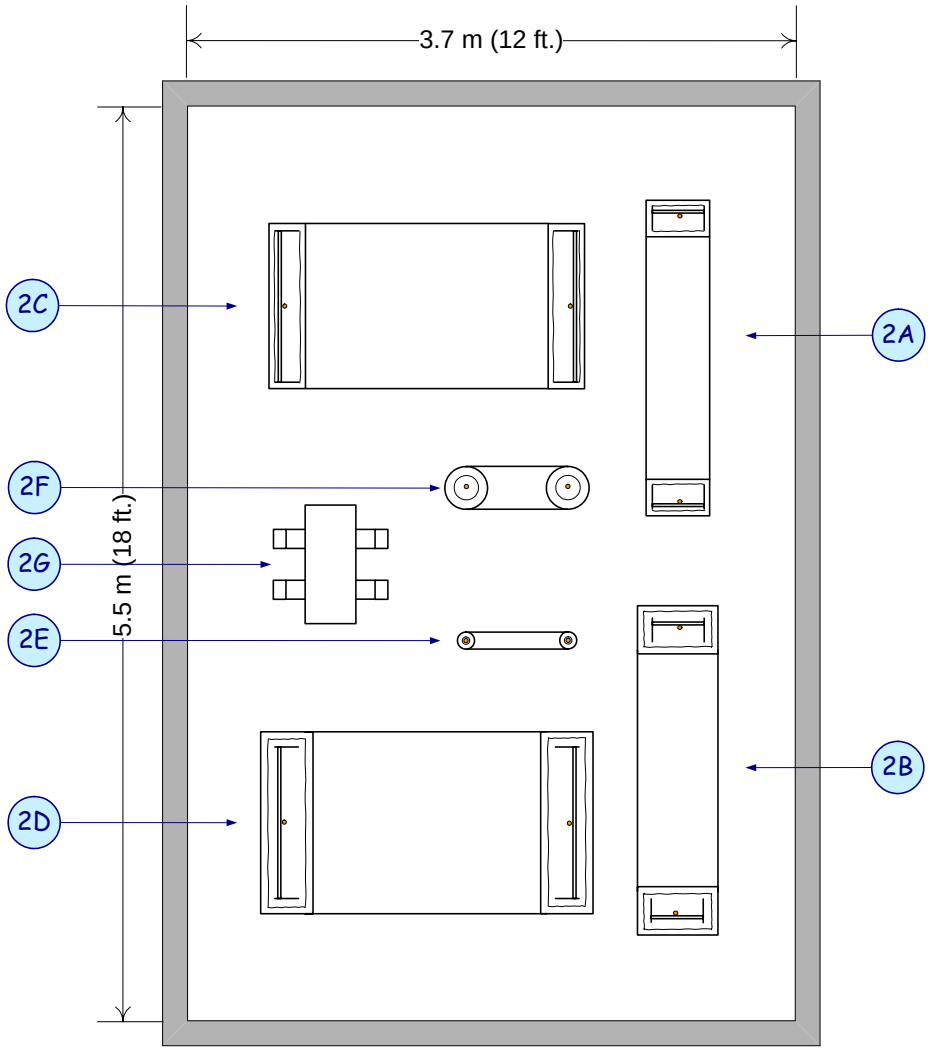
The vertical run of the 5 cm x 5 cm (2 in. x 2 in) tube steel will be approximately 0.9 m (36 in) below the test deck and the horizontal run will be 0.6 m (24 in) (See figure A7 in Appendix A).

3.4.2 Test #2

The second test will be conducted on seven test specimens, which will be protected with Hemyc ERFBS. Two of the cable trays and one cable drop will incorporate the necessary framework to provide a minimum of 50-mm (2 in) air gaps between the ERFBS and item. The nominal thickness of the Hemyc ERFBS enclosing the framed components will be 38 mm (1½ in). The remaining two cable trays, cable drop and junction box will be protected with directly attached (i.e., without air gap framework) Hemyc with a nominal wrap thickness of 50-mm (2 in).

One possible arrangement of the test specimens in the furnace during Test #2 is shown in Figure 3. The seven test specimens will include:

- A 914-mm (36 in) cable tray framed for 50-mm (2”) air gap,
- A 914-mm (36 in) cable tray employing direct attachment of the Hemyc,
- A 305-mm (12 in) cable tray framed for 50-mm air gap,
- A 305-mm (12 in) cable tray employing direct attachment of the Hemyc,
- A small cable drop loop employing direct attachment of the Hemyc,
- A 46 cm x 61 cm x 20 cm (18" x 24" x 8") junction box employing direct attachment of the Hemyc suspended from the top of the furnace with separately protected (direct attachment, ceramic fiber blanket) supports, and
- A small cable drop loop framed for 50-mm air gap.



Plan View

Test #2 Configuration Layout
Test Specimens Protected in Hemyc

2A – 305 mm (12") Cable Tray (direct attachment)
2B – 305 mm (12") Cable Tray (5 cm [2"] Air Gap)
2C – 914 mm (36") Cable Tray (direct attachment)
2D – 914 mm (36") Cable Tray (5 cm [2"] Air Gap)
2E – Cable Drop Loop (direct attachment)
2F - Cable Drop Loop (5 cm [2"] Air Gap)
2G – 46 cm X 61 cm X 20 cm (18" X 24" X 8") Junction Box (suspended by supports, enclosed in Hemyc by direct attachment)

Rev. 04
03/31/2005

Figure 3. Example of Test Specimen Layout during Test #2 (Hemyc, Framed for 50-mm (2”) Air Gap and Direct Attachment Configurations).

The cable trays will be supported from the furnace ceiling in a modified "U" configuration. The metal test deck of the test specimens will be adequately insulated to prevent interaction with the portion of the test specimens located outside the furnace and to protect the metal deck from structural failure during the 1-hour test. Each tray will include one sharp 90-degree transition from the horizontal span to one of the vertical legs. At the other transition a radius bend will be used. The cable trays will be modified and assembled to accommodate the right angle turn. The two vertical runs of these test articles will be approximately 0.9 m (36 in) along each leg inside the furnace and the horizontal span will be approximately 1.5 m (60 in) (See Figures A4 and A5 in Appendix A). The ERFBS will completely cover the test specimens within the furnace and extend through the test deck for a distance of 15 to 30 cm (6 – 12 in) above the test deck (See Figure A20 in Appendix A). All raceway supports shall be outside the furnace and shall not interfere with the ERFBS during testing.

The junction box will be supported from the furnace ceiling by Unistrut® channels (See Figure A6 in Appendix A). The junction box supports will be directly protected with a ceramic fiber blanket separately from the box.[3] (Note: The junction box supports are not considered as part of this test and will not be instrumented; however any failure in their performance during the test will be noted and investigated as deemed appropriate.) Two wrapped cable bundles (one with air gap, the other without) will be dropped through the top of the furnace and looped in the furnace and routed back up through the test deck (See figure A9 in Appendix A).

3.4.3 Test #3

The final test will be conducted on ten test specimens, all of which will be wrapped with the M.T. 3-hour rated ERFBS without any framework to provide air gaps between the wrap and raceway. The nominal thickness of the M.T. ERFBS will be approximately

[3] The junction box supports were protected with 50-mm (2") thick raw ceramic fiber blankets (not Hemyc) in Test #2 and kept thermally isolated from the box.

133 mm (5¼ in) for the cable drop. The nominal M.T. thickness for conduits and junction boxes will be 95 mm (3¾ in).

Figure 4 shows a possible configuration of the test specimens in the furnace during Test 3. The test specimens protected with M.T. during Test #3 will include:

- A 103-mm (4 in) conduit without additional cables,
- A 103-mm (4 in) conduit loaded with the maximum fill (30%) of cables,
- A 27-mm (1 in) conduit and condolet LB assembly without cables,
- A 27-mm (1 in) conduit and condolet LB assembly with additional cables (30% fill),
- A 63-mm (2½ in) conduit and condolet LB assembly with no cables,
- A 63-mm (2½ in) conduit and condolet LB assembly with cables (30% fill),
- A small cable drop loop,
- A partially protected Unistrut® support assembly,
- A partially protected 5 cm x 5 cm (2” x 2”) square steel tube support assembly, and
- A 46 cm X 61 cm X 20 cm (18" x 24" x 8") junction box

As in the other two tests, the conduit assemblies will be supported from the furnace ceiling in a modified “U” configuration. The metal deck of the test specimens will be adequately insulated to prevent interaction with the portion of the test specimens located outside the furnace and to protect the metal deck from structural failure during the 3-hour test. Each conduit will include one sharp 90-degree transition from the horizontal span to one of the vertical legs and a radius bend will be used for the other transition. A condolet fitting will be employed to provide the right angle turn. The two vertical runs of these test articles will be approximately 0.9 m (36 in) along each leg inside the furnace and the horizontal run will be approximately 1.5 m (60 in) (See Figures A1, A2, and A3 in Appendix A). The ERFBS will completely cover the test specimens within the furnace and extend through the test deck for a distance of 15 to 30 cm (6 – 12 in) above the test deck (See Figure A19 in Appendix A). All raceway supports shall be outside the furnace and shall not interfere with the ERFBS during testing.

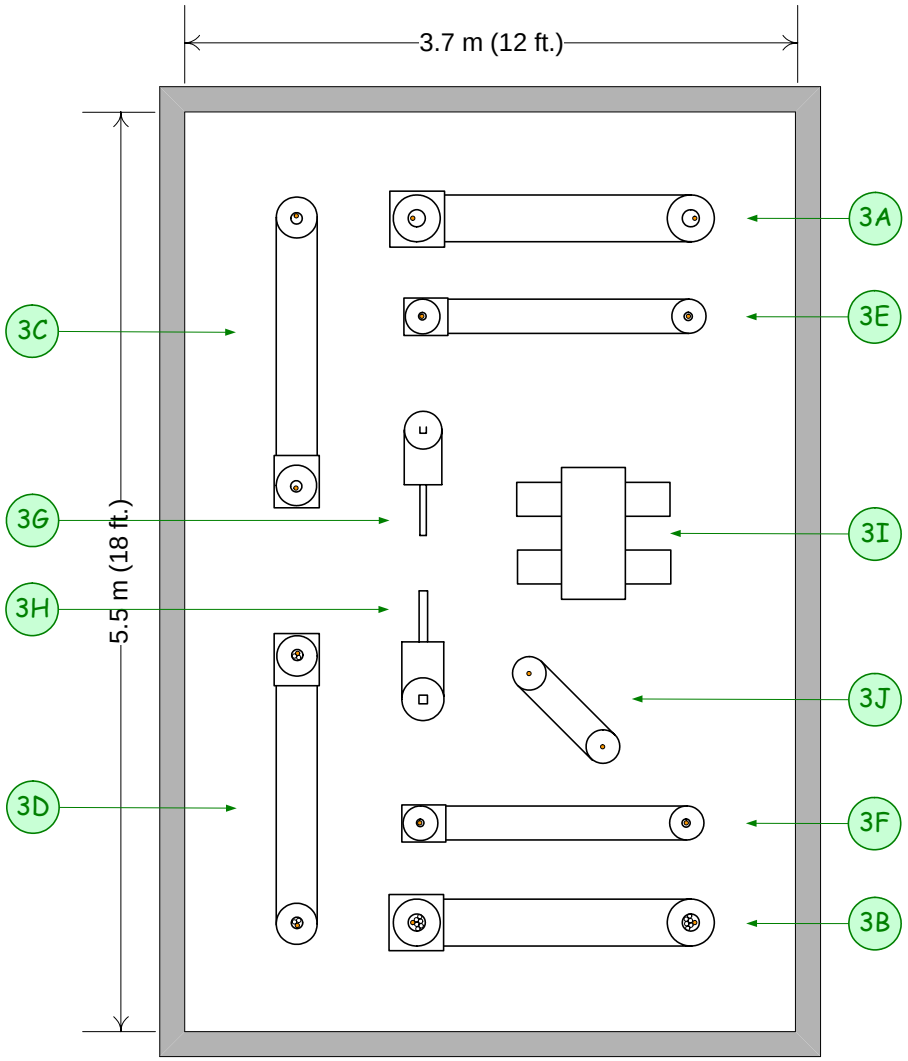

Figure 4. Example of Test Specimen Layout during Test #3 (M.T., Direct Wrap Configurations).

An M.T. ERFBS will be directly attached to the support structure analogs such that 30 cm (12 in) of their horizontal sections are exposed to the furnace environment. The junction box will be suspended from the test deck by Unistrut support members and protected with M.T. through direct attachment (See figure A6 in Appendix A).

The vertical run of the Unistrut will be approximately 0.9 m (36 in) within the furnace and the horizontal run will be 0.6 m (24 in) (See figure A8 in Appendix A).

The vertical run of the 5 cm x 5 cm (2 in. x 2 in) tube steel will be 0.9 m (36 in) in the furnace and the horizontal run will be 0.6 m (24 in) (See figure A7 in Appendix A).

One wrapped cable bundle will be dropped through the top of the furnace and looped in the furnace and routed back up through the test deck (See figure A9 in Appendix A).

3.5 Conduct of Tests

Each of the primary test runs will be conducted by exposing the test specimens to the time-temperature curve (Fig. 1) as specified in ASTM E 119, Standard Test Methods for Fire Tests of Building Construction and Materials. By this method, the temperature inside the furnace should reach 927 C (1700 F) at the end of the one-hour tests and 1052 C (1925 F) at the end of the 3-hour test. Figure 1 shows the desired temperature profile as a function of time. The time-temperature curve shall be maintained within the limits established in ASTM E 119.

Upon completion of each ASTM E 119 temperature run (one-hour and three-hours), the complete test assembly will be removed from the furnace and a hose stream will be applied to all of the test articles. The hose stream test will consist of a water stream applied at random to all exposed surfaces of the test specimens through a 38-mm (1½ in) fog nozzle set at a discharge angle of 15 degrees with a nozzle pressure of 517 kPa (75 psi) at a minimum discharge rate of 284 lpm (75 gpm) with the tip of the nozzle at a

maximum distance of 3 m (10 ft) from the test specimen. The hose stream application will be continued for at least 5 minutes upon completion of the test.

A visual inspection of all test articles will be conducted following the hose stream test. The purpose of the inspection will be to ascertain whether the ERFBS remained intact during the fire exposure and the cooling and mechanical impact of the hose stream test without developing any openings or breaches. Visible indications of an opening will include obvious tears or displacement of a barrier section or a view of the covered raceway through the fire barrier.

Photographs and video of the test specimens, both prior to and after disassembly, will be taken during the post-test inspection and recorded as part of the test documentation.

3.6 Instrumentation and Data Collection

The primary data to be generated in these tests will be component temperatures as indicated by insulated 24-gage Type-K thermocouples (Special Limit 32 to 2282^{o}F range and 2^{o}F or 0.4% tolerance value per ASTM E230-ANSI MC 96.1). The junction box temperatures will be monitored using Type-K thermocouples sheathed in Inconel. These thermocouples have been calibrated and certified to accuracies within 4^{o}F of the comparison standard over a temperature range of 70^{o}F to 1000^{o}F. Test #1 will require the use of approximately 380 thermocouples to monitor the test specimen temperatures. Test #2 will require about 335 thermocouples. Approximately 400 thermocouples will be needed for Test #3. The outputs of the thermocouples will be sent to a computerized data collection unit for recording and storage. Each thermocouple's output will be recorded at least once per minute. It is expected that Teflon-coated thermocouples will be used during Test #3 to ensure that there will not be interference from any gases evolving from the M.T. ERFBS.

Figures A10 through A18 in Appendix A show the preferred attachment locations of the thermocouples on the test specimens. Routing the thermocouples for monitoring the tray temperatures will be by laying the bundles in the tray at the entry point and branching the

thermocouples off for mechanical attachment to the tray rails and bare copper conductor at the appropriate locations (See figures A13 and A14 in Appendix A). Similarly, for the cable drop thermocouples, the thermocouples will be bundled with the cable drop cables at the points of entrance and exit at the ceiling of the furnace and branching off the thermocouples for attachment to the bare copper conductor wire at 150-mm (6 in) spacing intervals (See figure A18 in Appendix A).

Each conduit will have thermocouples mechanically fastened to the side or bottom surface located along the outside perimeter of the "U" shape (See Figures A10, A11, and A12, in Appendix A). The routing of thermocouples for monitoring the temperature of the conduit will require that a series of small thermocouple bundles be placed around the circumference of the conduit and run to their individual attachment locations between the conduit and ERFBS. In order to minimize the effect of these small bundles on the test results, the conduit thermocouples will be run in underneath the ERFBS from both ends of the test specimen. The bare copper wire routed through the interior of each conduit test specimen will be instrumented with thermocouples installed with a maximum spacing of 150-mm (6 in) along its length. The junction boxes and condolet fittings will have at least one thermocouple attached to each side located at or as closely as possible to the geometric center of the side walls.

Note that the thermocouple locations indicated in these figures are for information purposes only. The thermocouples will be installed, except as noted, at 150-mm (6 in) intervals along the conduits, cable tray rails, and bare #8 copper wires in accordance with the guidance provided in Supplement 1 to Generic Letter (GL) 86-10. The instrumented bare #8 copper wire will be embedded within the copper wire bundles of the "loaded" raceways to protect the thermocouples from physical damage when the bundles are pulled through the raceways. Thermocouples will be attached to the raceway vertical legs located 25-mm (1 in) above the top of the test deck and 25-mm (1 in) below the exposed surface of the insulation on the bottom of the test deck.

3.7 Follow-on Tests

The decision to plan and conduct follow-on tests will be made by NRC (RES) on the basis of the primary test results.

4 REPORTING AND DOCUMENTATION

For each test conducted, the testing laboratory shall produce a draft report within two weeks of completion of the test. Each draft report (including electronic data and color photographs) will be submitted to SNL for a one-week comment period. The draft report will contain a summary of the thermocouple data and a simple analysis on the effects of cable mass on ERFBS performance. Upon receipt of comments, the test laboratory shall issue the final test report within two weeks to SNL. The final report shall contain all thermocouple data (including plots and location maps), QA documentation and construction drawings and ERFBS installation details. Thermocouple data plots will include graphs of (1) each individual temperature monitored during the test, (2) graphs of the average and maximum temperatures recorded for each test specimen exterior surface as a function of time, and (3) graphs of the average and maximum temperatures recorded for each test specimen instrumented bare #8 conductor as a function of time. SNL shall review the final report for accuracy and transmit the complete laboratory report to NRC (RES) within one week.

The test data will be analyzed and the fire barrier performance will be evaluated based on the acceptance criteria.

It should be recognized that the possibility exists that these test results may form the technical basis for broad acceptance of these fire protection systems by NRC, or provided the basis for enforcement action or backfit requirements, as deemed appropriate.

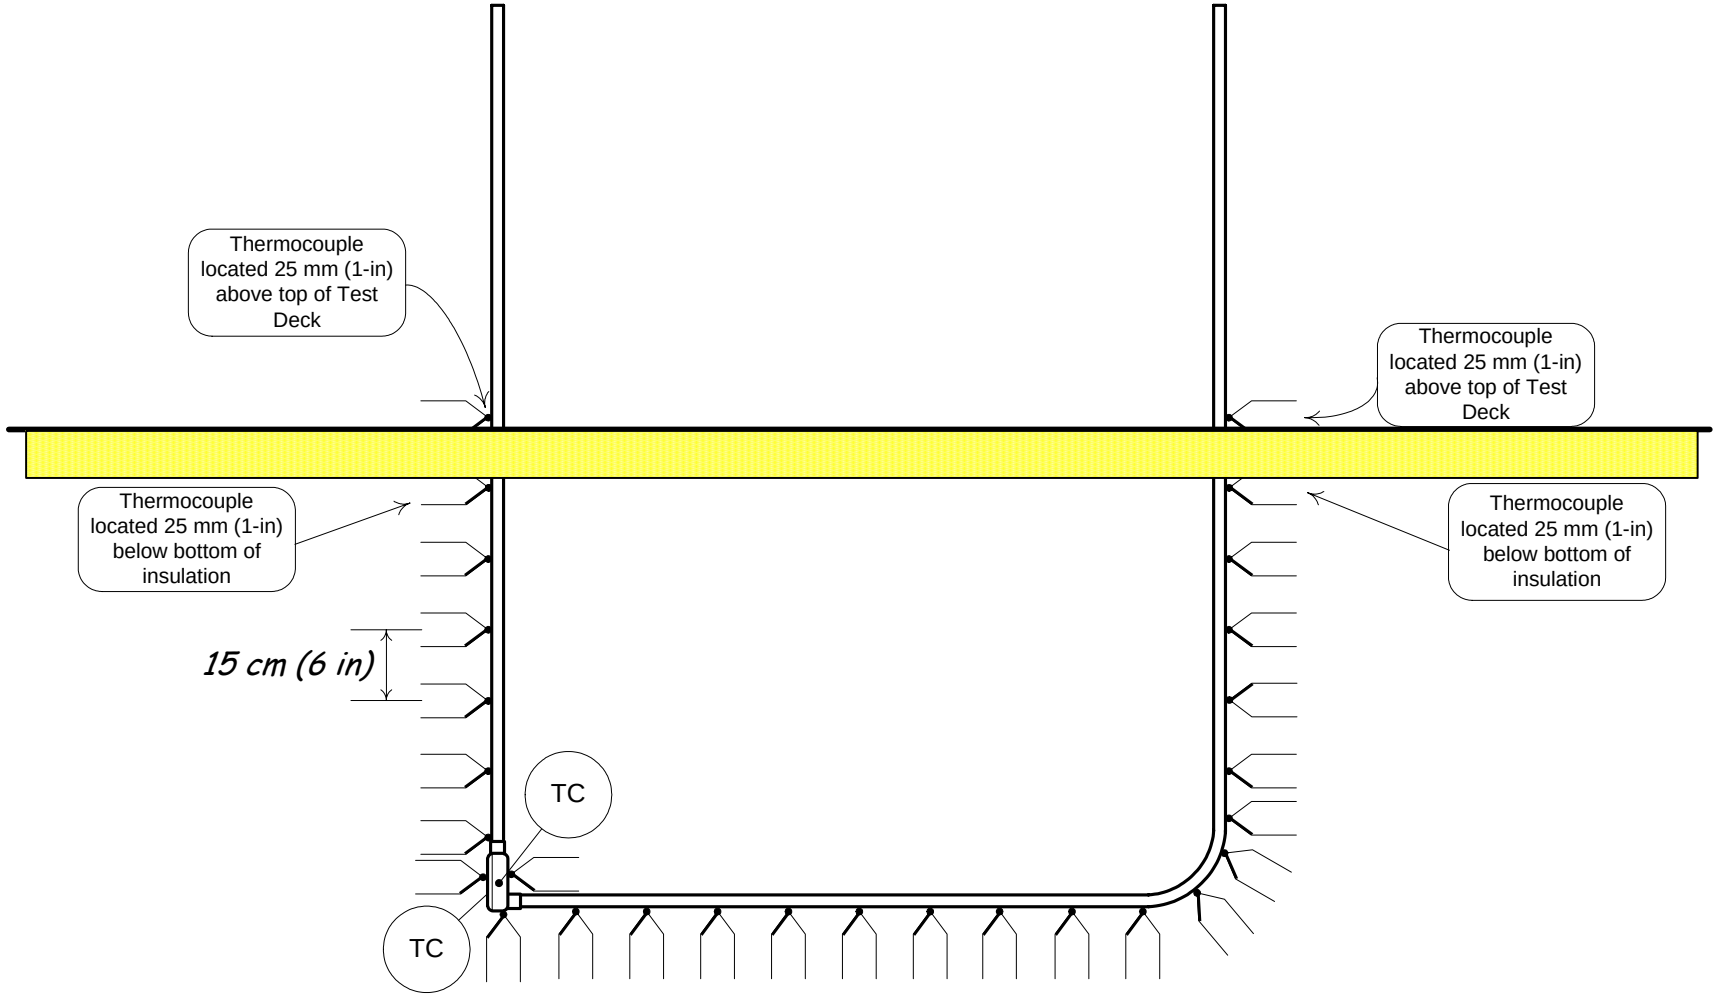

Figure A10: Thermocouple placement on 27-mm (1-in) conduit test specimens (additional thermocouples to be attached—at 150-mm [6-in] spacing intervals—to a bare #8 copper wire routed through conduit).

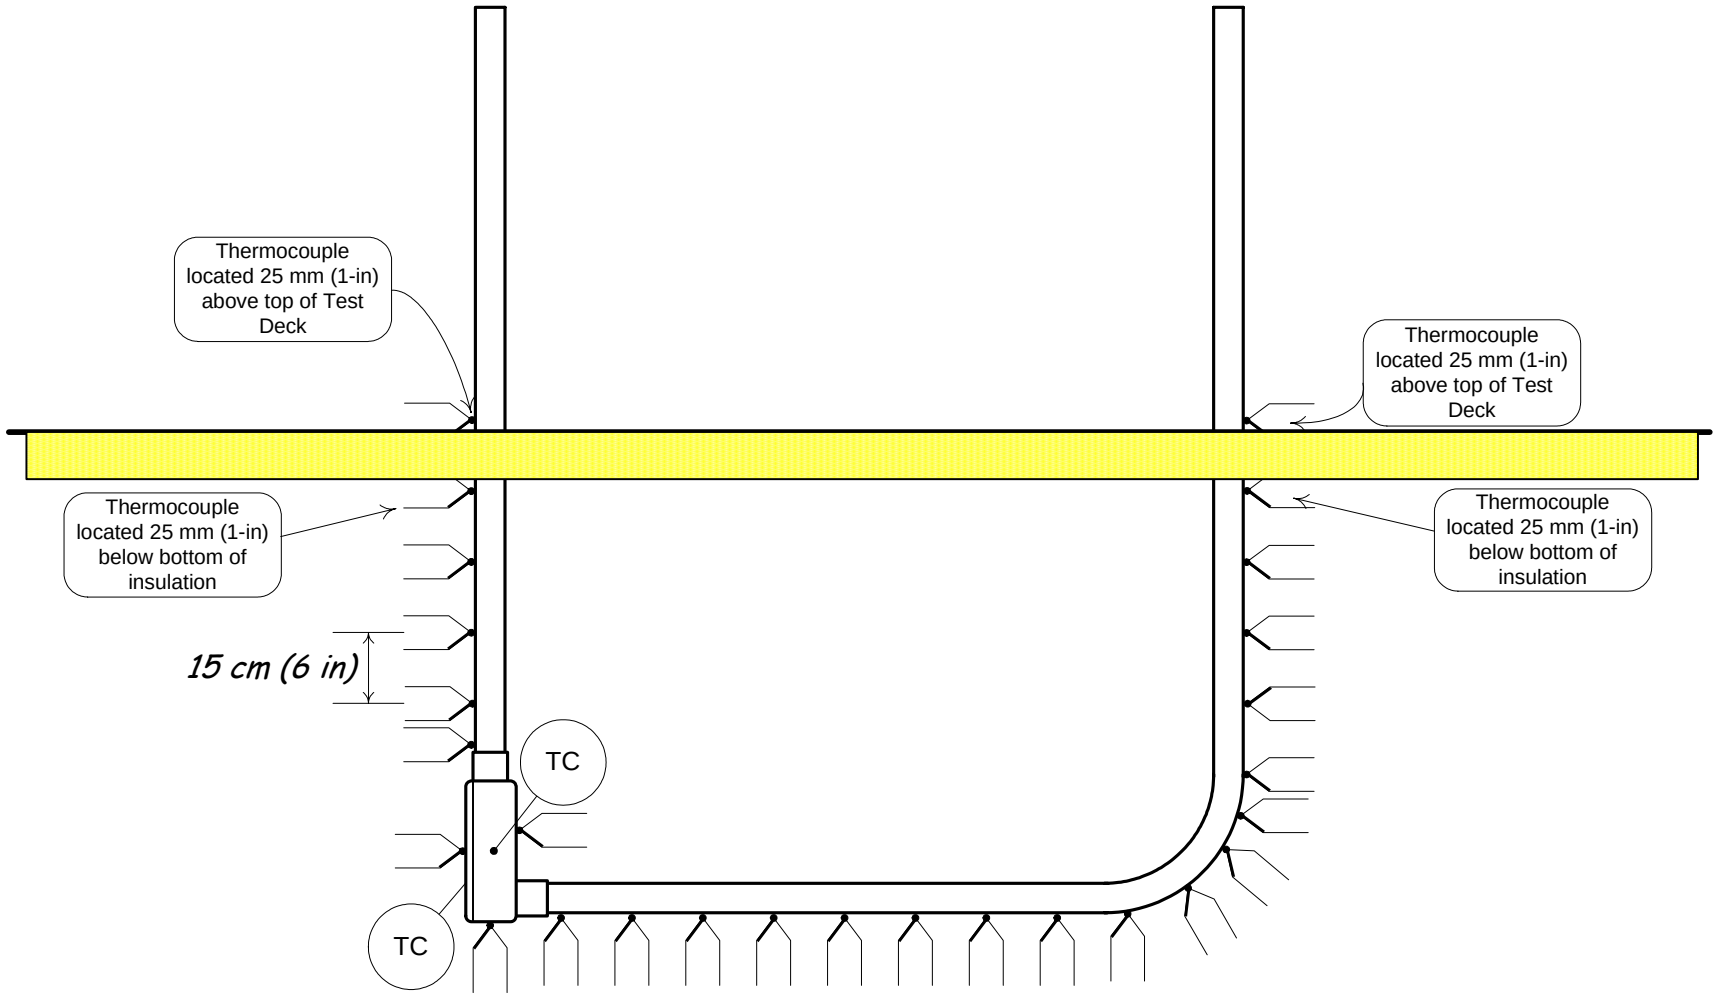

Figure A11: Thermocouple placement on 63-mm (2½-in) conduit test specimens (additional thermocouples to be attached—at 150-mm [6-in] spacing intervals—to a bare #8 copper wire routed through conduit).

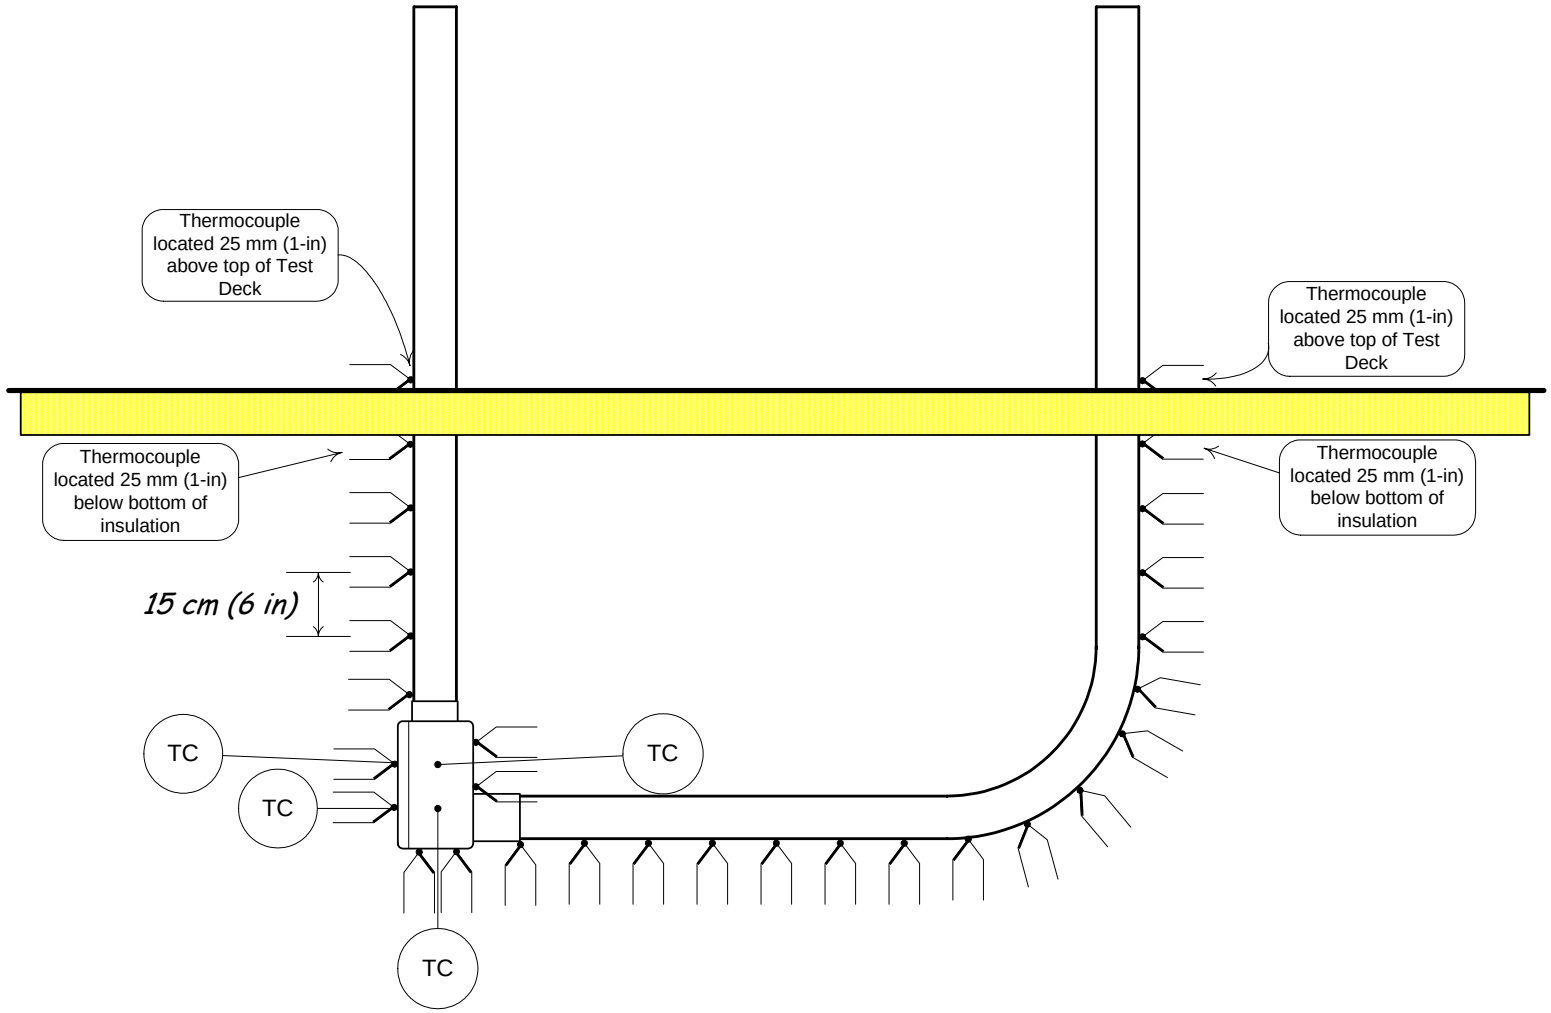

Figure A12: Thermocouple placement on 103-mm (4-in) conduit test specimens (additional thermocouples to be attached—at 150-mm [6-in] spacing intervals—to a bare #8 copper wire routed through conduit).

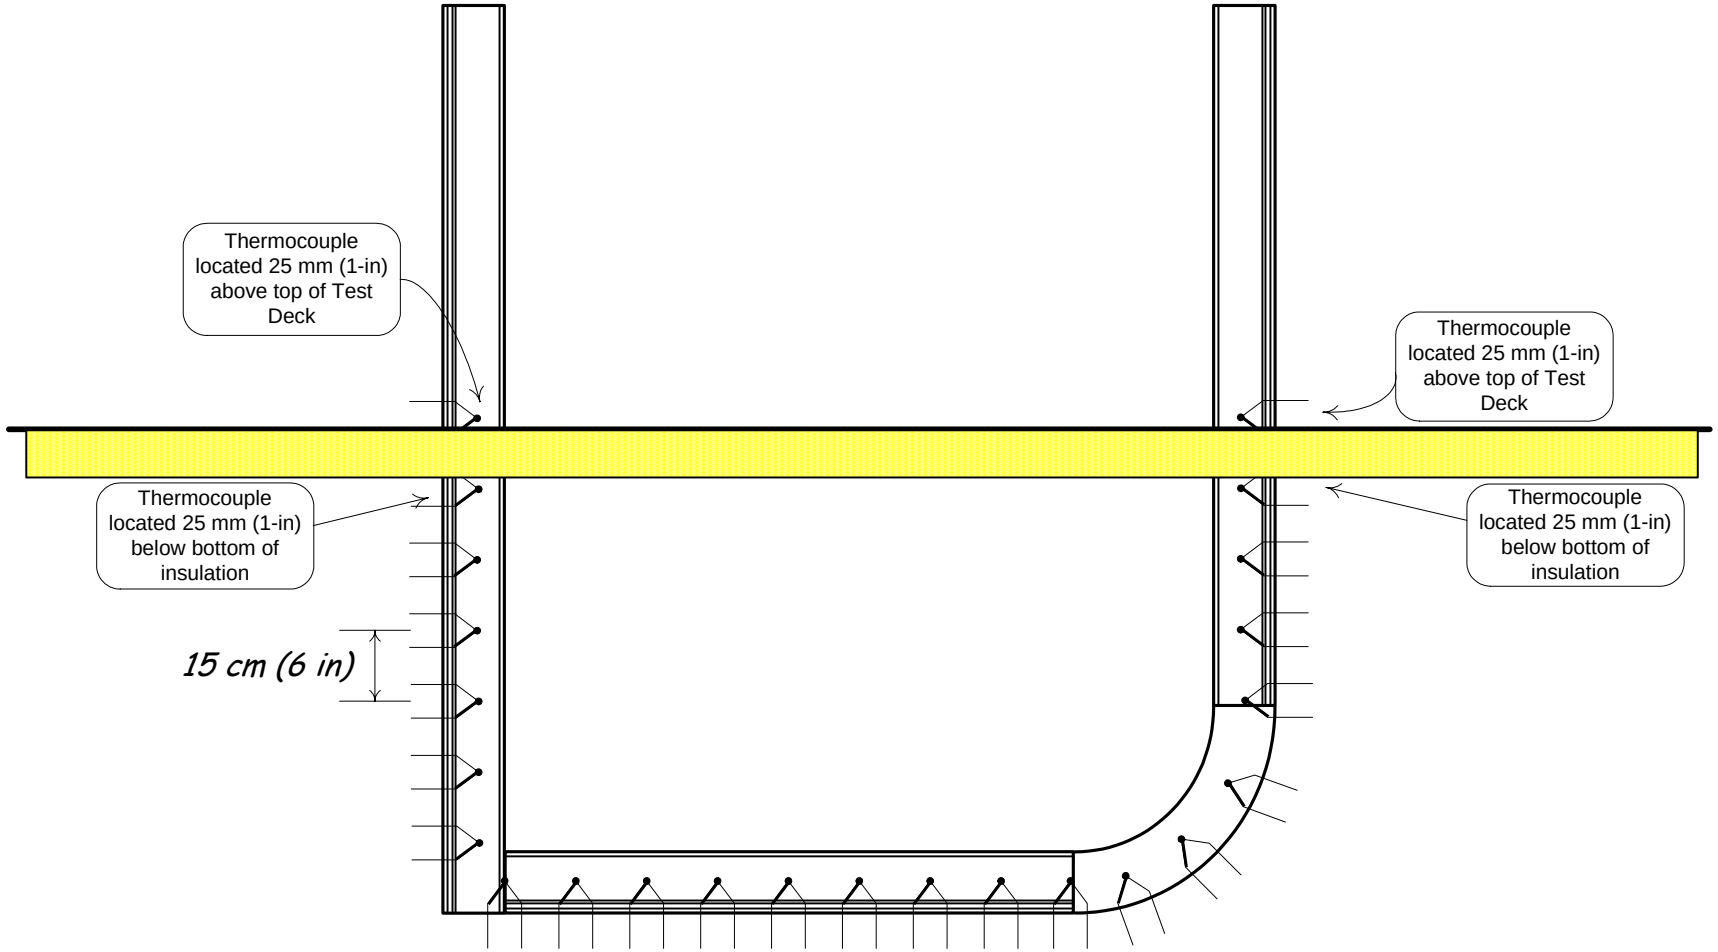

Figure A13: Thermocouple placement on 305-mm (12-in) cable tray test specimens (side view only, additional thermocouples to be attached at 150-mm [6-in] spacing intervals on other side rail and to a bare #8 copper wire routed along the mid-axis of the tray on the bottom of the rungs).

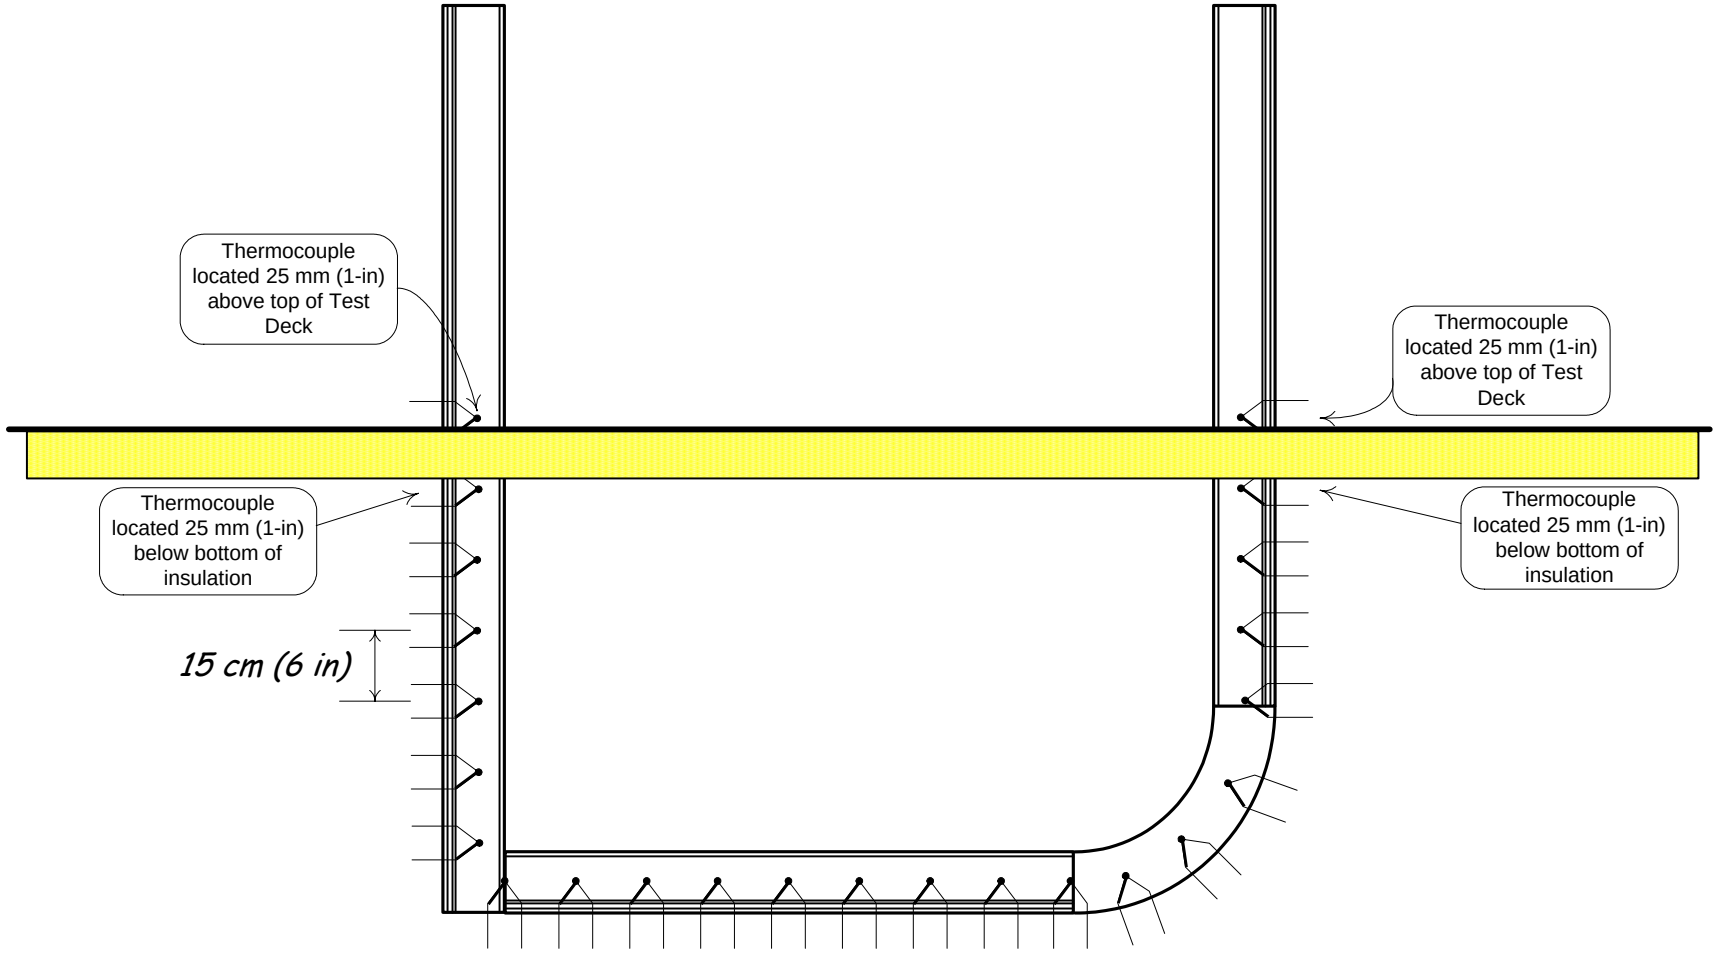

Figure A14: Thermocouple placement on 914-mm (36-in) cable tray test specimens (side view only, additional thermocouples to be attached at 150-mm [6-in] spacing intervals on other side rail and to a bare #8 copper wire routed along the mid-axis of the tray on the bottom of the rungs).

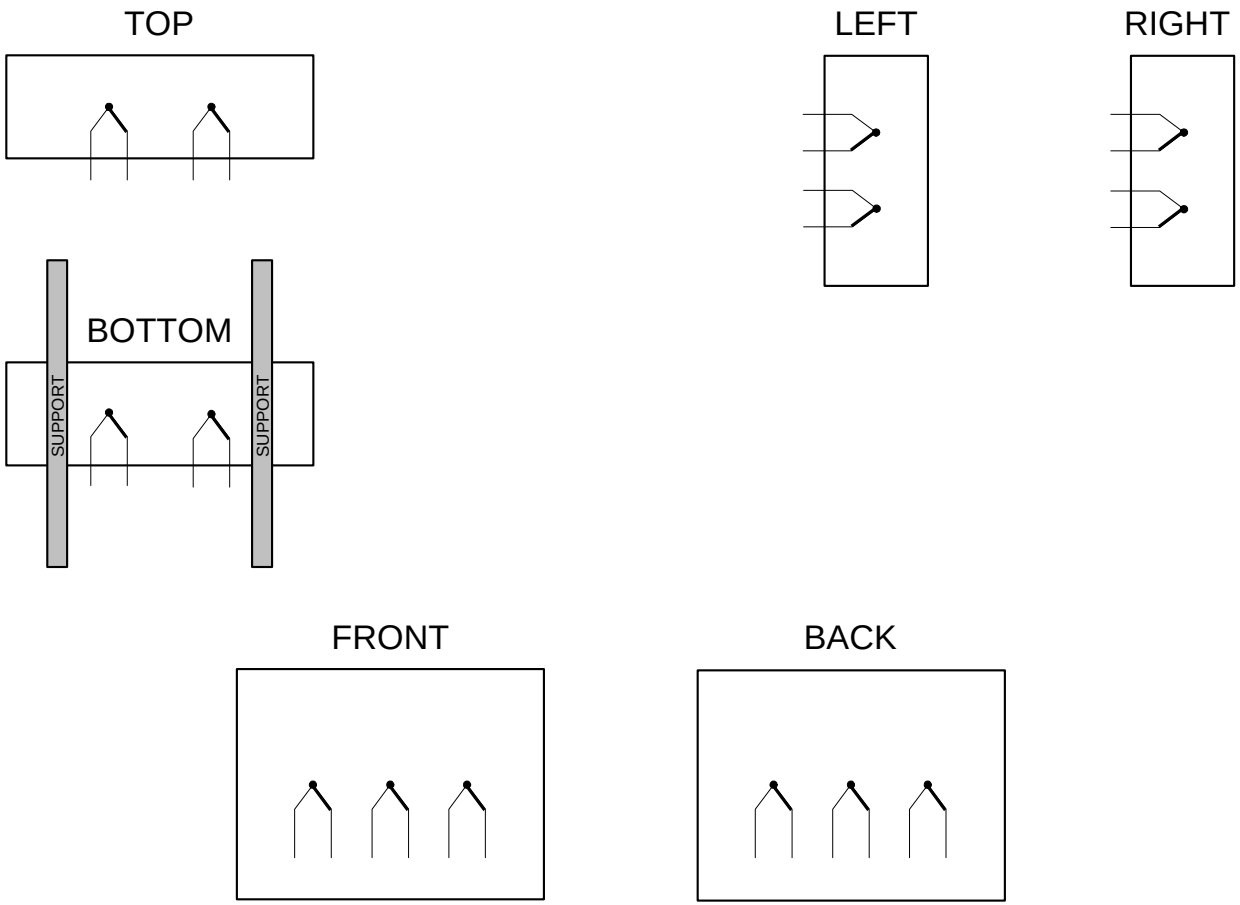

Figure A15: Thermocouple placement on junction box test specimen surfaces (no bare #8 copper conductor wire will be located inside the box and no thermocouples will be used to monitor the status of the junction box supports).

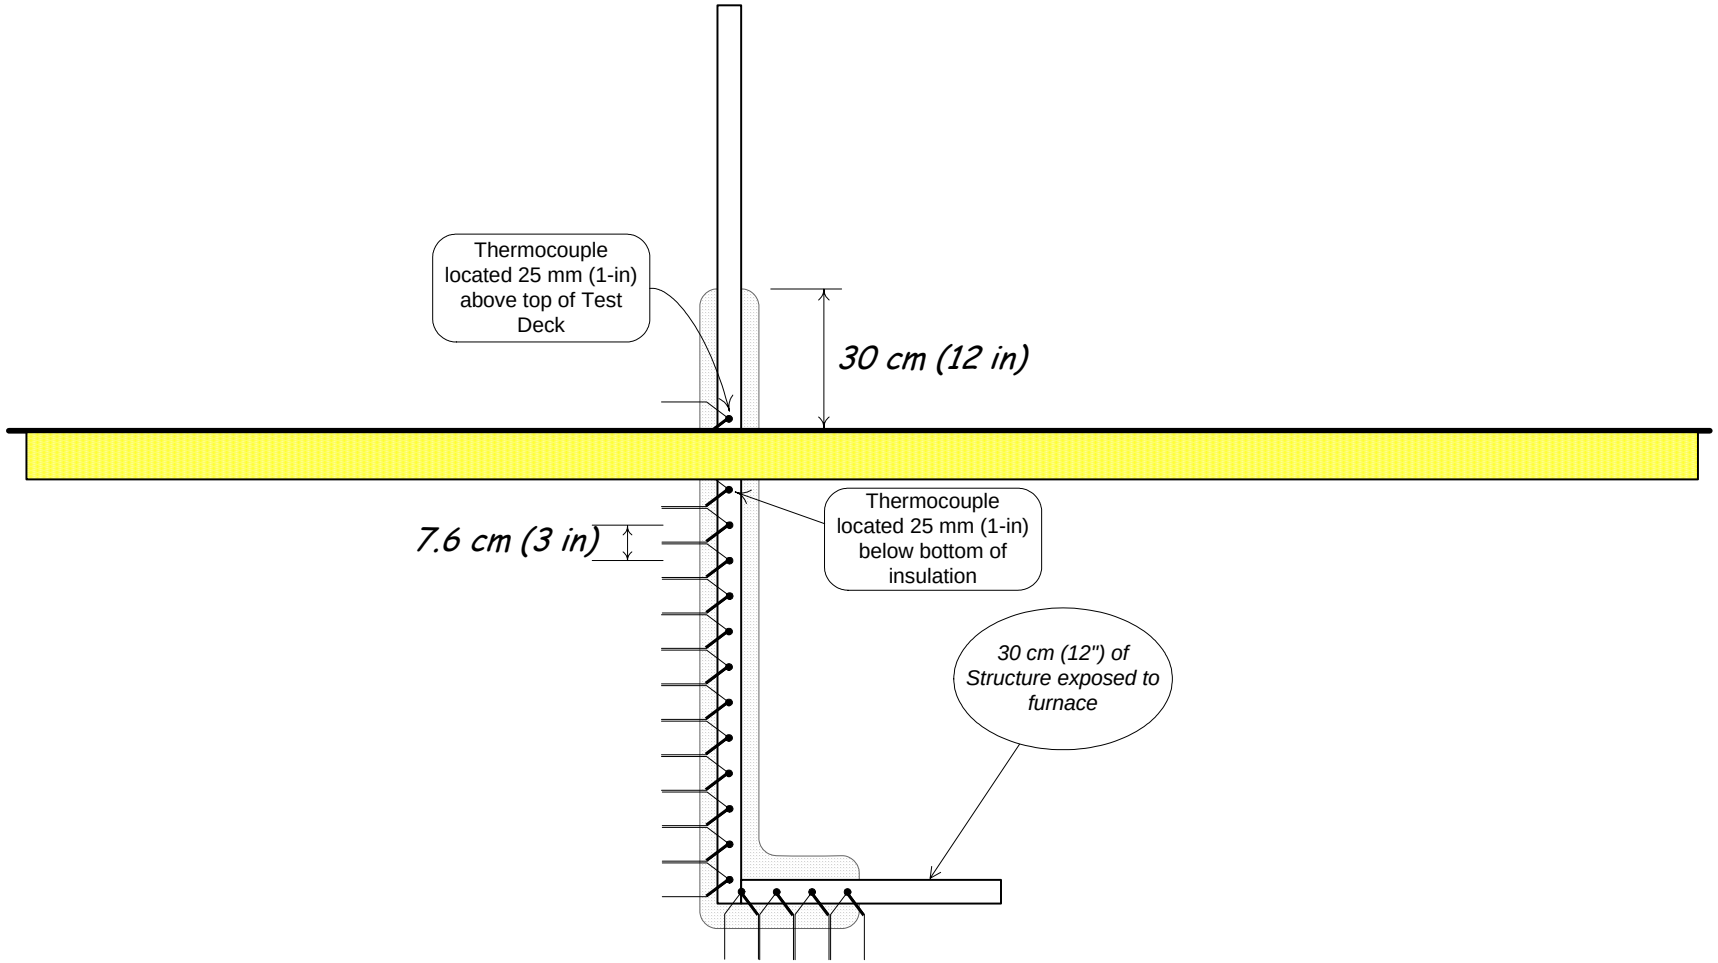

Figure A16: Thermocouple placement on tube steel support structure test specimens. (Note: ERFBS silhouette shown for reference only.)

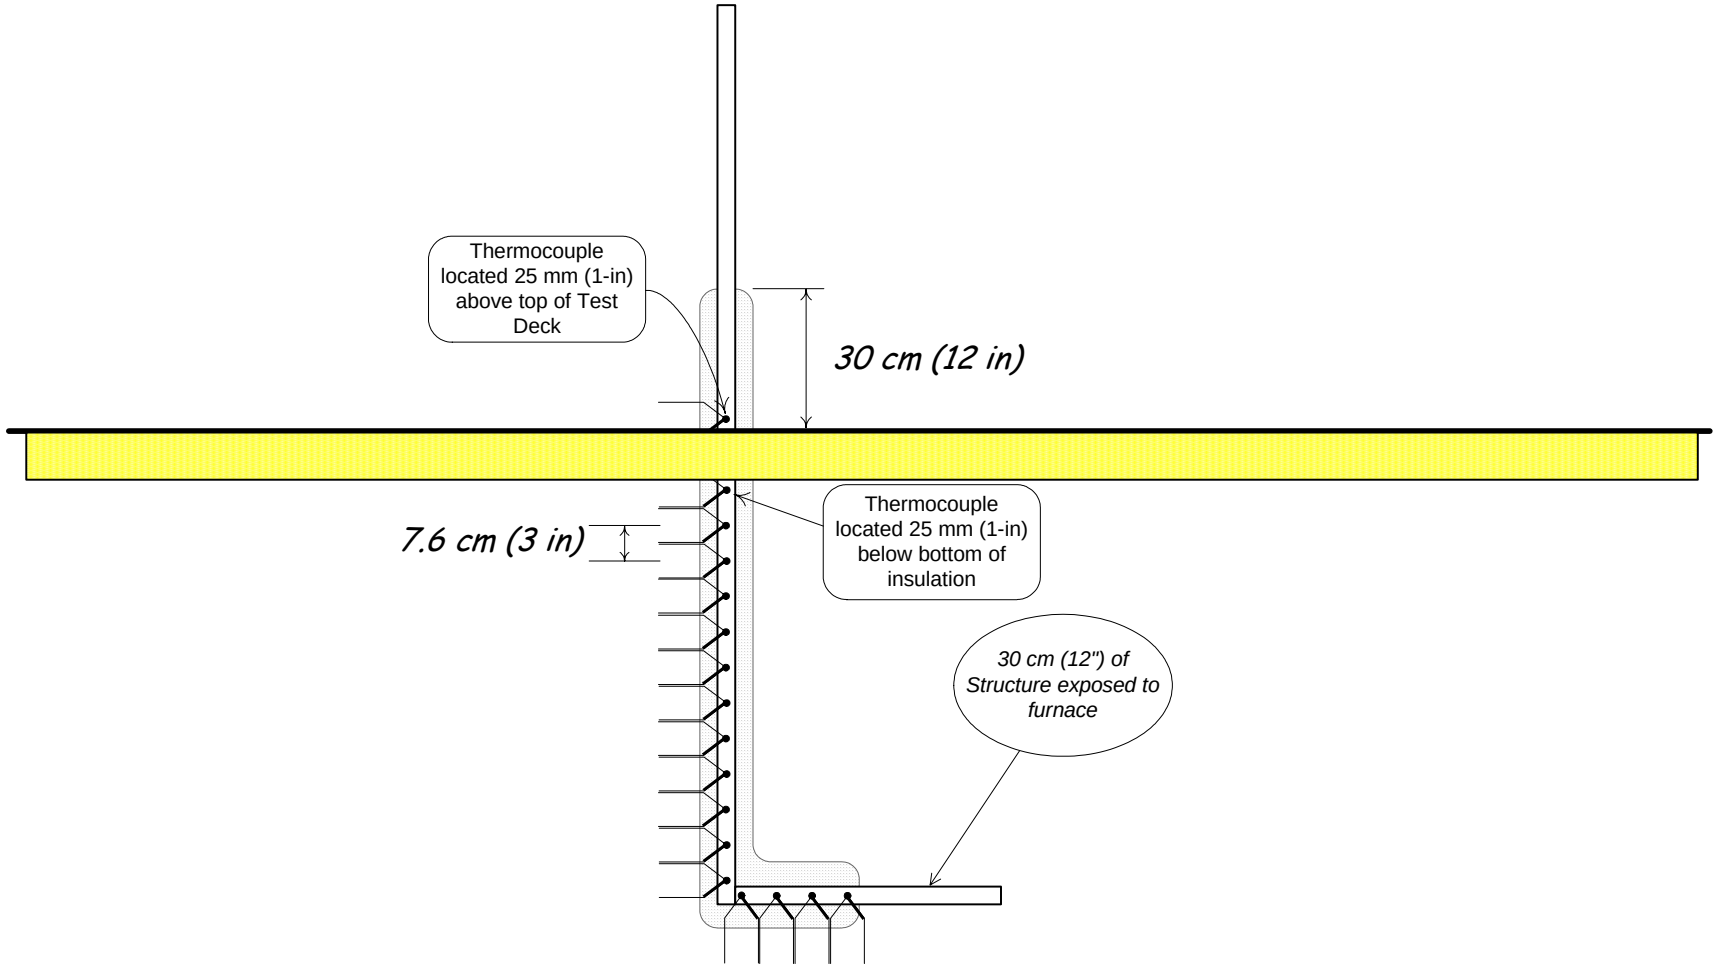

Figure A17: Thermocouple placement on Unistrut® channel support structure test specimens. (Note: ERFBS silhouette shown for reference only.)

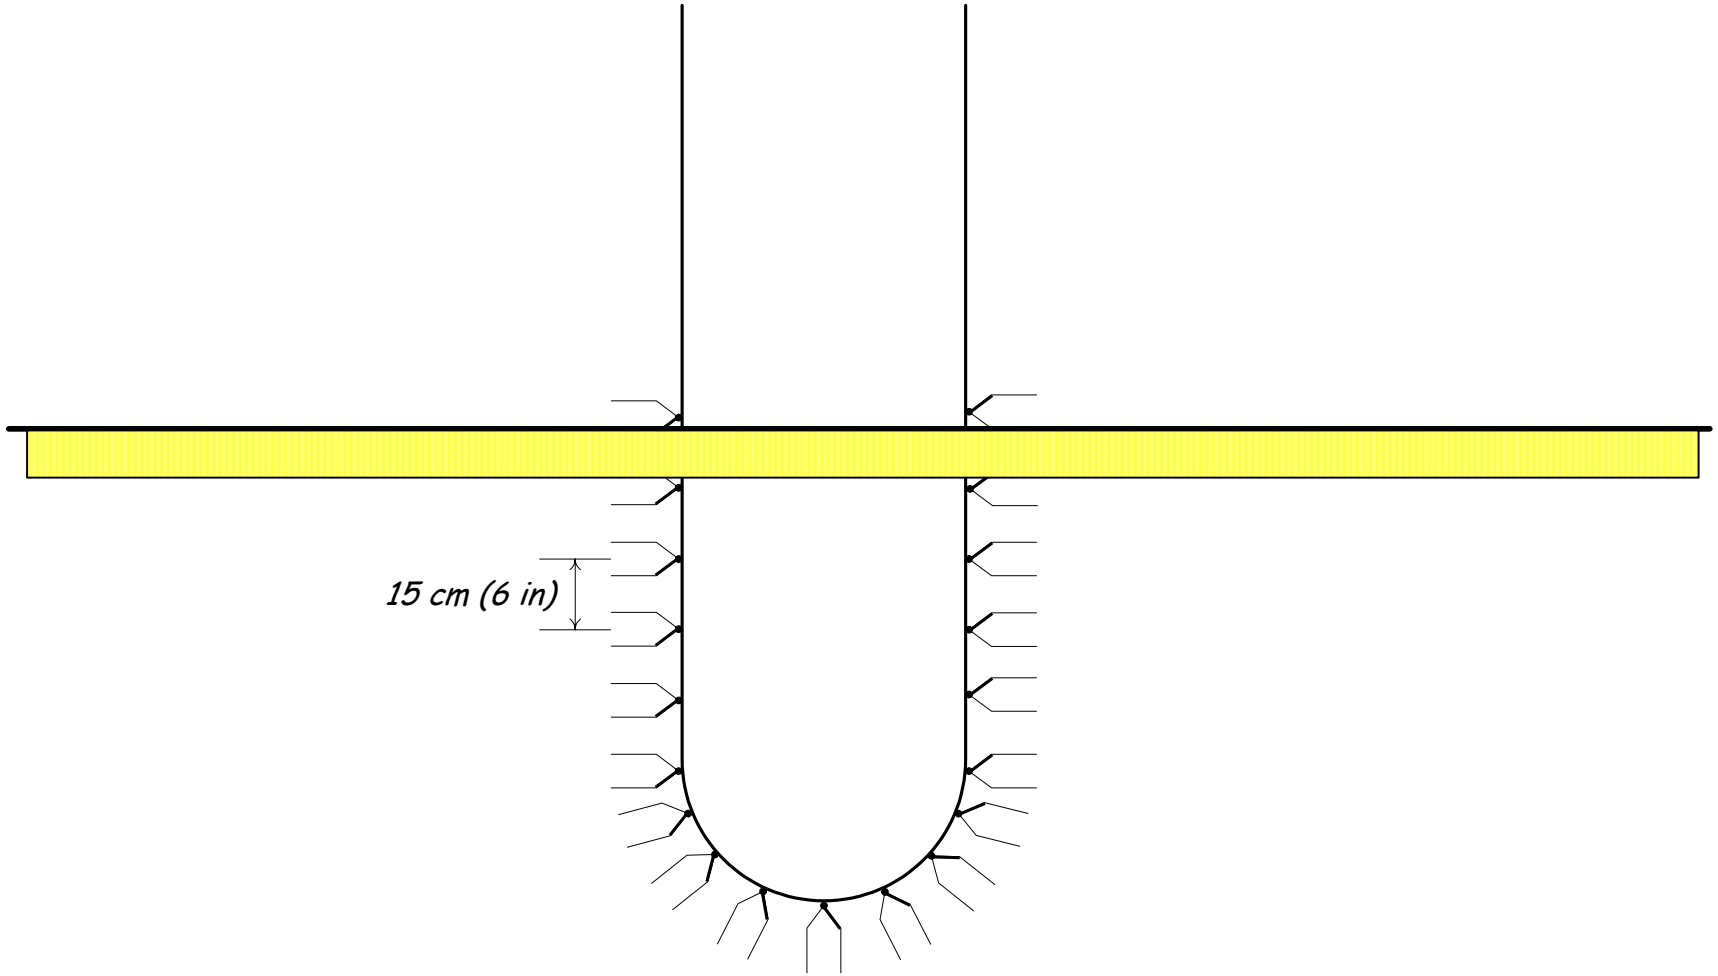

Figure A18: Thermocouple placement on unsupported cable drop test specimens.

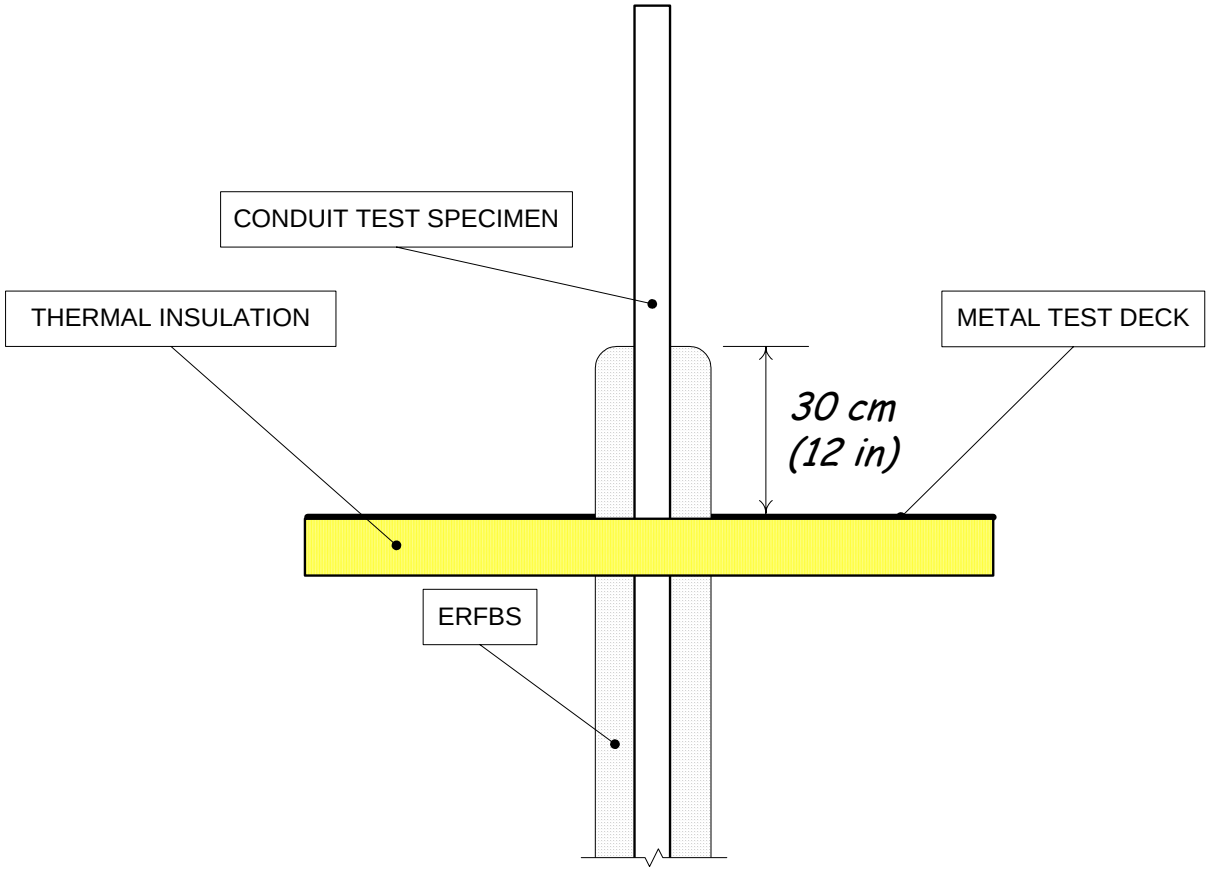

Figure A19: Detail of conduit test specimen direct attachment ERFBS extension through the test deck.

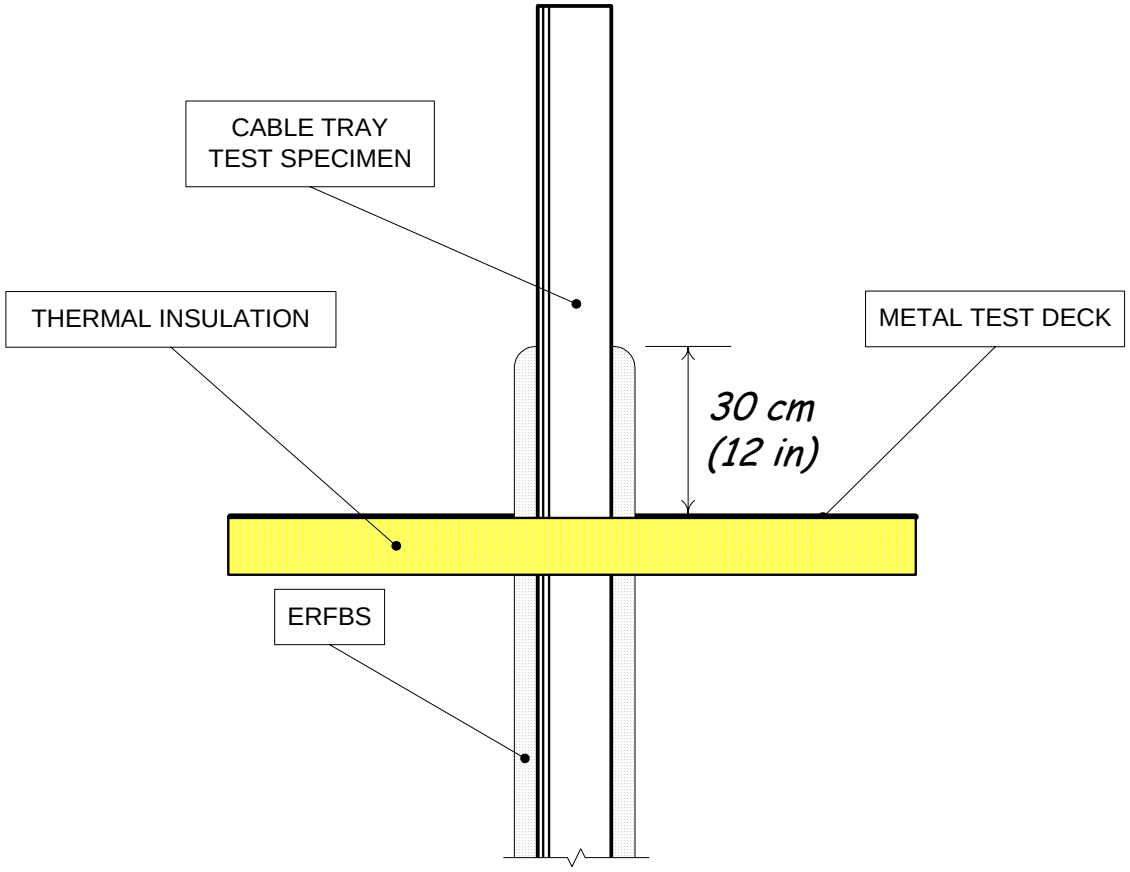

Figure A20: Detail of cable tray test specimen direct attachment ERFBS extension through the test deck.

B Email Correspondence from NEI to NRC Regarding Predominant Industry Practices for Hemyc

The message below is the body of an email from Fred Emerson, NEI, to Mark Salley, NRC, dated January 18, 2005, with subject heading, “Hemyc – Predominant Industry Practices.”

Mark and Roy -

As requested, here are the answers to your questions.

Thanks,

Fred Emerson
202-739-8086

<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<>>>>>>>>>>>>>>>>>>>>>>>>>>>>
>>>>>>>>>>>>>>>>>

1. Fiberglass cloth inner cover. Which is the predominate industry practice ~ To use the fiberglass cloth on the non-fire side of the barrier, or to just use the siltemp material on both sides? Was there any difference between the conduit & cable trays (as to how it was done)

Answer: The predominant industry practice is to use siltemp for both the internal and external fabric. In some cases the fiberglass cloth was used on the internal side (facing the protected component) and in these cases the external fabric was overlapped a minimum of 6" onto the non-fire side.

2. Attachments The testing used finger straps. Most of the photos we have seen use banding. Which method was prevalent in industry? Again, any difference between conduit vs. cable tray vs. junction boxes (e.g., bands are prevalent on conduits, while finger straps were used on cable trays)

Answer: The predominant industry practice is to use stainless steel banding. This applies to cable trays, conduits and boxes.

3. Air drops What is predominate ~ the use of air gap spacers between the cable & fire barrier, or direct attachment around the air drop?

Answer: The predominant method is to install the Hemyc wrap with gap spacers to ensure that a "dead air space" is maintained between the unexposed side of the wrap and the protected cable surface.

4. Density of material The spec calls out 6 - 8 lb density. Did any licensee have any QA requirements to measure this? Is there any record of what density of material the licensee installed?

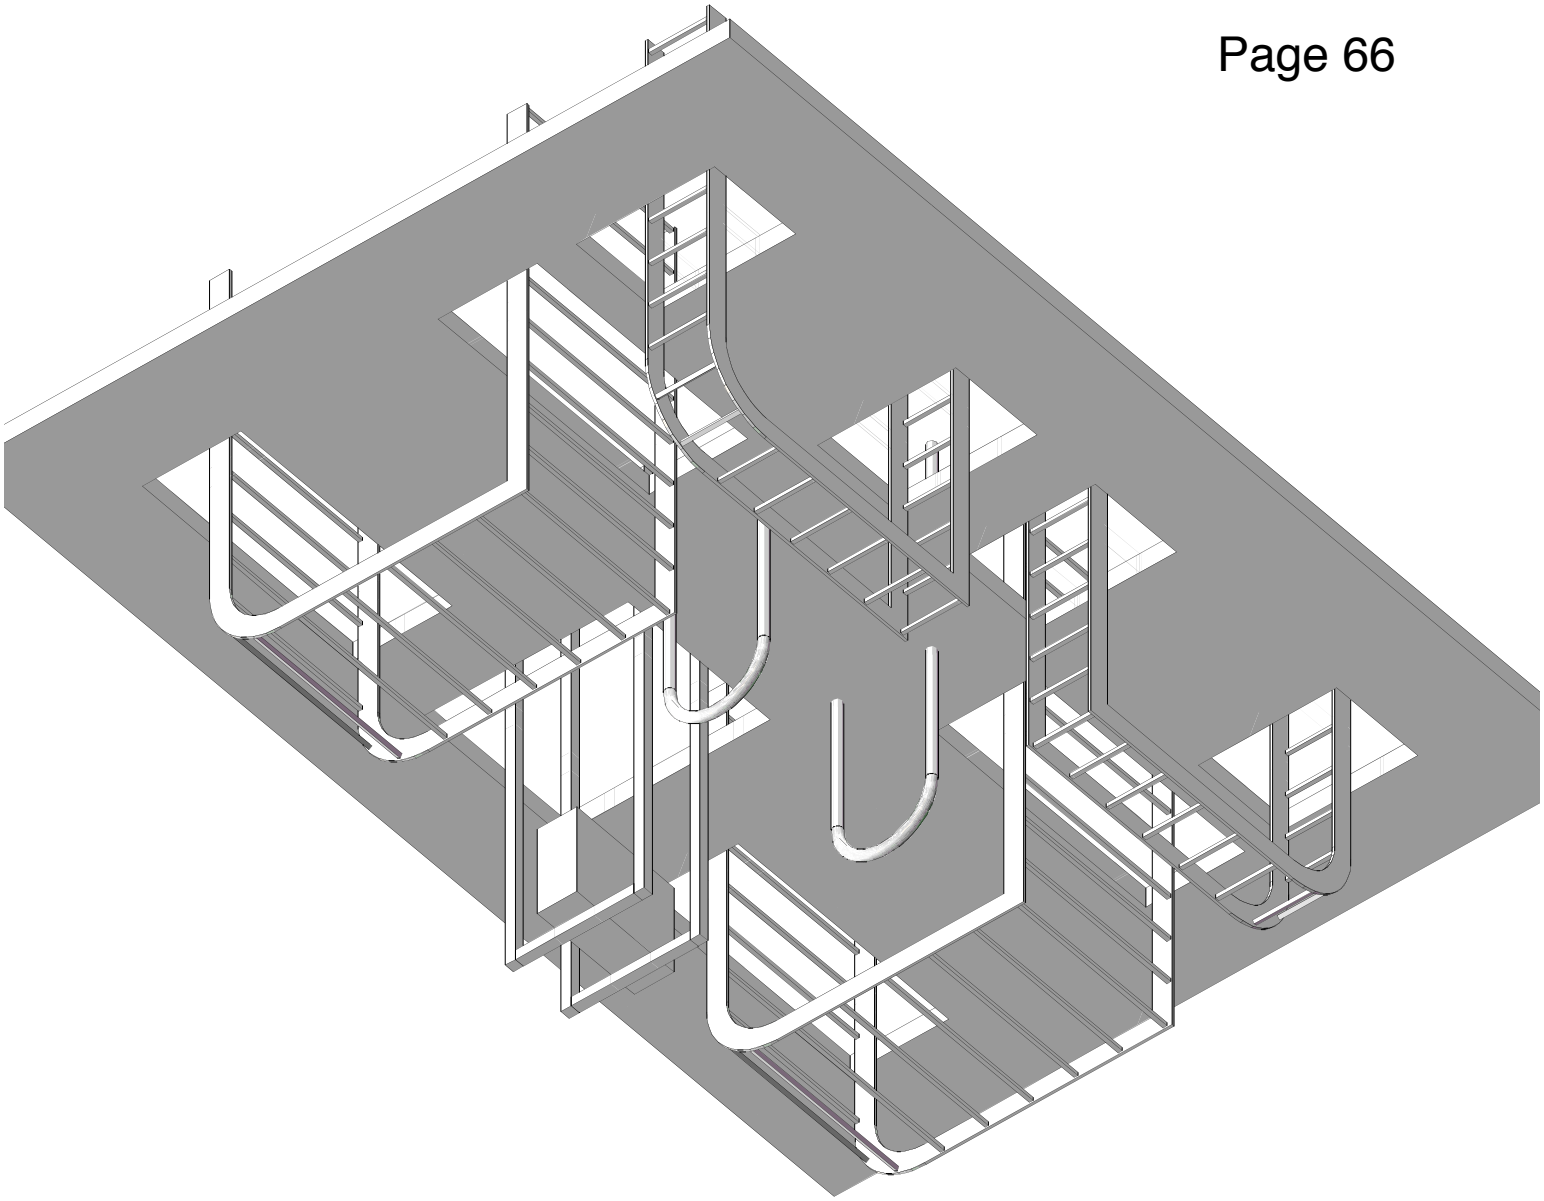
Answer: The material was specified to be 6 to 8 lb density as manufactured by Johns-Manville, Babcock & Wilcox or wrap vendor approved equal. This material was then installed to the specified thickness. No site verification of density was required nor necessary as the material used (density range) was consistent to that specified in the fire qualification tests. These materials were considered approved off-the-shelf items and required a certificate of compliance/conformance.

5. Joint Technique There are a number of different joint techniques, from butt joints, to overlapping the joint a minimum of 2 inches, to but joints with a 6 in. collar. Which method is predominate on conduits? cable trays?

Answer: The industry is essentially evenly split between using an overlapping joint method and the butt joint with a collar method for conduits. Typically trays use the overlapping joint method with an overlapping joint of 2 inches.

Appendix B

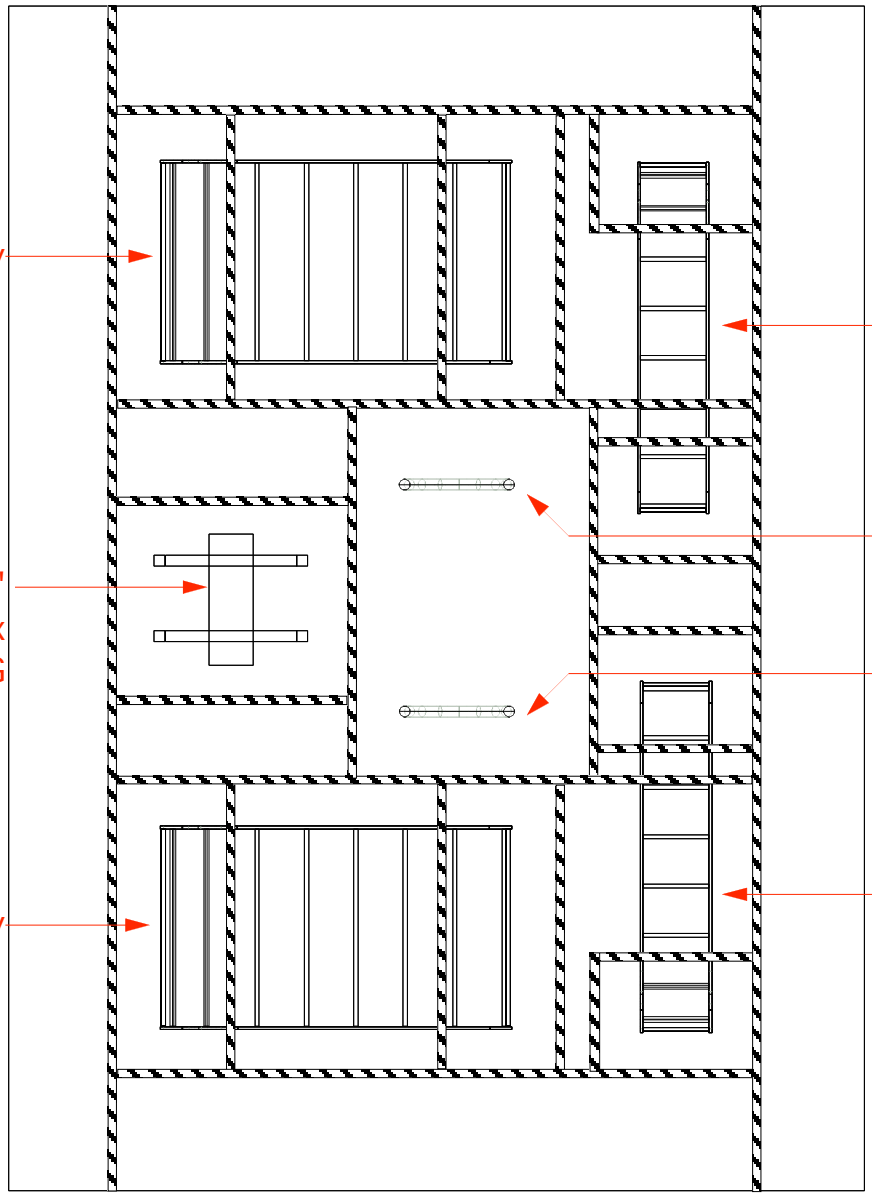
CONSTRUCTION DRAWINGS



Note:
This view shows the separation and placement of all raceways in Test #2. Support members on the unexposed side of the deck are not shown.

OMEGA POINT LABORATORIES, INC. Project No. 14790-123264
SANDIA NATIONAL LABORATORIES
Fig. 1, Rev. 1 Test 2 Assembly Isometric View
Drwn by:D.N.Priest Date: 1/4/05 OPL App'l: C Humphrey Date: 1/4/05 Sandia App'l: Date:

Scale=1:35



PLAN VIEW

Note:
All raceway items have been placed in the furnace in symmetric locations, to give as uniform exposure as possible between two of the same items. In this drawing, the C5x6.7 structural channel above the deck steel is shown cross-hatched, and the deck steel and 4" channel below it are transparent, to indicate the placement of the raceways. See Fig. 3 Test 2 Assembly for deck and opening dimensions.

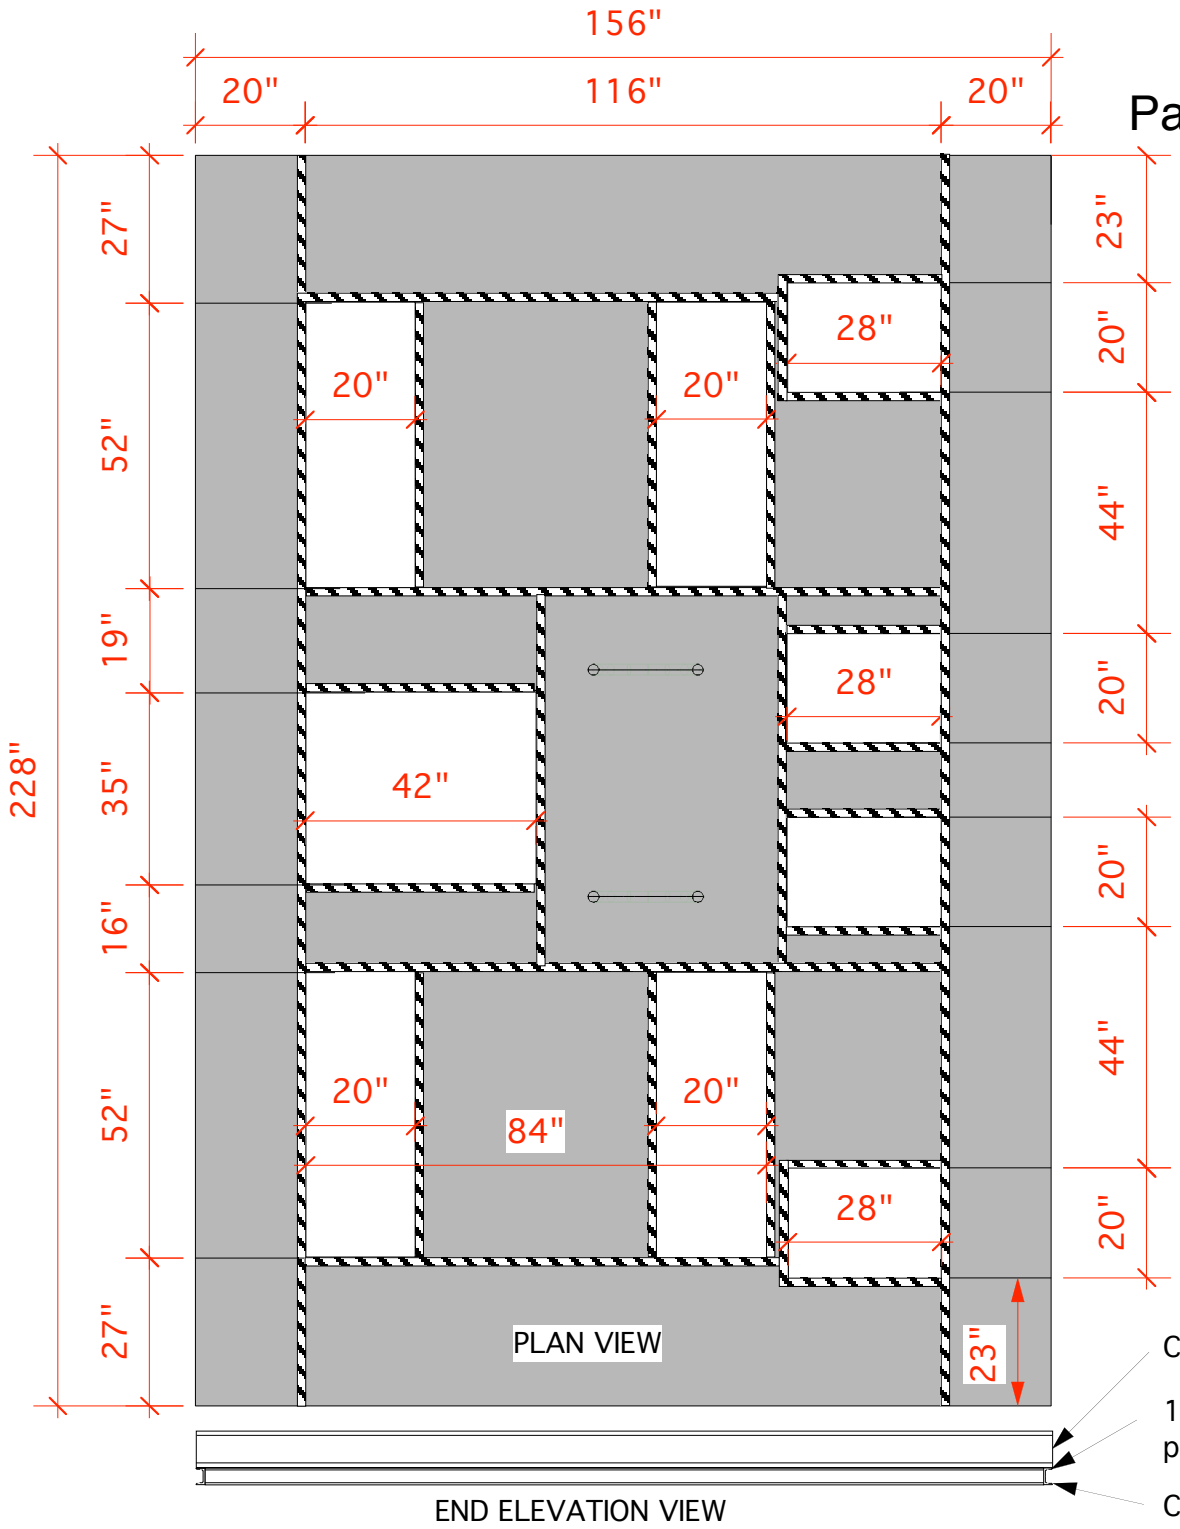
Drwn by:D.N.Priest Date: 1/25/05 OPL App'l: C Humphrey Date: 1/25/05 Sandia App'l: Date:

Scale=1:35



END ELEVATION VIEW

Note:
All dimensions plus or minus 1/2"

Note:
The lower perimeter steel consisted of C4x5.4 channel, positioned with flanges outwards, completely around the deck. Over the channel was placed a continuously-welded layer of 10 GA. hot-rolled steel plate. Over the steel plate was placed C5x6.7 channel, mounted with the flanges outwards from the shorter ends, and with flanges away from the interior of each opening (indicated by cross-hatching).

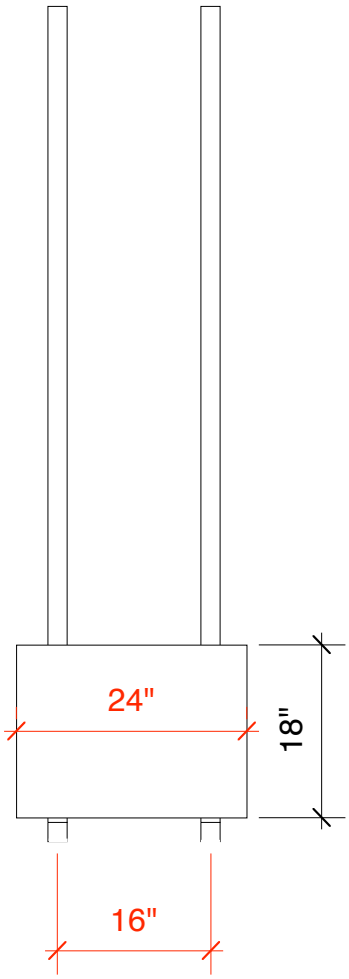
SIDE VIEW



SECTION A-A

Note:
The Unistrut supports for the junction box were constructed to the dimensions indicated. The bottom of the junction box was located 45" below the under side of the insulated deck. The JB was not attached to the supports. The 2" stand-off frame (not shown) was attached and then the JB was placed back on the support frame.

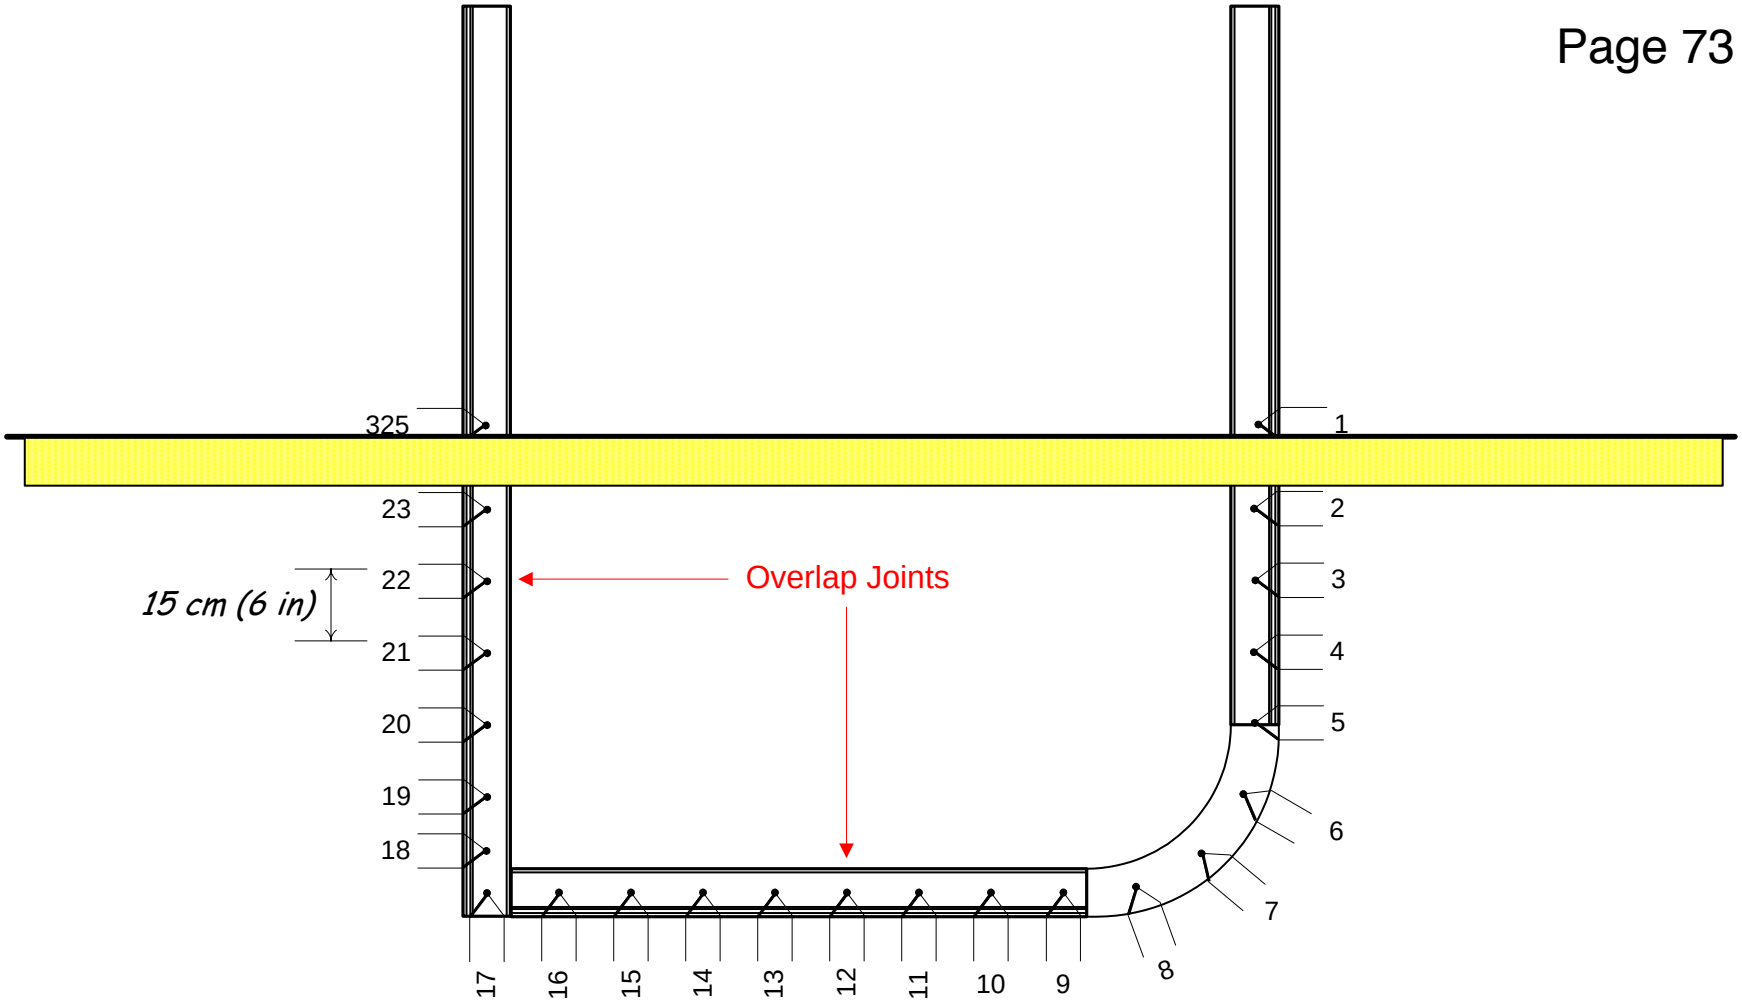
THERMOCOUPLE LOCATIONS

THERMOCOUPLE LOCATION DRAWINGS

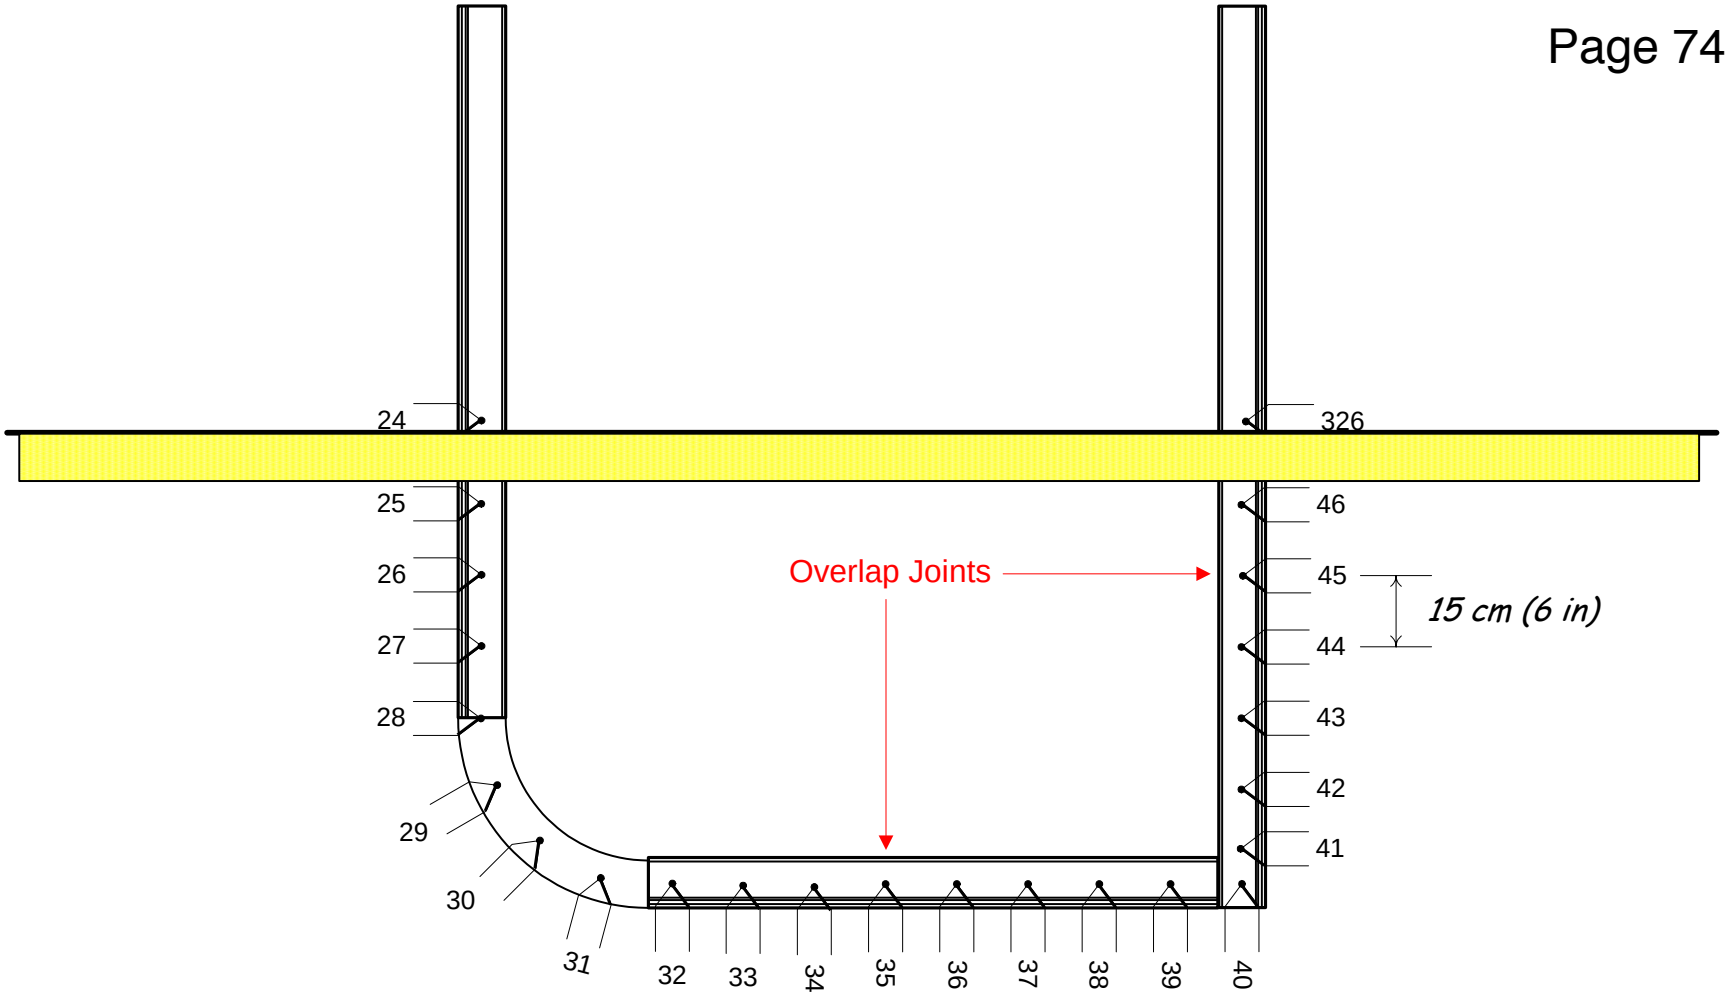
Test #2 – Hemyc, Direct Attachment and Framed for Air Gap

Revised 03/29/05



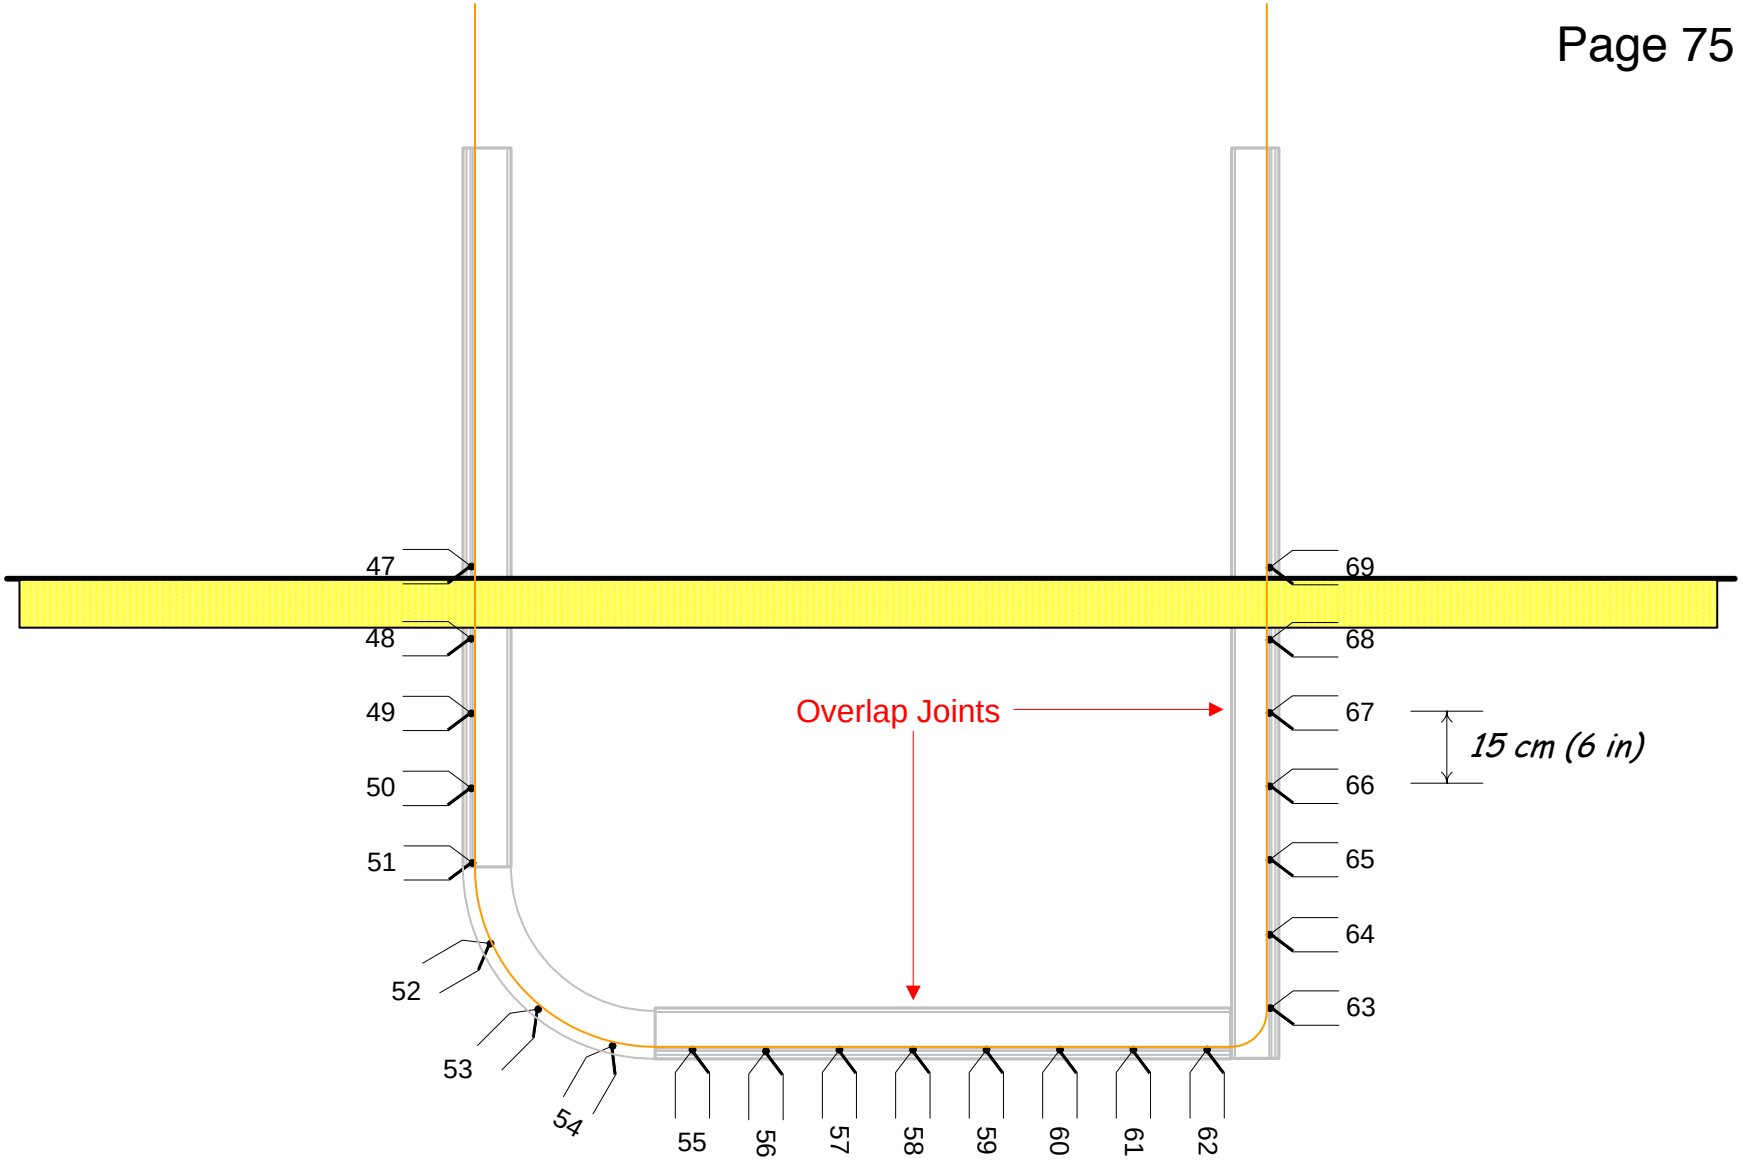
Outside side rail view
(facing toward furnace wall)

Test Specimen 2A – Empty 12-inch cable tray thermocouple locations and tag numbers. (Direct Attachment Hemyc wraps and banded.)

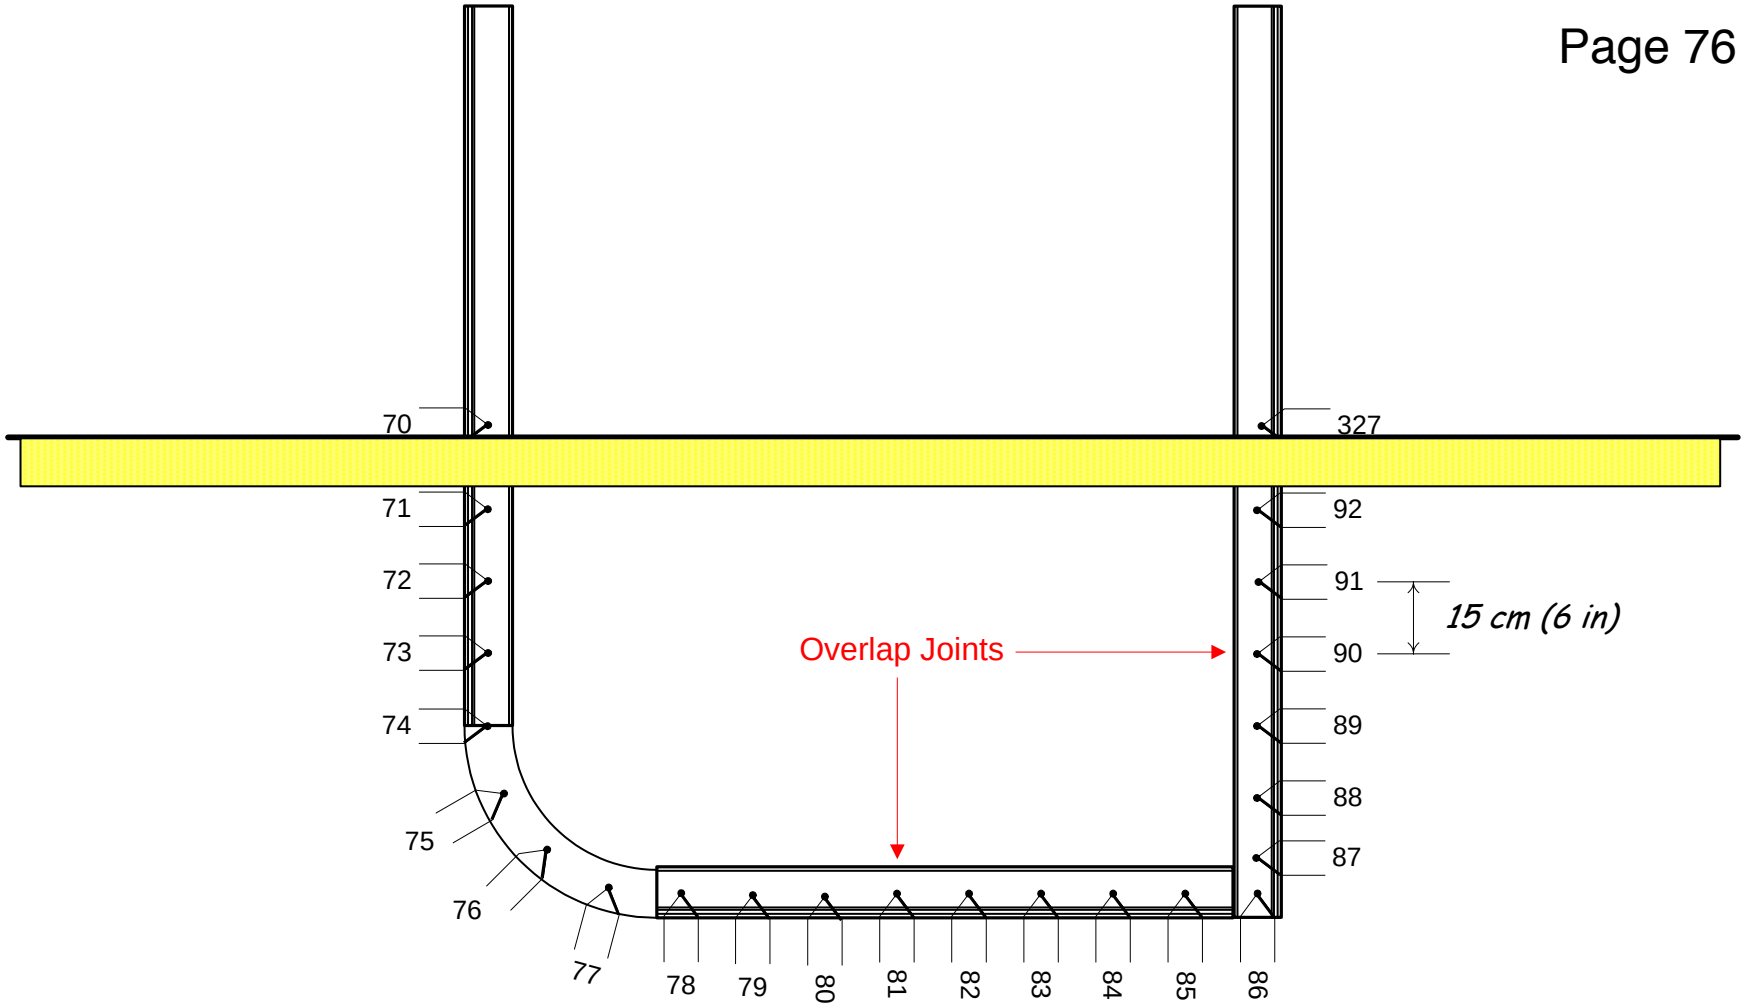


Inside side rail view
(facing toward furnace interior)

Test Specimen 2A – Empty 12-inch cable tray thermocouple locations and tag numbers. (Direct Attachment Hemyc wraps and banded.)

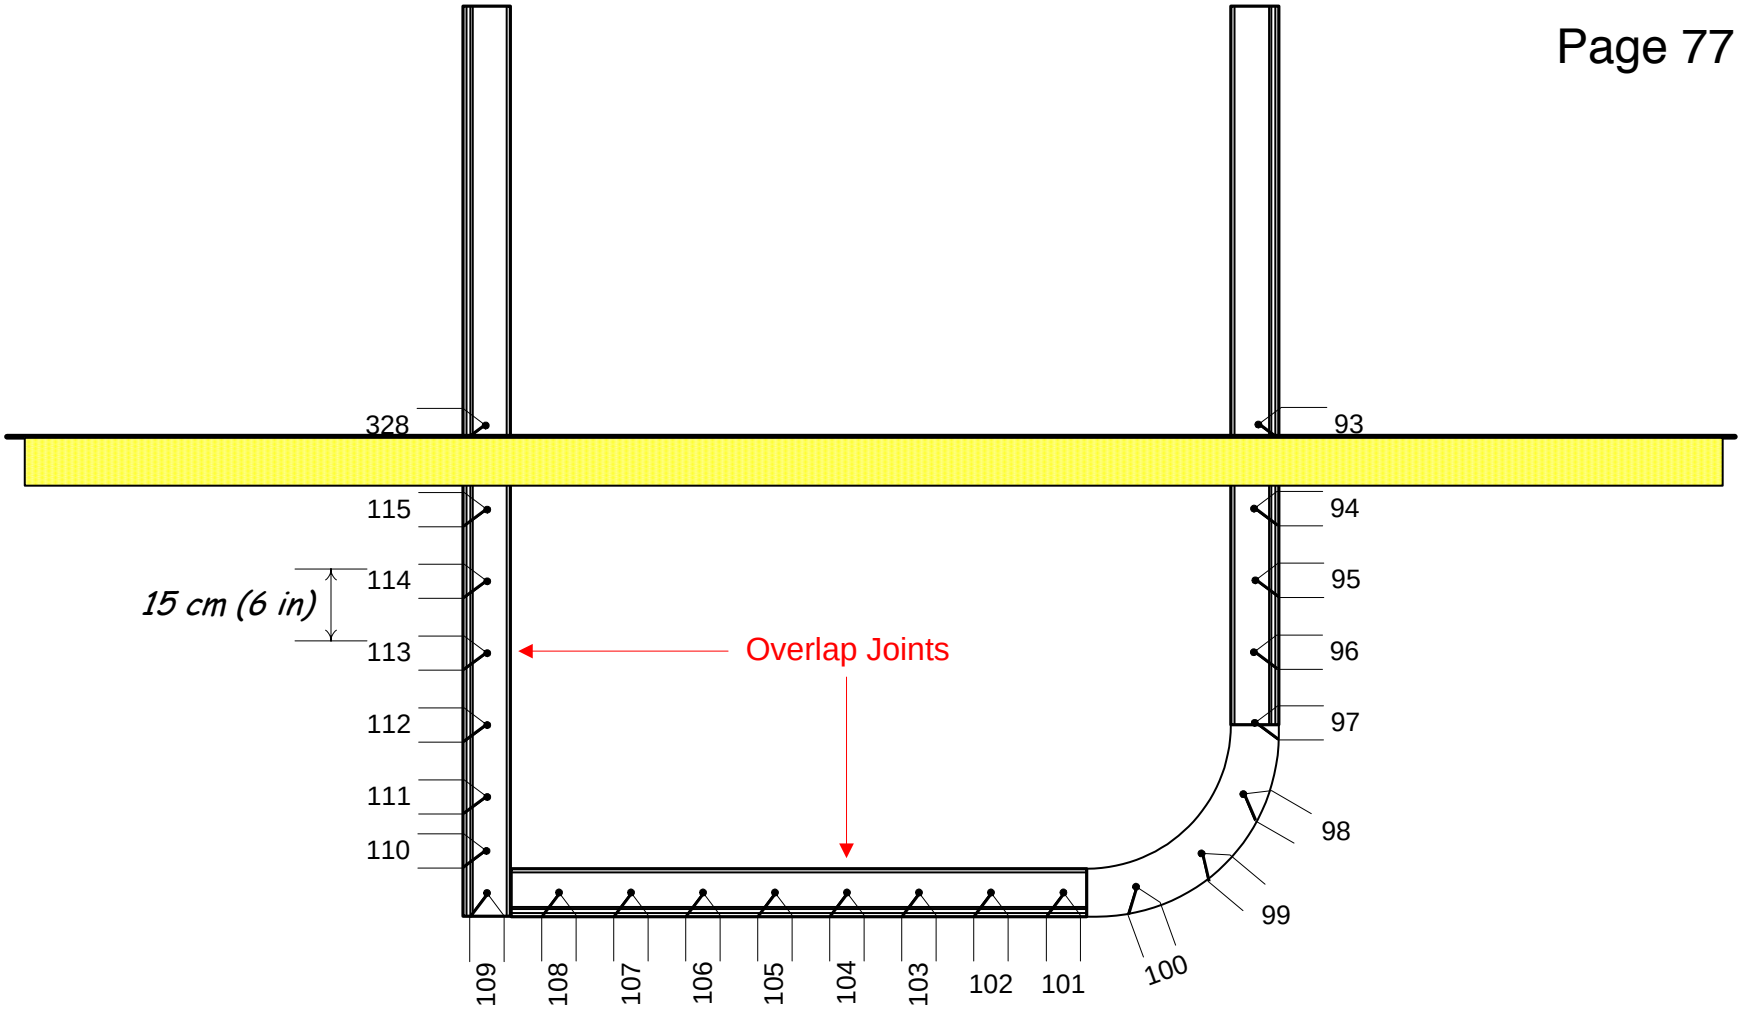


Test Specimen 2A – Empty 12-inch cable tray thermocouple locations and tag numbers on bare #8 copper wire. Note: Some uncertainty in exact thermocouple locations exists. (Direct Attachment Hemyc wraps and banded.)



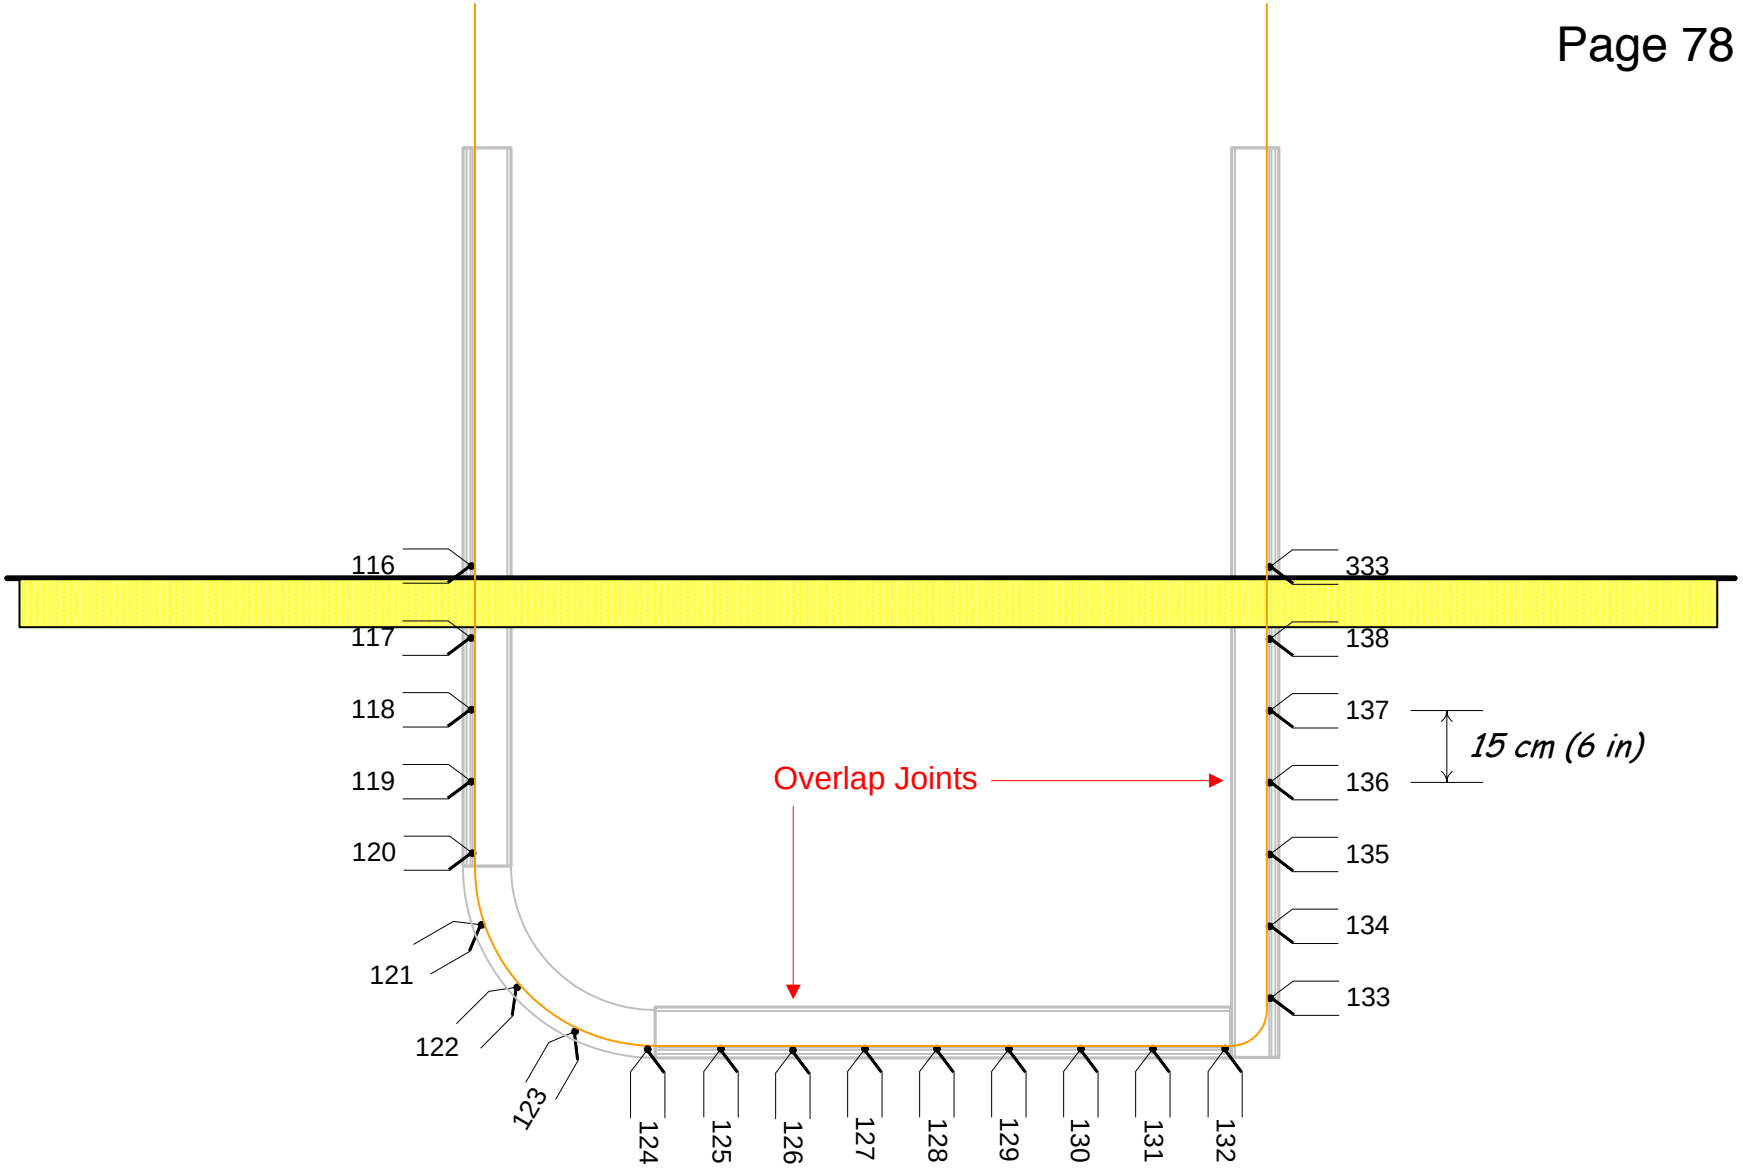
Outside side rail view
(facing toward furnace wall)

Test Specimen 2B – Empty 12-inch cable tray thermocouple locations and tag numbers. (Hemyc wrap framed for 2” Air Gap)

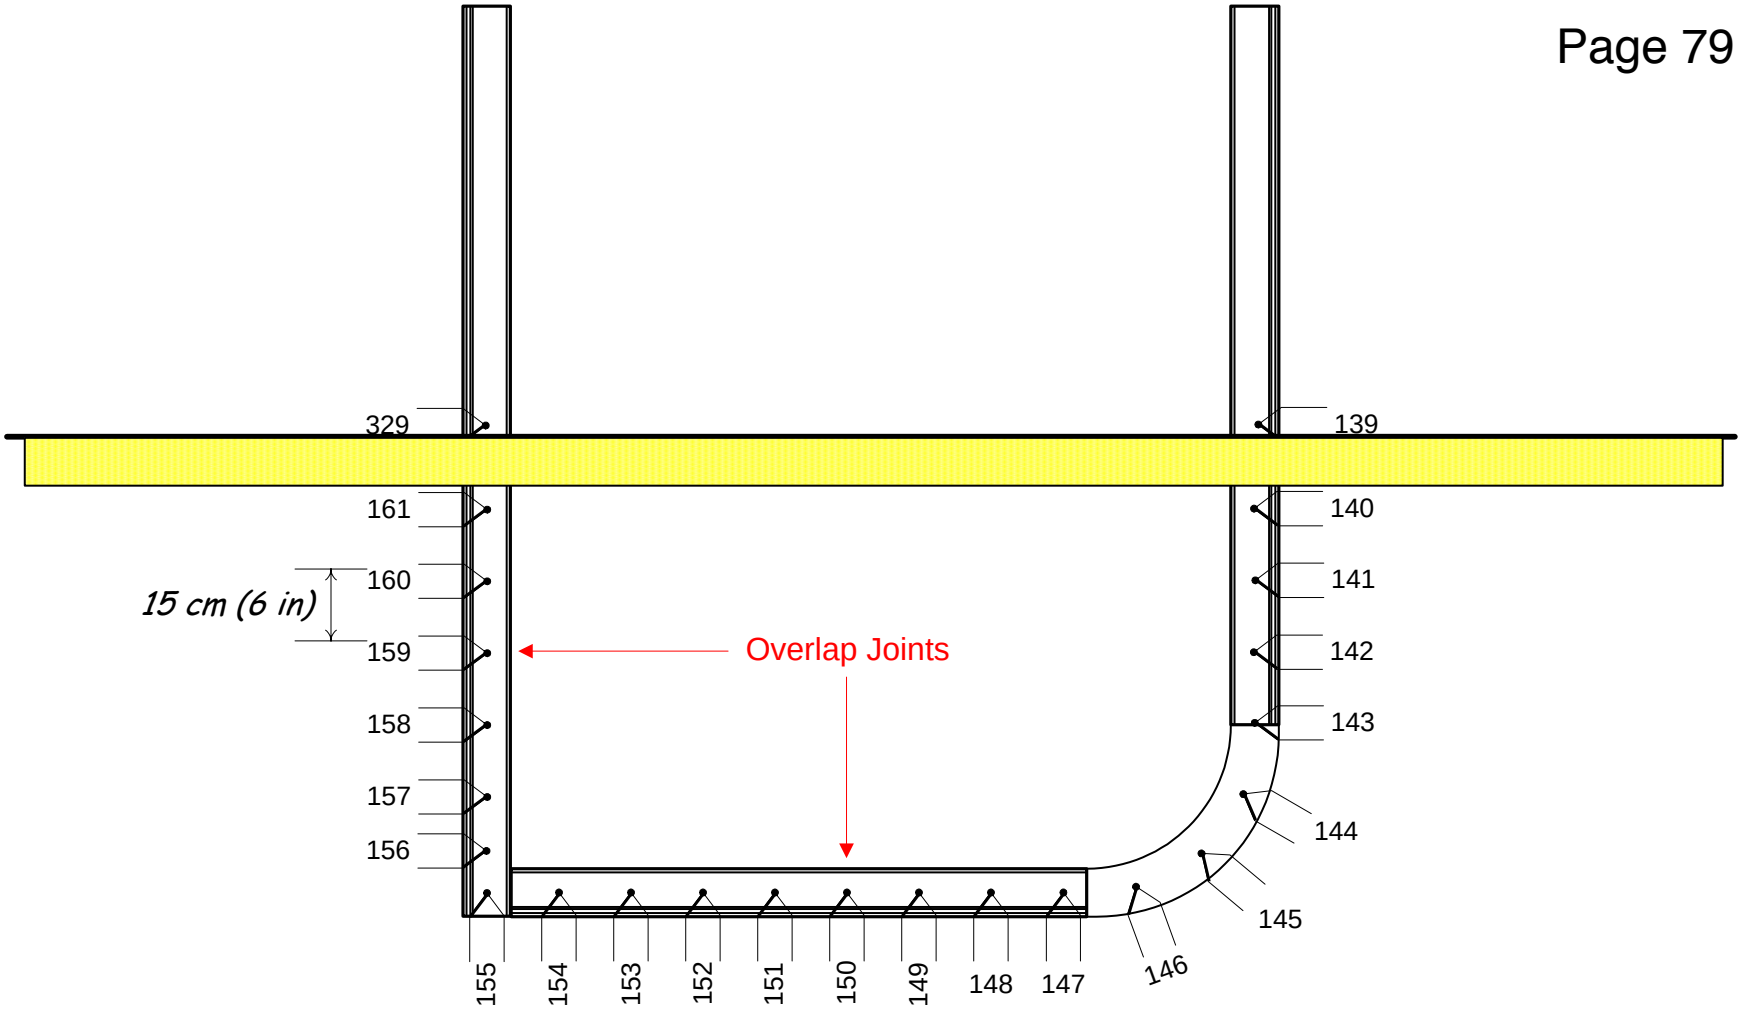


Inside side rail view
(facing toward furnace interior)

Test Specimen 2B – Empty 12-inch cable tray thermocouple locations and tag numbers. (Hemyc wrap framed for 2” Air Gap)

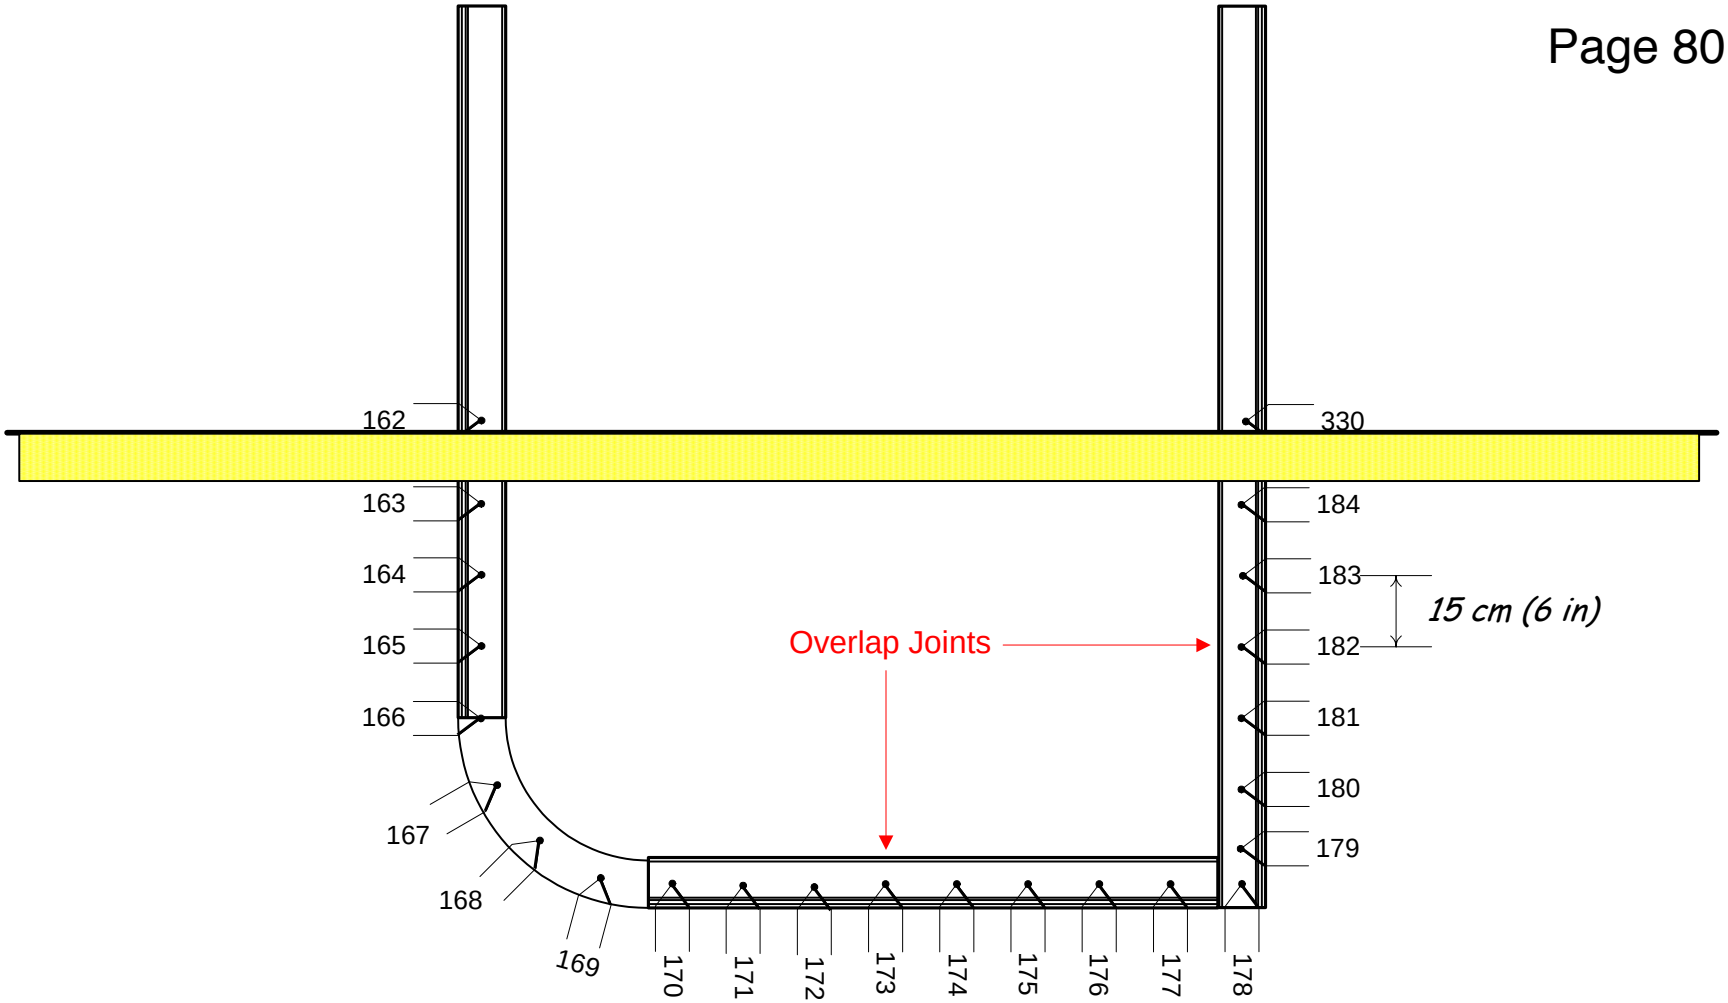


Test Specimen 2B – Empty 12-inch cable tray thermocouple locations and tag numbers on bare #8 copper wire. Note: Some uncertainty in exact thermocouple locations exists. (Hemyc wrap framed for 2" Air Gap)



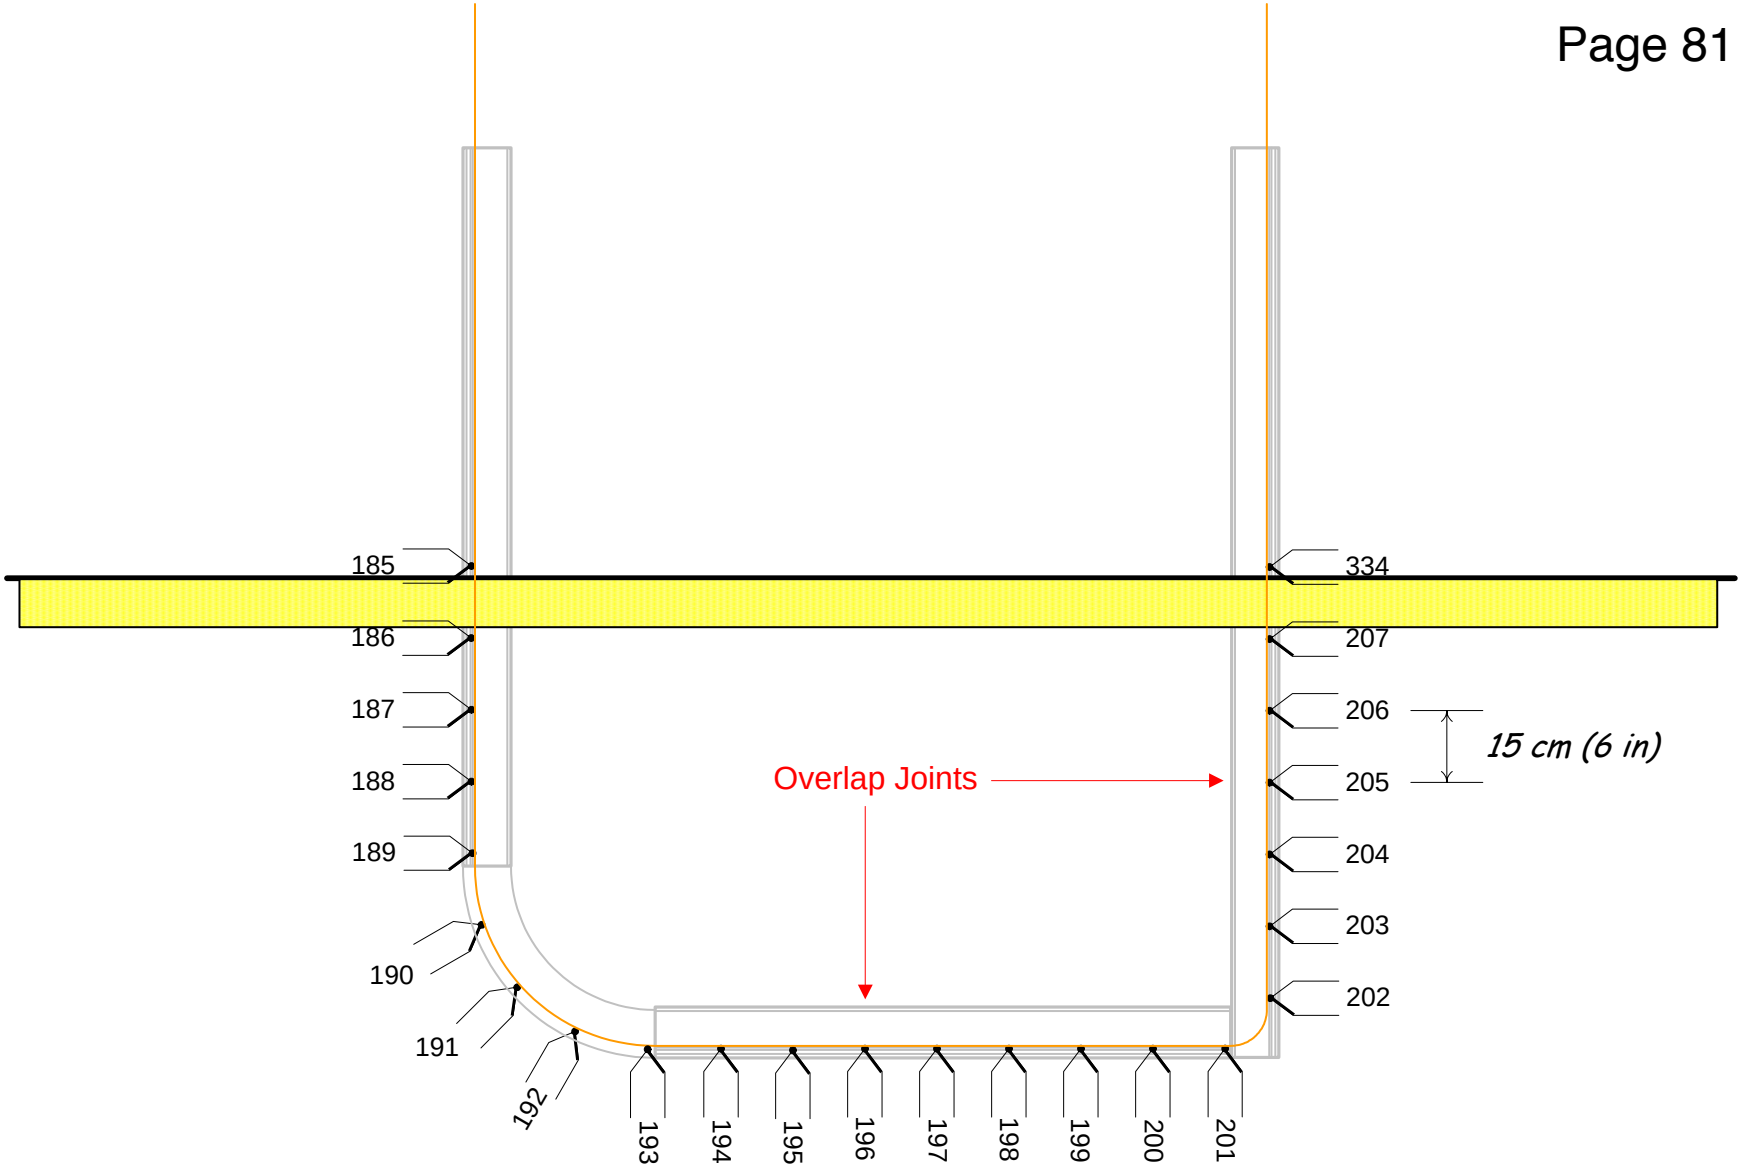
Outside side rail view
(facing toward furnace wall)

Test Specimen 2C – Empty 36-inch cable tray thermocouple locations and tag numbers. (Direct Attachment Hemyc wraps and banded.)

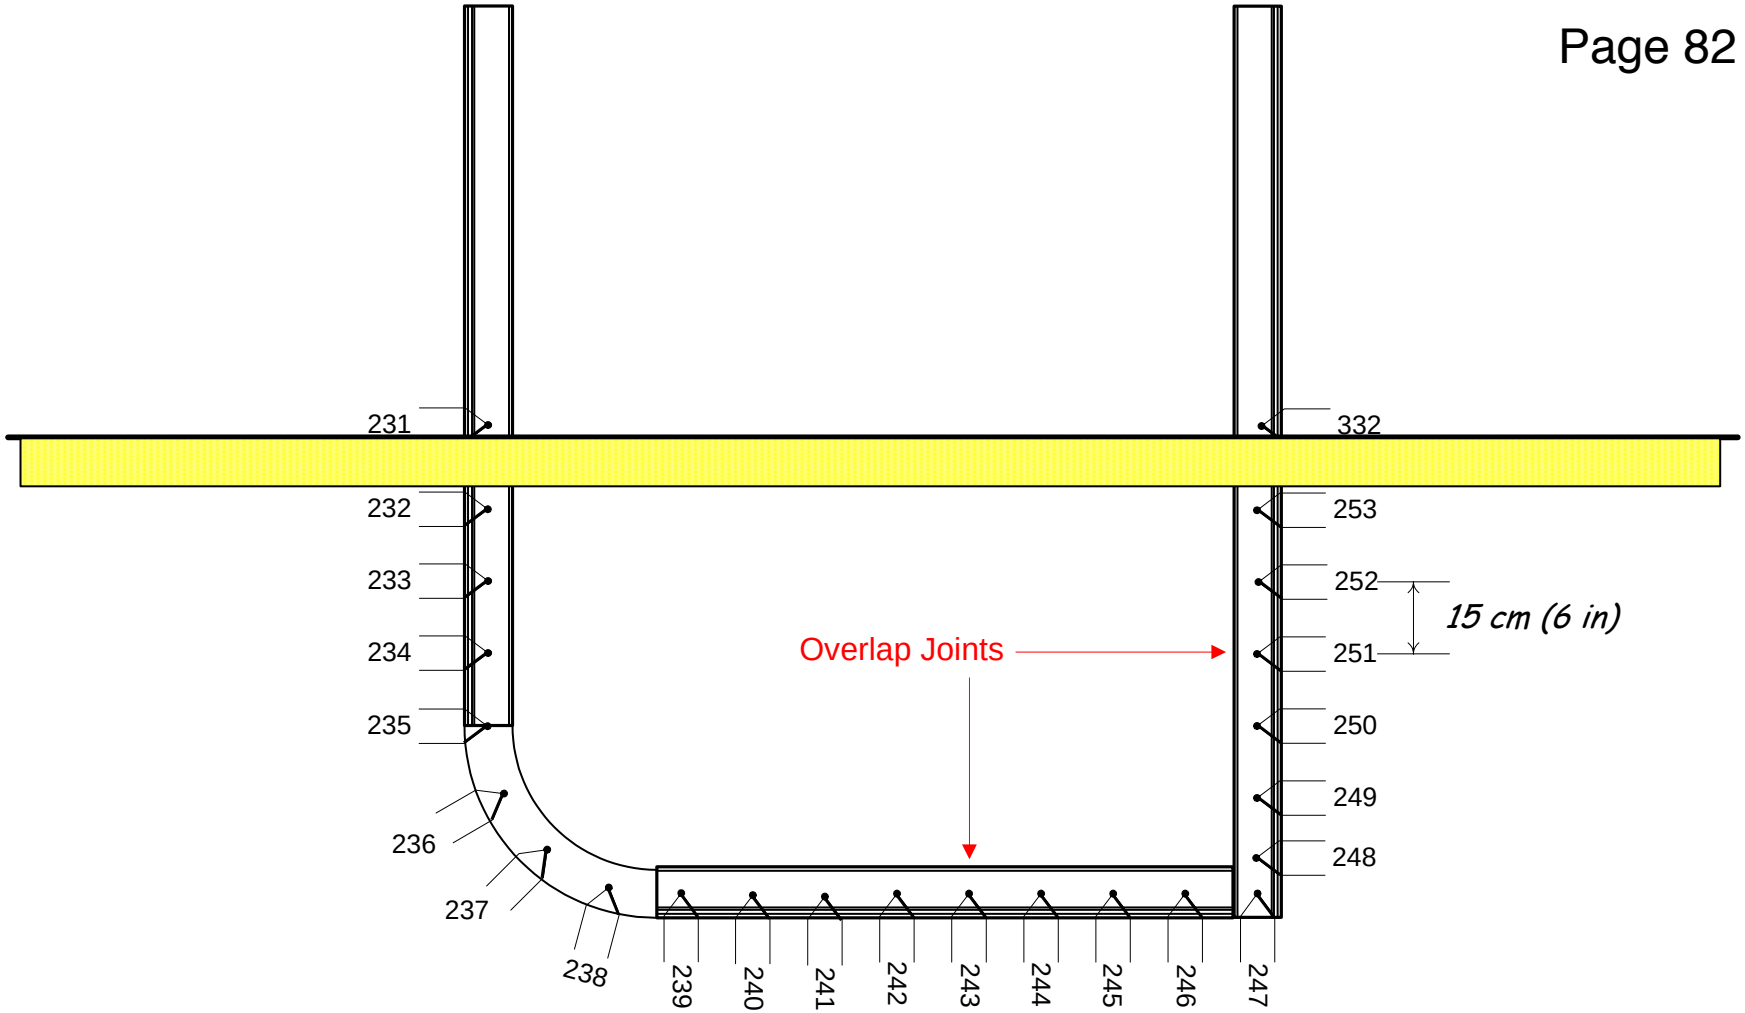


Inside side rail view
(facing toward furnace interior)

Test Specimen 2C – Empty 36-inch cable tray thermocouple locations and tag numbers. (Direct Attachment Hemyc wraps and banded.)

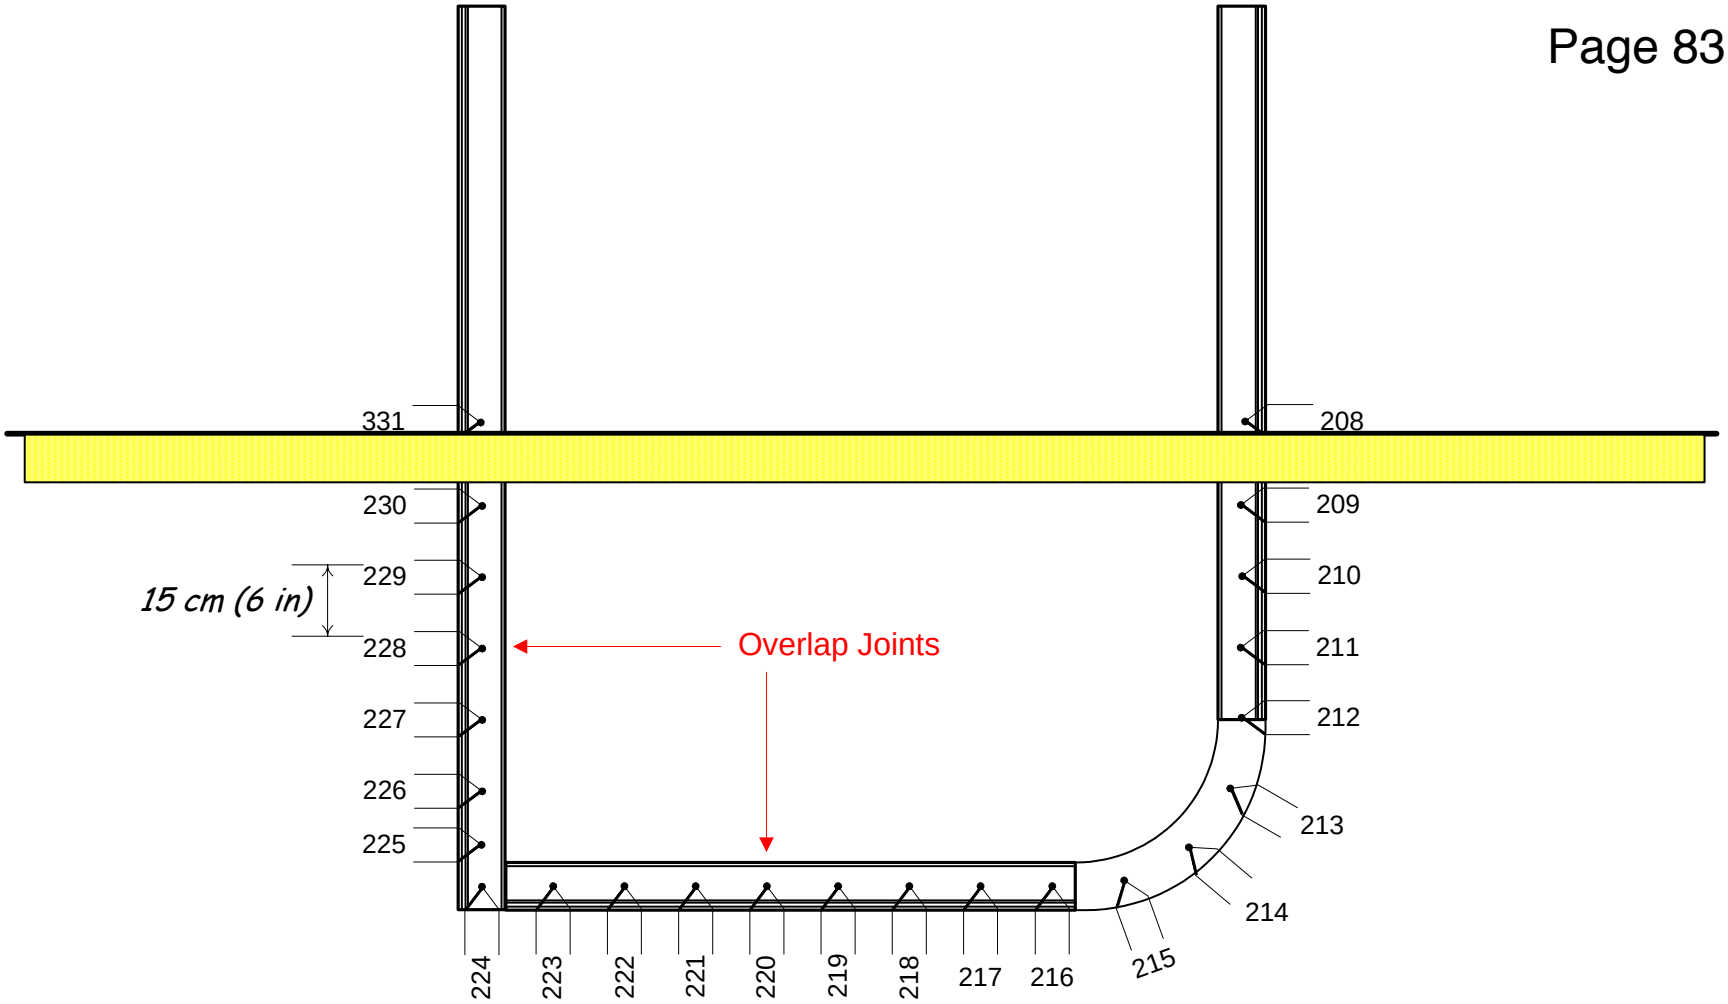


Test Specimen 2C – Empty 36-inch cable tray thermocouple locations and tag numbers on bare #8 copper wire. Note: Some uncertainty in exact thermocouple locations exists. (Direct Attachment Hemyc wraps and banded.)



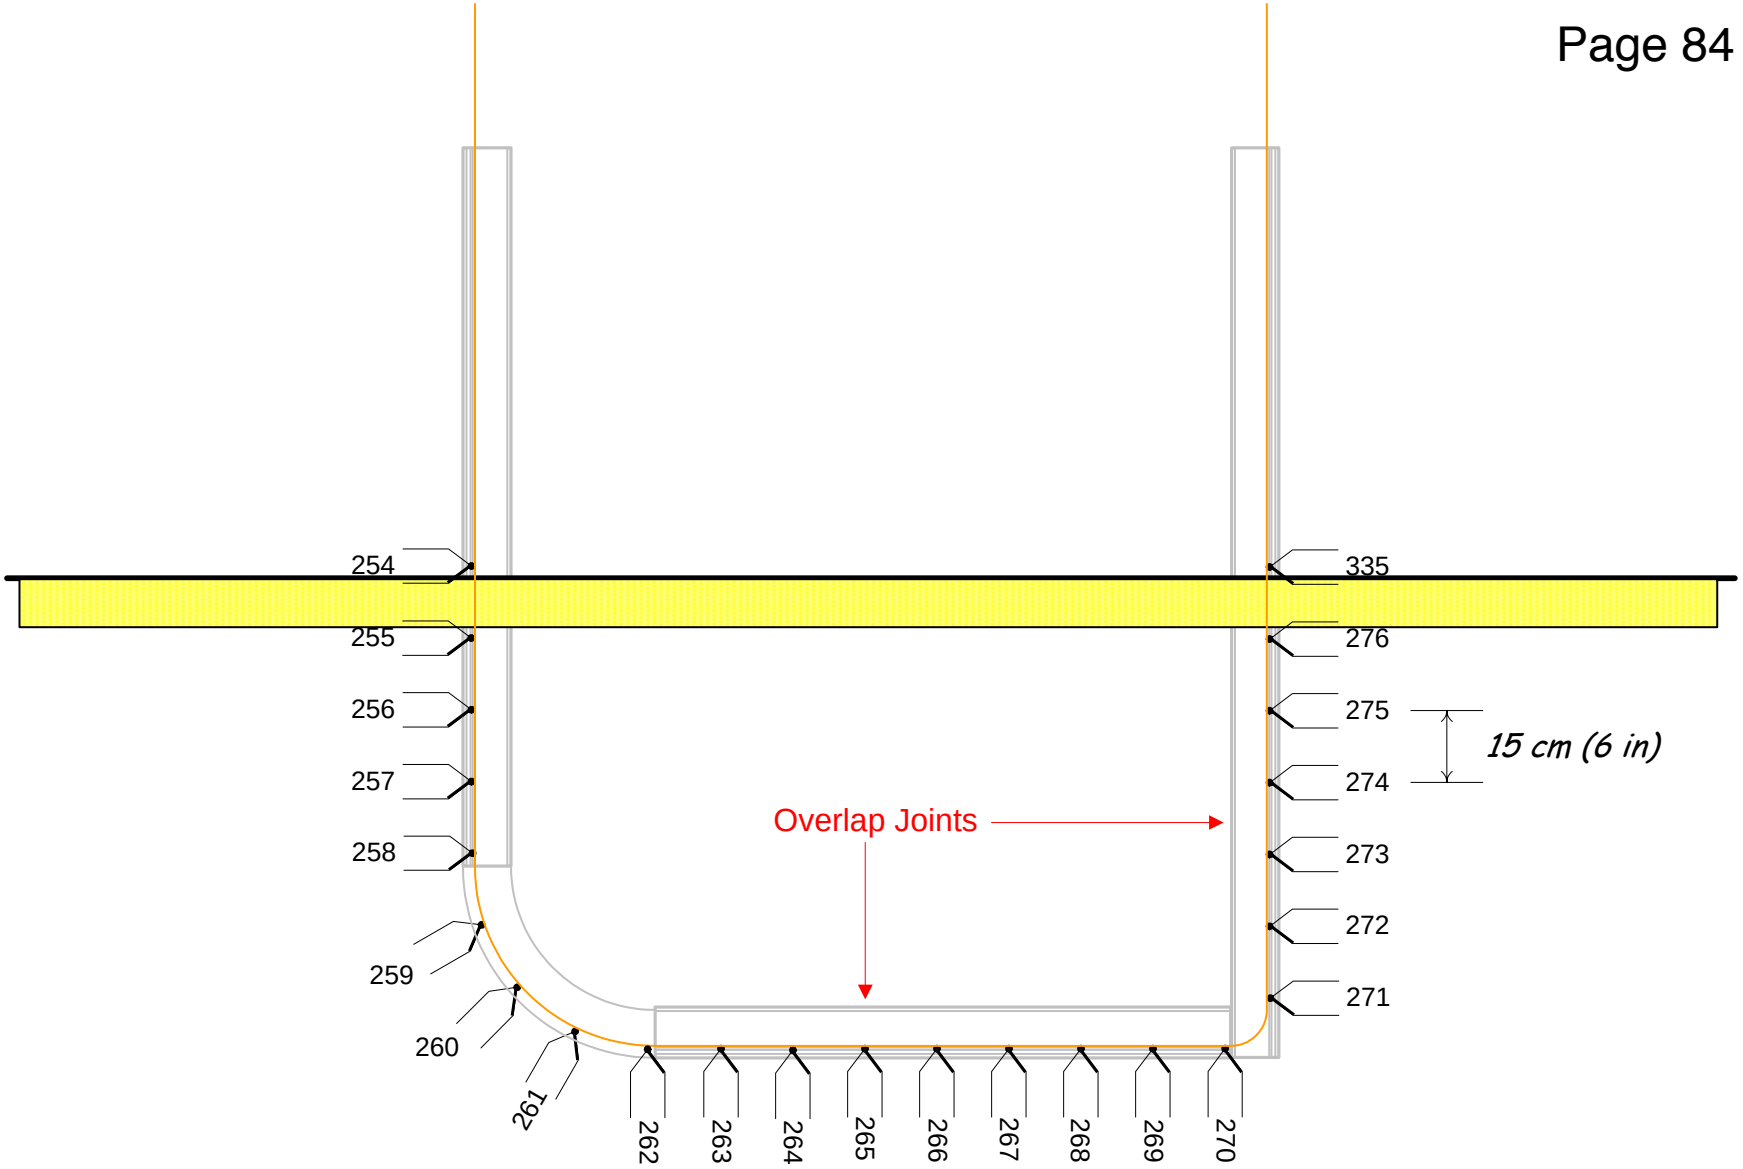
Outside side rail view
(facing toward furnace wall)

Test Specimen 2D – Empty 36-inch cable tray thermocouple locations and tag numbers. (Hemyc wrap framed for 2” Air Gap)

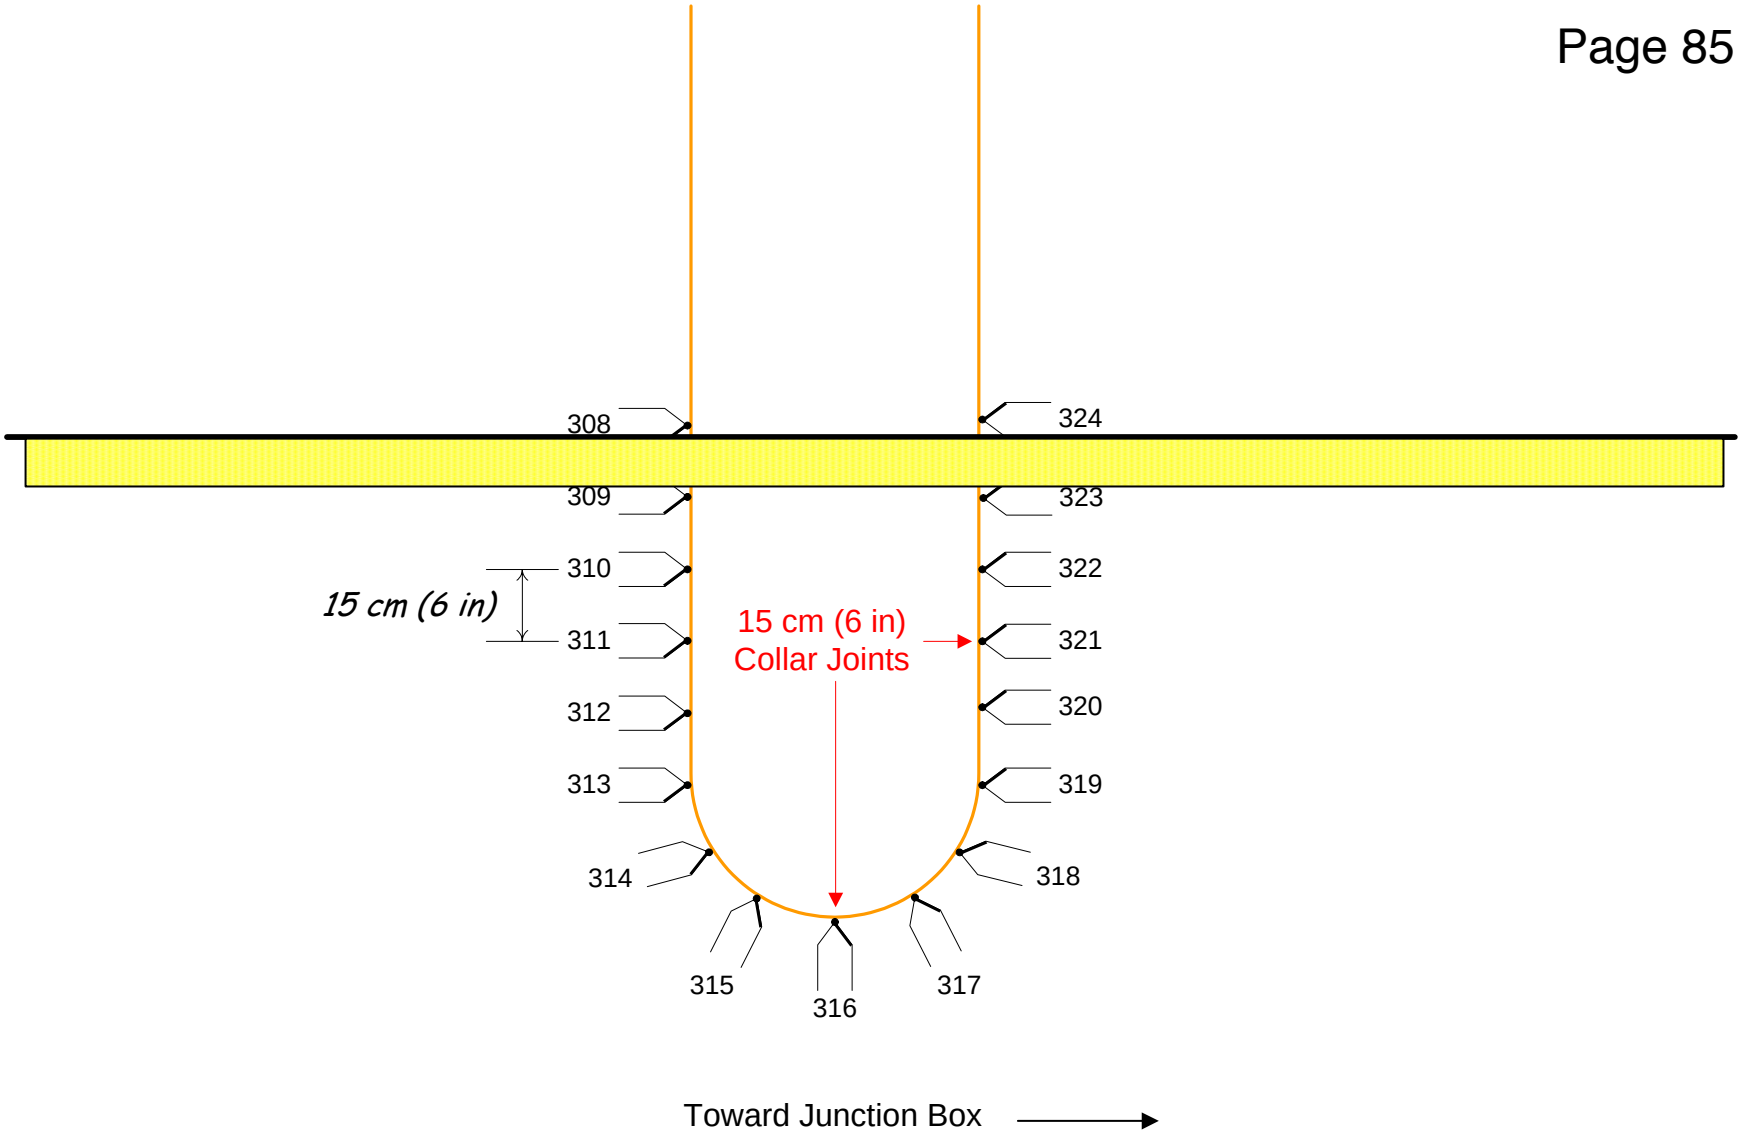


Inside side rail view
(facing toward furnace interior)

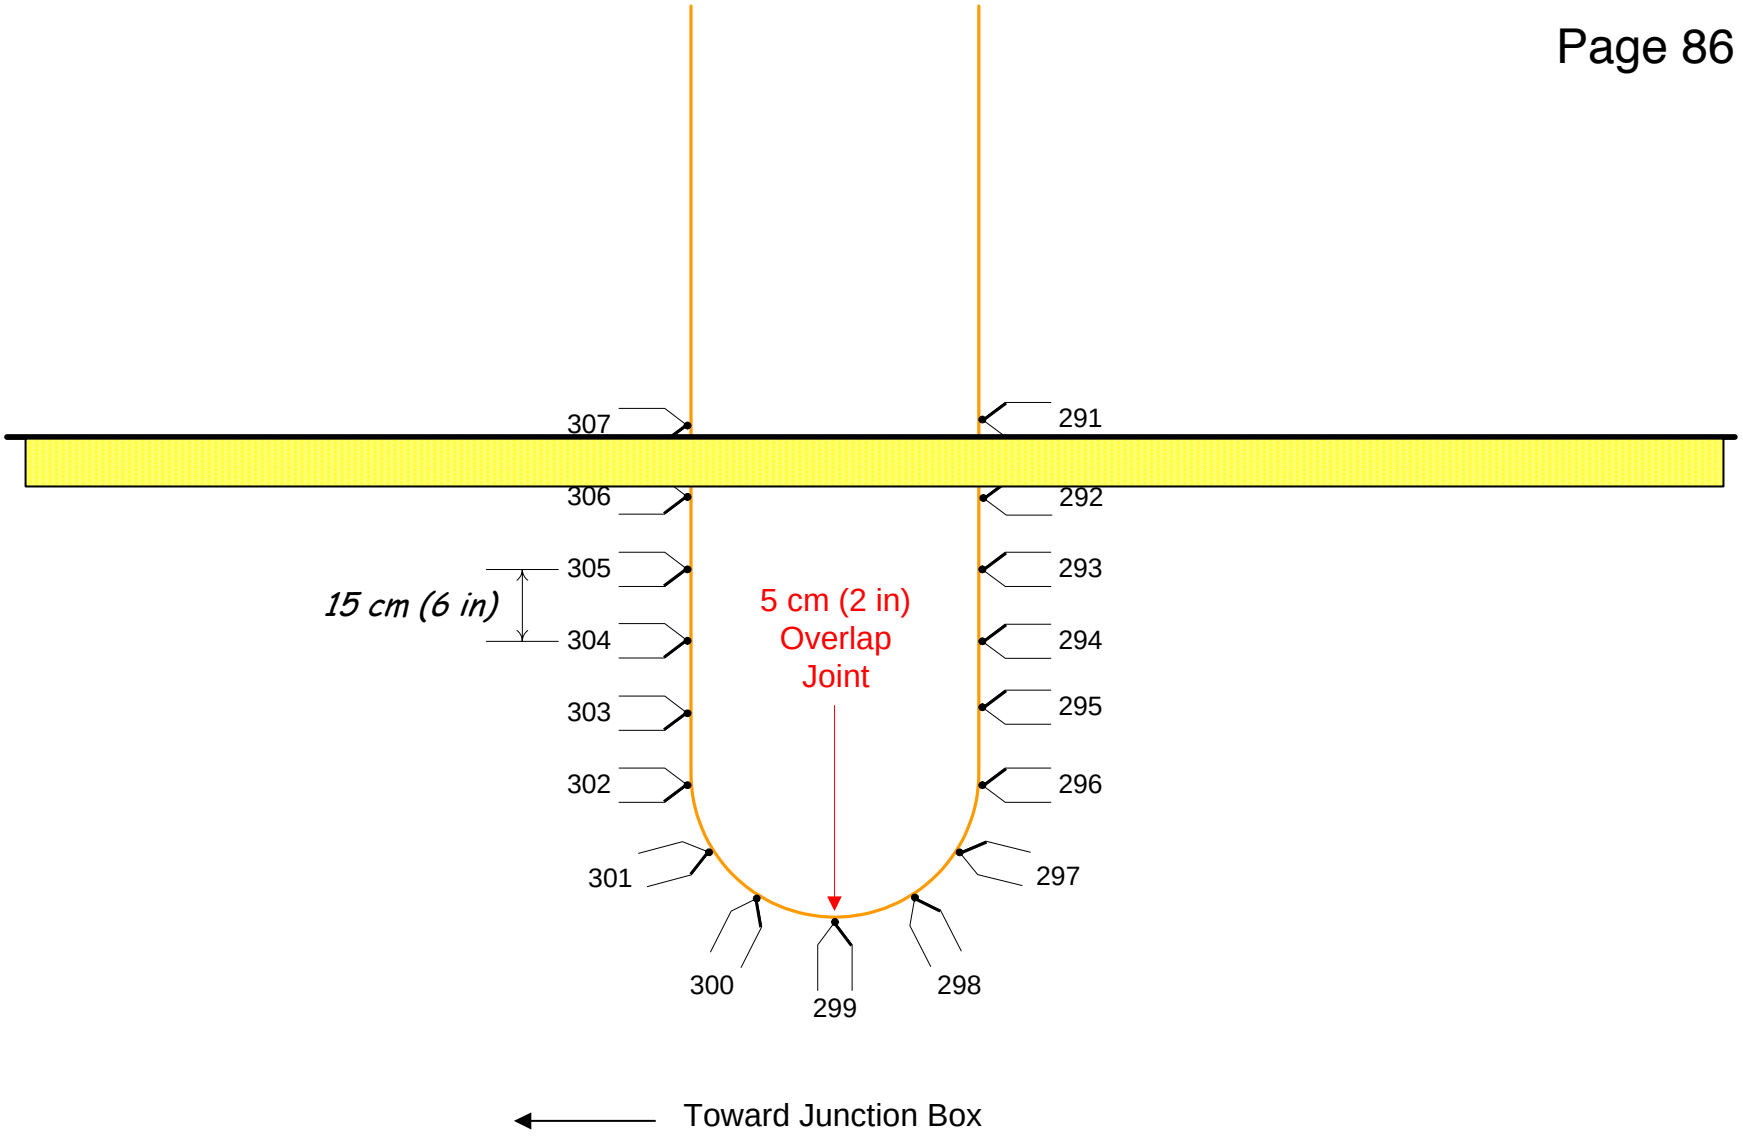
Test Specimen 2D – Empty 36-inch cable tray thermocouple locations and tag numbers. (Hemyc wrap framed for 2” Air Gap)



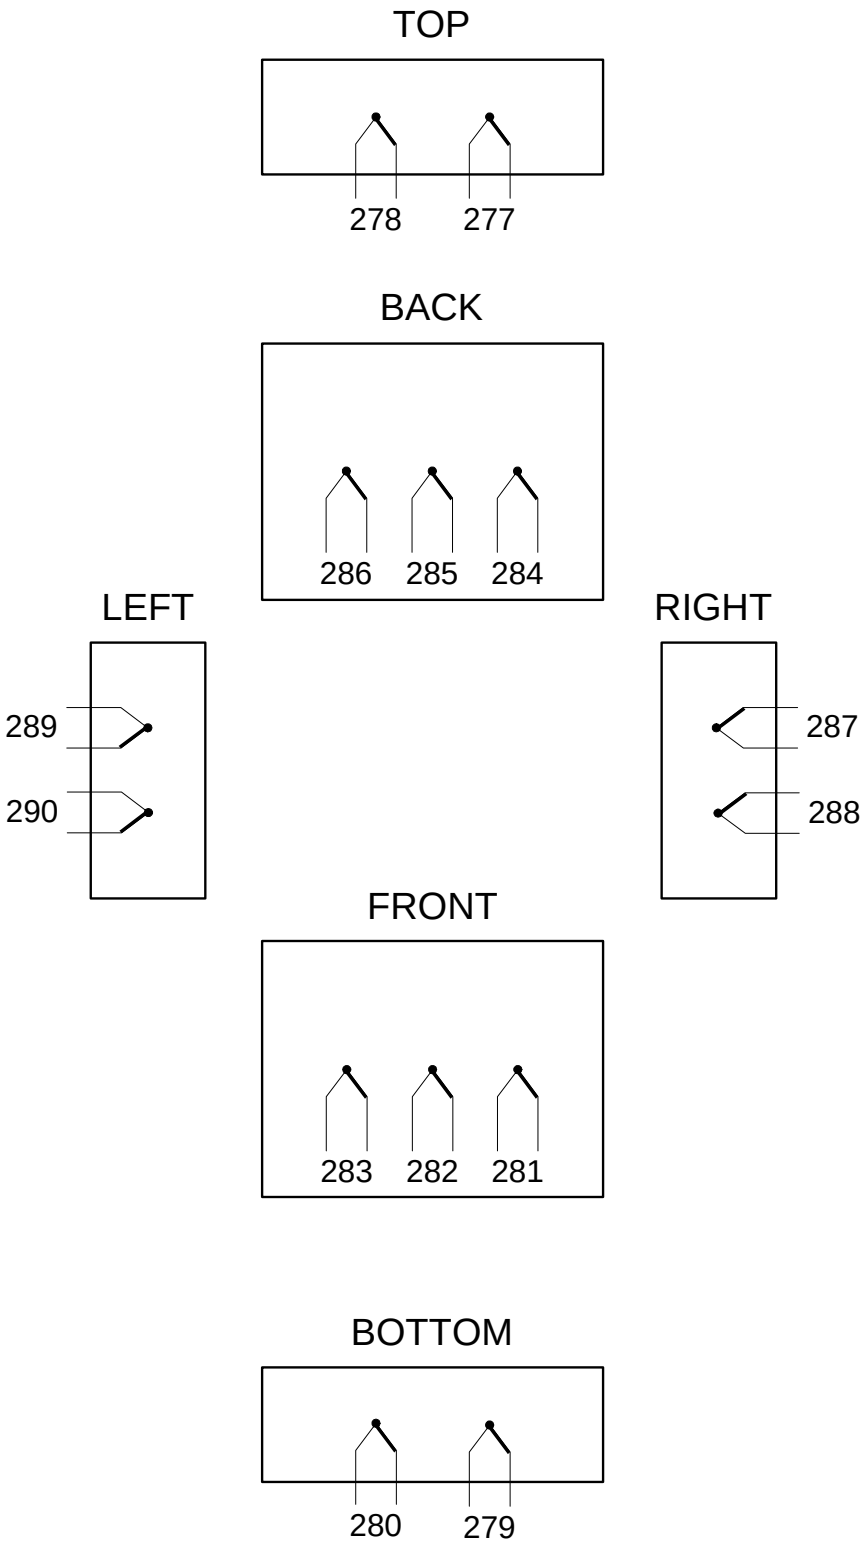
Test Specimen 2D – Empty 36-inch cable tray thermocouple locations and tag numbers on bare #8 copper wire. Note: Some uncertainty in exact thermocouple locations exists. (Hemyc wrap framed for 2" Air Gap)



Test Specimen 2E – Cable Drop Loop thermocouple locations and tag numbers. (Direct Attachment Hemyc wraps and banded.)



Test Specimen 2F – Cable Drop Loop thermocouple locations and tag numbers. (Hemyc wrap framed for 2” Air Gap and banded.)



Test Specimen 2G – Junction box thermocouple locations and tag numbers. Note: Back panel is transparent to show correct orientation of thermocouple locations. (Direct Attachment Hemyc wraps and banded.)

Appendix E

HEMYC INSTALLATION PROCEDURES

SANDIA TEST NUMBER 2

FABRICATION AND INSTALLATION CLARIFICATIONS

1. 2" Kaowool was wrapped completely around both hangers on the Junction Box. The Hemyc was then installed on the Junction Box and the covered assembly was mounted on the insulated supports to eliminate any possible heat transfer from the hangers to the Box
2. Additional bands were installed between the required 9" spacing to close gaps in the Hemyc on Trays A and C.
3. Hemyc piece number C-T1 only extended 4" above the top of the Test Deck.
4. Hemyc pieces on Trays B and D were stitched together where the pieces overlapped to close gaps in the overlaps along the side rails.
5. 3 pieces of _" all thread 2 _" long were welded to a perpendicular framing strut located above the bottom overlap joint of Tray D. The inside Hemyc pad extended 1" past the all thread and the outside Hemyc pad extended 3" past for a total overlap of 4". The Hemyc was then secured with fender washers and lock nuts.
6. At the attachment locations on Trays B and D where 3 layers of Hemyc were attached to the same stud, the first 2 layers were held in place with a fender washer and nut. The washer and nut were left in place and the third layer of Hemyc was installed and held with another fender washer and lock nut.
7. There were 8 - 1 _" fender washers used on Tray B instead of the 1 _".
8. A patch of Refrasil cloth was installed on the underside of Tray D. A few other minor scuffs or tears were stitched in other areas.
9. Hemyc pieces 2D-T1, T2, B1 and B2 only extended 4" to 5" above the test deck.
10. The top inside stud on the frame work for Tray D broke during installation. The stud was located 4" above the test deck. A _" stainless steel band was installed around the tray assembly at that location to secure the Hemyc to the framework.
11. The 2" overlap on Tray A was incorporated into a butt joint placed on the top of the tray side rail. This was done because the joint would have had no support on the top middle of the tray and might have unduly influenced test results if the overlap was placed on the bottom of the tray.
12. Hemyc piece 2E-2 was cut approximately in half and field stitched to provide a perimeter butt joint 17" below the test deck. A 6" wide collar was field fabricated and installed over the butt joint.
13. No vertical perimeter overlap joint was included on cable drop F.
14. 2 - _" stainless steel bands were attached to the test deck and used to support the horizontal joints on the cable drops E and F.
15. _" stainless steel bands were used to secure the Junction Box to the hangers.
16. IP-8400.103, Issue G specifies an 8" minimum width on collars for perimeter butt joints and a 4" perimeter overlap joint. A 6" maximum width collar and a 2" maximum perimeter overlap was used in the test that conform to the

minimum collar and overlap dimensions specified in IP-8400.103, Issue E (5/1/84).

17. Prior to the test on March 25, 2005, one additional band was installed on the corner of the 90° angle of Tray A and Tray C. The bands were installed to replace bands which were loose in the same location.
18. The vertical pads on 2B only extended ~4" above the test deck.
19. 2E and 2F were installed in positions reversed from the original layout plan.

ISSUE DESIGNATION IN THIS COLL INDICATES CURRENT CHANGE

FABRICATION OF HEMYC PROTECTIVE WRAP SYSTEM COMPONENTS

1.0 PURPOSE

The purpose of this procedure is to assure that the fabrication of the HEMYC Cable Protection System Components is consistent with the system components as tested in the various qualification tests. The Fire Qualification Test, referenced as CTP-1026, consisted of a One (1) Hour Fire Exposure, per ASTM E-119 criteria, including hose stream in accordance with the American Nuclear Insurers Information Bulletin No. 5(79) entitled, "ANI/MAERP Standard Fire Endurance Test Method to Qualify a Protective Envelope for Class Circuits".

2.0 SCOPE

This procedure provides the methods and guidelines for the fabrication of both cable tray and conduit protection system components. The fabrication and quality verification shall be performed on-site by Client personnel that have been trained and certified by PROMATEC.

3.0 REFERENCE

3.1 10CFR50, Appendix R

3.2 ANI Bulletin No. 5(79)

3.3 HEMYC Fire Qualification Test, CTP-1026

3.4 ANI Acceptance dated 08/02/82

3.5 QCP-10001, Packaging, Shipping, Receiving, Handling and Storage for HEMYC Protective Wrap Components

3.6 QCP-10002, Fabrication Inspection for HEMYC Protective Wrap Components

3.7 HEMYC Protective Wrap System Typicals, PROMATEC Drawings B-310, B-311, B-312 and B-313

4.0 DEFINITIONS

None

5.0 RESPONSIBILITIES

5.1 The authorized Installer's ENGINEERING DEPARTMENT shall be responsible to define the scope of work as prescribed on the applicable contract documents and to provide the applicable drawings, specifications, requirements, instructions, etc., to the department responsible for fabrication and installation.

This department shall also be responsible to provide liaison with applicable client personnel and other internal departments to assure a smooth flow of communication.

5.2 The authorized Installer's PRODUCTION DEPARTMENT shall be responsible for the identification and scheduling of work to be performed as defined on the documents furnished by ENGINEERING.

The Installer's FABRICATION DEPARTMENT, as trained and certified by PROMATEC, shall be responsible for the initiation of appropriate Fabrication Orders, verify their authenticity, initiate appropriate procurement documents and provide these documents to the fabrication facility.

5.3 The Installer's QUALITY CONTROL PERSONNEL, as trained and certified by PROMATEC, shall be responsible for appropriate inspection, documentation and monitoring.

6.0 PROCEDURE

6.1 Only approved materials as listed below shall be utilized in the fabrication of HEMYC Cable Protection System Components.

ACCEPTABLE MATERIALS

6.1.1 External Fabric

A. Siltemp WR84CSR, Thermal Barrier Cloth, 0.030 nom. thickness, 18oz/yd^2

B. or Approved equal

6.1.2 Internal Fabric

A. Klever 600/6 or J.P. Stevens #332 Fiberglass Cloth, 49" width, 13oz/yd^2

B. or Approved equal (Internal fabric may be used on the non-fire side of protective blanket as necessary. If used, external fabric must overlap a minimum of six (6") inches on to non-fire side.

6.1.3 Internal Filler

A. Johns-Manville Cerablanket
6 or 8 lb density
0.5, 1.5 and/or 2.0 inch thickness

OR

B. Babcock & Wilcox Kaowool Ceramic Fiber Blanket
6 or 8 lb density
0.5, 1.5 and/or 2.0 inch thickness

OR

C. Approval equal

6.1.4 Thread

A. Astroquartz sewing thread Type Q-24 Teflon coated; approximately .020" diameter
Breaking Strength -- 20 lbs

OR

B. Alphaquartz sewing thread Type Q-24 Teflon coated; approximately .020" diameter
Breaking Strength -- 20 lbs

OR

C. Approved equal

6.2 Fabrication Order (Form QC-59)

6.2.1 The completed Fabrication Order (Form QC-59) shall be provided to the fabrication facility.

6.2.2 This form shall define information as listed below:

A. Fabrication Order

B. Blanket Number

C. Project Number

D. Project Name

E. Location -- building, room, elevation

F. Drawing Reference

G. Blanket Length

H. Width

I. Thickness ___0.5", ___1.5", ___2"

J. Tray Identification

K. Conduit Identification

L. Other -- General comments, description, etc.

M. Sketch -- Brief sketch as required

N. Client Acceptance

ISSUE DESIGNATION IN THIS COLL INDICATES CURRENT CHANGE

O. Certification

P. Ordered by and Date

Q. PROMATEC QA/QC Acceptance and Date

If any information is not required, N/A shall be inserted in the applicable area.

6.3 Manufacture of Protective Wrap Components

6.3.1 Initial Envelope Assembly (Figure 1)

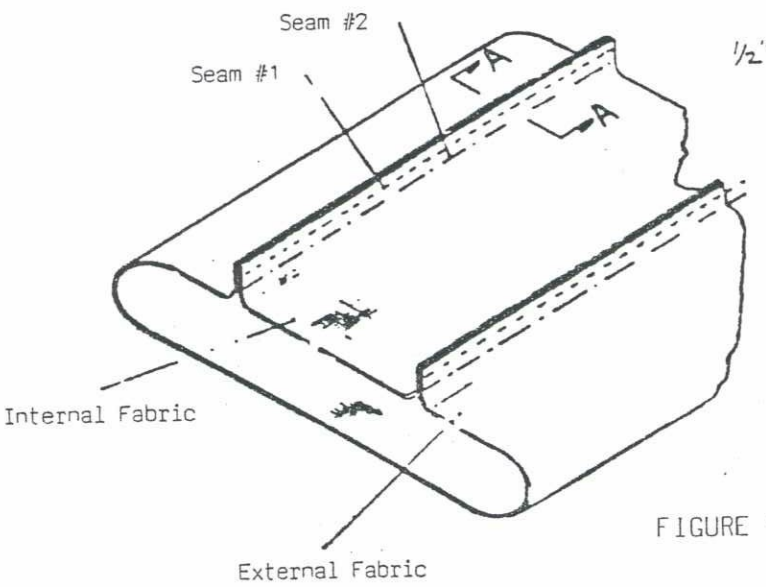
6.3.1.1 Cut external and internal (if required) fabrics to proper dimensions - as defined by fabricator to assure proper finished dimensions as specified on the applicable fabrication order. As applicable, fabricator shall measure from the "finished" edge of fabrics not the "factory" edge.

6.3.1.2 Double stitch external and internal fabrics together as shown in Figure 1. If only external fabric is used double stitch fabric together as shown in Figure 1A.

6.3.1.3 Double stitch one end of blanket as shown in Figure 2/2B, if applicable. Fabricator may elect to insert blanket prior to closure of either end. In this case, refer to Item 6.3.3.2 for instructions.

During fabrication of wraps it may be necessary to use staples, pins or clips to hold fabrics together while sewing. These may remain within the system but shall not damage or be detrimental to the wrap.

6.3.1.4 Turn envelope assembly inside out to hide exposed rough edges of fabric and provide a "finished" seam appearance.



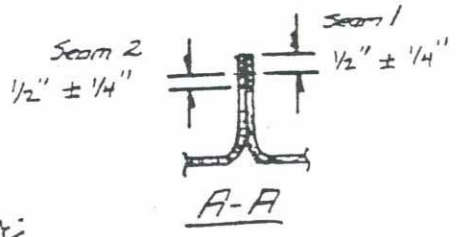


FIGURE 1

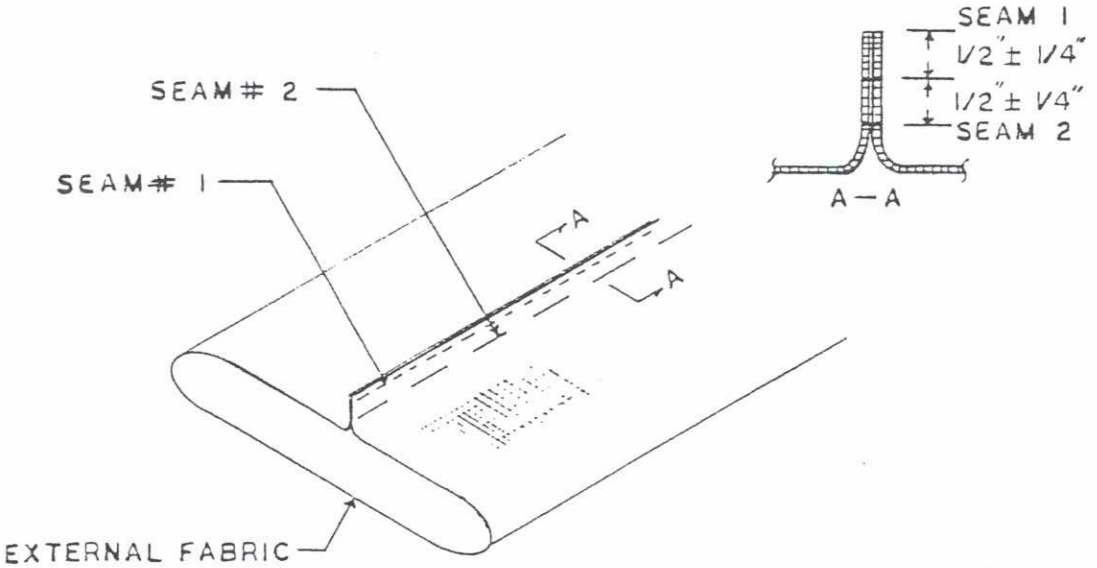

FIGURE 1A

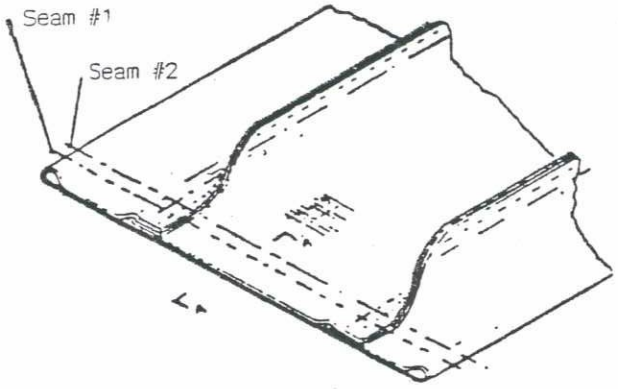

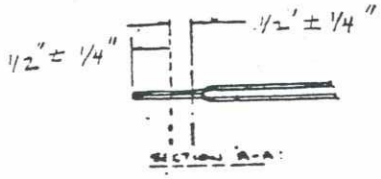

FIGURE 2

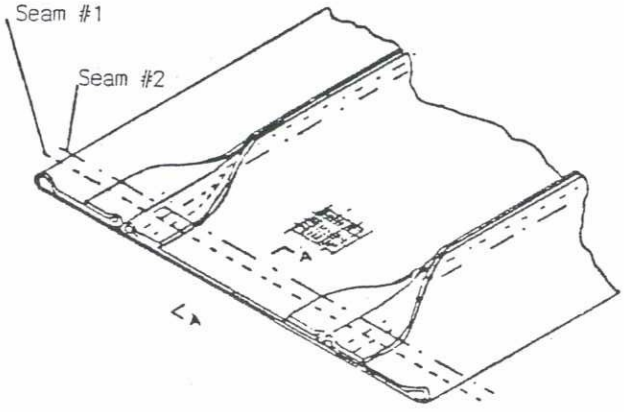
OR



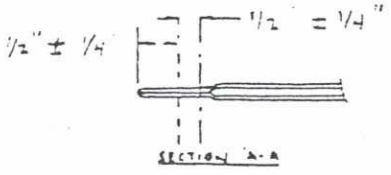


FIGURE 2B

6.3.2 Insertion of Filler Material

6.3.2.1 Cut filler material to proper size (as defined by fabricator to assure proper finished dimension) 0.5" thick - HEMYC Wrap; 1.5" thick - Cable Tray; 2" thick - Conduit.

6.3.2.2 Multiple pieces of filler material may be required to fabricate wraps. To prevent joint gaps in filler material, trim pieces as shown in Figure 3 and secure "darts" spaced on maximum nine (9") inch centers for two (2") inch blankets or four (4") inch hand sewn seam (See Figure 4) for 0.5" and 1.5" blankets. Darts or seam shall be placed parallel to overlap pieces a minimum six (6") inches = 1" from center line of overlap.

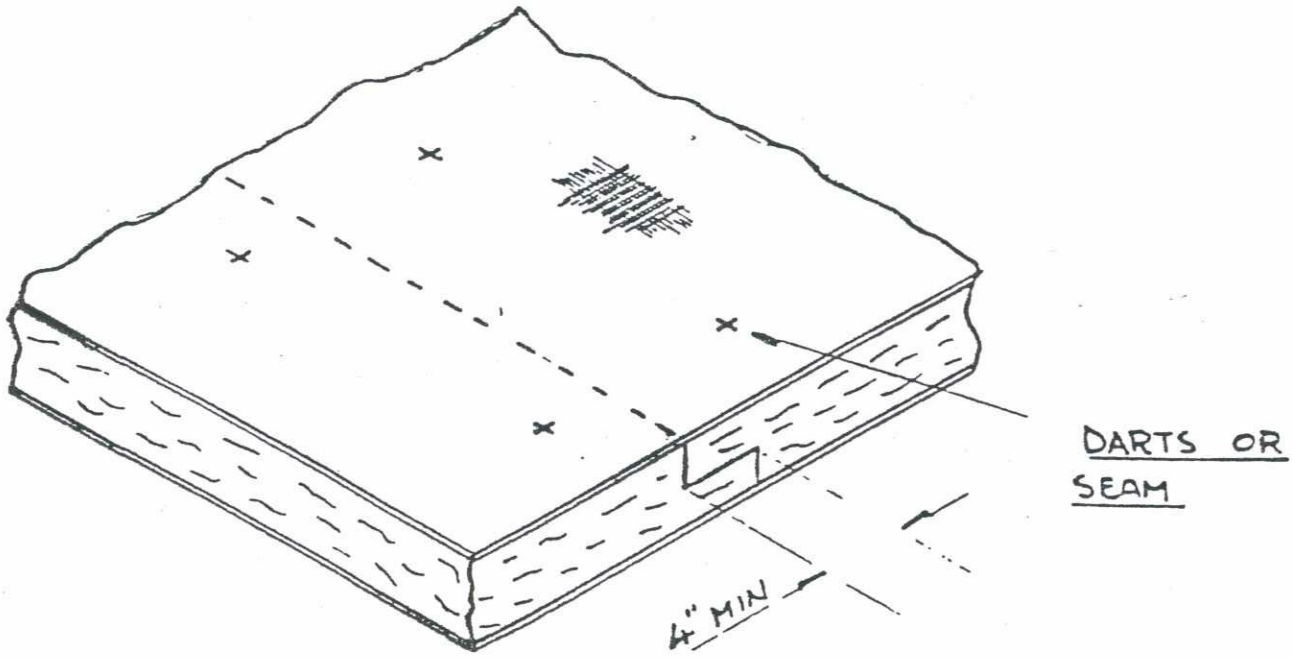

FIGURE 3

6.3.2.3 Insert filler material inside envelope assembly assuring that filler material is kept flat and occupies the entire interior of the envelope and is relatively tight.

6.3.2.4 If filler material has a tendency to "bunch up" during installation, the fabricator shall smooth by hand or use other means to assure total fill. Method used shall not cause damage or be detrimental to the Wrap System.

NOTE: If filler material appears to be too large creating "puckers" at

stitches, remove filler material and trim as necessary.

6.3.3 Completion of Envelope Assembly

6.3.3.1 Roll under fabric at open end and double stitch as shown in Figure 4A.

6.3.3.2 If both ends were left open until insertion of filler material, both ends shall now be closed as shown in Figure 4A.

6.3.4 Longitudinal Stitching

6.3.4.1 Longitudinal stitching shall be performed as shown in Figure 4. When multiple widths of filler material are required (Item 6.3.2.2) a minimum of two (2) rows of longitudinal stitches must be in each multiple width.

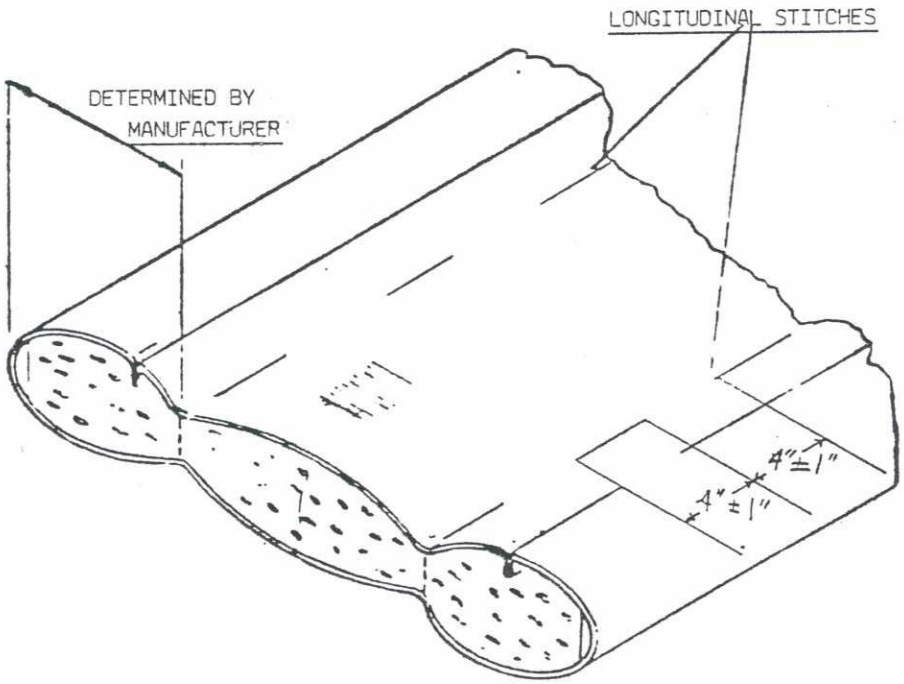

FIGURE 4
Typical Section Through Blanket

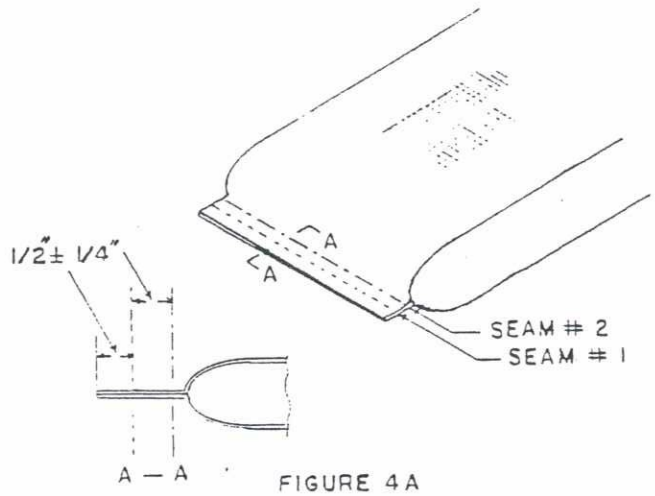

FIGURE 4A

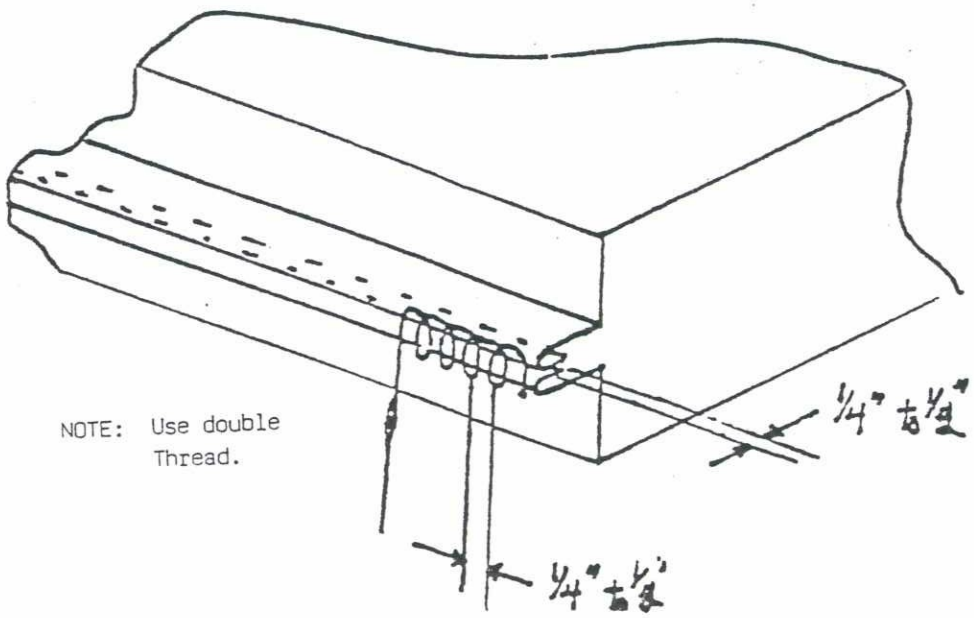

FIGURE 4B
ALTERNATE BLANKET CLOSURE
HAND SEWN METHOD

C

6.3.4.2 The specific placement of the longitudinal stitches is at the discretion of the fabricator.

6.3.4.3 Darts or similar may be used instead of longitudinal seams to secure the filler material in position. Refer to Figure 5.

6.3.4.4 The following requirements shall be complied with for darting/stitching to secure the filler material in position for HEMYC Blankets:

A) Any blanket with a circumferential dimension of sixteen (16") inches or less need not be darted if the filler material is of one piece.

B) Any blanket with a circumferential dimension of more than sixteen (16") inches but less than twenty-four (24") inches shall have at least one row of darts/stitches. Every multiple of eight (8") inches in that same dimension shall require an additional row of darts/stitches thereafter. Blankets with multiple pieces of filler material shall have at least one row of darts/stitches per piece.

C) For stitching to secure filler material the distance, in length, between stitches shall not exceed four (4") inches. For darts the distance shall not exceed nine (9") inches.

D) Equidistant placement of darts across the circumferential dimension is required unless there are multiple pieces of filler material, then the requirements of Item B above also apply.

E) All tolerances in darting/stitching shall be $\pm$ 1/4 inch.

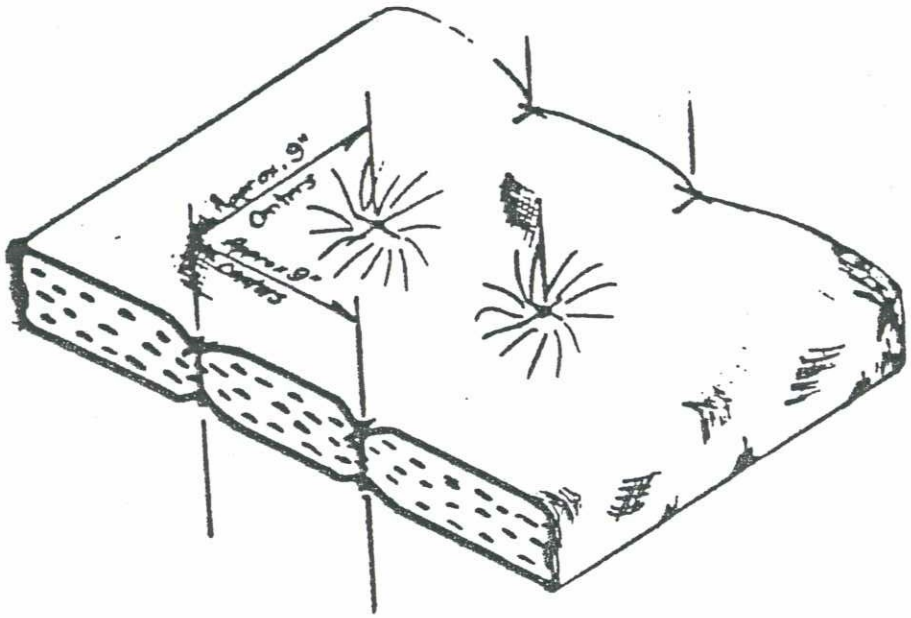

FIGURE 5

6.4 Fabricator Inspector

6.4.1 The fabricator shall assure that the completed wrap assembly conforms to the requirements specified on the applicable fabrication order.

6.4.2 This inspection by fabricator shall be in addition to verification by QC as defined in QCP-10002.

6.5 Identification Markings

6.5.1 Identification markings shall be placed on each wrap assembly at a minimum of two locations.

A) In close proximity to one of the lengthwise edges on the exposed surface.

B) In close proximity to one of the ends on the exposed surface.

C. Various project requirements may specify that this marking is also provided on the interior (non-fire) surface.

6.5.2 These markings shall be the blanket number as defined on the applicable fabrication order.

6.5.3 Markings shall be of a waterproof paint or ink which will retain the marking, withstand weathering deterioration, and other handling effects and shall not be deleterious to the fabric.

6.5.4 These markings shall be in characters no less than three-fourths (3/4") inches (19mm) high.

G ISSUE 08/16/95	L.C. Spriggs	R.J. Block	Revised as noted. Issue for use.

INSTALLATION OF
HEMYC PROTECTIVE WRAP SYSTEM
ONTO SINGLE OR MULTIPLE CONDUITS

1.0 PURPOSE

The purpose of this procedure is to assure that the installation of the HEMYC Protective Wrap System is consistent with the system as tested on the various qualification tests. The Fire Qualification Test, referenced as CTP-1026, consisted of a One (1) Hour Fire Exposure, per ASTM E-119 criteria, including hose stream test in accordance with the American Nuclear Insurers Information Bulletin No. 5(79) entitled, "ANI/MAERP Standard Fire Endurance Test Method to Qualify a Protective Envelope for Class IE Electrical Circuits".

2.0 SCOPE

This procedure provides the methods and guidelines to be utilized for the installation of HEMYC Protective Wrap Systems for conduits.

3.0 REFERENCE

3.1 10CFR50, Appendix R

3.2 ANI Bulletin 5(79)

ISSUE DESIGNATION IN THIS COLL INDICATES CURRENT CHANGE

4.0 DEFINITIONS

4.1 **CLIP** - sheet metal clip used to hold Wrap System onto finger strap.

4.2 **COLLAR** - a blanket used at wrap joints on conduit in place of wrap overlay.

4.3 **CONDUIT STANDOFF** - bracket used to allow two (2") inch airspace between conduit and blanket.

4.4 **FINGER STRAP** - thin, sheet metal strapping with pre-punched sections that may be bent out to provide anchoring for Wrap System.

4.5 **CLAMP/BANDING** - stainless steel or galvanized hose type clamp or banding. Hose clamps shall be a minimum gauge of .015" and a minimum width of one-half (1/2") inch.

4.6 **FLEX CONDUIT** - Non-rigid conduit that shall be covered using procedure IP-8400.112 for cable drops.

5.0 RESPONSIBILITIES

5.1 The authorized Installer's ENGINEERING DEPARTMENT shall be responsible to define the scope of work as prescribed on the applicable contract documents and provide the appropriate drawings, specifications, requirements, instructions, etc., to the department responsible for installation.

This department shall also be responsible to provide liaison with applicable client personnel and other internal departments to assure smooth flow of communication.

5.2 The authorized Installer's PRODUCTION DEPARTMENT shall be responsible for the identification and scheduling of work to be performed as defined on the documents furnished by ENGINEERING.

5.3 The Installers, as trained and certified by PROMATEC, shall be responsible for the performance of installation activities herein prescribed.

5.4 The Installer's QUALITY CONTROL PERSONNEL, as trained and certified by PROMATEC, shall be responsible for appropriate inspection, documentation and monitoring.

6.0 PROCEDURE

6.1 Stretch finger strapping along conduit to be protected and bend fingers out away from conduit.

6.2 Holding finger strapping against conduit, attach clamps on approximate eighteen (18") inch centers around conduit and tighten clamps. (See Figure 1.)

G 6.3 Impale wrap onto finger strap. Allow two (2") inch minimum between edge of wrap and fingers as shown on Figure 3.

6.4 Bring rest of wrap around conduit and impale edge of wrap onto fingers over the other edge. (See Figure 2.)

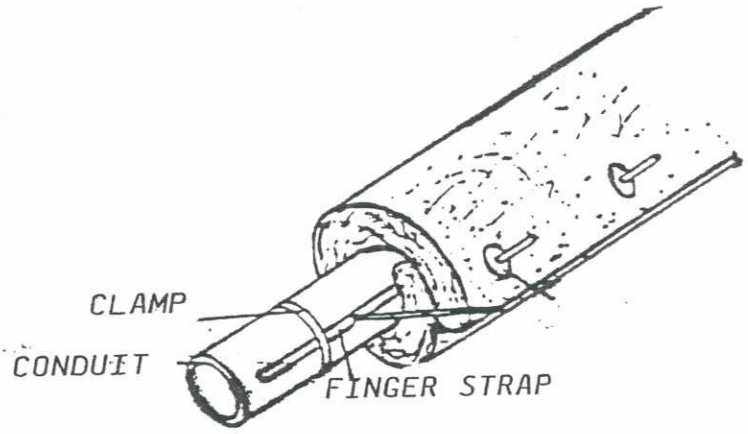

FIGURE 1

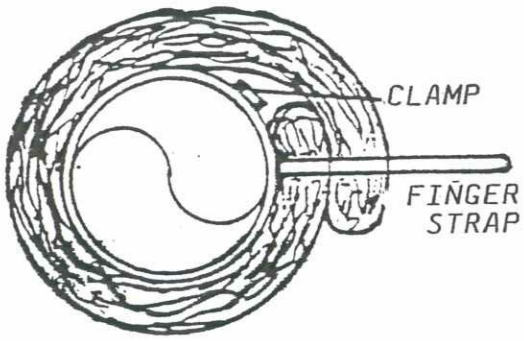

FIGURE 2

6.5 Attach clips onto fingers, compressing wrap approximately one-fourth to one-half (1/4" - 1/2") inch and bend finger over to secure blanket.

6.6 Multiple conduits are similar but only one conduit needs finger strapping. (Reference Figure 3.)

6.7 The number of conduits that may be wrapped is limited by wrap size. Large, bulky wrap sizes should be avoided due to difficulty in handling and possible damage.

If wrap sags excessively below conduit additional finger straps may be attached to centrally located conduits and used for additional wrap support.

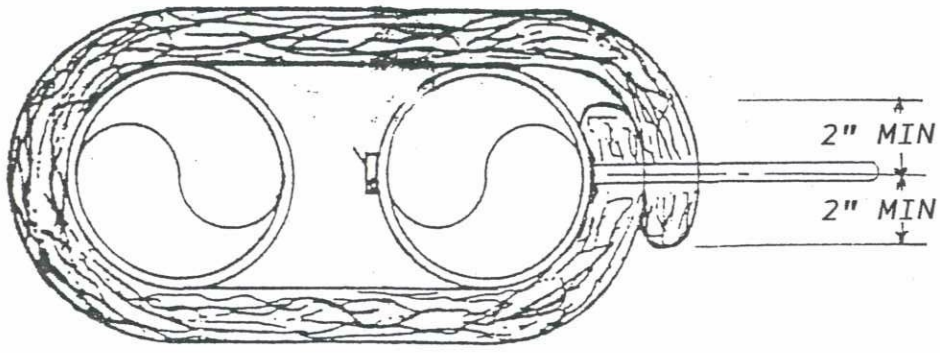

FIGURE 3

ISSUE DESIGNATION IN THIS COLI INDICATES CURRENT CHANGE

G

G 6.8 An alternate method of wrap attachment is to place the wrap around the conduit ensuring that the proper overlap is achieved. The proper overlap is a MINIMUM of two (2") inches for the circumferences of conduits and collars as shown on Fig. 4B. Attach clamps around the wrap to secure wrap to conduit. Clamp spacing shall be placed on maximum nine (9") inch centers.

Tighten clamps until wrap is compressed one-fourth to one-half (1/4" - 1/2") inches. DO NOT OVER-TIGHTEN as distortion of the blanket will result.

If gaps occur at wrap overlap, loosen clamps, shift blanket as necessary and re-tighten clamps.

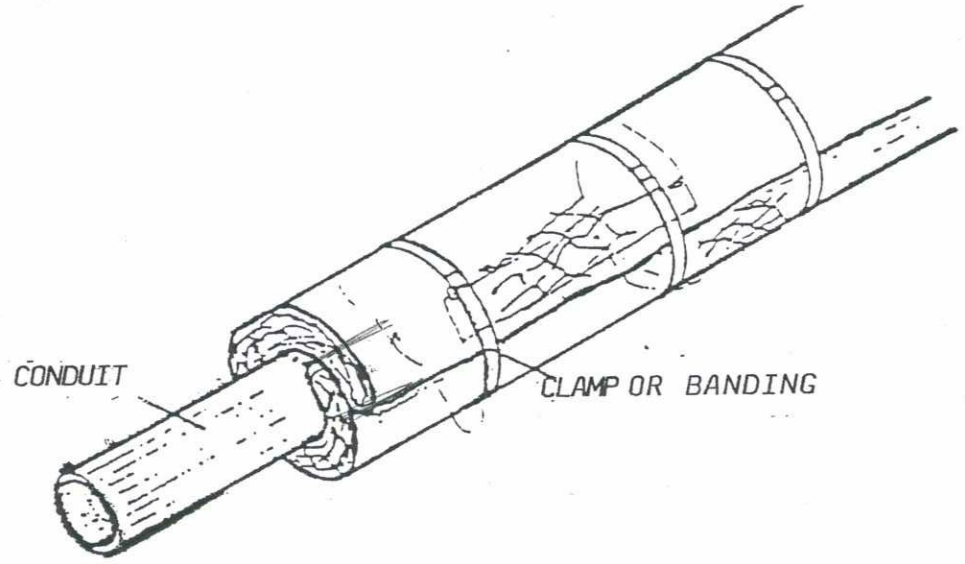

FIGURE 4A

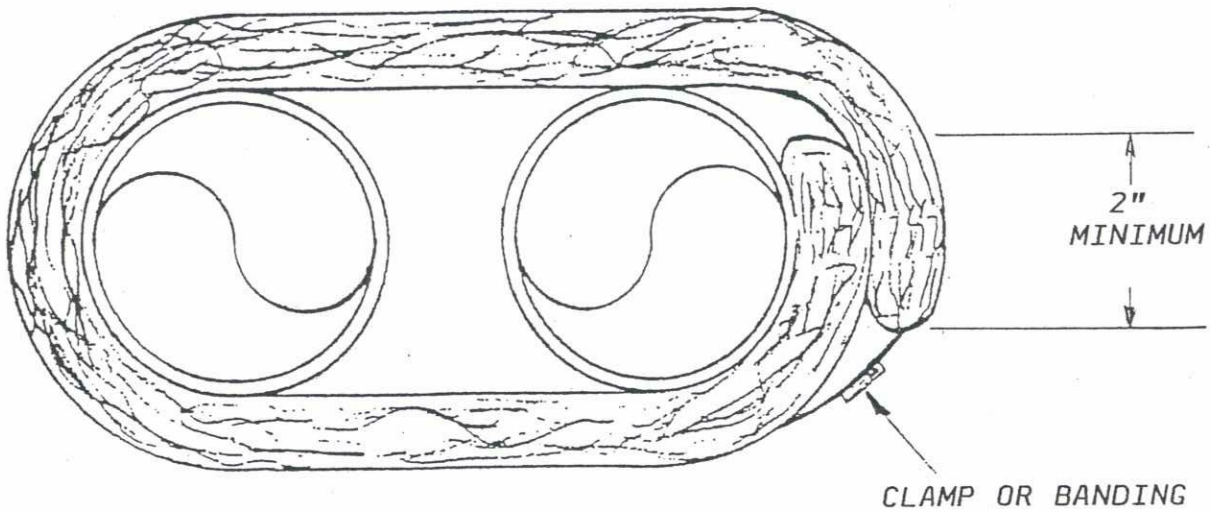

FIGURE 4B

6.9 In areas where ceiling, wall or floor clearances do not allow for wrap thickness, the wrap may be attached using methods and materials outlined in Procedure No. IP-8400.104, Section 6.3.

6.10 One of the two methods as shown in Figures 5 and 6 shall be outlined at wrap joints. Clamps or banding to secure should be installed as shown.

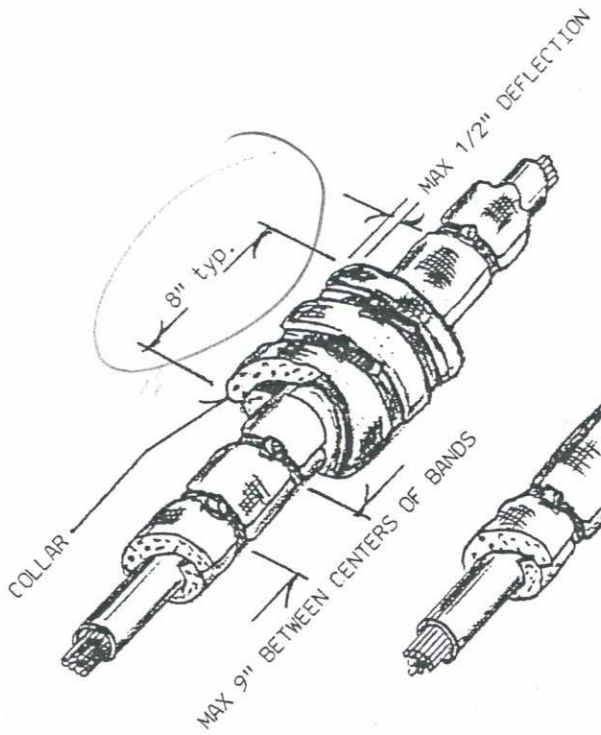

FIGURE 5
Typical Conduit Wrap
(Separate Wrap Style)

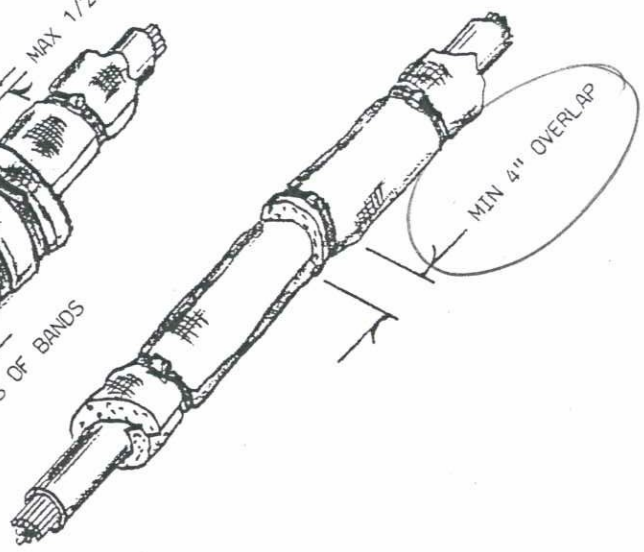

FIGURE 6
Typical Conduit Wrap
Joint Detail
(Overlap Type)

6.11 The following method is to be used where two (2") inch standoff bracket is required. Attach conduit standoff to conduit using all thread rod (See Figure 7). Use lock-washer and bolt to secure to conduit.

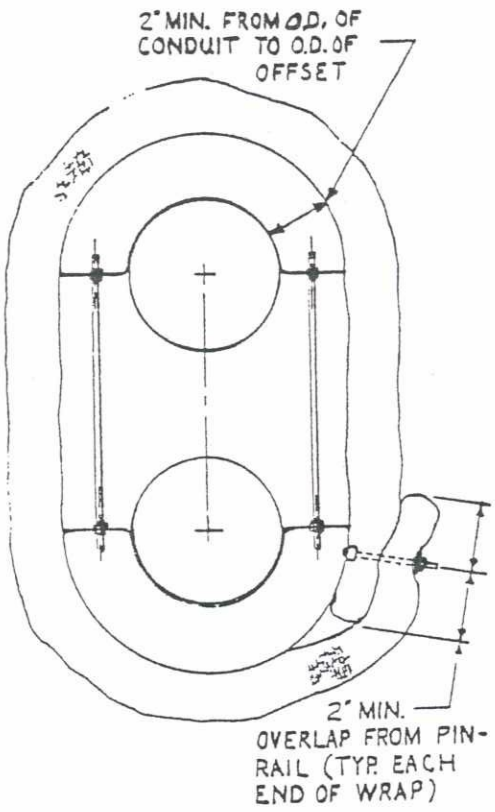

FIGURE 7

6.12 Conduit standoff are to be placed on maximum eighteen (18") inch centers. Attach rail and/or strut using bolts and lockwashers. Stud spacing is on nine (9") inch maximum centers (See Figure 8). Additional pin rail and/or strut may be used as determined by Installer's Site Engineer.

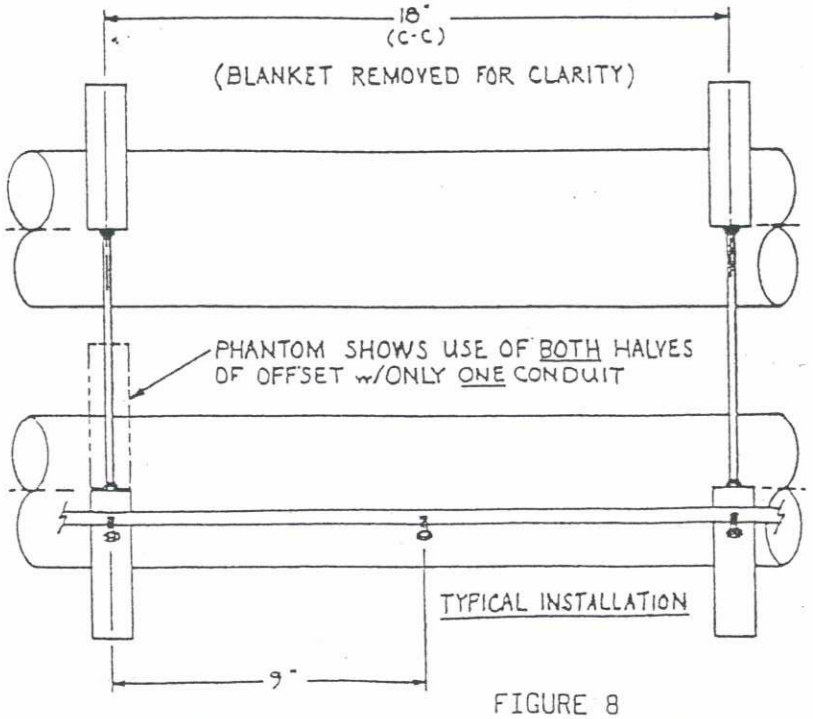

FIGURE 8

6.13 After framework is complete be sure to tighten all bolts.

6.14 Place blanket over studs allowing a minimum two (2") inch overlap from stud to edge of wrap. Bring wrap around standoff and impale edge of wrap onto studs. Allow minimum two (2") inch overlap from stud to edge of wrap. (See Figure 7.)

6.15 Use fender washer locknut to secure wrap to pin rail. Tighten locknut until wrap is compressed one-fourth to one-half (1/4" - 1/2") inch.

6.16 Use termination of system similar to procedure IP-8400.106, Section 6.3 Termination - Conduit (Floor, Ceiling or Wall).

REPAIR AND INSTALLATION OF HEMYC PROTECTIVE WRAP SYSTEM AROUND INTERFERENCES AND OBSTRUCTIONS

1.0 PURPOSE

The purpose of this procedure is to assure that the installation of the HEMYC Protective Wrap System is consistent with the system as tested on the various qualification tests. The Fire Qualification Test, referenced as CTP-1026, consisted of a One (1) Hour Fire Exposure, per ASTM E-119 criteria, including hose stream test in accordance with the American Nuclear Insurers Information Bulletin No. 5(79) entitled "ANI/MAERP Standard Fire Endurance Test Method to Qualify a Protective Envelope for Class IE Electrical Circuits".

2.0 SCOPE

This procedure provides the methods and guidelines to be utilized for the repair and installation of the HEMYC Protective Wrap Systems around interferences and obstructions.

3.0 REFERENCE

3.1 10CFR50, Appendix R

3.2 ANI Bulletin No. 5(79)

3.3 HEMYC Test CTP-1026

3.4 QCP-10001, Packaging, Shipping, Receiving, Handling and Storage for the HEMYC Protective Wrap Components

3.5 QCP-10002, Fabric Inspection for HEMYC Protective Wrap Components

3.6 QCP-10003, Installation Inspection Criteria for HEMYC Protective Wrap Components

3.7 HEMYC Protective Cable Wrap System Typicals, PROMATEC Drawings B-310, B-311, B-312 and B-313.

4.0 DEFINITIONS

4.1 **CONCRETE ANCHORS** - site approved anchors such as HILTI or Phillips Wedge Anchors used to hold blanket to walls, ceiling or partitions.

4.2 **NEEDLE** - a needle, curved or straight, capable of handling the thread type noted in these definitions.

4.3 **PLUMBERS TAPE** - flexible metal strip having pre-punched holes running the length

ISSUE DESIGNATION IN THIS COLUMN INDICATES CURRENT CHANGE

of the attached wrap.

4.4 **RETAINER STRAP** - rigid metal strip having pre-punched holes running the length of the attached blanket.

4.5 **THREAD** - fire and heat resistant, quartz type thread such as Alpha Quartz Q-24.

5.0 RESPONSIBILITIES

5.1 The authorized Installer's ENGINEERING DEPARTMENT shall be responsible to define the scope of work as prescribed on the applicable contract documents and provide the appropriate drawings, specifications, requirements, instructions, etc., to the department responsible for installation.

This department shall also be responsible to provide liaison with applicable client personnel and other internal departments to assure smooth flow of communications.

5.2 The authorized Installer's PRODUCTION DEPARTMENT shall be responsible for the identification and scheduling of work to be performed as defined on the documents furnished by ENGINEERING.

F 5.3 The Installers, as trained and certified by PROMATEC, shall be responsible for the performance of installation activities herein prescribed.

F 5.4 The Installer's QUALITY CONTROL PERSONNEL, as trained and certified by PROMATEC, shall be responsible for appropriate inspection, documentation, and monitoring.

6.0 PROCEDURE

6.1 Penetrating Members

6.1.1 Cut affected wrap to a depth sufficient to allow the wrap to be installed around the penetrating member (See Figure 1).

6.1.2 Using quartz thread and proper needle (curved needle suggested), sew the inner portion of the wrap (Siltemp or fiberglass) together around the penetrating member.

6.1.3 Fill any gaps in the ceramic fiber fill with additional fiber and sew the outer Siltemp material together (See Figure 2). Stitches shall be no more than one-half (1/2") inch apart.

6.1.4 Fill any gaps around the penetrating member with ceramic fiber.

F 6.1.5 Cut a four (4") inch wide piece of ceramic blanket and place around the penetrating member with a one to two (1" - 2") inch overlap at the ends. (See Figure 3).

F 6.1.6 A slightly larger section of Siltemp shall be placed over the ceramic blanket and sewn top, sides and bottom to tightly seal the Wrap System (See Figure 4). Stitches shall be no more than one-half (1/2") inch apart. Seal shall be accomplished by sewing/banding the blanket in place. Interfering cable trays may be wrapped as described in Procedure IP-8400.106, Sections 6.1.2

through 6.1.5.

6.1.7 It may not be possible in all cases to get the Siltemp cloth tight against the penetrating member. In these cases ensure that the ceramic blanket is forced tightly against the penetrating member by the Siltemp to prevent flame and/or heat passage into system. Clamps may be used to accomplish this, as necessary.

F 6.1.8 All supports and interferences shall be protected a minimum of four (4") inches measured linearly from the structure being protected.

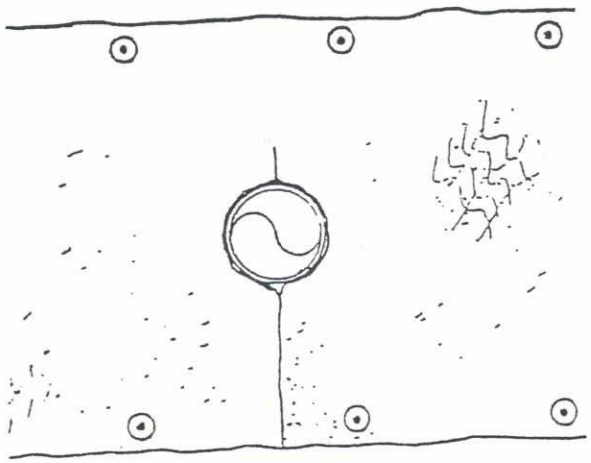

FIGURE 1

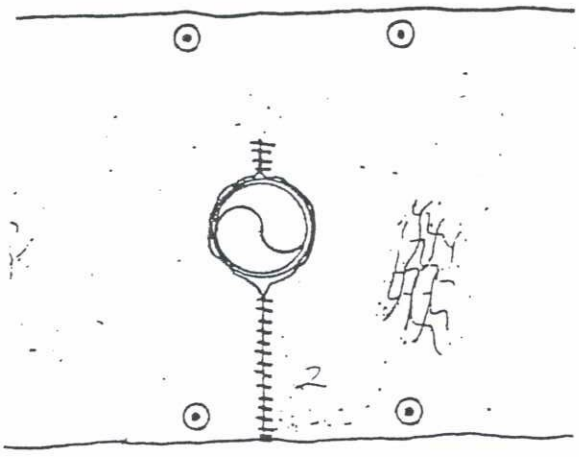

FIGURE 2

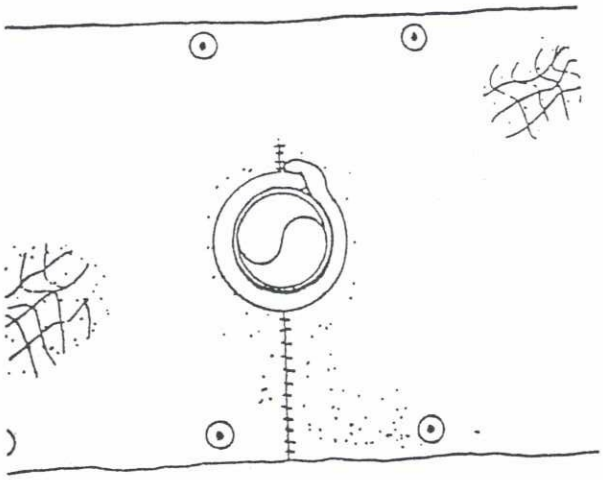

FIGURE 3

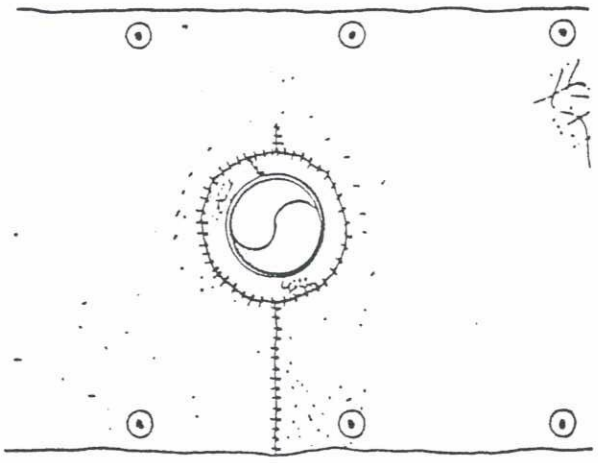

FIGURE 4

6.2 Adjoining or Supporting Members

F

6.2.1 If possible the adjoining or supporting member should be encapsulated within the system using the procedure outlined in Section 6.1 to seal any openings. (See Figure 5.) In addition, these interfering members may have pin rail banded to them to help secure the wrap. This configuration may be substituted for pin rail studs where top and/or bottom rails meet these interfering members, maintaining nine (9") inch maximum spacing between adjacent pin rail studs. All stud spacings are as measured along the rail.

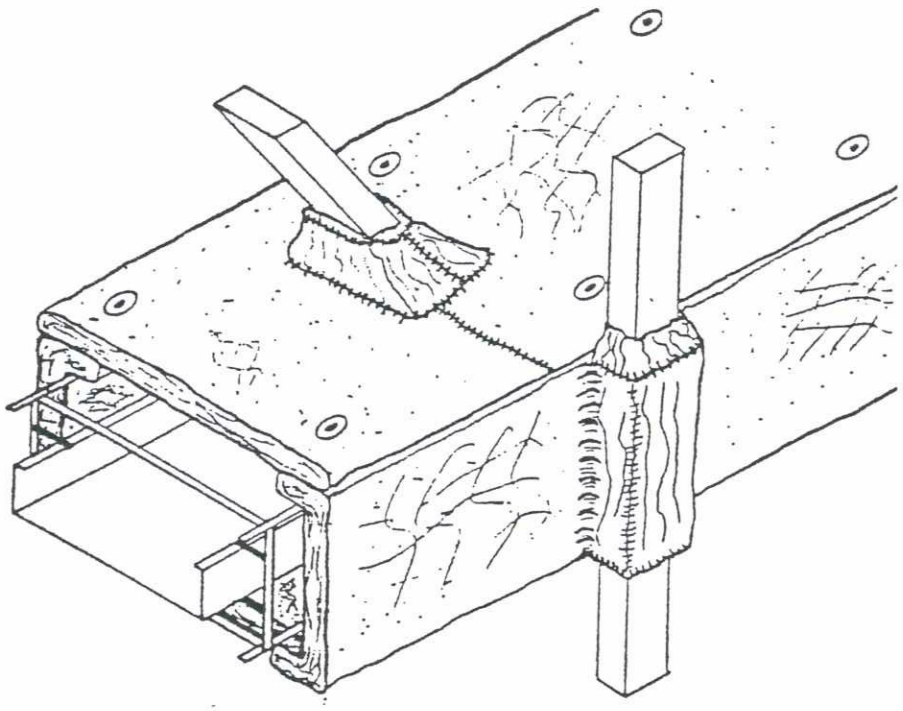

FIGURE 5

6.2.2 Where, due to size, shape or location, the adjoining or supporting member cannot be encapsulated, the Installer's Site Engineer shall determine alternate methods on a case by case basis. Client's Engineer or authorized representative shall review alternate methods, as required. Such alternates shall be within the parameters established by the HEMYC fire testing.

6.3 Wall, Ceiling or Floor Interferences

6.3.1 Where walls, ceilings or floors prevent the installation of the full system, the wraps may be installed as shown in Figure 6. Extra wrap supports may be required as determined by the Installer's Site Engineer.

6.3.2 Framework shall be attached to the interfering surface using concrete anchors and L-Brackets #B-6102 as shown in Figure 6.

ISSUE DESIGNATION IN THIS COLUMN INDICATES CURRENT CHANGE

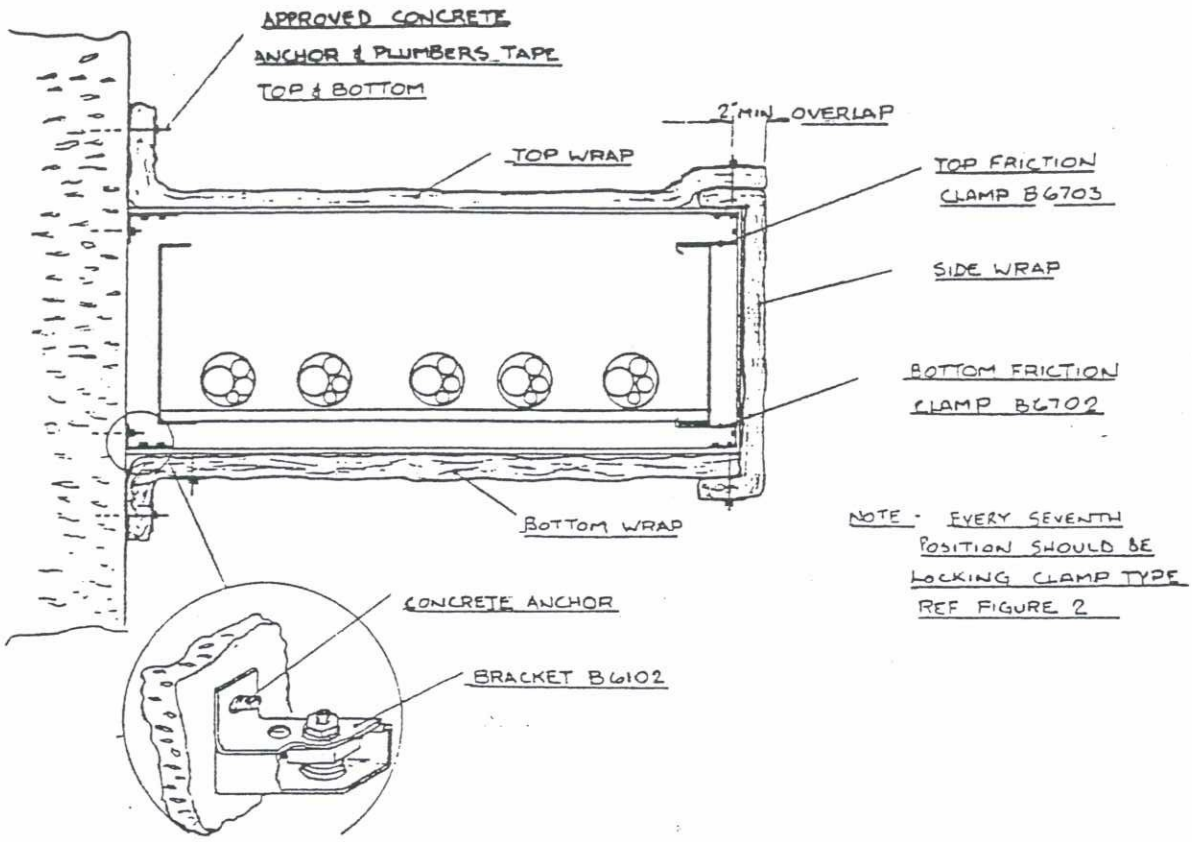

FIGURE 6

6.3.3 Concrete anchors for wrap shall be placed no more than nine (9") inches apart.

6.3.4 Plumbers tape or retainer strap must be installed in the areas where the Wrap System is attached to a wall or ceiling. The plumbers tape or retainer strap is to be installed over the studs after the blanket is installed and prior to the fender washer and locknut. (See Figure 7.) Tape should be kept as tight as possible to prevent the wrap from sagging away from the wall creating a passage for heat and/or flame. Additional holes in plumbers tape or retainer strap may be made as necessary to accommodate variations in stud placement.

F 6.3.5 Where the Wrap System is to be attached to a termination surface (e.g., wall, floor, ceiling, adjoining structure), pin rail may be mounted as an alternative to installing multiple anchor studs.

To attach pin rail to the surface:

- Install a strip of ceramic blanket as a "gasket", between the pin rail and the surface. This blanket strip shall be one-fourth to one-half (1/4" - 1/2") inch thick and at least twice as wide as the rail.

- At least one (1) anchoring stud shall be located at each end of the pin rail.

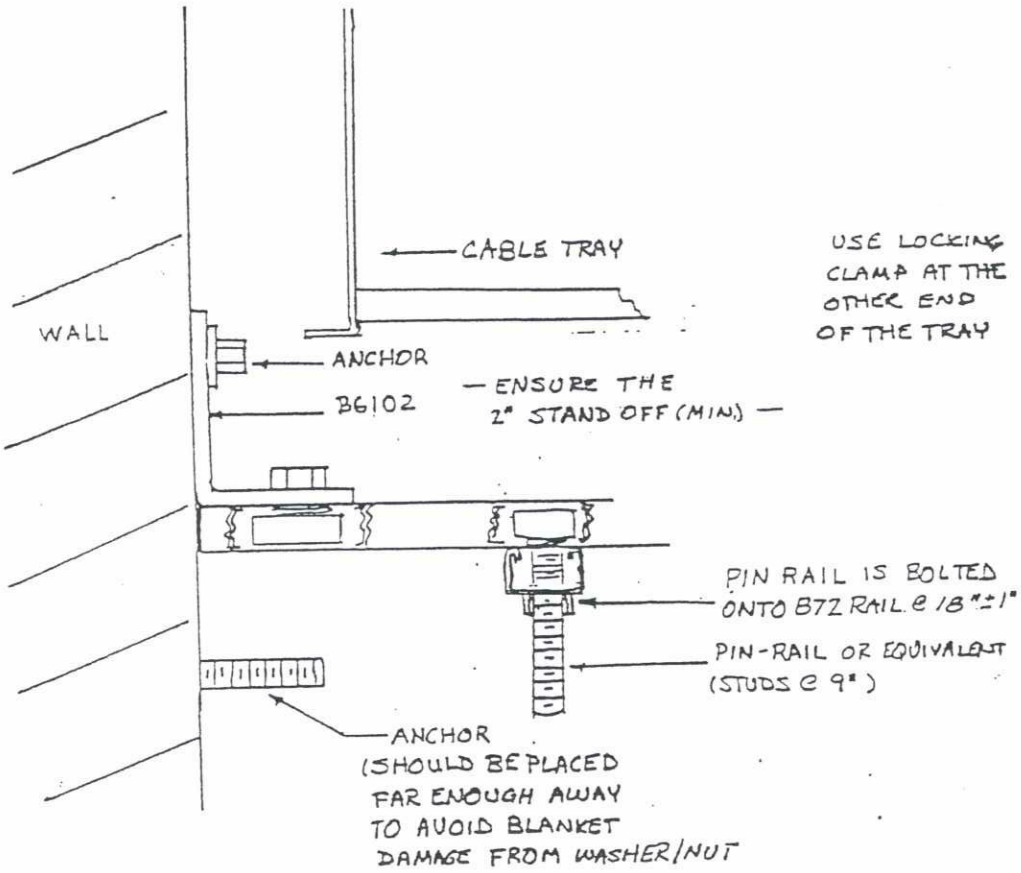
Install the end studs one-half (1/2") inches to five (5") inches O.C. from each end.

- For pin rail up to twenty-four (24") inches long use a minimum of two (2) anchoring studs; one at each end.

- For pin rail twenty-five (25") inches to sixty (60") inches long, use a minimum of three (3) studs; each end and one in the approximate middle.

- For pin rails sixty-one (61") inches to one hundred twenty (120") inches long, use a minimum of four (4) studs; each end and another two approximately evenly spaced between the end anchoring studs.

NOTE: Anchoring studs may be site approved concrete anchors, 1/4-20 through-bolts or other engineering approved fasteners.



NOTE: IT IS SUGGESTED THAT LOCK WASHERS AND NUTS BE USED ON THE ANCHORS RATHER THAN LOCKNUTS, TO AVOID OVER TORQUING OF ANCHORS

FIGURE 6A
TRAY MOUNTING DETAIL
WALL TO WALL WRAP
BOTTOM SECTION

F

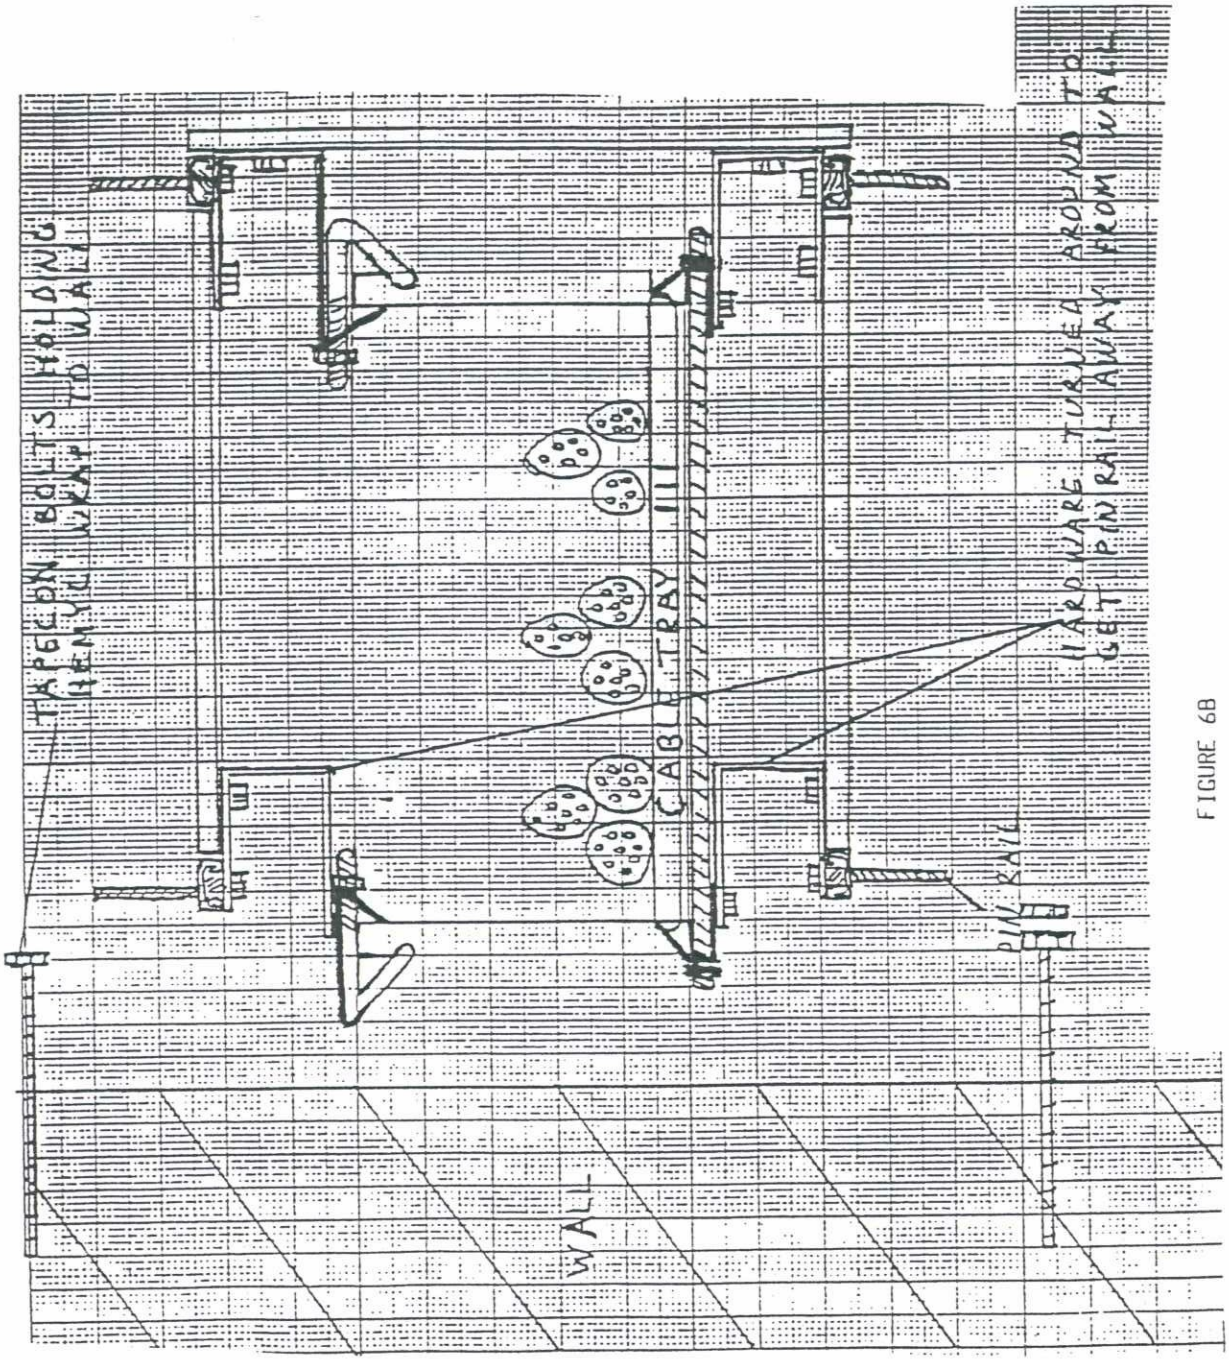


FIGURE 6B

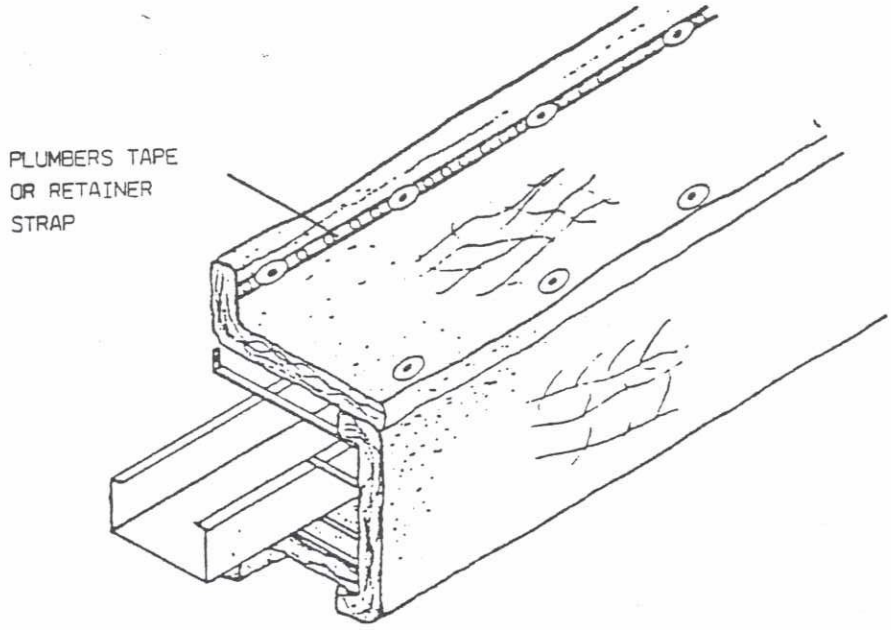

FIGURE 7

6.4 Repair Procedure

6.4.1 Responsible parties shall inspect damaged wrap to determine the extent of damage and if repair or replacement is required. Order replacement wrap if damage is extensive.

6.4.2 Remove damaged wrap to work area.

6.4.3 Replace any damaged or deformed framework/support materials utilizing methods outlined in PROMATEC Installation Procedures IP-8400.101, IP-8400.102 and/or IP-8400.103.

6.4.4 Rips

6.4.4.1 Sew the interior fabric, if necessary, the full length of the ripped fabric with stitches no more than one-half (1/2") inch apart. Extra stitches will need to be added to each end of rip to ensure that the rip does not "creep".

6.4.4.2 Replace any ceramic fiber lost due to damage. Ensure that no gaps remain in fiber filler and that proper thickness is maintained.

6.4.4.3 Sew the exterior fabric together as outlined in Section 6.4.4.1. If any gaps are found in fabric it may be necessary to insert an appropriately sized piece of fabric inside the system prior to sewing fabric closed.

6.4.4.4 Reinstall wrap as outlined in PROMATEC Procedure IP-8400.101.

6.4.5 Holes or Large Tears

6.4.5.1 Patches of the proper type fabric, Siltemp or fiberglass, should be cut to a size sufficient to cover the hole with an approximate two (2") inch overlap onto undamaged fabric

6.4.5.2 Repair the interior surface first, if necessary, by placing patch over hole and sewing around the perimeter of patch with stitches no more than one-half (1/2") inch apart.

6.4.5.3 Replace any ceramic fiber as necessary. Ensure that no gaps remain and that proper thickness is maintained.

6.4.5.4 Place the exterior patch over the hole and sew as noted in Section 6.4.5.2. (See Figure 8.)

6.4.5.5 Reinstall wrap as outlined in PROMATEC Procedure IP-8400.101, using new locknuts on studs.

C 3.7 QCP-10002, Fabrication Inspection for HEMYC Protective Wrap Components

C 3.8 QCP-10003, Installation Inspection Criteria for HEMYC Protective Wrap Components

4.0 DEFINITIONS

4.1 **CLIP** - stainless steel metal clip used to hold banding in place.

C 4.2 **COLLAR** - a blanket used at wrap joints on conduit and/or cable wrap in place of wrap overlap.

C 4.3 **CLAMP** - stainless steel or galvanized hose type clamp or stainless steel banding.

ISSUE DESIGNATION IN THIS COLUMN INDICATES CURRENT CHANGE

C 4.4 **STRIP** - ceramic blanket sufficiently thick to achieve two (2") inches air space between cable and blanket wrap.

C 4.5 **WRAP** - a fireproof product consisting of ceramic fiber material sewn into an envelope of fireproof fabric.

5.0 RESPONSIBILITIES

5.1 The authorized Installer's ENGINEERING DEPARTMENT shall be responsible to define the scope of work as prescribed on the applicable contract documents and provide the appropriate drawings, specifications, requirements, instructions, etc., to the department responsible for installation.

C This department shall also be responsible to provide liaison with applicable client personnel and other internal departments to assure smooth flow of communication.

C 5.2 The authorized Installer's PRODUCTION DEPARTMENT shall be responsible for the identification and scheduling of work to be performed as defined on the documents furnished by Engineering.

C 5.3 The Installers, as trained and certified by PROMATEC, shall be responsible for the performance of installation activities herein prescribed.

C 5.4 The Installer's QUALITY CONTROL PERSONNEL, as trained and certified by PROMATEC, shall be responsible for appropriate inspection, documentation and monitoring.

6.0 PROCEDURE

C 6.1 Cut ceramic fiber blanket sufficiently thick to achieve two (2") inch air space in approximately three (3") inch wide strips, place around cable(s) and secure, space the three (3") inch wide strips on maximum nine (9") inch centers. A minimum of two (2") inch air space is required between cable and blanket wrap.

C 6.2 Additional three (3") inch wide ceramic fiber blanket sufficiently thick to achieve two (2") inch air space may be utilized in order to maintain two (2") inch air space.

C 6.3 Place minimum one and one-half (1-1/2") inch blanket wrap around three (3") inch wide strips and cable. Banding to be placed around blanket wrap at point over three (3") inch wide strip. Blanket must overlap a minimum of three (3") inches. Outside (blanket wrap band) banding is to be placed over the three (3") inch wide strips only.

Tighten banding until blanket is compressed one-fourth to one-half (1/4" - 1/2") inch. DO NOT OVER-TIGHTEN.

6.4 At blanket wrap joints, or overlap, a two (2") inch ceramic fiber blanket cut in approximate six (6") inch wide strip should be used around cable. See IP-8400.103, Section 6.9 for detail of blanket wrap.

6.5 For termination to wall, floor or ceiling, use IP-8400.106 Conduit.

6.6 For Cable Drops into Cable Tray Wrap System, use IP-8400.104, Section 6.1 Penetrating Member.

4.0 DEFINITIONS

None

5.0 RESPONSIBILITIES

5.1 The authorized Installer's ENGINEERING DEPARTMENT shall be responsible to define the scope of work as prescribed on the applicable contract documents and provide the appropriate drawings, specifications, requirements, instruction, etc., to the department responsible for installation.

This department shall also be responsible to provide liaison with applicable client personnel and other internal departments to assure smooth flow of communication.

5.2 The authorized Installer's PRODUCTION DEPARTMENT shall be responsible for the identification and scheduling of work to be performed as defined on the documents furnished by ENGINEERING.

C 5.3 The Installers, as trained and certified by PROMATEC, shall be responsible for the performance of installation activities herein prescribed.

C 5.4 The Installer's QUALITY CONTROL PERSONNEL shall be responsible for appropriate inspection, documentation, and monitoring.

6.0 PROCEDURE

6.1 Layout of Wrap

6.1.1 The Installer's Site Engineer shall take exterior measurements of the junction boxes to be protected and develop a pattern similar to the pattern shown in Figure 1. An alternate method would be to develop pieces that could be sewn as shown in Figure 2.

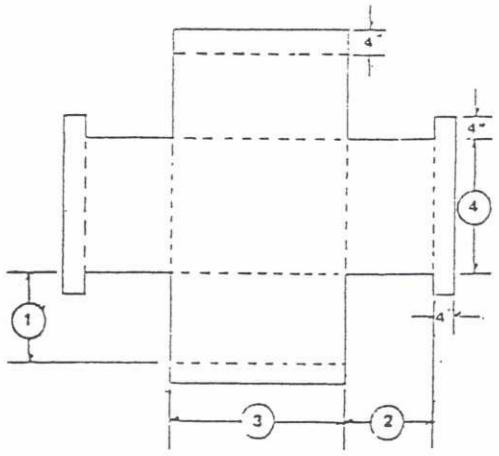

FIGURE 1

ISSUE DESIGNATION IN THIS COLU NDICATES CURRENT CHANGE

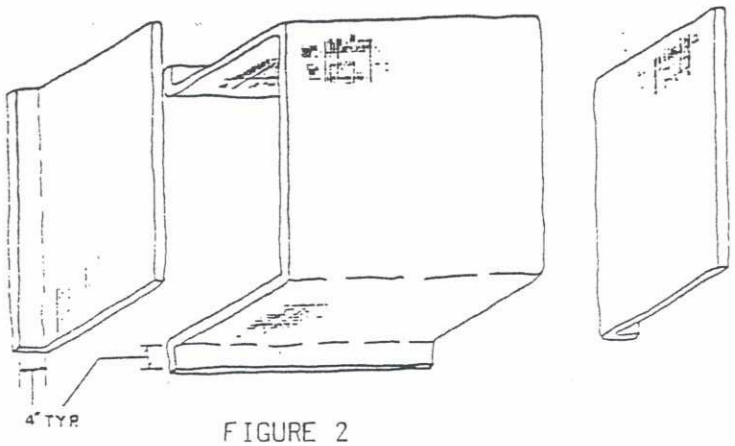

FIGURE 2

6.1.2 Dimensions #1, 2 and 3 on Figure 1 should be increased four (4") inches from junction box dimensions to allow for wrap thickness.

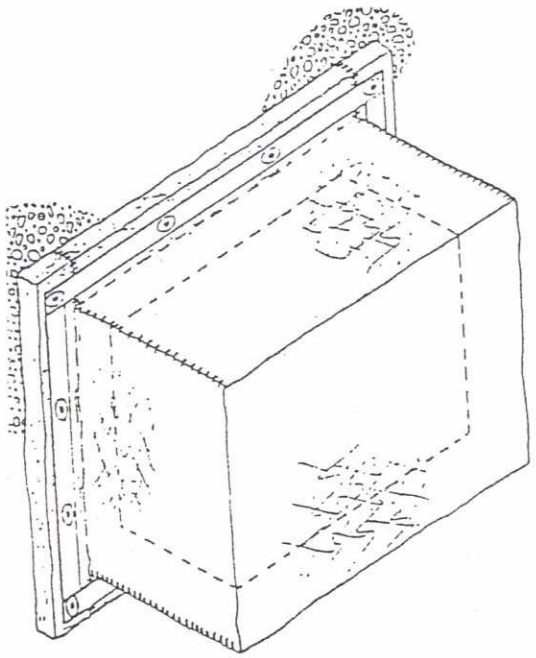
6.1.3 Note on Figures 1 and 2 that approximately four (4") inches is allowed at ends to overlap onto surface for attachment.

6.1.4 The Installer's Site Engineer should ensure that sufficient material allowances are made on all patterns to provide for overlap at corners of junction box.

6.2 Installation

6.2.1 Wrap System may be installed as shown in Figure 3 for floor, wall or ceiling mounting or as shown in Figure 4 in the case of free standing equipment.

FIGURE 3



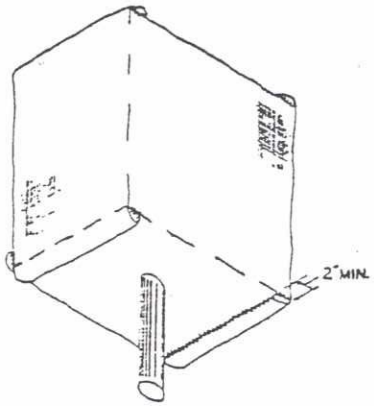


FIGURE 4

6.2.2 For equipment that will require frequent access, a framework may be used as shown in Figure 5 to provide ease of system removal.

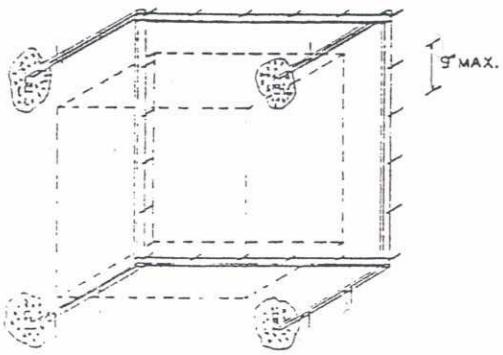

FIGURE 5

6.2.3 Concrete anchors used for floor, wall or ceiling installation shall be placed as determined by the Installer's Site Engineer.

6.2.4 Mounting of wrap to floor, wall or ceiling shall be done similar to that described in Procedure IP-8400.104.

6.2.5 All sewing shall be done in accordance with the requirements of Procedure IP-8400.104.

? even with stand-of

6.2.6 Ensure that no gaps exist in Wrap System. Minimum thickness of wrap at all points is two (2") inches. Fill as necessary with ceramic blanket to maintain minimum thickness.

PROCEDURE FOR:	PROCEDURE NUMBER:
INSTALLATION OF HEMYC PROTECTIVE WRAP SYSTEM - STRAIGHT SECTIONS OF CABLE TRAY	IP-8400.101

PROCEDURE ISSUE SUMMARY

ISSUE/DATE	PREPARER	APPROVED	COMMENTS
G ISSUE 01/25/95	L.C. Spriggs	R.J. Block	Revised as noted. Issue for use.

ISSUE DESIGNATION IN THIS COLUMN INDICATES CURRENT CHANGE

INSTALLATION OF HEMYC PROTECTIVE WRAP SYSTEM STRAIGHT SECTIONS OF CABLE TRAY

1.0 PURPOSE

The purpose of this procedure is to assure that the installation of the HEMYC Protective Wrap System is consistent with the system as tested on various qualification tests. The Fire Qualification Test, referenced as PROMATEC CTP-1026, consisted of a One (1) Hour Fire Exposure, per ASTM E-119 criteria, including hose stream test in accordance with the American Nuclear Insurers Information Bulletin No. 5(79) entitled, "ANI/MAERP Standard Fire Endurance Test Method to Qualify a Protective Envelope for Class IE Electrical Circuits".

2.0 SCOPE

This procedure provides the methods and guidelines to be utilized for the installation of HEMYC Protective Wrap Systems.

3.0 REFERENCE

3.1 10CFR50, Appendix R

3.2 ANI Bulletin No. 5(79)

3.3 HEMYC Test CTP-1026

3.4 QCP-10001, Packaging, Shipping, Receiving, Handling and Storage for HEMYC Protective Wrap Components

3.5 QCP-10002, Fabrication Inspection for HEMYC Protective Wrap Components

3.6 QCP-10003, Installation Inspection Criteria for HEMYC Protective Wrap Components

3.7 HEMYC Protective Cable Wrap System Typicals; PROMATEC Drawings B-310, B-311, B-312 and B-313

4.0 DEFINITIONS

4.1 **BASE** - slotted and drilled, formed plate used in assembly of locking clamp.

4.2 **BRACKET** - galvanized "C" used in conjunction with a base and U-Bolt to make a locking clamp.

4.3 **FENDER WASHER** - a flat washer approximately 1-1/2" O.D. with a small inside hole to slip over rail studs. The function is to prevent or minimize damage to wrap by the locknut and to provide more wrap support.

4.4 **FRAMEWORK** - an assembly consisting of four struts and four clamps (friction or

ISSUE DESIGNATION IN THIS COLL NDICATES CURRENT CHANGE

locking) that surrounds the cable tray, normally spaced on eighteen (18") inch centers.

4.5 **FRICTION CLAMP** - pre-galvanized device used to connect framework to cable tray.

4.6 **LOCKING CLAMP** - galvanized assembly similar to friction clamp but is tightly bolted to the cable tray to prevent movement of the framework.

4.7 **LOCKNUT** - a specially designed, vibration resistant nut having a plastic insert on the threaded portion. These are used primarily on the locking clamp and the rail studs.

4.8 **RAIL** - long sections of strut with threaded anchors stud-welded to it. These are attached to the framework parallel to the tray. Rails provide anchors to secure the Wrap System and add longitudinal support to the framework.

4.9 **SPRING NUTS** - a specially designed rhomboid shaped nut with a spring permanently attached that is used to secure clamps to the struts.

4.10 **STRUTS** - lightweight, pre-galvanized channel used to provide structural support to the Wrap System.

4.11 **U-BOLT** - a "U" shaped bolt bent to provide attachment of locking clamp to cable tray.

4.12 **WRAP** - a fireproof product consisting of ceramic fiber material sewn into an envelope of fireproof fabric.

5.0 RESPONSIBILITIES

5.1 The authorized Installer's ENGINEERING DEPARTMENT shall be responsible to define the scope of work as prescribed on the applicable contract documents and provide the appropriate drawings, specifications, requirements, instructions, etc., to the department responsible for installation.

This department shall also be responsible to provide liaison with applicable client personnel and other internal departments to assure smooth flow of communication.

5.2 The authorized Installer's PRODUCTION DEPARTMENT shall be responsible for the identification and scheduling of work to be performed as defined on the documents furnished by Engineering.

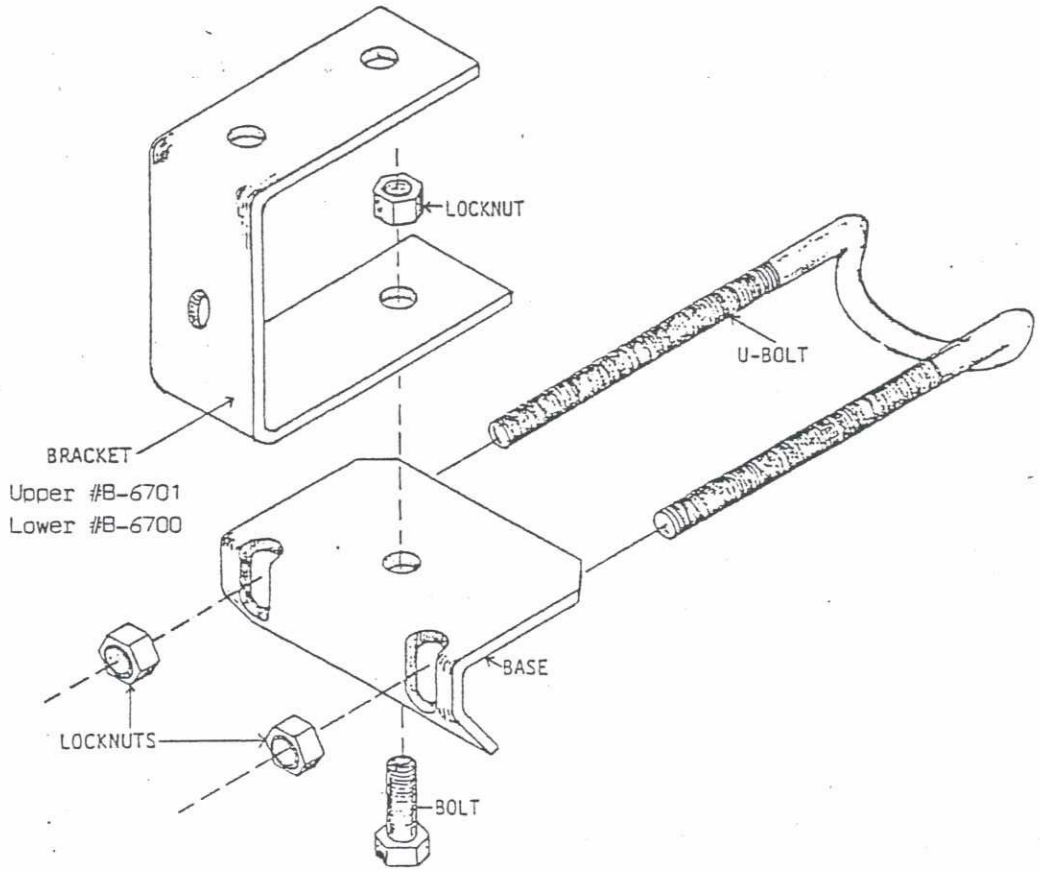
G 5.3 The Installer's, as trained and certified by PROMATEC, shall be responsible for performance of installation activities herein prescribed.

G 5.4 The Installer's QUALITY CONTROL PERSONNEL, as trained and certified by PROMATEC, shall be responsible for appropriate inspection, documentation and monitoring.

6.0 PROCEDURE

6.1 Locking Clamp Assembly (See Figure 1).

G 6.1.1 Attach U-Bolt to base by sliding U-Bolt through slots in base. U-Bolt and base plate may be turned 180°.



LOCKING CLAMP - ASSEMBLY

FIGURE 1

6.1.2 Secure U-Bolt by threading locknuts onto legs until threads contact nylon insert in locknut. DO NOT TIGHTEN.

G

6.1.3 Insert 1/4" x 3/4" - 20 Thread Bolt through hole in bottom of base and through hole on long leg of bracket. For cable tray 90° or 45° bend sections, two clamp bases may share this bolt.

6.1.4 Thread locknut onto bolt and tighten. Ensure that a minimum of one (1) full thread is visible above the locknut. Keep bracket as square as possible in relation to base.

6.1.5 For alternate cable tray types, the Installer's Site Engineer shall determine the type of clamping devices to be utilized. (Alternate clamping devices shall, as a minimum, provide adequate support similar to those devices utilized in the fire test.)

6.2 Framework Assembly and Installation

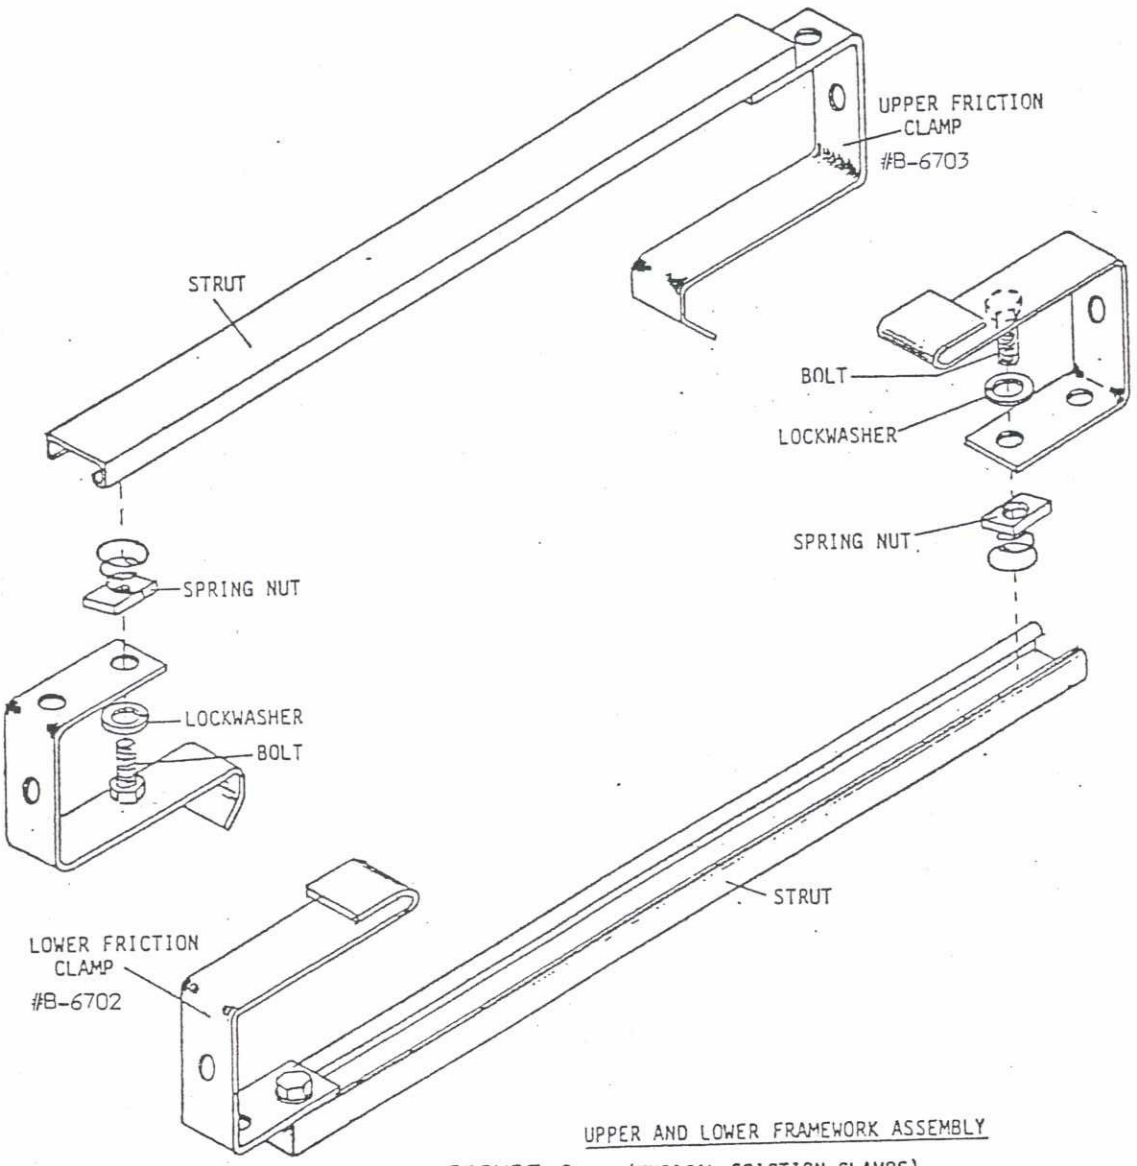
6.2.1 Insert Spring nuts near ends of strut sections.

ISSUE DESIGNATION IN THIS COLL .DICATES CURRENT CHANGE

G

6.2.2 Attach clamps to each end of horizontal struts using bolt and lockwasher threaded into spring nut. (Written instruction for installation of alternate clamping devices shall be delineated on site specific addendums to this and/or other procedures.)

When necessary for additional support, horizontal strut may be attached to an adjacent support using the #B-6141 flat bracket. In order to match existing interferences, horizontal and side struts may be installed at acute or obtuse angles.



UPPER AND LOWER FRAMEWORK ASSEMBLY

FIGURE 2 (TYPICAL-FRICTION CLAMPS)

ISSUE DESIGNATION IN THIS COLUMN INDICATES CURRENT CHANGE

6.2.3 Install clamp and strut assembly onto cable tray on approximate eighteen (18") inch centers. At least every seventh assembly should be locking clamps. Additional locking clamps may be installed if required by Installer's Site Engineer. Clamps may be mixed as determined by the Installer's Site Engineer (See Figure 3A and Figure 3B). Do not damage cable during installation.

G #B-6700 and #B-6701 brackets may be bent as necessary to install framework. Two (2") inch minimum air space to be maintained in all directions between the outside of the tray and the outside of the struts, unless approved by FCR.

FRICTION CLAMP ASSEMBLY-TYPICAL

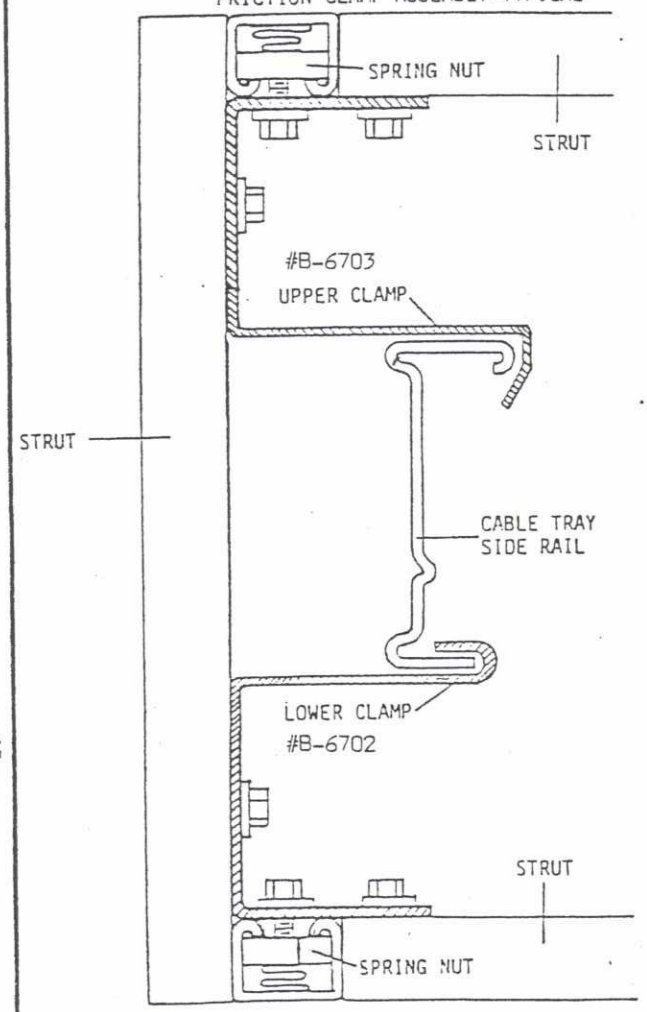


FIGURE 3A

LOCKING CLAMP ASSEMBLY-TYPICAL

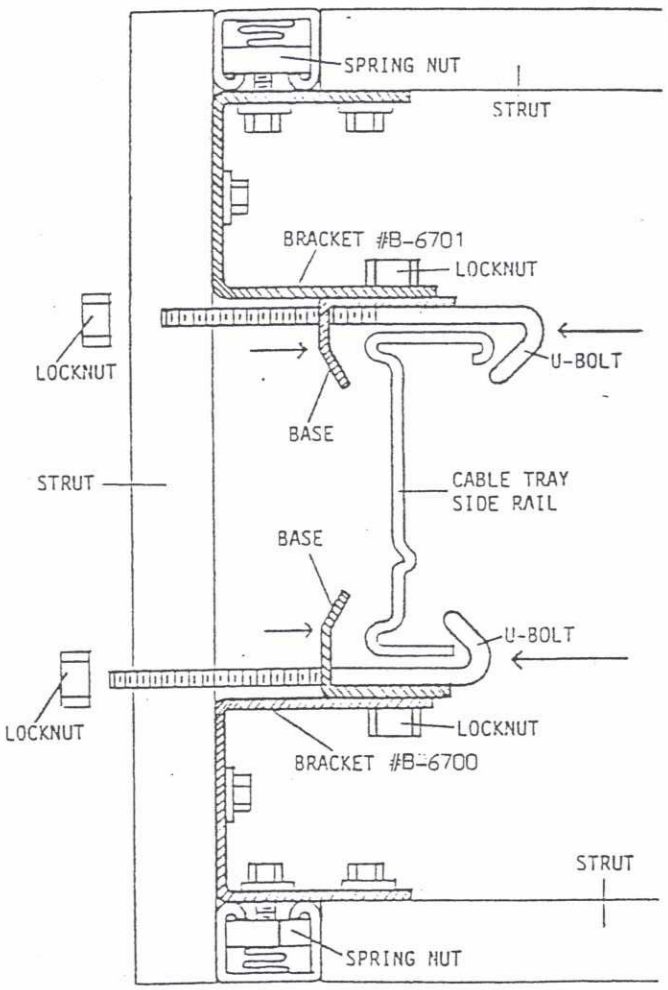

FIGURE 3B

G 6.2.4 Attach side struts to horizontal assemblies using bolt and lockwasher threaded into spring nut. Strut may need to be moved up or down to facilitate bolt insertion. (See Figure 4.) In order to match existing interferences, horizontal and side struts may be installed at acute or obtuse angles.

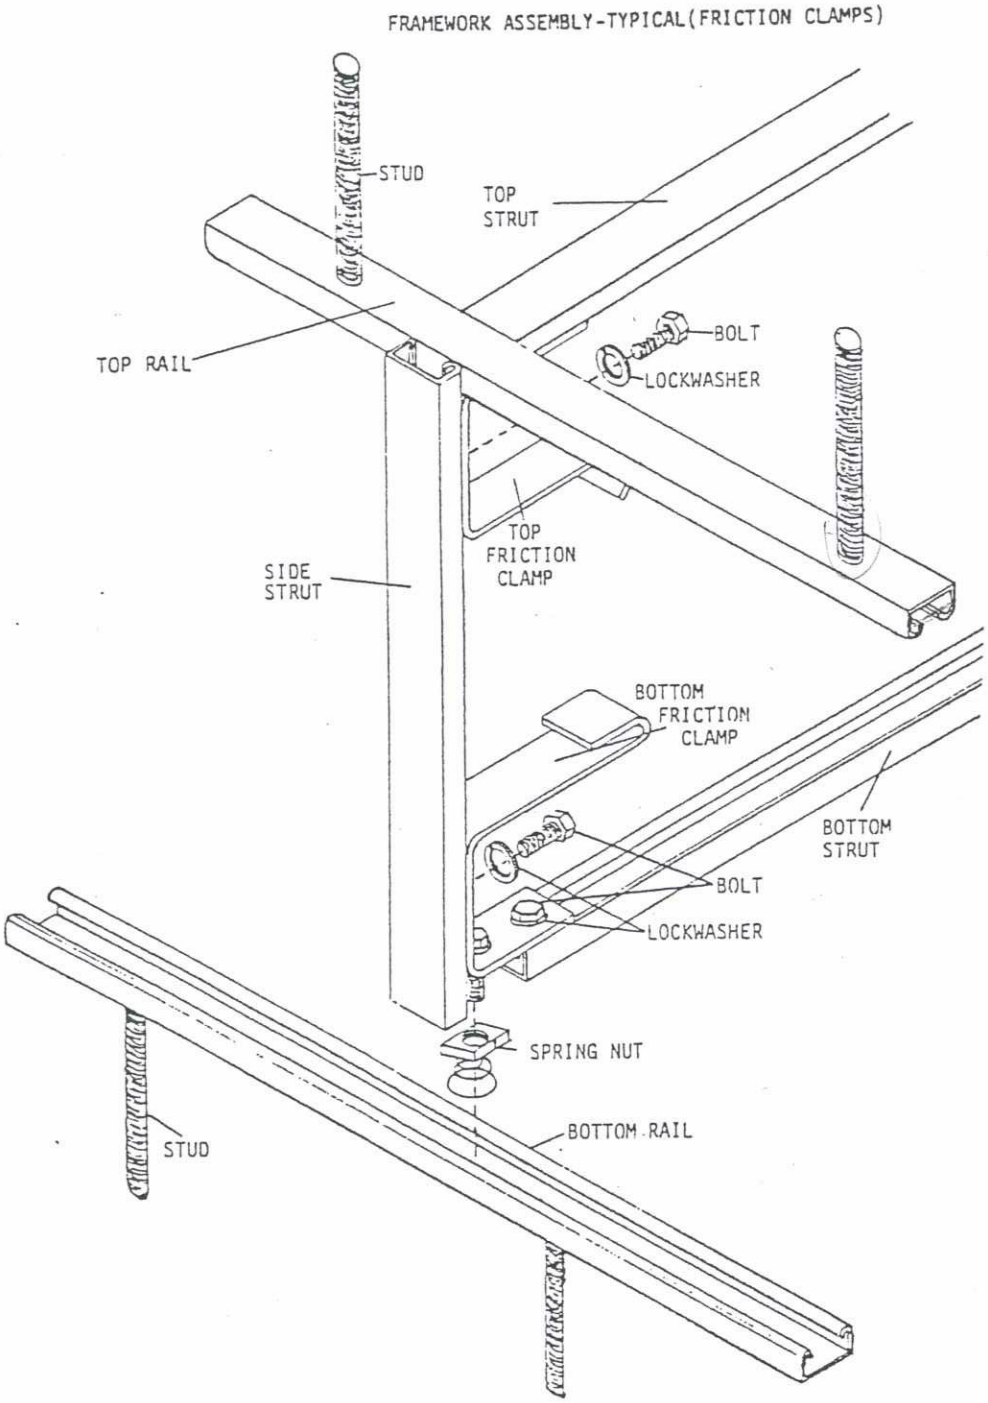

FIGURE 4

ISSUE DESIGNATION IN THIS COLU DICATES CURRENT CHANGE

6.2.5 Insert spring nuts into rails on approximate eighteen (18") inch centers.

6.2.6 With the framework sections placed on approximate eighteen (18") inch centers (± 1"), attach rails using bolts and lockwashers.

6.2.7 Check to ensure that side struts are flush (± 1/4") with the rails and firmly tighten bolts to ensure side struts to clamps.

6.2.8 Firmly tighten bolts to ensure rails to clamps.

6.2.9 Remove gaps, if any, between rails and horizontal strut by pulling on opposing side strut or rail and firmly tighten bolt to secure horizontal struts.

6.2.10 Firmly tighten locknuts on positive clamp U-Bolt to secure framework.

6.2.11 Frameworks may be shifted, if necessary, by loosening bolt to rail, moving framework as required, and retightening bolt.

6.3 Wrap Installation

6.3.1 Assemble materials, wraps, washers, nuts, etc., in area of cable tray to be protected.

6.3.2 For ease of installation either the sides or bottom wrap may be placed on the framework first. The top blanket should be the last blanket to be placed on the framework in order to have ease of access to cables.

6.3.3 Attach side wraps to top rails by forcing wraps onto studs (Use of pointed instrument, such as a punch, to start holes in wraps is suggested). Ensure the wrap is secured to studs. Impale wrap (inside filler material) at least two (2") inches past the edge of the stud. (See Figure 5.)

[CONTINUED ON NEXT PAGE]

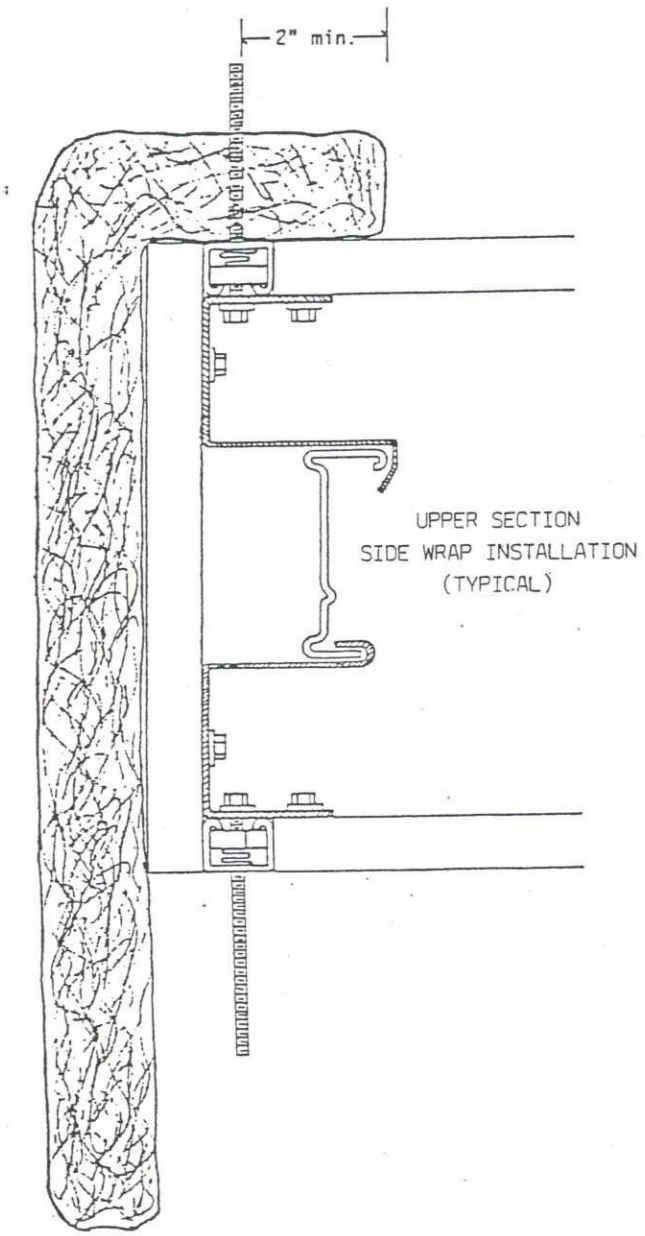

FIGURE 5

6.3.4 Install bottom wrap onto bottom rails. This is easier if both sides are done at the same time working from one end. Use fender washers and locknuts to hold the wrap onto the studs temporarily. Do not tighten the locknuts or damage the plastic insert. (See Figure 6.) If locknut is damaged, replace with a new one.

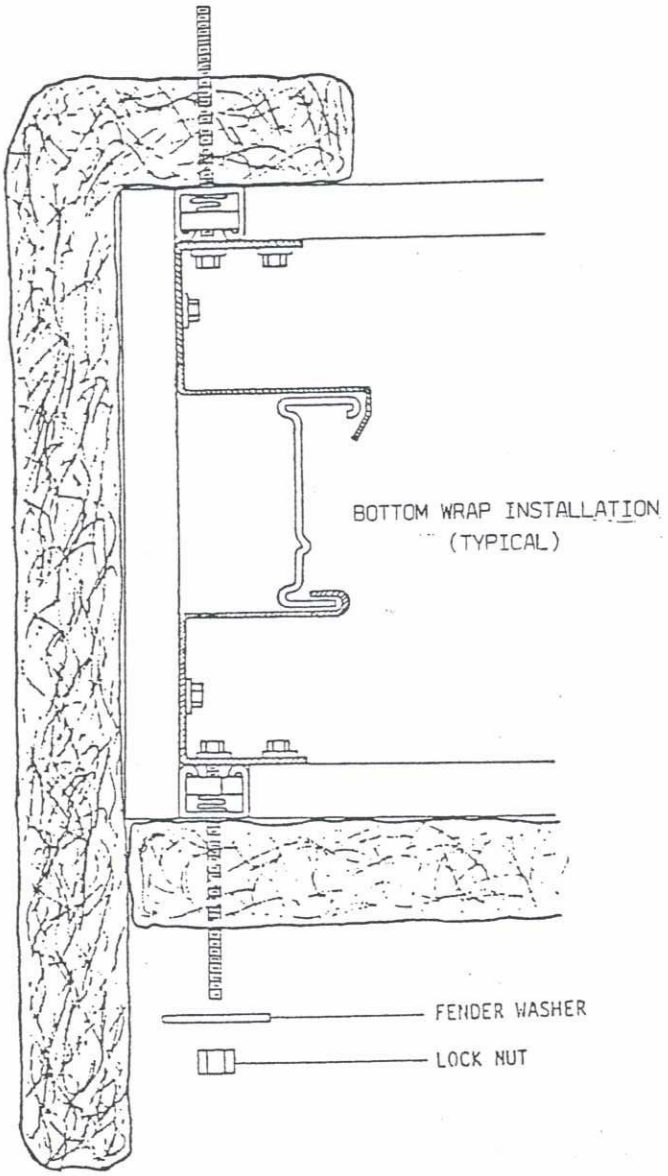

FIGURE 6

6.3.5 Attach lower end of side wraps to bottom rail. This is best accomplished by removing, one at a time, a fender washer and locknut supporting the bottom wrap, forcing the side wrap onto the stud and re-installing the fender washer and locknut. Make sure that the side wrap extends a minimum of two (2") inches past the studs. (See Figure 7.)

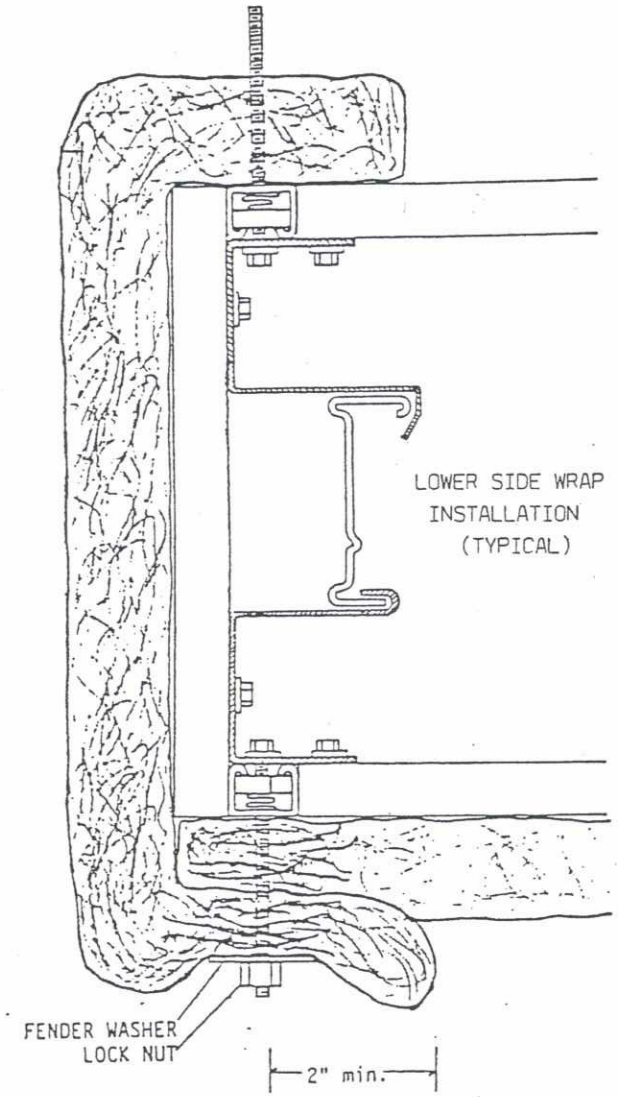

FIGURE 7

6.3.6 Place top wrap on top framework approximately centered. Push wrap onto studs and install fender washer and locknuts. (See Figure 8.)

6.3.7 Tighten locknuts onto studs until the wraps are compressed one-fourth to one-half (1/4" - 1/2") inches.

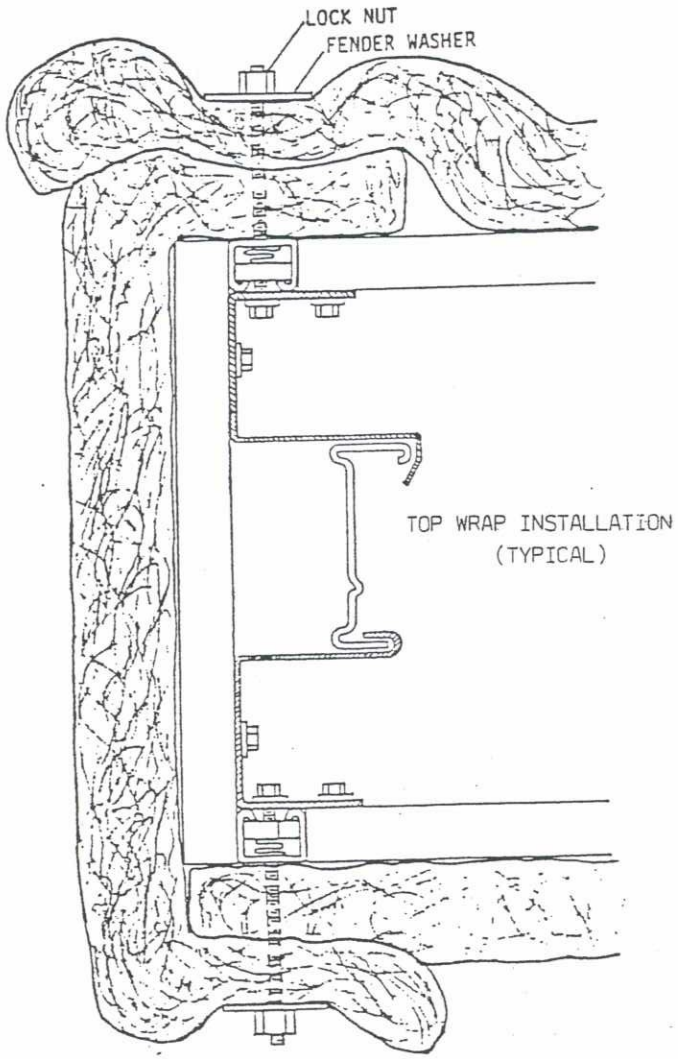

FIGURE 8

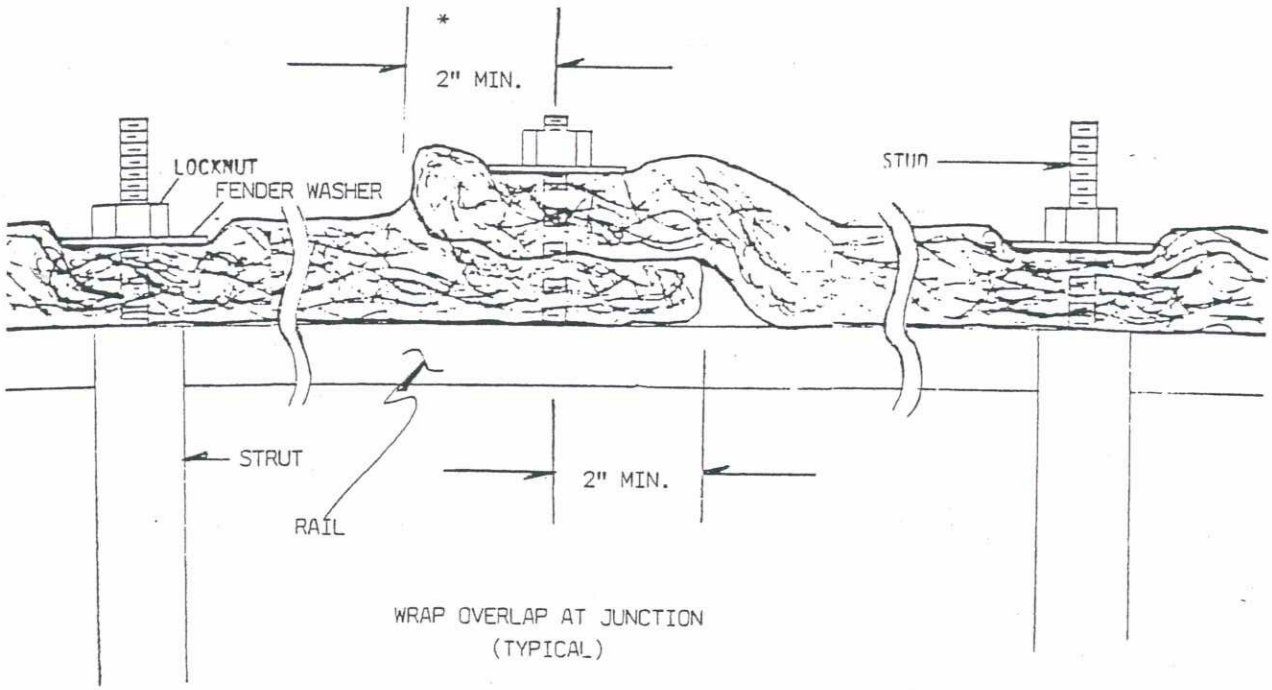
ISSUE DESIGNATION IN THIS COLU .DICATES CURRENT CHANGE

G 6.3.8 At Wrap System continuation joints, the continuing Wrap System must overlap four to six (4" - 6") inches onto the other system. (See Figure 9.) Additional studs may be required as determined by Installer's Site Engineer. These studs are to be installed by Construction or any required or additional framework rail or strut where Wrap System needs additional support. In some cases, pin rail may need to be installed in place of strut. Engineering approval is not required for additional support.



WRAP OVERLAP AT JUNCTION
(TYPICAL)

* SEE PARA 6.3.9 WHEN EXTERIOR BLANKET DOES NOT EXTEND BEYOND THE STUDS THE REQUIRED 2" MINIMUM.

FIGURE 9

6.3.9 In those situations where the exterior blanket at any joint does not extend beyond the studs the recommended two (2") inch minimum, an overlap of less than two (2") inches used in conjunction with a continual quartz thread stitching along the joint is an acceptable alternate.

6.3.10 Stagger Wrap System continuation joints so that only opposite sides stop at any one stud (two side wraps or top and bottom wrap). No more than three thicknesses of wrap should be on any one stud.

ISSUE DESIGNATION IN THIS CO. N INDICATES CURRENT CHANGE

FABRICATION PROCEDURE FOR THREE HOUR FIRE M.T. BARRIER COMPONENTS

1.0 PURPOSE

The purpose of this procedure is to assure that the fabrication of the Three Hour Fire M.T. Barrier Components are consistent with the system components as tested in PROMATEC Three Hour Fire qualification tests.

2.0 SCOPE

The PROMATEC Three Hour M.T. Barrrier System is comprised of Three compponent assemblies: 1) Inner Blanket Assembly, 2) Moisture Barrier, 3) Outer Blanket Assembly. This procedure shall address the Inner Assembly and Outer Assembly only and shall provide the methods and guidelines utilized in the fabrication of these assemblies.

3.0 REFERENCES

3.1 Fabrication Order (Form QC-59). See Attachment 7.1.

3.2 QCP-0042 -- Fabrication Inspection for PROMATEC protective wrap envelopes (Blankets).

3.3 QCP-0041 -- Packaging, shipping, receiving, handling and storage of PROMATEC protective wrap components

4.0 DEFINITIONS

4.1 Hot Side -- The outermost surface of a blanket assembly. See Attachment 7.2, Figure 3.

4.2 Cold Side -- The innermost surface of a blanket assembly. See Attachment 7.9, Figure 7.

5.0 RESPONSIBILITY

5.1 The Construction Manager or designee shall be responsible for the preparation and processing Fabrication Orders (QC-59) in accordance with PROMATEC field engineering and/or client requirements.

5.2 The Technical Services Manager or designee shall be responsible for providing assistance and direction for unique design configurations.

5.3 The authorized fabricator shall follow Fabrication Order form (QC-59), fabrication procedure, and Quality Control Procedure. The Quality Assurance Manager or designee shall be responsible for the development and implementation of appropriate procedures for shop field and source inspection of fabricated components to verify conformance with design requirements.

ISSUE DESIGNATION IN THIS CO N INDICATES CURRENT CHANGE

6.0 PROCEDURE

6.1 This procedure applies to the fabrication of the Three Hour M.T. Barrier Components by PROMATEC at the shop and field level, by PROMATEC qualified fabrication sources, and by client or their contractors (when written agreements allow).

6.2 Fabrication performed by any organization other than PROMATEC shall require qualification of such organizations and approval of programs established for controlling fabrication.

6.3 PROMATEC Quality Assurance shall have right of access for source inspection and/or audit to verify compliance with design and quality requirements.

6.4 Prior to the fabrication of any blankets the applicable portions of Fabrication Order Forms (QC-59) shall be completed as outlined in Fabrication Inspection (QCP-0042) guideline. Only acceptable materials listed on Attachment 7.2 will be utilized for fabrication.

6.5 Fabrication of Inner Blanket Assembly

6.5.1 Cut alumina/silica fiber blanket to proper dimensions per Fabrication Order Form (QC-59), to assure finished edge. Cut alumina/silica fiber back six inches as shown on fabrication order to allow for ship lap. See figure 1, Attachment 7.3.

6.5.2 Cut two pieces of fiberglass cloth to proper dimensions for alumina/silica blanket. Allow enough fiberglass cloth to assure all ends have a min. 3/8" tuck. See figure 2, Attachment 7.4.

6.5.3 Place fiberglass cloth and alumina/silica fiber blanket in appropriate position, allow for 3/8" min. tuck on ends and hog ring all edges of fiberglass cloth on hot side of envelope. For spacing of hog rings and clarification of finish edge see figure 3, Attachment 7.5.

6.6 Fabrication of Outer Blanket Assembly

6.6.1 The outer blanket assembly consists of two subassemblies, enveloped in silica dioxide fabric cloth. These subassemblies consist of, alumina/silica fiber blanket and powder (Honey Comb and/or straight tube) envelope.

6.6.2 Fabrication of the powder envelope (Honey Comb).

6.6.2.1 Cut three pieces of coated fiberglass cloth to dimensions assuring proper finished edges as per fabrication order form.

6.6.2.2 Lay all three pieces of coated fiberglass cloth together and sew a single stitch the length of the fabric 1/2"(±1/4") from the edge on one side only.

6.6.2.3 Sew top and center layers of cloth 3/8"(±1/8") form first sewn edge. Sew with a single stitch the length of the fabric.

6.6.2.4 Fold bottom end of fabric (across grain of tubes) 1/2"(±1/4") and sew across the length of fold with a single stitch.

6.6.2.5 Alternate sewing with a single stitch the length of the fabric from the top and center layers and the bottom and center layers every 7/8"(±1/8"). See figure 4, Attachment 7.6.

6.6.2.6 Fold bottom end of fabric (across grain of tubes) 1/2"(±1/4") and sew across the length of fold with a single stitch.

6.6.2.7 Fill each tube with powder to the size required for each assembly. As per Fabrication form (QC-59).

6.6.2.8 Fold top end of fabric (across grain of tubes) 1/2"(±1/4") and sew across fabric with a single stitch to seal tubes. See figure 5, Attachment 7.7.

6.6.3 Alternate-Fabrication of the powder envelope (straight tubes).

6.6.3.1 Cut two pieces of coated fiberglass cloth to dimension assuring proper finished edges as per fabrication order form.

6.6.3.2 Lay the two pieces of coated fiberglass cloth together and sew a single stitch the length of the fabric 1/2"(±1/4") from the edge on one side only.

6.6.3.3 Continue to sew the length of the fabric every 1 5/8"(±1/8") from the first sewn edge with a single stitch. See figure 6, Attachment 7.8.

6.6.3.4 Fold bottom end of fabric (across grain of tubes) 1/2"(±1/4") and sew across the length of fold with a single stitch.

6.6.3.5 Fill each tube with powder to the size required for each assembly. As per Fabrication form (QC-59)

6.6.3.6 Fold top of fabric (across fabric of tubes) 1/2" ($\pm$1/4") and sew across fabric with a single stitch to seal tubes. Reference of finished assembly, see figure 5, Attachment 7.7.

6.7 Cut Alumina/Silica Fiber Blanket to proper dimensions per Fabrication Order Form (QC-59) to assure finished edge.

6.7.1 Cut two pieces of silica dioxide cloth to proper dimensions to make one envelope for alumina/silica fiber blanket and powder assembly.

6.7.2 Place silica dioxide cloth, alumina/silica fiber blanket, and powder assembly in proper layer. Adjust alumina/silica fiber blanket as shown on fabrication order to allow for 6" ship lap design. Hog ring silica dioxide cloth on cold side of outer blanket assembly. See figure 7, Attachment 7.9.

6.7.3 Alternate method for hog rings on outer blanket assembly, is the use of (Type Q-24) teflon coated thread.

6.7.4 Lacing hooks shall be placed 7-1/2"($\pm$1/4") from finished edges. They shall be place on all top ship lap edges 1-1/2" ($\pm$1/4") from the edge. Lacing hooks to be spaced on maximum of 6" centers. See figure 8, Attachment 7.10.

6.8 Identification Markings of Inner and Outer Blankets

6.8.1 Identification markings shall be placed on every blanket assembly, both inner and outer at a minimum of two locations as follows:

a) In close proximity to one of the lengthwise edges on the hot side surface.

b) In close proximity to one of the end edges on the hot side surface.

c) Various project requirements may specify that these markings are also provided on the cold side surface.

6.8.2 These markings shall be the blanket number as shown on Fabrication Order Form (QC-59).

6.8.3 These markings shall be of a site approved waterproof paint and/or ink which will retain the marking, withstand weather deterioration, other handling effects and shall not be deleterious to the fabrics.

6.8.4 These markings shall be in character no less than 3/4" high.

6.8.5 Other Client approved methods of identification, i.e., tags, etc. may be used in lieu of blanket marking as described if required by project specification.

6.9 Multiple Pieces of Ceramic Fiber Blanket

6.9.1 Whenever multiple pieces of alumina/silica fiber blanket are utilized within one envelope the use of ship lap design is to be used, and darting with Quartz (Type Q-24) thread is to be used to avoid separation of the pieces of alumina/silica fiber blanket. See figure 9, Attachment 7.11.

ATTACHMENT 7.2

Only approved materials as listed below shall be utilized in the fabrication of PROMATEC's protective wrap components.

1. Silica Dioxide Cloth

   a. Siltemp S84 and/or 84 SRWR
   b. Santex
   c. Refrasil

2. Fiberglass cloth (Inner Blanket).

   a. Alpha 76281-4634
   b. J.P. Stevens 3582 3910
   c. J.P. Stevens 2025
   d. Havaglass

3. Coated fiberlass cloth

   a. Alpha 76281-4634
   ~~b. J.P. Stevens 3582 3910~~

INNER OUTER not same AS Figure 1

4. Alumina Silica Fiber Blanket - 1" and 1-1/2" nom.

   a. Johns Manville Cerablanket, 8# density 2400° F.
   b. Babcock & Wilcox Kaowool Blanket, 8# density 2300° F. Carborundum Durablanket, 8# density 2300° F.

5. Trihydrate Alumina Grade 30

   a. Alcoa-C30 and/or B. Solem-SB30

6. Hog Rings

   a. Spenaz 16SS-110
   b. Or approved equal

7. Lacing Hooks

   a. Alpha-Maritex 2-1/2" AML-1201-SS
   b. Erico Jones
   c. Or approved equal.

8. Nylon Thread

   a. Tex 90 Spun Kevlar

9. Quartz Thread

   a. Astroquartz - Type Q-24 teflon coated
      and/or
   b. Alphaquartz - Type Q-24 teflon coated

INSTALLATION OF
THREE HOUR PROTECTIVE WRAP SYSTEMS
CONDUITS / THREE SIDED WRAP / CABLE DROPS

1.0 PURPOSE

To establish methods and guidelines for the installation of PROMATEC Three Hour Fire Protective Wrap Systems in accordance with established design criteria.

2.0 SCOPE

2.1 To provide methods and sequence steps for installation of inner blanket assemblies, foil barrier and the outer blanket assemblies.

2.2 To establish dimensional requirements for installation.

2.3 To provide requirements and methods for field repairs and modifications.

2.4 Inform craft personnel of the Quality Control inspection notification points to assure work does not proceed until such inspection is performed.

3.0 REFERENCE

3.1 QCP-0041, Installation Inspection of Three Hour Fire Protective Wrap Systems

3.2 Typical Design Details B-495 and B-496

4.0 DEFINITIONS

4.1 **INNER BLANKET** - total one (1") inch thickness of alumina silica blanket enveloped with fiberglass cloth.

4.2 **FOIL BARRIER** - .002 thick stainless steel foil.

4.3 **OUTER BLANKET** - a multi-layered outer blanket assembly consisting of a one and one-half (1-1/2") inch alumina silica blanket and a separate prefabricated fiberglass assembly containing a powdered ingredient with either both enveloped by a fire resistant outer fabric or as two separate components with alumina silica blanket enveloped with a fire resistant fabric.

5.0 RESPONSIBILITIES

5.1 The authorized Installer's ENGINEERING DEPARTMENT shall be responsible to define

the scope of work as prescribed on the applicable contract documents and provide the appropriate drawings, specifications, requirements, instructions, etc., to the department responsible for installation.

This department shall also be responsible to provide liaison with applicable client personnel and other internal departments to assure smooth flow of communication.

5.2 The authorized Installer's PRODUCTION DEPARTMENT shall be responsible for the identification and scheduling of work to be performed as defined on the documents furnished by Engineering.

5.3 The Installer's, as trained and certified by PROMATEC, shall be responsible for performance of installation activities herein prescribed.

5.4 The Installer's QUALITY CONTROL PERSONNEL, as trained and certified by PROMATEC, shall be responsible for appropriate inspection, documentation and monitoring.

6.0 PROCEDURE

6.1 Only approved materials as supplied by PROMATEC, issued under controlled conditions, shall be used in the installation, modification and repair of Three Hour Fire Protective Wrap System components.

6.2 Conduit/Junction Box Installation

6.2.1 Installation of Inner Blanket Assemblies
(Refer to FIRST STEP as shown on Figure 1)

6.2.1.1 Install first inner blanket around the conduit/junction box assuring that the shiplap joint is a tight as possible. Maximum allowable gap is one-half (1/2") inch.

6.2.1.2 Duct tape may be utilized to hold blanket firmly in place (duct tape may be applied completely around blanket to provide tape to tape adhesion).

6.2.1.3 Install subsequent blankets per 6.2.1.1 assuring that lengthwise shiplap joints are as tight as possible. Maximum allowable gap is one-half (1/2") inch.

6.2.1.4 Duct tape per 6.2.1.2.

6.2.1.5 Notify Quality Control for inspection prior to proceeding.

6.2.2 Installation of Stainless Steel Foil Barrier
(Refer to SECOND STEP as shown on Figure 1)

6.2.2.1 Install foil strips lengthwise around the conduit/junction box providing a MINIMUM six (6") inch overlap on ends and edges.

6.2.2.2 In cases where a six (6") inch overlap cannot be achieved due to conduit curvature, foil strips shall be installed with a minimum two (2") inch overlap.

ISSUE DESIGNATION IN THIS COL INDICATES CURRENT CHANGE

6.2.2.3 Duct tape may be utilized to hold foil strips firmly in place. Duct tape and/or aluminum foil tape may be used at the edges of the strips if gap appears excessive due to conduit curvature.

6.2.2.4 Notify Quality Control for inspection prior to proceeding.

6.2.3 Installation of Outer Blanket Assemblies
Refer to THIRD STEP as shown on Figure 2)

6.2.3.1 Install first outer blanket around conduit/junction box assuring that the shiplap joint is as tight as possible. Maximum allowable gap is one-half (1/2") inch.

6.2.3.2 Connect ends by fastening 16 gauge stainless steel tie wire between corresponding lacing hook. Recheck final positioning and tighten securely exercising caution to prevent blanket damage.

NOTE: An additional tie wire may be used after blanket is in final position as necessary to assure a snug fit.

F 6.2.3.3 Install subsequent blankets per 6.2.3.1 and 6.2.3.2 assuring that lengthwise shiplap joints are properly aligned.

F 6.2.3.4 Connect adjoining blankets at circumferential shiplap joints by fastening 16 gauge stainless steel tie wire between each corresponding lacing hook.

NOTE: An additional tie wire may be used after blanket is in final position as necessary to assure a snug fit.

6.2.3.5 Notify Quality Control for final inspection.

6.3 Three Sided Wrap Installation
(Refer to Typical Design Drawings B-495 and B-496)

A three sided or similar installation is required in the event that the conduit or a junction box is installed in close proximity to a wall or floor preventing installation of a wrap surrounding the conduits.

This type of installation requires attachment to concrete surface utilizing site approved anchoring devices as outlined herein. If anchors are installed by others, notify Quality Control for inspection per 6.3.3 prior to proceeding with blanket installation.

6.3.1 Install site approved concrete anchors (minimum 1/4" diameter recommended) on maximum twelve (12") inch centers. Distance from sides of conduit or junction boxes to be determined by Engineering.

Factors to consider are: 1) blanket size, 2) surface characteristics of concrete, 3) number and type of interferences.

6.3.2 Anchors should be pre-set before blankets are impaled onto studs.

6.3.3 Notify Quality Control for inspection before proceeding.

6.3.4 Place inner blanket around conduit or junction box and impale on studs going from side to side to assure proper alignment. Maintain a one (1") inch nominal thickness of inner blanket.

6.3.5 Duct tape may be utilized to keep joints flush and to hold blanket(s) in position.

6.3.6 Edge of inner blanket shall extend a minimum of two (2") inches from center of studs.

6.3.7 Notify Quality Control for inspection before proceeding.

6.3.8 Install stainless steel foil barrier over inner blanket providing a MINIMUM six (6") inch overlap on all joints. In cases where six (6") inch overlap cannot be achieved due to sharp curvatures install foil strips with a minimum two (2") inch overlap.

6.3.9 Impale foil over studs allowing for the two (2") inch minimum requirements.

6.3.10 Duct tape may be utilized to hold foil firmly in place. Aluminum foil tape may be utilized if gaps are excessive.

6.3.11 Notify Quality Control for inspection before proceeding.

6.3.12 Install outer blanket over foil barrier and impale over studs. Edge of outer blanket shall extend a minimum of two (2") inches over studs. Maintain a two and one-half (2-1/2") inch nominal thickness of outer blanket.

6.3.13 Install fender washers and/or B72 strut and/or flat bar retainer strap over studs assuring that blanket assemblies are not wrinkled or bunched.

6.3.14 Install appropriate sized locknuts (or double nuts) and securely tighten. Do not over-tighten. Depression of blanket shall not exceed three-fourths (3/4") inch.

6.3.15 Connect adjacent blankets or edges of a prefabricated blanket together with 16 gauge stainless steel tie wire between each corresponding lacing hook.

NOTE: An additional tie wire may be used after blanket is in final position as necessary to assure a snug fit.

6.3.16 Recheck final positioning and tighten securely. Exercise caution to prevent damage to blanket assemblies.

6.3.17 Notify Quality Control for final inspection.

6.4 Field Modifications and Repairs

6.4.1 Should an opening in the Wrap System exist due to installation conditions, fill with appropriate inner blanket, alumina silica blanket/fiber, foil barrier and/or outer blanket materials. Engineering to determine size of such small assemblies required.

If hog rings are to be used to close blanket assembly, rings are to be installed on one (1") inch MAXIMUM centers. Q-24 Quartz Thread may be used in lieu of hog rings for inner and/or outer blanket.

Site craft installers to fabricate under supervision of Engineering. Quality Control to provide inspection of such fabrication and/or installation.

6.4.2 Non-electrical interferences (piping, hangers, supports, etc.) shall be protected with a nominal four (4") inch thickness of alumina silica blanket. The outer layer of alumina silica blanket shall be enveloped with an approved outer fabric. Wrap for a minimum distance of eighteen (18") inches or for full length of interference if less than eighteen (18") inches as shown on Figure 3, page 11 of this procedure. Install a sufficient number of lacing hooks and tie wire to close longitudinal seam and to secure wrap to primary system.

6.4.3 When a protected conduit is in close proximity to an electrical cable tray, the interfering portion of the tray shall be included within the conduit wrap system.

Insert alumina silica blanket/fiber around cables for a minimum distance of eighteen (18") inches from each side of the protected conduit as shown on Figure 4, page 12 of this procedure.

6.4.4 Craft installers shall repair damaged blanket assemblies under supervision of Engineering. Only acceptable materials shall be utilized.

6.4.4.1 Patches of proper fabric type shall be cut to a size sufficient to cover a tear or hole overlapping a minimum of two (2") inches onto undamaged fabric. Patches shall have a finished edge on all sides. Install as shown on Figure 5, page 13 of this procedure.

NOTE: Small tears not exceeding two (2") inches in length can be loop stitched with Q-24 thread at maximum spacing of one-half (1/2") inch. Holes or tears in fiberglass cloth and outer fabric not exceeding one (1") inch shall not require repair.

6.4.4.2 If inner alumina silica blanket material is damaged or has a void, add additional material as necessary.

6.4.4.3 Engineering concurrence shall be obtained for any repair activities. Upon completion, notify Quality Control for inspection.

6.4.5 Additional lacing hooks may be added as needed in conjunction with original installation or modification.

6.5 Cable Drop Installation

6.5.1 Installation of Inner Blanket Assemblies
(Refer to first step as shown in Figure 6)

6.5.1.1 Bundle cables into as nearly a round configuration as feasible. Duct tape or cable tie wraps may be used to maintain this configuration.

6.5.1.2 Install first inner blanket around cable bundle assuring that shiplap joint is as tight as possible. Maximum allowable gap is one-half (1/2") inch.

6.5.1.3 Duct tape may be utilized to hold blanket firmly in place (duct tape may be applied completely around blanket to provide tape to tape adhesion).

6.5.1.4 Install subsequent blankets (if required) per 6.5.1.2 assuring the lengthwise shiplap joints are as tight as possible.

6.5.1.5 Duct tape per 6.5.1.3.

6.5.1.6 Notify Quality Control for inspection prior to proceeding.

6.5.2 Installation of Stainless Steel Foil Barrier
(Refer to second step as shown in Figure 6)

6.5.2.1 Install foil strips length wise around the cable bundle providing a minimum six (6") inch overlap on ends and edges.

6.5.2.2 Duct tape may be utilized to hold foil strips firmly in place. Duct tape and/or aluminum foil tape may be used at the edges of the strips if gaps appear excessive due to curvature of the cable drop bundle.

6.5.2.3 Notify Quality Control for inspection prior to proceeding.

6.5.3 Installation of Outer Blanket Assemblies
(Refer to third step as shown on Figure 7)

6.5.3.1 Install first outer blanket around conduit assuring that the shiplap joint is as tight as possible. Maximum allowable gap is one-half (1/2") inch.

6.5.3.2 Connect ends by fastening 16 gauge stainless steel tie wire between each corresponding lacing hook. Recheck final positioning and tighten securely exercising caution to prevent blanket damage.

NOTE: An additional tie wire may be used after blanket is in final position as necessary to assure a snug fit.

6.5.3.3 Install subsequent blankets per 6.2.3.1 and 6.2.3.2 assuring that lengthwise shiplap joints are properly aligned.

6.5.3.4 Connect adjoining blankets at circumferential shiplap joints by fastening 16 gauge stainless steel tie wire between each corresponding lacing hook.

NOTE: An additional tie wire may be used after blanket is in final position as necessary to assure a snug fit.

6.5.3.5 Notify Quality Control for final inspection.

6.6 Alternate method for installing outer blanket assemblies.

6.6.1 Wrap tube assembly around foil barrier assuring that ends abut with no apparent gaps. Install approved tape completely around assembly with tape-to tape adhesion at sufficient spacing to assure no gaps at longitudinal joint.

6.6.2 Install subsequent tube assemblies per 6.6.1 assuring that circumferential joints firmly abut with no apparent gaps and that longitudinal joints are properly aligned. Apply duct tape lengthwise across each circumferential joint to hold in place.

6.6.3 Notify Quality Control for inspection prior to proceeding.

6.6.4 Install alumina silica blanket around tube assembly assuring that ends abut with no apparent gaps. Stagger longitudinal and circumferential joints a minimum six (6") inches from respective tube assembly joints.

6.6.5 Connect longitudinal joints by fastening 16 gauge stainless steel tie wires between each adjacent lacing hook.

NOTE: An additional tie wire may be used after blanket is in final position as necessary to assure a snug fit.

6.6.6 Notify Quality Control for inspection after each blanket is installed.

6.6.7 Install subsequent blankets as noted above. Stagger circumferential joints a minimum six (6") inches from tube assembly joints.

6.6.8 Connect adjoining blankets by fastening 16 gauge stainless steel tie wire between each adjacent lacing hook at circumferential joints assuring tight fit with no apparent gaps.

NOTE: An additional tie wire may be used after blanket is in final position as necessary to assure a snug fit.

6.7 Raceway Identification Tags

6.7.1 Upon completion of Wrap System installation, raceway identification (as furnished by client) shall be affixed on both ends with stainless steel tie wire as follows:

6.7.1.1 If conduit funs five (5') feet or longer, affix tags at all entrance and exit points (walls, floors) and at the origin and destination points (cable tray, junction box, etc.).

6.7.1.2 If conduit run is less than five (5') feet, affix one tag at a central location or at the most visible location of the conduit. Conduits shall be identified at intervals not greater than fifteen (15') feet.

FABRICATION INSPECTION FOR HEMYC PROTECTIVE WRAP COMPONENTS

1.0 PURPOSE

The purpose of this procedure is to assure that the manufacture of the HEMYC Protective Wrap Components is consistent with the system as tested on the various qualification tests. The Fire Qualification Test, referenced as CTP-1026, consisted of a one (1) hour fire exposure, per ASTM E-119 criteria including hose stream test in accordance with the ANI Information Bulletin No. 5(79) entitled, "ANI/MAERP Standard Fire Endurance Test Method to Qualify a Protective Envelope for Class IE Electrical Circuits".

2.0 SCOPE

This procedure provides the methods and guidelines for the inspection and verification activities performed to ascertain the manufacture and/or fabrication of the protective wrap components is within acceptable standards.

3.0 REFERENCES

3.1 IP-8400.105, Fabrication of HEMYC Cable Protection System Components

3.2 CTP-1026, HEMYC Fire Qualification Test

3.3 American Nuclear Insurers Acceptance dated 08/02/82

4.0 DEFINITIONS

Refer to Quality Assurance/Quality Control terms and definitions contained in the back of the PROMATEC Quality Assurance Program.

5.0 RESPONSIBILITIES

B 5.1 When fabrication is performed at jobsite, the Installer's QUALITY CONTROL PERSONNEL, as trained and certified by PROMATEC, shall be responsible for appropriate inspection, documentation and monitoring activities.

B When fabrication is performed at a separate manufacturing facility, the facility's INSPECTOR shall be responsible for the performance of these activities.

B 5.2 The DOCUMENT CONTROL COORDINATOR shall be responsible to implement and maintain an adequate filing system of the documentation provided by jobsites or as provided from the manufacturing facility Inspector.

ISSUE DESIGNATION IN THIS COLUMN INDICATES CURRENT CHANGE

6.0 PROCEDURE

B The assigned Quality Control Inspector shall perform the verification activities herein prescribed. The Fabrication Inspection Register (QC-61) shall be completed as defined in Item 7.1 of this procedure.

6.1 HOLD POINT ONE

6.1.1 All materials utilized in the construction of the specific order shall have been previously accepted as outlined in QCP-0008. This includes the verification that applicable certification documents were received with shipment or are available at PROMATEC.

6.1.2 If certification documents are not available with the material, an Inspection Report (Form QC-20) shall be instrumented as outlined in QCP-0019. PROMATEC Quality Assurance may elect to authorize use of the subject material after verification from manufacturer that required certification documents are either in transit or have been reviewed and accepted by PROMATEC.

6.1.3 Only approved materials as listed below shall be utilized in the fabrication of HEMYC Cable Protection System Components.

ACCEPTABLE MATERIALS

a. External Fabric

1. SILTEMP WR84CSR Water Repellent, Thermal Barrier Cloth .030 nom. thickness, 18oz/yd(2).

2. Or Approved equal.

b. Internal Fabric

1. Klever 600/6 or J.P. Stevens #332 Fiberglass Cloth, 49" width, 13oz/yd(2).

2. Or Approved equal.

(Internal Fabric may be used on the non-fire side of protection blanket as necessary. If used, external fabric must overlap a minimum of six (6") inches on to non-fire side.)

c. Internal Filler

1. Johns-Manville Cerablanket; 6 or 8 lb density; 1.5 and/or 2.0 inch thickness.

Or

2. Babcock & Wilcox Ceramic Fiber blanket; 6 or 8 lb density; 1.5 and/or 2.0 inch thickness.

Or

3. Approved equal.

d. Thread

1. Astroquartz Sewing Thread Type Q-24 Teflon coated approximately .020" diameter; Breaking strength - 20lbs.

Or

2. Alphaquartz Sewing Thread Type Q-24 Teflon coated approximately .020" diameter; Breaking strength - 20lbs.

Or

3. Approved equal.

6.2 HOLD POINT TWO

Refer to IP-8400.105 for specific fabrication requirements.

In Process Inspection

6.2.1 The assigned Quality Control Inspector shall periodically inspect on a random basis, compliance to the manufacture of Protective Wrap Components as outlined in Items 6.3.1, 6.3.2 and 6.3.3 of IP-8400.105.

As a minimum requirement, all wrap assemblies constructed shall be 100% Quality Control inspected the first week of fabrication, and a minimum of one day's production per week thereafter.

6.2.2 Verification that each wrap assembly is properly identified and marked as specified in Item 6.5 of IP-8400.105 shall be performed.

B 6.2.3 Verification that the Traceability ID Register (QC-60) is accurately completed for each wrap assembly as defined in Item 7.3 of this procedure.

6.3 HOLD POINT THREE

6.3.1 Each wrap component (blanket) shall be physically inspected by the assigned Quality Control Inspector prior to final acceptance from fabricator. This inspection shall verify conformance to the finished dimension requirements as specified on the applicable fabrication order.

7.0 ATTACHMENTS

7.1 Instructions for the completion of Form QC-61, Fabrication Inspection Register

7.2 Form QC-61

ATTACHMENT 7.1

INSTRUCTIONS FOR COMPLETION OF FABRICATION INSPECTION REGISTER (FORM QC-61)

1. REPORT NUMBER - This is a two part number utilizing the numerical portion of the Project Number and the numerical sequence of the individual sequence of the individual report sheet, i.e., 274/03. This defines the third QC-61 used on Project No. FS-274.

2. PROJECT NAME - Name of Project or Plant.

3. PROJECT NUMBER - The PROMATEC Job Number (i.e., 0027-CM).

4. FABRICATOR - The name of the company fabricating blanket.

5. BLANKET NUMBER/ BLANKET FAB ORDER NO. - Identification of assigned blanket number per blanket fab order (Form QC-59).

6. QC-60 NUMBER - Number of the QC-60, Traceability ID Register for reference of traceability.

QC HOLD POINT ONE - MATERIAL RECEIVING

7. ACCEPT/REJECT - Insert appropriate check mark upon verification that only accepted materials as prescribed in QCP-10002 are utilized.

8. BY - Initials of the assigned Quality Control Representative performing this inspection.

9. DATE - Date of performance of this inspection.

QC HOLD POINT TWO - IN PROCESS INSPECTION

The assigned Quality Control Inspector shall periodically spot check on a random basis, compliance to the fabrication of Protective Wrap Components as outlined in IP-8400.105.

As a minimum requirement, all wrap assemblies constructed shall be 100% Q.C. inspected the first scheduled week of fabrication, and a minimum of one day's production per week thereafter.

When this inspection is performed, Items 12 and 13 (below) shall be completed.

10. ACCEPT/REJECT -

(a.) External and Internal fabrics are cut to proper dimensions, as determined by fabricator to assure proper finished dimensions as specified on the applicable fabrication order (Form QC-59).

(b.) Stitching is performed per IP-8400.105, Item 6.3.1.

(c.) Filler material is proper size to assure proper finished dimension per IP-8400.105, Item 6.3.2.

(d.) Fabric at open end of envelope is rolled under and double stitched per IP-8400.105, Item 6.3.3.

(e.) Longitudinal stitching performed per IP-8400.105, Item 6.3.4.

(f.) Identification markings are performed per IP-8400.105, Item 6.5.

11. BY - Initials of inspector performing documentation.

12. DATE - Date of documentation of QC HOLD POINT TWO

QC HOLD POINT THREE & FINAL ACCEPTANCE

13. ACCEPT/REJECT - Insert appropriate check mark upon acceptance or rejection of Completed Wrap Assembly.

14. BY - Initials of inspector performing inspection.

15. DATE - Date of Final Acceptance of Completed Wrap Assembly.

INSTALLATION INSPECTION OF CRITERIA FOR HEMYC PROTECTIVE WRAP COMPONENTS

1.0 PURPOSE

The purpose of this procedure is to assure that the installation of the HEMYC Protective Wrap System components is inspected to verify consistency with the system as tested on the various qualification tests. The Fire Qualification Test, referenced as CTP-1026, consisted of a One (1) Hour Fire Exposure, per ASTM-119 criteria, including hose stream test in accordance with the American Nuclear Insurers Information Bulletin No. 5(79) entitled, "ANI/MAERP Standard Fire Endurance Test Method to Qualify a Protective Envelope for Class IE Electrical Circuits."

2.0 SCOPE

This procedure provides the inspection criteria to enable the assigned Quality Control Inspector to perform adequate verification of compliance to quality requirements for the fabrication of HEMYC Protective Wrap System components.

4.0 DEFINITIONS

None

5.0 RESPONSIBILITIES

5.1 The Installer's QUALITY CONTROL PERSONNEL, as trained and certified by PROMATEC, shall be responsible for appropriate inspection, documentation and monitoring activities.

5.2 The DOCUMENT CONTROL COORDINATOR shall be responsible to implement and maintain an adequate filing system of the documentation herein prescribed.

6.0 PROCEDURE

Inspection and acceptance criteria of the framework installation for cable tray and conduit assemblies. The assigned Quality Control Inspector shall inspect the installed framework for compliance to requirements established in the applicable PROMATEC procedures and as defined herein.

6.1 QUALITY CONTROL HOLD POINT NO. ONE

6.1.1 Verify that clamping devices are adequate for the specific type and size of cable tray.

6.1.2 Clamps must be used in sets. All clamps in a single set must be either all locking type or all friction type. NO INTERMIXING of types in a single set is acceptable (Refer to Figure 1 and 2).

6.1.3 Locking type clamps must be utilized at least every seventh clamp set.

6.1.4 Clamp sets are located on approximate eighteen (18") inch centers.

6.1.5 Locknuts shall be securely tightened to secure frame to cable tray. Locknuts shall only be used once.

6.1.6 Verify that a minimum of two (2") inch Dead Air Space is maintained between side, bottom and top of cable tray and outside of frame on all configurations, unless approved by FCR. (See Figure 3.)

ISSUE DESIGNATION IN THIS COLUI DICATES CURRENT CHANGE

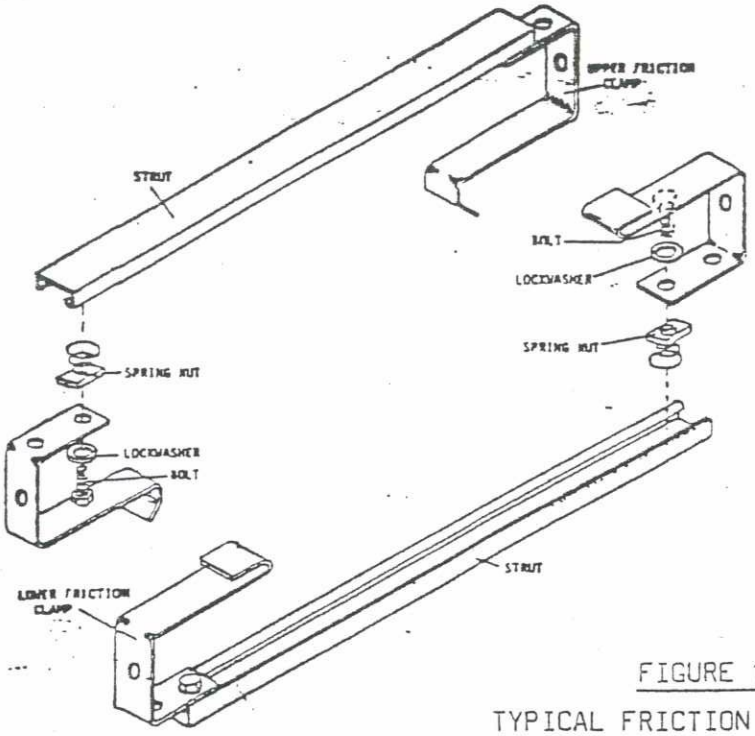

FIGURE 1

TYPICAL FRICTION CLAMP AND
TYPICAL INSTALLATION

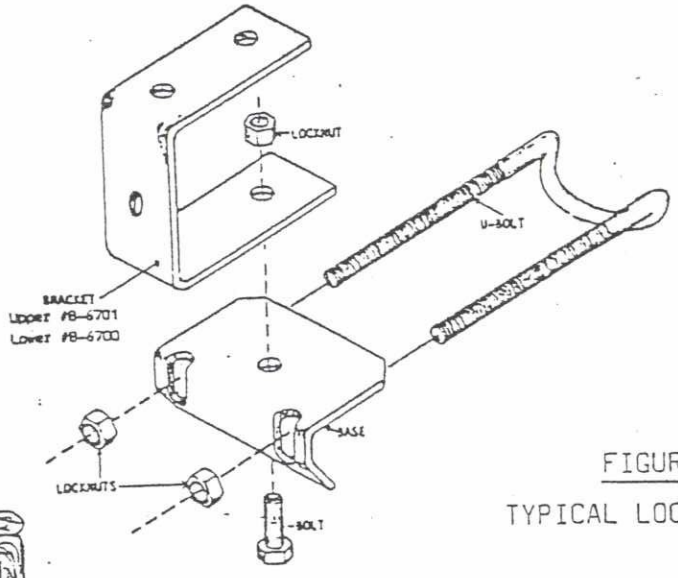

FIGURE 2

TYPICAL LOCKING CLAMP

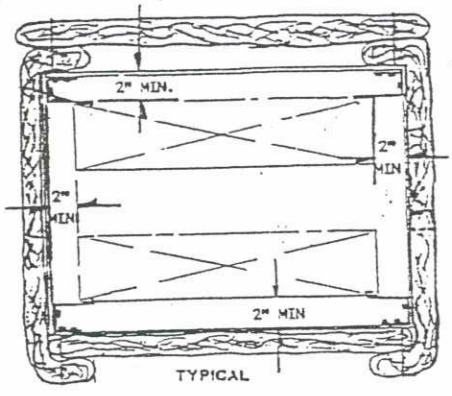

FIGURE 3

2" DEAD AIR SPACE
Single and Multiple Tray Configurations

6.1.7 Verify that top and bottom rails have blanket anchors spaced at a maximum nine (9") inch between centers throughout (Refer to Figure 4).

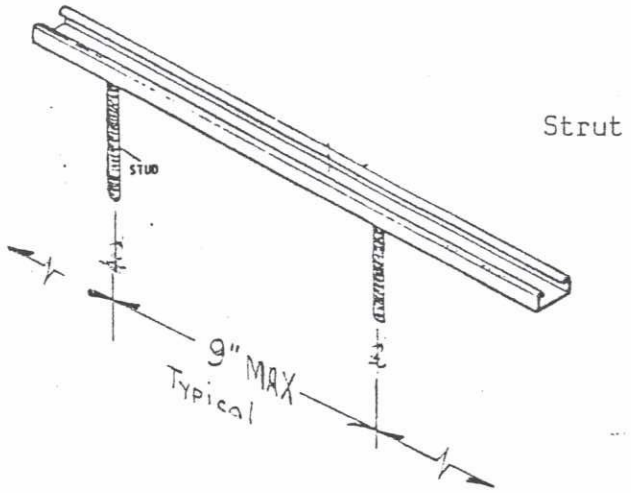

FIGURE 4
BLANKET ANCHOR SPACING

6.1.8 If concrete anchors are utilized to attach blankets to wall, ceiling or floor, they shall be a site-approved type. These anchors shall be spaced on a maximum nine (9") inch between centers throughout.

6.1.9 In the case of direct wrap on conduit, verify that finger strap is firmly attached to conduit per IP-8400.103 (if applicable).

6.1.10 Verify that frame is firmly attached to cable tray and that all nuts are securely tightened.

6.2 QUALITY CONTROL HOLD POINT NO. TWO

Inspection and acceptance criteria for installation of blanket wrap for single and multiple cable trays and conduits.

6.2.1 Assure that blanket to be installed is blanket number assigned for the designated section of cable tray or conduit.

6.2.2 Verify that a minimum of two (2") inches between center of anchors and edges of blanket on overlaps at top, bottom, and side of cable trays is maintained. (See Figure 5.)

6.2.3 Verify that either a eight (8") inch collar is on joints of conduit blanket wrap or that blanket wraps extend over adjoining blanket a minimum of four (4") inches. (See Figure 6.)

ISSUE DESIGNATION IN THIS COLUMN INDICATES CURRENT CHANGE

D

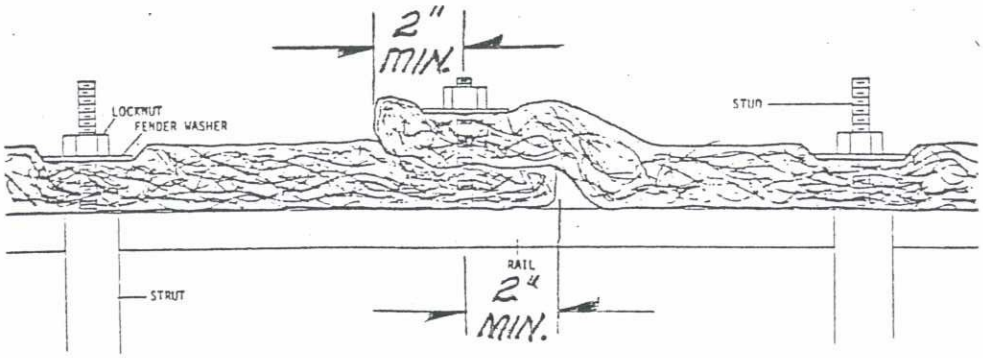

FIGURE 5

TYPICAL OVERLAP

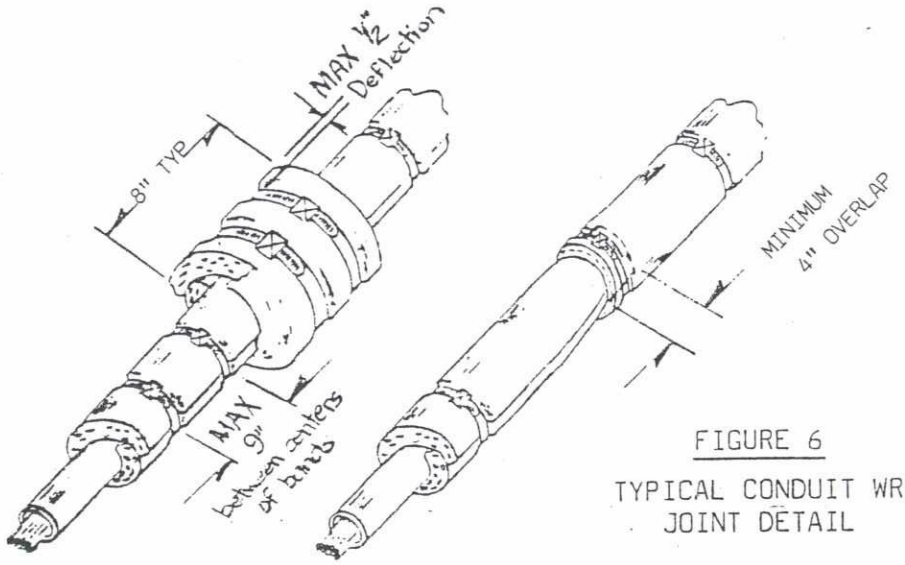

FIGURE 6

TYPICAL CONDUIT WRAP JOINT DETAIL

6.2.4 Verify that either stainless steel strapping or stainless steel band clamps are attached to blanket wrap on a maximum nine (9") inch center on conduit blanket wrap. If single conduit is attached to concrete surface, verify that concrete anchors are of site approved type. These anchors shall be spaced on a maximum of nine (9") inches between centers throughout. (See Figure No. 7.) Banding shall be a minimum gauge of .015 and a minimum width of one-half (1/2") inches.

ISSUE DESIGNATION IN THIS COLUMN INDICATES CURRENT CHANGE

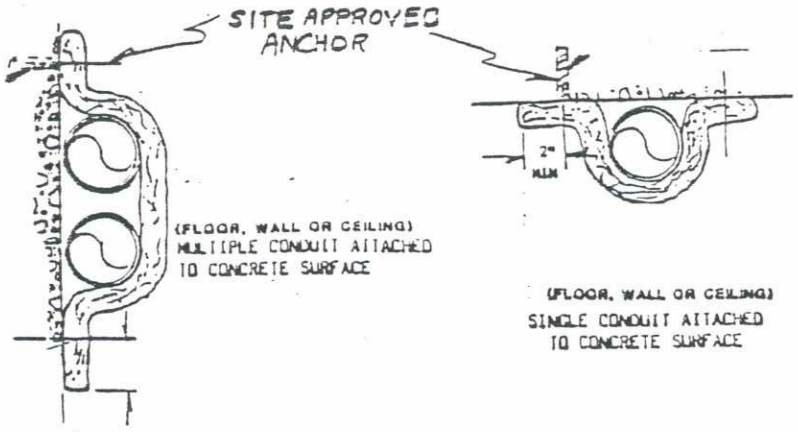

FIGURE 7

CONCRETE ATTACHMENT

6.2.5 Verify that termination of cable tray (floor, ceiling or wall) complies with IP-8400.106, Section 6.2. Check to assure that frame work stops within six (6") inches of surface and ensure that wraps are long enough to extend onto the surface. Wraps shall be attached to surface using the methods outlined in IP-8400.104, Section 6.3 (Refer to Figure 8).

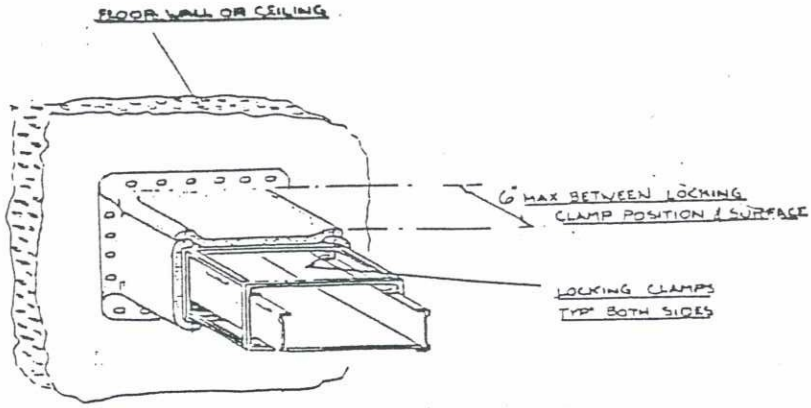

FIGURE 8

TYPICAL TERMINATION OF CABLE TRAY AT WALL, FLOOR OR CEILING

6.2.6 Verify that termination of conduit (floor, ceiling or wall) complies with IP-8400.106, Section 6.3. Assure that flange portion of termination collar is firmly attached onto concrete nuts and lock nuts are firmly tightened and that if gaps exist, they have plumbers tape or equivalent installed as outlined in IP-8400.104, Section 6.3.3 (Refer to Figure 9).

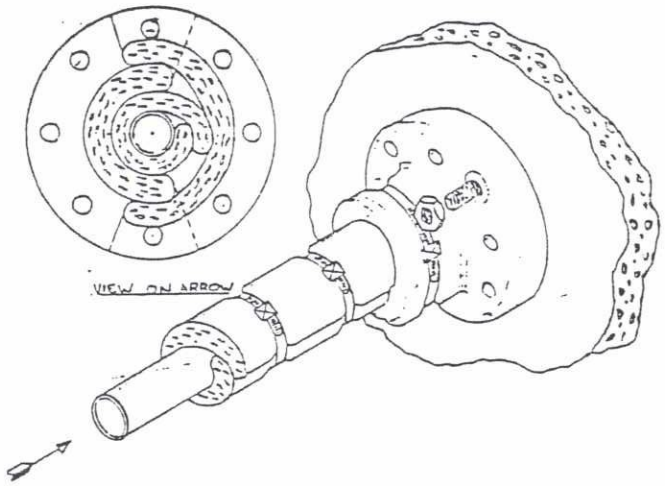

FIGURE 9

TYPICAL TERMINATION OF CONDUIT AT WALL, FLOOR OR CEILING

6.3 If fire stops are required on cable tray that ends with cable protruding, verify that firestops comply with IP-8400.106, Section 6.1.

6.3.1 Assure that a minimum of twelve (12") inch width layer of ceramic blanket is wrapped around bottom, sides and top of cable tray. Tray shall be filled with bulk fiber to that width. Two bands must be applied at four to six (4" - 6") inches apart and compressing both wraps and ceramic fiber filler. (See Figure 10 and 11.)

NOTE: Completed installation shall reflect a good workmanship product with tight folds and secured seams and bands.

HOLD POINT INSPECTION
AND
FINAL SIGNOFF REPORT

1.	Report Number -	This is a two part number utilizing the numerical portion of the project number and the numerical sequence of the individual report sheet, i.e., 274/04 (This defines the fourth QC-62 used on Project FS-274).
2.	Project Name -	Name of project or plant.
3.	Project Number -	The PROMATEC assigned job number, i.e., FS-274.
4.	Identification Number Cable Tray/Conduit -	Cable tray identification number and conduit identification number obtained from customer supplied information.
5.	Location/Area/Elevation/ Room/etc. -	Location of Area, Elevation, Room, etc., obtained from customer supplied information.
6.	Dead Air Space - 2" -	Verify that a minimum of two (2") inch Dead Air space is maintained between side, bottom and top of cable tray and outside of frame on all configurations per QCP-10003, page 3, Section 6.1.
7.	Clamp Devices -	Verify that clamps are in sets. Clamps in a single set must be either locking type or all friction type. No intermixing of types in a single set is acceptable per QCP-10003, page 3, Section 6.1.2, Figures 1 & 2. If acceptable, designate with a check mark.
8.	Frame Secure -	Verify that frame is firmly attached to cable tray and that all nuts are securely tightened. If acceptable designate with a check mark.
9.	Blanket Anchors -	Verify that top and bottom rails have blanket anchors spaced on a maximum nine (9") inches between centers throughout, per QCP-10003, page 5, Section 6.1.7, Figure 4.
10.	Concrete Anchors -	Verify that concrete anchors are site approved, maximum spacing of nine (9") inches between centers allowed. If acceptable designate with a check mark.

11. Other - Mark N/A. This space is for other Hold Points, as required.

12. Pass - If frame is secured to frame, all nuts firmly tightened, and visual inspection verifies that frame work is structurally sound, designate by check mark.

13. Reject - If above is rejected designate by check mark.

14. Date - Date of visual inspection and release.

15. By - Name of inspector performing inspection.

BLANKET NO./FAB ORDER NUMBER FOR CABLE TRAY(S)

16. Conduit - Number of conduit assigned by customer supplied information. Refer to Number (4) identification of cable tray or conduit above. If cable tray number, mark N/A.

17. Top - Identification of blanket number and fab order number for top section.

18. Bottom (Bot.) - Identification of blanket number and fab order number for bottom section.

19 thru 24 (Side) - Identification of blanket number and fab order number of required side sections. If side sections identification is not required, mark N/A.

QC HOLD POINTS & FINAL ACCEPTANCE

25. Overlaps - Overlaps four (4") inches minimum, verify that top, bottom, and side sections overlap each other by at least four (4") inches minimum. If accepted, designate by check mark.

26. Retainer Intact - Verify that Retainers are tight and secure, nuts, lock nuts, finger strap clips, etc. If accepted, designate by check mark.

27. Banding Spacing Deflection - Verify that the maximum deflection of the banding into the blanket is a maximum of one-half (1/2") inches. If so, designate by check mark.

28. Termination Adequate - Verify that the termination of the cable tray (floor, ceiling, or wall) complies with Procedure No. 8400.106, Section 6.2. Verify also that all nuts are securely tightened. If so, designate by a check mark.

29. Accept Visual Inspection - Insert check mark upon acceptance of completed blanket assembly.

30. Hold - Insert check mark if blanket assembly is incomplete or repairs are needed. Indicate appropriate action on a separate page if necessary.

31. Reject - Insert check mark if blanket assembly is rejected. Initiate appropriate action.

32. Date - Date inspection was performed.

33. By - Name of inspector performing inspection.

ISSUE DESIGNATION IN THIS COL INDICATES CURRENT CHANGE

FABRICATION INSPECTION OF THREE HOUR PROTECTIVE WRAP COMPONENTS

1.0 PURPOSE

1.1 To establish inspection methods and acceptance criteria to assure three hour protective wrap systems are fabricated in accordance with established fabrication procedures.

2.0 SCOPE

2.1 Provide methods for the inspection of protective wrap components during fabrication to verify correct materials are utilized.

2.2 Provide methods for the inspection of protective wrap componets during fabrication to verify conformance to fabrication procedures.

2.3 Provide methods for the final inspection of completed protective wrap components to verify conformance to design requirements.

2.4 Establish requirements for recording inspection activities to provide documentary evidence of proper fabrication.

3.0 REFERENCES

3.1 Procedure No. IP-002, Fabrication Procedure for Three Hour Fire Protective components.

4.0 DEFINITIONS

4.1 Approved Materials -- Materials qualified for use as protective wrap components and issued for fabrication under controlled conditions.

4.2 Hold Point -- Critical steps in the fabrication process that require Quality Control inspection and acceptance prior to proceeding.

4.3 Check Point -- Random sample inspection of fabrication process performed at the descretion of Quality Control. Notification is not required.

4.4 Hot Side -- Outer surface of wrap design.

4.5 Cold Side -- Inner surface of wrap design.

4.6 In-Process Inspection -- Hold Point I and II.

4.7 Final Inspection -- Hold Point III.

ISSUE DESIGNATION IN THIS COL INDICATES CURRENT CHANGE

5.0 RESPONSIBILITIES

5.1 The Quality Assurance Manager or Designee shall be responsible for the development and proper implementation of this procedure.

5.2 The assigned Quality Control Inspector shall be responsible for performing activities established in this procedure.

6.0 PROCEDURE

6.1 Inspection instruments required to perform the activities described in this procedure include a measuring tape. Calibrated instruments are not required.

6.2 Inspection activities (Hold Point I, Hold Point II, Hold Point III) required by this procedure shall be documented on Form QC-61 (Fabrication Inspection Register).

6.3 Approved material traceability identification shall be documented on Form QC-60 (Traceability ID Register).

6.4 Non-conforming conditions identified in paragraph 6.8 shall be documented on Form QC-16 (Nonconformance Report) and dispositioned in accordance with QCP-0018.

6.5 Inspection activities described herein are mandatory hold points. Release for work to proceed shall be given by the assigned Quality Control Inspector upon satisfactory completion of all inspection activities required for each hold point.

6.6 Check point inspections may be performed at any time at the discreation of Quality Control. Such inspections are not mandatory and need not be documented unless discrepancies are identified.

6.7 Discrepancies identified during in process inspection that can be corrected within a (24) twenty four hour period in accorance with Procedure No. IP-002 may be accomplished without generating a non conformance report.

6.8 Non conformance reports shall be generated when any of the following conditions exist.

6.8.1 Discrepancies identified during in-process inspection are not corrected in accordance with IP-002 within (24) twenty four hours.

6.8.2 Discrepancies identified during final inspection where dispositioning party plans to recommend use-as-is, repair or reject dispositions (as defined in QCP-0018).

6.8.3 Any failure to notify Quality Control for hold point inspection prior to proceeding or proceeding prior to acceptance by Quality Control of each inspection attribute required, including satisfactory completion of any discrepancies identified.

6.9 A fabrication order shall be initated and complete, for the exception of the final release signatures at the bottom of Form QC-59, prior to any fabrication.

6.10 Copies of Fabrication Procedure No. IP-002 shall be issued in conjunction with this procedure to each assigned Quality Control Inspector for use and reference.

6.11 Hold Point One -- Material inspection

6.11.1 Only approved materials as listed in IP-002 shall be utilized in the fabrication of three hour fire protective components.

6.11.2 Document individual blanket material traceability on Form QC-60. Document Hold Point I on Form QC-61 after completion of Form QC-60.

6.12 Hold Point Two -- Inspection of inner blanket.

6.12.1 Inspect alumina silicia fiber blanket for proper dimensions in accordance with fabrication order. Verify 6" min. shiplap with 1/2" ± 1/4" deep trim in ceramic fiber blanket.

6.12.2 Inspect fiberglass cloth for proper dimensions in accordance with fabrication order. Verify 3/8" min. tuck allowed for securing hog rings. Verify hog rings are spaced 1" max apart around edges of fiberglass cloth on hot side of envelope.

6.13 Hold Point Two -- Inspection of outer blanket.

6.13.1 The outer blanket consists of two sub-assemblies, enveloped into a silica dioxide cloth. The sub-assemblies consist of, powder envelope (honeycomb and/or straight tubes) and the alumina/silica fiber blanket.

6.13.2 Inspect honeycomb tube powder envelope coated fiberglass cloth for stitching spaced 7/8"± 1/8" apart before powder fill. Verify two sides are stitched 1/2" min. from edge of cloth. Verify two adjacent sides are folded across grain of tube 1"± 1/4" and double stitched. Verify 100% fill of powder in tubes. Verify overall dimensions are in accordance with fabrication order 3/4".

6.13.3 Inspect straight tube powder envelope coated fiberglass cloth for stitching spaced 1 5/8"±1/8" apart before powder fill. Verify two sides are stitch 1/2" min. from edge of cloth. Verify adjacent two sides are folded across grain of tubes 1"± 1/4" and double stitched. Verify 100% fill of powder in tubes. Verify overall dimensions are in accordance with fabrication order 3/4".

6.13.4 Inspect alumina/silica fiber blanket for proper dimensions in accordance with fabrication order. Inspect siltemp for proper dimensions in accordance with fabrication order. Verify siltemp envelope and sub-assemblies (powder envelope and alumina/silica fiber blanket) are placed in proper order and are arranged to allow for min. 6" ship lap design in accordance with fabrication order. Verify siltemp has 3/8" min. tuck for securing hog rings. Verify hog rings are spaced 1" min. around edges of siltemp on cold side of envelope. Type Q-24 telfon coated nylon thread may be used in lieu of hog rings on outer blanket. Verify lacing hooks are placed on hot side 1 1/2" ± 1/4" from edge of all upper shiplap edges and are spaced on maximum of 6" centers. Verify lacing hooks are placed on hot side 7 1/2"± 1/4" from edge of all inner ship lap edges and spaced on 6" centers.

6.13.5 Verify that inner and outer blankets are marked with appropriate blanket identification numbers from applicable fabrication order. These markings shall be in min. 3/4" lettering. Marking shall be made with waterproof paint and/or ink which will retain the marking, withstand weather deterioration other handling effects and shall not be deleterious to the fabrics. These markings shall be in close proximity of the edges of any (2) two adjacent sides on the hot side of blanket.

6.13.6 A maximum of two pieces of cermic fiber blanket utilized in one envelope are acceptable only with the use of ship lap design and darting with approved thread to avoid seperation.

6.13.7 A maximum of two pieces of siltemp utilized in one side of envelope are acceptable only with the use of splicing by double stitching. Verify first stitch is 1/2"± 1/4" from edges of siltemp and second stitch is 1/2" ±1/4" from first stitch.

6.14 Hold Point III - Final Inspection

6.14.1 Inspect completed three hour fire protective blankets for damage, proper dimensions and markings in accordance with fabrication order.

6.14.2 Verify Q.C. Forms 59, 60 and 61 are accurately completed.

INSTALLATION INSPECTION OF THREE HOUR PROTECTIVE FIRE WRAP SYSTEMS

1.0 PURPOSE

To establish inspection methods and acceptance criteria to assure three hour protective wrap systems are installed in accordance with established installation procedures.

2.1 SCOPE

2.1 To provide methods for the inspection of protective wrap components during installation to verify correct materials are issued.

2.2 To provide methods for in-process and final inspection of protective wrap systems to verify conformance to design requirements.

2.3 To establish requirements for recording inspection activities to provide documentary evidence proper installation.

3.0 REFERENCES

3.1 Procedure No. IP-001, Installation of Three Hour Fire Protective Wrap Systems

3.2 Typical Design Detail B-495 and B-496

3.3 Procedure No. QCP-0042, Fabrication Inspection of Three Hour Protective Wrap Components

4.0 DEFINITIONS

4.1 **APPROVED MATERIALS** - Materials qualified for use as protective wrap system components and issued for installation under controlled conditions.

4.2 **HOLD POINT** - Criteria steps in the installation process that require Quality Control inspection and acceptance prior to proceeding.

4.3 **CHECK POINT** - Random sample inspection of installation processes performed at the discretion of Quality Control. Notification is not required.

5.0 RESPONSIBILITIES

5.1 The Quality Assurance Manager or Designee shall be responsible for the development and proper implementation of this procedure.

5.2 The assigned Quality Control Inspector shall be responsible for performing activities established in this procedure.

5.3 The Construction Manager or Designee shall be responsible for assuring that craft personnel notify Quality Control for inspections as referenced in IP-001.

ISSUE DESIGNATION IN THIS COLU NDICATES CURRENT CHANGE

6.0 PROCEDURE

6.1 Inspection instruments required to perform the activities described in this procedure include a six (6") inch scale and a measuring tape. Calibrated instruments are not required.

D 6.2 Inspection activities required by this procedure shall be documented on Form No. QC-117 (Three Hour Fire Protective Wrap Inspection Report) or an approved QC checklist. Nonconforming conditions identified in accordance with paragraph 6.5 shall be documented on Form QC-16 (Nonconformance Report) and dispositioned in accordance with Procedure No. QCP-0018.

D 6.3 Inspection activities described herein are mandatory hold points. Release for work to proceed shall be given by the assigned Quality Control Inspector upon satisfactory completion of all inspection activities required for each hold point and sign-off of Form QC-117 or approved QC checklist.

6.4 Random sample check points may be performed at anytime at the discretion of Quality Control. Such inspections are not mandatory and need not be documented unless discrepancies are identified.

6.5 Minor deviations identified during in-process inspection may be corrected without the issuance of Nonconformance Reports provided corrective action is taken immediately and documented on Form QC- 117 or an approved QC checklist. Minor deviations that cannot be corrected immediately shall be documented on Form QC-121 and processed in accordance with Procedure No. QCP-0018.

6.6 Nonconforming conditions that could adversely affect product integrity shall be documented on Form No. QC-16 and processed in accordance with Procedure No. QCP-0018.

6.7 Copies of Installation Procedure No. IP-001 shall be issued in conjunction with this procedure to each assigned Quality Control Inspector for field use and reference.

6.8 Conduit, Cable Drop and Junction Box Wrap Inspection.

6.8.1 Hold Point One - Inner Blanket Inspection

6.8.1.1 For cable drops, verify that cables are bundled tightly with duct tape, cable tie wrap or other suitable means.

D 6.8.1.2 Upon completion of installation, verify that serial number for each blanket is clearly visible and record on Form QC-117 or approved QC checklist.

6.8.1.3 Visually examine each blanket for damage. Holes and tears exceeding one (1") inch shall be repaired in accordance with IP-001 and re-inspected per section 6.13 of this procedure.

6.8.1.4 Inspect shiplap joints on each blanket for tightness and verify that gaps, if any, do not exceed one-half (1/2") inch, including blanket to blanket joints.

D

6.8.1.5 Inspect duct tape and verify application at full circumference around each blanket with tape to tape adhesion

6.8.2 Hold Point Two - Foil Barrier Inspection

6.8.2.1 Upon completion of installation visually examine each foil barrier strip for damage. Cuts, tears and holes shall be repaired with additional strips of foil exceeding one (1") inch and re-inspected prior to installation of outer blankets.

6.8.2.2 Inspect each foil barrier strip for lengthwise application and verify a minimum six (6") inch overlap on ends and edges (two (2") inches for sharp curvatures).

6.8.2.3 Inspect tape for sufficient spacing to assure no excessive gaps exist in overlaps with particular emphasis on conduit curvatures.

6.8.3 Hold Point Three - Outer Blanket Inspection

6.8.3.1 Upon completion of installation, verify that serial number for each blanket is clearly visible and record on Form QC-117 or approved QC checklist.

6.8.3.2 Visually examine each blanket for damage. Holes and tears exceeding one (1") inch shall be repaired in accordance with IP-001 and re-inspected per section 6.13 of this procedure.

6.8.3.3 Inspect shiplap joints for tightness and proper alignment. Verify that gaps, if any, do not exceed one-half (1/2") inch. Inspect each lacing hook and verify 16 gauge stainelss steel tie wire is securely fastened between each adjacent hook.

6.8.4 Hold Point Four - Final Inspection

6.8.4.1 Perform final examination of completed system to assure correct installation in accordance with this section.

6.8.4.2 Verify that correct raceway identification tags are affixed at all entrance and exit points (walls, floors) and at origin and destination points on runs five (5') feet and longer or at the most visible location on runs less than five (5') feet.

6.9 Three sided wrap installation inspection

6.9.1 Hold Point One - Concrete Anchor Inspection

6.9.1.1 Upon completion of installation inspect anchors for compliance to site requirements.

6.9.1.2 Measure anchor spacing for maximum twelve (12") inch centers and verify that each anchor is pre-set.

6.9.2 Hold Point Two - Inner Blanket Inspection

ISSUE DESIGNATION IN THIS COLL INDICATES CURRENT CHANGE

6.9.2.1 Upon completion of installation inspect each blanket in accordance with subsection 6.8.1 of this procedure. Additionally:

6.9.2.2 Inspect each blanket and verify proper alignment following impalement through studs.

6.9.2.3 Measure from blanket edges of each inner blanket to center of corresponding studs and verify minimum two (2") extension.

6.9.3 Hold Point Three - Foil Barrier Inspection

6.9.3.1 Upon completion of installation inspect each foil barrier strip in accordance with subsection 6.8.2. Additionally:

6.9.3.2 Inspect each foil barrier strip and verify proper alignment following impalement through studs.

6.9.3.3 Measure from edges of foil barrier to center of studs on each barrier strip and verify minimum two (2") extension.

6.9.4 Hold Point Four - Outer Blanket Inspection

6.9.4.1 Upon completion of installation inspect each blanket in accordance with subsection 6.8.3 . Additionally:

6.9.4.2 Inspect blanket and verify proper alignment following impalement through studs.

6.9.4.3 Inspect anchor assembly and verify that fender washers and/or B72 studs and/or flat bars are in place and that locknuts (or double nuts) are securely tightened.

6.9.4.4 Visually examine blanket assembly for wrinkles and bunches, and verify that assembly is not depressed over three-fourth (3/4") inch at anchors.

6.9.5 Hold Point Five - Final Inspection

6.9.5.1 Perform final examination of completed system to assure correct installation in accordance with this section.

6.9.5.2 Verify that correct raceway identification tags are affixed at all entrance and exit points (walls, floors) and at origin and destination points on runs five (5') feet and longer or at the most visible location on runs less than five (5') feet.

6.10 Field Modification Inspection - Non-Electrical Interferences

6.10.1 Hold Point One - Fabrication Inspection

D

6.10.1.1 Upon issuance of alumina silica blankets and outer fabric for fabrication record lot number(s) and receiving report number(s) on Form No. QC-117 or approved QC checklist.

ISSUE DESIGNATION IN THIS COLL NDICATES CURRENT CHANGE

6.10.2 Hold Point Two - Installation Inspection

6.10.2.1 Upon completion of fabrication and installation, verify correct thickness based alumina silica blanket size issued (actual measurement is not required due to blanket compression factor). Measure for minimum distance of eighteen (18") inches from point of interference or full length if interference is less than eighteen (18") inches.

6.10.2.2 Inspect lacing hooks and tie wire fasteners for sufficient spacing and tightness (six (6") inch minimum spacing is not required for interferences).

6.10.2.3 Inspect blanket joint and seam, and verify that no apparent gaps exist.

6.11 Cable Tray Interference Installation Inspection

6.11.1 Hold Point - Cable Inspection

D 6.11.1.1 Upon issuance of alumina silica blankets, record lot number and receiving report number on Form QC-117 or approved QC checklist.

6.11.1.2 Upon completion of installation inspect alumina silica blanket and verify that distance from each side of protected conduit is a minimum of eighteen (18") inches.

6.11.2 Cable Tray Interference Wrap Inspection

6.11.2.1 Installation inspection of cable tray wrap systems shall be in accordance with section 6.8 of this procedure and design details as established by Engineering.

6.12 Inspection of Field Fabrication Components

6.12.1 Primary wrap components fabricated in the field shall be inspected and documented in accordance with QCP-0042 prior to installation.

D 6.12.2 Field fabrication of items used for modification of existing wrap components shall be inspected in accordance with the applicable sections of QCP-0042. Inspection results and material traceability shall be recorded on Form QC-117 (or approved QC checklist) in lieu of Form QC-60 and QC-61.

6.13 Field Repair Inspection

D 6.13.1 Record lot numbers and receiving report numbers for materials issued for use on Form No. QC-117 or approved QC checklist.

6.13.2 Upon completion of installation inspect for tightness and verify that patch overlaps a minimum of two (2") inches on undamaged fabric, and that patches have finished edges.

6.13.3 Inspect Q-24 thread stitching on patches and tears two (2") inches and under and verify minimum spacing of one-half (1/2") inch.

6.14 When the alternate method for installing outer blanket assemblies is utilized as described in subsection 6.6 of IP-001, the following Inspection Hold Point shall apply in lieu of subsection 6.8.3 and 6.8.4.

6.14.1 Hold Point Three - Tube Assembly Inspection

D 6.14.1.1 Upon completion of tube assembly installation, verify that serial numbers are clearly visible and record on Form QC-117 or approved QC checklist.

6.14.1.2 Visually examine each component for damage and verify that tubes are parallel with system run. Holes and tears shall be patches with aluminum or duct tape to prevent powder leakage. If holes and tears result in excessive powder loss, the affected component shall be replaced.

6.14.1.3 Inspect circumferential and longitudinal joints and verify abutting fit with no apparent gaps. Inspect duct tape for sufficient spacing and tape to tape adhesion.

6.14.2 Hold Point Four - Alumina Silica Blanket Inspection

D 6.14.2.1 Upon completion of installation of each alumina silica blanket, verify that serial number is clearly visible and record on Form QC-117 or an approved QC checklist.

6.14.2.2 Visually examine each blanket for damage. Holes or tears in fabric exceeding one (1") inch shall be repaired per IP-001 and inspected per section 6.13 of this procedure.

6.14.2.3 Verify that circumferential and longitudinal joints are staggered a minimum six (6") inches from tube assembly joints.

6.14.2.4 Inspect longitudinal and circumferential joints for tightness with no apparent gaps. Verify that 16 gauge stainless steel tie wire is securely fastened between adjacent lacing hooks.

6.14.3 Hold Point Five - Final Inspection

6.14.3.1 Upon completion of total system installation perform final visual inspection of system to assure compliance with all applicable requirements.

6.14.3.2 Verify that correct raceway identification tags are affixed in accordance with paragraph 6.8.4.2.

QUALITY ASSURANCE DOCUMENTATION

Quality Assurance Statement

Omega Point Laboratories, Inc. is an independent, wholly owned company incorporated in the state of Texas, devoted to engineering, inspection, quality assurance and testing of building materials, products and assemblies. The company has developed and implemented a Quality Assurance Program designed to provide its clients with a planned procedure of order and document processing for inspection and testing services it provides to assure conformity to requirements, codes, standards and specifications. The Program is designed to meet the intent of ANSI 45.2 Quality Assurance Program Requirements for Nuclear Power Plants, and complies with the requirements of the ASME Code, SPPE, Military Standards and other less stringent programs. It is the Laboratory's intention to adhere strictly to this Program, to assure that the services offered to its clients remains of the highest quality and accuracy possible.

The overall responsibility of the supervision, operation and coordination of this Quality Assurance Program is that of the Quality Assurance Manager, a person not involved with the performance of the inspection or testing services, and who is under the full time employ of the Laboratory. This individual is responsible for implementing and enforcing all procedures presented in the Quality Assurance Manual and the Procedures Manual. All personnel involved with activities which fall under the scope of this Program are required to cooperate with the letter and intent of this Program.

All QA Surveillance documents remain on file at the Laboratory, and are available for inspection by authorized personnel in the performance of an on-site QA Audit. All materials, services and supplies utilized herein were obtained with appropriate QA Certifications of Compliance, and the inclusion of these in this report would not be practical nor useful to the reader.

EVENT LOG

Fire Resistance Test of Cable Trays Protected by Hemyc ERFBS

PROJECT NUMBER:

14790-123264

SANDIA NATIONAL LABORATORIES

EVENT LOG

SANDIA NATIONAL LABORATORIES
Client # 14790

NOTE:
This Log is used to document the date and note the significant events during the completion of test project #123264 for SANDIA National Laboratories. The following is a brief description of this project:

Project No. 123264: **One Hour ASTM E1725 Fire Test of 12" and 36" Cable Trays, a Cable Drop and a Junction Box Protected by Hemyc 1-Hour Rated ERFBS.**

ITEM	DATE	INIT'L
Request for Quotation (RFQ) # 7253 is received by Omega Point Labs from Patricia Brown of Sandia Labs.	11/5/04	CH
Technical Proposal No. PO41206-01 is issued to Sandia Labs by Deg Priest, President of Omega Point.	12/6	CH
Sandia Labs issues Purchase Order No. 389803 to Omega Point.	12/22	CH
Deg Priest accepts contract terms by signing and returning the P.O. signature page by fax on 12/22/04 and again on 12/27/04 for some minor changes to the P.O.	12/27	CH
Deg Priest completes the initial project drawings for Sandia review.	12/30	CH
Project Hold Points are determined by Frank Wyant, Sandia Technical contact and Connie Humphrey, OPL QA Director.	1/4/05	CH
Veda Patton, QA Assistant orders the steel components for the project test decks.	1/4	CH
Connie Humphrey receives approval for the qualification method of the thermocouple supplier. (10CFR50 app. B)	1/5	CH
OPL QA/QC personnel receive the steel shipment and OPL technicians begin fabricating the steel decks for all three Sandia projects.	1/5	CH
Drwg Fig. 3, assembly 2 revision is issued.	1/6	CH
Deck fabrication continues.	1/6/05	CH

Test 2

EVENT LOG

SANDIA NATIONAL LABORATORIES
Client # 14790

NOTE:
This Log is used to document the date and note the significant events during the completion of test project #123264 for SANDIA National Laboratories. The following is a brief description of this project:

Project No. 123264: **One Hour ASTM E1725 Fire Test of 12" and 36" Cable Trays, a Cable Drop and a Junction Box Protected by Hemyc 1-Hour Rated ERFBS.**

ITEM	DATE	INIT'L
OPI QA/QC personnel verify the dimensions on Project #123264, referred to as Assembly 2 or Test 2, per construction drawing.	1/7/05	CH
Determination was made by Frank Wyant regarding the extent of the video monitoring during the construction process of the test articles.	1/7	CH
Dee Priest issues the Junction Box thermocouple drawings.	1/11	CH
OPI QA/QC personnel receive the documents for Shipment # 44855 enroute to Omega Point from Sandia Labs.	1/11	CH
OPI QA/QC Personnel ship 46 quick Disconnect Thermocouples to Bruce Levin, Technical Contact at Sandia Labs for verification using Transmittal Letter #1126.	1/11	CH
Construction ~~continues~~ completed on the test decks. Verification is made by QA.	1/12	CH
OPI QA/QC Personnel receive the hardware shipment # 44855 from Sandia Labs. All items received.	1/14	CH
OPI technicians begin ~~continue~~ installation of the conduits and cable tray raceways together.	1/18	CH
Raceway fabrication continues	1/19	CH
Chuck Gihard Sandia Consultant arrives at OPI. Dee Priest meets with Chuck Giard to discuss project.	1/24	CH
Chuck Giard verifies test article measurements.	1/25	CH

This Log is used to document the date and note the significant events during the completion of test project #123264 for SANDIA National Laboratories. The following is a brief description of this project:

Project No. 123264: **One Hour ASTM E1725 Fire Test of 12" and 36" Cable Trays, a Cable Drop and a Junction Box Protected by Hemyc 1-Hour Rated ERFBS.**

ITEM	DATE	INIT'L
Peg Priest issues Figure 2, Rev. 2 Drawing for Test 2 Raceway layout.	1/25/05	CH
J.B. & Conduits and cable trays are removed from test decks and weighed by OPL technicians and re-installed. OPL QA/QC personnel re-verify the installation measurements when the raceways were installed to the test deck.	1/26	CH
Frank Wyant arrives at OPL and a group meeting is held involving all personnel.	1/27/05 CH 1/26 CH	
Cable trays are marked for thermocouple locations by OPL technicians.	1/28	CH
The unistrut frame for the Junction Box (J.B.) is weighed.	1/28	CH
The fiberglas wrapped thermocouples are installed on the cable trays by OPL technicians.	1/31	CH
TC's are verified by QA/QC personnel.	1/31	CH
The unistrut frame is installed to the test assembly. (Quick Disc. TC's arrive)	2/1 2/2/05	CH CH
Bare #8 copper wire is cut for the two air drops.	2/4	CH
TC's on the air drops are verified by OPL QA/QC personnel.	2/5	CH
Frank Wyant arrives to verify the TC's on the test article.	2/7	CH
~~2/7/05~~ Air drops are weighed and measured.	~~2/7~~ 2/8	CH
Frank Wyant verifies deck for project #123264 (Test 2)	2/23	CH
Frank Wyant departs OPL	2/24/05	CH

Test 2

EVENT LOG

SANDIA NATIONAL LABORATORIES
Client # 14790

NOTE:
This Log is used to document the date and note the significant events during the completion of test project #123264 for SANDIA National Laboratories. The following is a brief description of this project:

Project No. 123264: **One Hour ASTM E1725 Fire Test of 12" and 36" Cable Trays, a Cable Drop and a Junction Box Protected by Hemyc 1-Hour Rated ERFBS.**

ITEM	DATE	INIT'L
Sandia informed OPC that the cables trays and instrument and the thermocouples attached to all four cable trays are removed. The four cable trays are removed from the test deck by OPC technicians.	3/1/05	CH
Sandia approves cable trays from OPC stock that were the approved type.	3/1	CH
The new cabled trays from OPC are fabricated, weighed and installed into the test deck. Thermocouples were reinstalled on the new cable trays.	3/2	CH
OPC QA/QC re-verifies the trays and the thermocouples are verified (on 3/4.)	3/2	CH
Promatic crew arrives consisting of Mike Murphy, Michael Jordan, Jerry Thorton and Frank Haese. OPC installs the Junction Box on test deck 2.	3/3	CH
Mike Murphy and Jerry Thorton begin construction of the "stand-offs".	3/3	CH
Training on Hemyc installation was held by Michael Jordan for Mike Murphy, Jerry Thorton, Frank Haese and Melda Patton, OPC QA/QC assistant.	3/3	CH
Frank Wyant arrives from Sandia. Stand off construction and application to cable trays continues.	3/4	CH
	3/4/05	CH

Project No. 123264: **One Hour ASTM E1725 Fire Test of 12" and 36" Cable Trays, a Cable Drop and a Junction Box Protected by Hemyc 1-Hour Rated ERFBS.**

ITEM	DATE	INIT'L
Frank Wyant and Cleda Patton verify TC's on Test deck 2.	3/4/05	CH
Stand-off construction and/or application continues on cable trays and JB.	3/5	CH
Promatec personnel depart OPL	3/5	CH
Michael Jordan and Frank Haese arrive. Bruce Levin arrives from Sandia.	3/18	CH
Frank Wyant and Bruce Levin decide to remove the standoffs from the junction box.	3/18	CH
Promatec installers begin applying the Hemyc insulation.	3/18	CH
Work continues on insulation.	3/20	CH
Willie Theis, Promatec installer, arrives and begins insulating.	3/21	CH
Frank Wyant arrives to inspect progress.	3/21	CH
Mike Murphy from Promatec arrives and Michael Jordan departs.	3/21	CH
Michael Jordan arrives and Mike Murphy departs OPL.	3/22	CH
Work continues with the Hemyc insulation.	3/22	CH
Promatec insulators depart OPL after finishing installing the Hemyc. Chuck Girard (Sandia contractor) arrives at OPL.	3/23	CH
Frank Wyant and Chuck Girard witness the video taping of the installation of the test assembly onto the test furnace. Deg Priest oversees this procedure.	3/24	CH
	3/24/05	CH

Test 2

Project No. 123264: **One Hour ASTM E1725 Fire Test of 12" and 36" Cable Trays, a Cable Drop and a Junction Box Protected by Hemyc 1-Hour Rated ERFBS.**

ITEM	DATE	INIT'L
David Lew, Mark Salley and Roy Woods arrive from the USNRC.	3/24	CH
Cleda Patton OPL QA/QC assistant verifies data acquisition TC's (335).	3/24	CH
Pre test data acquisition requirement has been satisfied with the post test calibration done by Mike Dey on 3/11/05 for Sandia Proj. 123263 (Test 1) approved by Frank Wyant.	3/24	CH
On site to witness the fire test of Sandia Project# 123264 are:	3/25	CH
Frank Wyant — Sandia		
Bruce Lebrin — "		
Chuck Hirard — Sandia Contractor		
Mark Salley — USNRC		
Roy Woods — "		
David Lew — "		
Alex Klein — "		
Randy Brown — Promatec Technologies		
Michael Jordan — " "		
Frank Haese — " "		
On site to perform the fire test are:	3/25	CH
Deg Pfost — Omega Point Labs		
Mike Dey — " " "		
Cleda Patton — " " "		
Connie Humphrey — " " "		
Oscar Estrada — " " "		
Laudencio Castanon — " " "		
Troy Brongtad — " " "		
A quality control check of the Hemyc wrap was done with ~~Roy Woods~~, ~~Mark Salley~~, Michael Jordan, Frank Wyant, Roy Woods and Cleda Patton. Cleda Patton video taped the installation of two additional stainless steel bands.	CH 3/25/05 3/25/05	CH

Client # 14790

NOTE:
This Log is used to document the date and note the significant events during the completion of test project #123264 for SANDIA National Laboratories. The following is a brief description of this project:

Project No. 123264: **One Hour ASTM E1725 Fire Test of 12" and 36" Cable Trays, a Cable Drop and a Junction Box Protected by Hemyc 1-Hour Rated ERFBS.**

ITEM	DATE	INIT'L
The pre-test checklist is performed by Mike Dey, Mgr. Dept 02 and Dey Priest, President and Chief Technical Officer of OPL. The test acceptance is signed.	3/25/05	CH
The One-hour test of Project #123264 began at 9:10 am. The temperature at the time the test started was 73°F with 89% Relative Humidity.	3/25	CH
The one hour test is completed at 10:10 am and the data acquisition thermocouples are disconnected from the data acquisition equipment. The test article is moved by overhead crane to the hose stream area. A five minute hose stream test followed the fire test using a 1½" fog nozzle with a 15 degree spray pattern at 75 psi from a distance of ten feet.	3/25	CH
The tear down and inspection of the test article was completed after the assembly cooled down. The was performed by OPL technicians and witnessed by client and USNRC personnel on site.	3/25	CH
Post test data acquisition equip. verification was performed by Mike Dey, OPL Dept 02 Manager.	4/1/05	CH

Channel Verification for Yokogawa 300 Channel

Serial No.: 48JF0082

Calibrator Used: T-207318

Temperature Setting (°F): 300.0

Certificate of Verification

Certification No.: 92145

Verification Date: 03/11/2005

Reverification Date: 09/11/2005

Manufacturer: Yokogawa

Model No.: 100 Channel DAU

Serial No.: 99LE004

Equipment Description: 100 Channel Data Acquisition System with YOKOGAWA Darwin Series

Verification Sources: TEGAM Model 840-A, SN: T-207318. Calibration due 05/03/2005

PERFORMANCE:

Temperature: (75°F) +1.3/-0.2	Temperature: (150°F) +1.3/-0.1	Temperature: (300°F) +1.3/-0.3	Temperature: (400°F) +1/-0.3	Temperature: (1000°F) ++1.1/-0.3	Temperature: (2000°F) +1.2/-0.2

Verification Performed by:

Certificate of Verification

Certification No.:	92146
Verification Date:	03/11/2005
Reverification Date:	09/11/2005
Manufacturer:	Yokogawa
Model No.:	100 Channel DAU
Serial No.:	99LE006
Equipment Description:	100 Channel Data Acquisition System with YOKOGAWA Darwin Series
Calibration Sources:	TEGAM Model 840-A, SN: T-207318. Calibration due 05/03/2005.

PERFORMANCE:

Temperature: (75°F) +1.6/-0	Temperature: (150°F) +1.3/-0.3	Temperature: (300°F) +1.3/-0.3	Temperature: (400°F) +1.4/-0.3	Temperature: (1000°F) +1.3/-0.3	Temperature: (2000°F) +1.7/-0.6

Verification Performed by:

Mike Dey
Manager of Fire Resistance

Verification Approved by:

Deg Priest
President/Chief Technical Officer

Channel Verification for Yokogawa 100 Channel

Serial No.: 99-LE-006

Calibrator Used: T-207318

Temperature Setting (°F): 75.0

Within specs? Yes/No

Certificate of Verification

Certification No.:	92148
Verification Date:	04/11/2005
Re-verification Date:	10/11/2005
Manufacturer:	Yokogawa
Model No.:	300 Channel DAU-
Serial No.:	48JF0082
Equipment Description:	300 Channel Data Acquisition System with YOKOGAWA Darwin Series
Calibration Sources:	Tegam T-156701 due: 07/26/2005

PERFORMANCE:

Temperature: (75°F) 1.3/-0.3	Temperature: (150°F) 1.2/-0.6	Temperature: (300°F) 1.1/-0.5	Temperature: (400°F) +1.2/-0.4	Temperature: (1000°F) 1.3/-0.5	Temperature: (2000°F) 2.6/-1.5

Measurement Uncertainty: ± 0.2%

Verification Performed by:

Range for 400°F Signal: **+1.2/-0.4**

Allowable range: ±2.0

Within specification for this temperature? Yes

Channel Verification for Yokogawa 300 Channel

Serial No.: 48JF0082

Calibrator Used: SNT156701

Temperature Setting (°F): 1000.0

Certificate of Verification

Certification No.: 92150

Verification Date: 04/11/2005

Reverification Date: 010/11/2005

Manufacturer: Yokogawa

Model No.: 100 Channel DAU

Serial No.: 99LE004

Equipment Description: 100 Channel Data Acquisition System with YOKOGAWA Darwin Series

Verification Sources: TEGAM Model 840-A, SN: T-156701
Calibration due 07/26/2005

PERFORMANCE:

Temperature: (75°F) +0.9/-0.2	Temperature: (150°F) +1/-0.1	Temperature: (300°F) +0.9/-0	Temperature: (400°F) +0.8/-0.1	Temperature: (1000°F) +0.8/-0.1	Temperature: (2000°F) +0.8/-0.1

Verification Performed by:

Mike Dey
Manager of Fire Resistance

Verification Approved by:

Deg Priest

Certificate of Verification

Certification No.:	92151
Verification Date:	04/11/2005
Reverification Date:	10/11/2005
Manufacturer:	Yokogawa
Model No.:	100 Channel DAU
Serial No.:	99LE006
Equipment Description:	100 Channel Data Acquisition System with YOKOGAWA Darwin Series
Calibration Sources:	TEGAM Model 840-A, SN: T-207318. Calibration due 05/03/2005.

PERFORMANCE:

Temperature: (75°F) +1.8/-0.3	Temperature: (150°F) +1.7/-0.5	Temperature: (300°F) +1.8/-0.5	Temperature: (400°F) +1.9/-0.6	Temperature: (1000°F) +2/-0.5	Temperature: (2000°F) +2.8/-0.8

Verification Performed by:

VENDOR PURCHASING SPECIFICATION AND QUALITY ASSURANCE REQUIREMENTS

Vendor: SSC Lab-Division
Purchase Order No. 14357 Q

Any of the following Quality Assurance requirements shall be incorporated as conditions to this procurement when corresponding box is marked. Failure to comply with any requirement specified may result in rejection and/or return of shipment at seller's expense.

1.0 QUALITY PROGRAM

☒ Seller shall furnish all items on this Purchase Order in accordance with Quality Program approved by Buyer.

2.0 Quality Verification

When additional quality verification activities are required as a condition to this procurement, invoices will not be paid until satisfactory completion of such activities.

☒ Receiving Inspection- Buyer shall inspect items upon receipt to verify compliance with purchase order requirements. Rejected items shall be returned at seller's expense.

☐ Independent Laboratory Tests- Samples of materials furnished shall be tested independently for conformance to specification requirements prior to final acceptance. Rejected materials shall be returned at seller's expense.

☒ Document Review- Final acceptance shall be based on satisfactory review or required certifications and other supporting documents.

3.0 CERTIFICATIONS

When certifications are required as a condition to this procurement, the seller shall furnish one reproducible copy either with or prior to each shipment. Shipments will not be accepted and invoices will not be paid until certifications are in buyer's possession.

☐ Certificate of Compliance/Conformance Required – Certification that materials and /or services comply with purchase order requirements. Certification shall reference purchase order number and traceability numbers (when applicable).

☐ Certified Test Report Required – Certification that material complies with applicable material specification (s) and the purchase order. Include actual results of required tests.

☒ Certificate of Calibration Required - Certification shall be traceable to National Bureau of Standards. (NIST, Nat'l Inst. of Science & Technology).

4.0 AUDITS/RIGHT OF ACCESS

☒ The buyer reserves the right to audit your facility to verify compliance with purchase order, code and specification requirements with (10) days notice,

☒ Shipments shall only originate form facilities approved by the buyer.

☐ Buyer reserves the right to inspect any or all work included in this order at seller's facility with as early notice as practicable.

5.0 IDENTIFICATION

☐ Seller shall identify each item with a unique traceability number by physical marking or tagging. Traceability numbers shall be traceable to certifications and packing lists.

☒ Seller shall identify each container with a unique identification number. The identification number shall be traceable to certifications and packing lists.

6.0 10CFR,PART 21

☐ The material, equipment and/or services to be furnished under this purchase order are involved in the testing of basic components of a Nuclear Regulatory Commission (NRC) licensed facility. Accordingly, the seller is subject to the provisions of 10 CFR, Part 21 (Reporting of Defects and Noncompliance)

7.0 PACKING/SHIPPING

☒ All materials shall be packaged in air tight, moisture free containers and shall be free from all foreign substance such as dirt, oil, grease or other deleterious material.

☐ All materials and equipment shall be suitable crated, boxed or otherwise prepared for shipment to prevent damage during handling and shipping. Wherever practical, equipment shall be palletized for ease of unloading and storage at destination. Each container shall be clearly marked with buyer's purchase order number.

QUALITY ASSURANCE APPROVAL _____ DATE 4/19/04

SSC LAB DIVISION
a Division of System Scale Corporation
Employee Owned
"Quality You Can Measure"

CERTIFICATE NO: 36283-0003

ACCREDITED
Cert. #1754.01
Calibration Laboratory
ISO / IEC / 17025

CERTIFICATE OF CALIBRATION

SSC LAB DIVISION certifies that this instrument conforms to original manufacturers specifications or to tolerances indicated below and has been calibrated using standards with accuracies traceable to a National Measurement Institute, or to accepted values of natural physical constants, or have been derived by ratio techniques. This certificate complies with ISO / IEC 17025 & ANSI Z540. Unless otherwise stated, the M & T E for which this certificate is issued, based on interpretation of data, was found to meet the required specification. Reported uncertainty represents expanded uncertainty at approximately 95% confidence level, coverage factor of k=2.

Material as defined above shall be provided in accordance with the Critical Characteristics as listed below:

TEST	DESCRIPTION	SPECIFICATION RANGES MIN. - MAX.
ASTM E220-96	Std. Test Method for Calibration of Thermocouples by Comparison	Temp. Range +32°F to +545°F Special Limits of Error ± 2% °F
	(Chromel/Alumel wire alloy)	Temp. Range +545°F to +2300°F Special Limits of Error ± .4%
ASTM E220-96	Std. Test Method for Calibration of Thermocouples by Comparison	Temp. Range -85°F to +270°F Special Limits of Error ±.9%°F
	(Copper/Constantan wire alloy)	Temp. Range +270°F to +660°F Special Limits of Error ±.4%

QUALITY ASSURANCE REQUIREMENTS

1.0 QUALITY PROGRAM

Seller shall furnish this item in accordance with Quality Program approved by Omega Point Laboratories. Material specified herein is to be produced and tested in accordance with vendor quality standards, methods, guidelines and manufacturing instructions as defined in that Quality Program.

2.0 QUALITY VERIFICATION

Receiving Inspection - Buyer shall inspect items upon receipt to verify compliance with purchase order requirements. Rejected items shall be returned at seller's expense.

Document Review - Final acceptance shall be based on satisfactory review of required certifications and/or supporting documents.

3.0 CERTIFICATIONS

3.1 Certification that supplied materials comply with this material specification and listing Critical Characteristics shall be provided. This certificates shall reference Omega Point Labs purchase order number and specification number for all material furnished under this specification. This Certification shall be signed by the appropriate vendor representative.

3.2 The material furnished under this specification shall be a product that complies with the following:

3.2.1 Has been tested and passed all tests specified herein.

3.2.2 Manufacturing methods for this material have not changed. Vendor will advise Omega Point in writing of any changes in the manufacturing prior to material manufacture.

3.2.3 Raw materials used in the manufacture of this material meet Vendor specifications.

4.0 AUDITS/RIGHTS OF ACCESS

Omega Point Labs reserves the right to audit your facility to verify compliance with the purchase order and specification requirements with a minimum ten (10) day notice.

5.0 IDENTIFICATION

Seller shall identify each item with a unique traceability number by physical marking or tagging. These identification numbers shall be traceable to certifications and packing lists.

6.0 PACKING/SHIPPING

All materials shall be packaged in air tight, moisture free containers and shall be free of foreign substances such as dirt, oil, grease or other deleterious materials.

All materials shall be suitably crated, boxed or otherwise prepared for shipment to prevent damage during handling and shipping.

THIS MEMORANDUM

is an acknowledgment that a Bill of Lading has been issued and is not the Original Bill of Lading nor a copy or duplicate, covering the property named herein, and is intended solely for filing or record.

RECEIVED, subject to the classifications and tariffs in effect on the date of the receipt by the carrier of the property described in the Original Bill of Lading, the property described below, in apparent good order, except as noted (contents and condition of contents of packages unknown), marked consigned, and destined as indicated below, which said carrier (the word carrier being understood throughout this contract as meaning any person or corporation in possession of the property under the contract) agrees to carry to its usual place of delivery at said destination, if on its route, otherwise to deliver to another carrier on the route to said destination. It is mutually agreed, as to each carrier of all or any of said property over all or any portion of said route to destination, and as to each party at any time interested in all or any of said property, that every service to be performed hereunder shall be subject to all the terms and conditions of the Uniform Domestic Straight Bill of Lading set forth (1) in Official, Southern, Western and Illinois Freight Classifications in effect on the date hereof, if this is a rail or a rail-water shipment or (2) in the applicable motor carrier classification or tariff if this is a motor carrier shipment.

Shipper hereby certifies that he is familiar with all the terms and conditions of the said bill of lading, including those on the back thereof, set forth in the classification or tariff which governs the transportation of this shipment, and the said terms and conditions are hereby agreed to by the shipper and accepted for himself and his assigns.

Re: Quick Disconnect Thermocouples

Dear Deg,

Please find the forty-six thermocouples enclosed for installation and insulation thermal testing of the junction boxes. The Primary Standards Laboratory at SNL verified calibration of each of the thermocouples and have provided a certificate of uncertainty over a range of 70°F to 1000°F for each thermocouple. Please find enclosed copies of these certificates along with calibration stickers. Each sticker can be attached to its associated thermocouple near the connector end following the test to minimize interference during assembly and testing.

Yours truly,

Bruce

PRIMARY STANDARDS LABORATORY

Sandia National Laboratories, Albuquerque, New Mexico 87185-0665

CERTIFICATE

File No. 51536
LIMITED

THERMOCOUPLE	TYPE K - STD
Model No.	KQIN-116-144
Serial No.	1
Procedure No.	CP – TC (07/22/98)
Lab Conditions:	Temperature: 23 °C ± 2 °C Humidity: 40% ± 10%
Submitted by:	Organization 06113 SNL / NM
Certified:	January 18, 2005
Expires:	January 18, 2006

The thermocouple was calibrated over the temperature range of 71 °F to 1000 °F by comparison with a Standard Platinum Resistance Thermometer (SPRT). The thermocouple was calibrated in the 9122 Dry Well, with an immersion of 6 inches. The probe mV output was measured with an 8508A Fluke Multimeter. Both the SPRT and the Multimeter have calibrations that are traceable to the National Institute of Standards and Technology (NIST) or to intrinsic standards. The thermocouple type, temperature range calibrated over and the uncertainty of a confidence level of k=2 is as follows:

TC Type	Range	Uncertainty
K	70 °F to 1000 °F	± (4 °F or 0.75% of reading) (whichever is greater)

NOTES: The tolerance statement applies only to the thermocouple, and does not include any instrument used by the owner to measure it.
The results relate only to the items tested or calibrated.

THERMOCOUPLE	TYPE K - STD
Model No.	KQIN-116-144
Serial No.	5
Procedure No.	CP – TC (07/22/98)
Lab Conditions:	Temperature: 23 °C ± 2 °C Humidity: 40% ± 10%
Submitted by:	Organization 06113 SNL / NM
Certified:	January 18, 2005
Expires:	January 18, 2006

The thermocouple was calibrated over the temperature range of 71 °F to 1000 °F by comparison with a Standard Platinum Resistance Thermometer (SPRT). The thermocouple was calibrated in the 9122 Dry Well, with an immersion of 6 inches. The probe mV output was measured with an 8508A Fluke Multimeter. Both the SPRT and the Multimeter have calibrations that are traceable to the National Institute of Standards and Technology (NIST) or to intrinsic standards. The thermocouple type, temperature range calibrated over and the uncertainty of a confidence level of k=2 is as follows:

TC Type	Range	Uncertainty
K	70 °F to 1000 °F	± (4 °F or 0.75% of reading) (whichever is greater)

NOTES: The tolerance statement applies only to the thermocouple, and does not include any instrument used by the owner to measure it.

Lab Conditions:	Temperature: 23 °C ± 2 °C Humidity: 40% ± 10%
Submitted by:	Organization 06113 SNL / NM
Certified:	January 18, 2005
Expires:	January 18, 2006

The thermocouple was calibrated over the temperature range of 71 °F to 1000 °F by comparison with a Standard Platinum Resistance Thermometer (SPRT). The thermocouple was calibrated in the 9122 Dry Well, with an immersion of 6 inches. The probe mV output was measured with an 8508A Fluke Multimeter. Both the SPRT and the Multimeter have calibrations that are traceable to the National Institute of Standards and Technology (NIST) or to intrinsic standards. The thermocouple type, temperature range calibrated over and the uncertainty of a confidence level of k=2 is as follows:

TC Type	Range	Uncertainty
K	70 °F to 1000 °F	± (4 °F or 0.75% of reading) (whichever is greater)

NOTES: The tolerance statement applies only to the thermocouple, and does not include any instrument used by the owner to measure it.
The results relate only to the items tested or calibrated.

The thermocouple was calibrated over the temperature range of 71 °F to 1000 °F by comparison with a Standard Platinum Resistance Thermometer (SPRT). The thermocouple was calibrated in the 9122 Dry Well, with an immersion of 6 inches. The probe mV output was measured with an 8508A Fluke Multimeter. Both the SPRT and the Multimeter have calibrations that are traceable to the National Institute of Standards and Technology (NIST) or to intrinsic standards. The thermocouple type, temperature range calibrated over and the uncertainty of a confidence level of k=2 is as follows:

TC Type	Range	Uncertainty
K	70 °F to 1000 °F	± (4 °F or 0.75% of reading) (whichever is greater)

NOTES: The tolerance statement applies only to the thermocouple, and does not include any instrument used by the owner to measure it.
The results relate only to the items tested or calibrated.

MEASUREMENTS STANDARDS PROGRAM
SANDIA NATIONAL LABORATORIES
Albuquerque, New Mexico

General Traceability Statement: Values and the associated uncertainties supplied by the Measurements Standards Program (MSP) are traceable to one or more of the following:

1. The values of the units (either base or derived) maintained and disseminated by the National Institute of Standards and Technology (United States of America) or, in special cases and where appropriate, to the National Standards Laboratory of another nation;
2. The accepted value(s) of fundamental physical phenomena (intrinsic standards);
3. Ratio(s) or other non-maintained standards established by either a self-calibration and/or a direct calibration technique;
4. Standards maintained and disseminated by the MSP in special cases and where warranted;
5. Values and uncertainties arising from participation in a National Measurement System.

Because of inherent complexity in the calibration process and the uncertainty contribution by both standards and calibrating instruments, traceability always requires evaluation of a "traceability tree." A "traceability tree" analysis can be assembled for a specific calibration and valid for a particular and specific point in time. The "traceability tree" will include copies of relevant certificates and reports, excerpted as appropriate for brevity. However, the cost of preparation of the "traceability tree" will be charged to the requester.

Note 1: This certificate or report shall not be reproduced except in full without the advance written approval of the Measurement Standards Program at Sandia National Laboratories.

Note 2: For National Voluntary Laboratory Accreditation Program (NVLAP) accredited capabilities, the MSP at Sandia National Laboratories is accredited by NVLAP for the specific scope of accreditation under Laboratory Code 105002. This certificate or report shall not be used by the customer to claim product endorsement by NVLAP or any agency of the U. S. Government.

Note 3: The as received condition of the standard, set of standards, or measurement equipment described herein was as expected, unless otherwise noted in the body of the certificate or report.
