#### I. INTRODUCTION

This report is submitted pursuant to Specification 6.9.1.8 of St. Lucie Unit 1 and St. Lucie Unit 2 Technical Specifications. The Annual Radiological Environmental Operating Report provides information, summaries and analytical results pertaining to the radiological environmental monitoring program for the calendar year indicated. This report covers surveillance activities meeting the requirements of Unit 1 and Unit 2 Technical Specifications.

### II. RADIOLOGICAL ENVIRONMENTAL MONITORING PROGRAM

4-1-29-20

### A. <u>Purpose</u>

The purpose of the radiological environmental monitoring program is to provide representative measurements of radiation and of radioactive materials in those exposure pathways and for those radionuclides which lead to the highest potential radiation exposures to members of the public resulting from station operation. The radiological environmental monitoring program also supplements the radiological effluent monitoring program by verifying that the measurable concentrations of radioactive materials and levels of radiation are not higher than expected on the basis of the effluent measurements and the modeling of the environmental exposure pathways.

### B. Program Description

The radiological environmental monitoring program (REMP) for the St. Lucie Plant is conducted pursuant to the St. Lucie Units 1 and 2 Offsite Dose Calculation Manual (ODCM) Section 3/4.12.1., Monitoring Program.

- 1. Sample Locations, Types and Frequencies:
  - a. Direct radiation gamma exposure rate is monitored continuously at 27 locations by thermoluminescent dosimeters (TLDs). TLDs are collected and analyzed quarterly.
  - b. Airborne radioiodine and particulate samplers are operated continuously at five locations. Samples are collected and analyzed weekly. Analyses include lodine-131, gross beta, and gamma isotopic measurements.
  - c. Surface water samples are collected from two locations. Samples are collected and analyzed weekly and monthly, respectively. Analyses include gamma isotopic and tritium measurements.

- d. Shoreline sediment samples are collected from two locations coinciding with the locations for surface water samples. Samples are collected and analyzed semi-annually. Sediment samples are analyzed by gamma isotopic measurements.
- e. Fish and invertebrate samples are collected from two locations. Samples are collected and analyzed semi-annually. Fish and invertebrate samples are analyzed by gamma isotopic measurements.
- f. Broad leaf vegetation samples are collected from three locations. Samples are collected and analyzed monthly. Broad leaf vegetation samples are analyzed by gamma isotopic measurements.
- g. A goat milk sample is collected from one location. The sample is collected and analyzed on a quarterly basis. No other milk-producing goats feeding on similar wild vegetation have been found in the St. Lucie region; therefore, there is no control location for this sample type.

Attachment A provides specific information pertaining to sample locations, types and frequencies.

### 2. Analytical Responsibility:

Radiological environmental monitoring for the St. Lucie Plant is conducted by the State of Florida, Department of Health (DOH), Bureau of Radiation Control (BRC). Samples are collected and analyzed by DOH personnel.

Samples are analyzed at the DOH BRC Environmental Radiation Control Laboratory in Orlando, Florida.

### C. Analytical Results

Table 1, Environmental Radiological Monitoring Program Annual Summary provides a summary for all specified samples collected during the referenced surveillance period. Deviations from the sample schedule or missing data, if any, are noted and explained in Table 1A. Samples not meeting the specified "A PRIORI" LLD, if any, are noted and explained in Table 1B. Analysis data for all specified samples analyzed during the surveillance period is provided in Attachment B.

### ANNUAL RADIOLOGICAL ENVIRONMENTAL OPERATING REPORT ST. LUCIE PLANT – UNITS 1 & 2

### D. Land Use Census

A land use census out to a distance of a five-mile radius from the St. Lucie Plant is conducted annually to determine the location of the nearest milk animal, residence, and garden producing broad leaf vegetation, in each of the 16 meteorological sectors. A summary of the land use census for the surveillance year is provided in <u>Table 2</u>, <u>Land Use</u> Census Summary.

### E. Interlaboratory Comparison Program

The intercomparison program consists of participating in the DOE Mixed Analyte Performance Evaluation Program (MAPEP).

This program provides similar testing (matrices, nuclides, and levels) as the former EPA Interlaboratory Comparison Program and is referred to as the Mixed Analyte Performance Evaluation Program (MAPEP).

The samples are analyzed using the methods applicable to the REMP (gamma spectroscopy, Gross Beta, and Tritium for water).

From the MAPEP handbook:

Acceptance criteria were developed from a review of precision and accuracy data compiled by other performance evaluation programs (PEPs), the analytical methods literature, from several MAPEP pilot studies, and from what is considered reasonable, acceptable, and achievable for routine analyses among the more experienced laboratories.

The results for nuclides associated with the REMP are listed in ATTACHMENT C, RESULTS FROM THE INTERLABORATORY COMPARISON PROGRAM.

### F. Effect of 2005 Hurricane Season

Hurricanes Wilma affected the Air Sampling portion of St. Lucie's REMP.

- All five Air Sampling Stations had reduced run times due to power loss.
- Two of five Air Sampling Stations lost their particulate filters due to wind damage to the filter mounting system.
- Other aspects of program (e.g., TLDs soil, water, vegetation sampling) were not affected.

The REMP was fully restored well in advance of Units 1 and 2 re-start.

### III. DISCUSSION AND INTERPRETATION OF RESULTS

### A. Reporting of Results

The Annual Radiological Environmental Operating Report contains the summaries, interpretations and information required by St. Lucie Plant ODCM. Table 1 provides a summary of the measurements made for the nuclides required by ODCM, Table 4.12-1, for all samples specified by Table 3.12-1. In addition, summaries are provided for other nuclides identified in the specified samples, including those not related to station operation. These include nuclides such as K-40, Th-232, Ra-226, and Be-7, which are common in the Florida environment.

### B. Interpretation of Results

### 1. Direct Radiation:

The results of direct radiation monitoring are consistent with past measurements for the specified locations. The exposure rate data shows no indication of any trends attributed to effluents from the plant. The measured exposure rates are consistent with exposure rates that were observed during the pre-operational surveillance program. Direct radiation monitoring results are summarized in Table 1.

### 2. Air Particulates/Radioiodine:

The results for radioactive air particulate and radioiodine monitoring are consistent with past measurements and indicate no trends attributed to plant effluents. All samples for radioiodine yielded no detectable I-131. Gamma isotopic measurements yielded no indication of any nuclides attributed to station operation. The results for air particulate/radioiodine samples are consistent with measurements that were made during the pre-operational surveillance program. Air particulate and radioiodine monitoring results are summarized in Table 1.

#### Surface Water:

Tritium was detected in 2 of 52 indicator location samples and in 1 of 12 control location samples. The highest level seen was at the control locations and is less than five percent of the Required LLD specified in ODCM Table 4.12-1. No other nuclides attributed to station operation were detected. Results for surface water samples are summarized in Table 1.

### 4. Waterborne Sediment and Food Products:

The results for radioactivity measurements in waterborne sediment, fish and crustacean samples are consistent with past measurements and with measurements made during the pre-operational surveillance program. There were no indications of any nuclides attributed to plant effluents. Results for the waterborne sediment, fish and crustacean samples are summarized in Table 1.

### 5. Broad Leaf Vegetation:

The results of radioactivity measurements in broad leaf vegetation are consistent with past measurements and with measurements made during the pre-operational surveillance program.

Cs-137 was detected in one of 12 indicator location samples and in one of 12 control location samples. The highest level seen was at the control locations and is less than one-half of the Required LLD specified in ODCM Table 4.12-1. There were no indications of any other nuclides attributed to plant effluents. Results for the broad leaf vegetation samples are summarized in Table 1.

### 6. Milk, Goat:

Cesium-137 was detected the sample. The presence of this nuclide is considered "weapons fallout"; the animal uptake is due to the foraging habits of the goat. Samples of the wild vegetation consumed by the "pet goat" (Brazilian Pepper) indicated the presence of Cs-137. The State Department of Health found comparable levels of Cs-137 in samples from numerous wilderness locations. The goat is no longer 'fresh', no more samples are available. The owner of the pet goat has indicated the goat may never return to milch. The Goat-Milk sampling is being dropped from the program.

#### 7. Land Use Census:

No locations yielding a calculated dose or dose commitment greater than the values currently being calculated were identified by the land use census. No locations yielding a calculated dose or dose commitment (via the same exposure pathway) 20 percent greater than locations currently being sampled in the radiological environmental monitoring program were identified by the land use census.

### ANNUAL RADIOLOGICAL ENVIRONMENTAL OPERATING REPORT ST. LUCIE PLANT – UNITS 1 & 2

### 8. Interlaboratory Comparison Program:

The State laboratory participated MAPEP 13 and 14.

In MAPEP 13, the results Air Filter and Water matrices for those nuclides associated with nuclear power plant operation and using analytical methods used in the REMP are Acceptable. The Soil matrix had a few warnings in response to over-estimated results. The vegetation sample had on warning result for a nuclide (Co-57) not typically associated with plant effluents.

In MAPEP 14, the results for Air filter, Soil, and Water matrices for those nuclides associated with nuclear power plant operation and using analytical methods used in the REMP are Acceptable.

The Vegetation matrix failed, all but one result was Not Acceptable. An investigation found the Lab Technician invoked an improper counting geometry file. Reanalyzing the assay using the correct geometry file returned Acceptable results for all nuclides except Co-57. Co-57 is not typically associated with plant effluents; assay using REMP methods will typically yield poor results for low levels.

The results are listed in Attachment C.

### C. Conclusions

The data obtained through the St. Lucie Plant radiological environmental monitoring program verifies that the levels of radiation and concentrations of radioactive materials in environmental samples, representing the highest potential exposure pathways to members of the public, are not being increased.

The measurements verify that the dose or dose commitment to members of the public, due to operation of St. Lucie Units 1 and 2, during the surveillance year, are well within "as low as reasonably achievable (ALARA)" criteria established by 10 CFR 50, Appendix I.

ENVIRONMENTAL RADIOLOGICAL MONITORING PROGRAM ANNUAL SUMMARY
Name of Facility <u>St. Lucie Units 1 & 2</u>, Docket No(s). <u>50-335 & 50-389</u>
Location of Facility <u>St. Lucie, Florida</u>, Reporting Period <u>January 1 - December 31, 2005</u>
(County, State)

### **NOTES**

- a. The LLD is an "a priori" lower limit of detection which establishes the smallest concentration of radioactive material in a sample that will yield a net count above system background that will be detected with 95% probability with only 5% probability of falsely concluding that a blank observation represents a real signal.
  - LLDs in this column are at time of measurement. The MDAs reported in Attachment B for the individual samples have been corrected to the time of sample collection.
- b. Mean and range based upon detectable measurements only. Fraction of detectable measurements at specified locations is indicated in parentheses (f).
- c. Specific identifying information for each sample location is provided in Attachment A.
- d. Results were based upon the average net response of three elements in a TLD (thermoluminescent dosimeter).
- e. There are no other milk producing goats grazing on similar vegetation, back yard grass and wild bushes in the St. Lucie region. Therefore, there is no control location.

MDA refers to minimum detectable activity.

### ANNUAL RADIOLOGICAL ENVIRONMENTAL OPERATING REPORT ST. LUCIE PLANT - UNITS 1 & 2

### <u>TABLE 1A</u> (page 1 of 2)

### **DEVIATIONS / MISSING DATA**

A) Pathway:

Airborne, Particulates & Radioiodines

Location:

H-34, 0.5 miles North

Dates:

10-12-05 to 10-19-05

Deviation:

Failure to perform continuous monitoring

Description of Problem:

Power was off at time of collection; sample duration

was 164.5 hours out of the 168.3 hour period.

Corrective Action:

Requested restoration of power. Power to be

restored same day; air sampling equipment will auto-

start.

B) Pathway:

Airborne, Particulates & Radioiodines

Deviation:

Failure to perform continuous monitoring

Description of Problem:

Power loss due to hurricane Wilma caused smaller

then expected sample volume

Corrective Action:

**Restored Power** 

Dates:

10-19-05 to 10-25-05, landfall late in planned

sampling period of 10-19-05 to 10-26-05

Affected Locations:

Runtime (run hours out of sample period hours)

H-08, 6 miles West-northwest

128.8 out of 150

H-12, 12 miles South

As found: Power On; 140 out of 146

H-14, 1 mile Southeast

117 out of 144

H-30, 2 miles West

121 out of 147

H-34, 0.5 miles North

Power off at beginning of period: 109 out of 142

### ANNUAL RADIOLOGICAL ENVIRONMENTAL OPERATING REPORT ST. LUCIE PLANT - UNITS 1 & 2

### TABLE 1A (page 2 of 2)

### **DEVIATIONS / MISSING DATA**

C) Pathway:

Airborne, Particulates & Radioiodines

Deviation:

Failure to perform continuous monitoring

Description of

Problem:

Particulate Filter loss due to hurricane Wilma

Corrective

Replaced Filter

Action:

Dates:

10-19-05 to 10-25-05

Affected Locations:

H-14, 1 mile southeast

H-30, 2 miles West

D) Pathway:

Airborne, Particulates & Radioiodines

Deviation:

Failure to perform continuous monitoring

Description of

Power loss due to hurricane Wilma extends into next sampling

Problem:

period

Corrective Action:

Restored Power

Dates:

10-25-05 to 11-03-05

Affected Locations:

Runtime (run hours out of sample period hours)

H-14, 1 mile southeast

107 out of 220

H-30, 2 miles West

118 out of 216

H-34, 0.5 miles North

204 out of 223

E) Pathway:

Ingestion: Milk, goat

Location:

H101, 3.5 miles west-southwest

Date:

Second quarter 2005

Deviation:

Failure to monitor

Description of

Problem:

Pet goat is no longer fresh; owner indicated animal will not

become milch.

Corrective Action:

None: Deleting this from ODCM due to loss of sampling capabilities. (This pet goat was the only milch animal within 5

miles of the power plant.)

### TABLE 1B

ANALYSIS WITH LLDs ABOVE THE REQUIRED DETECTION CAPABILITIES (LLDs) Listed in ODCM TABLE 4.12-1 1/1/2005 – 12/31/2005

The values specified in ODCM Table 4.12-1, Detection Capabilities, were achieved for all samples.

### TABLE 2

| wsw    | L                              | 1.9/240                  | 3.4/248 (h)               |
| W      | L                              | 1.9/260                  | L                         |
| WNW    | L                              | 2.2/281                  | L                         |
| NW     | L                              | 3.5/304                  | L                         |
| NNW    | L                              | 3.4/342 (g)              | L                         |

### TABLE 2

### LAND USE CENSUS (Page 2 of 2)

### **NOTES**

- a. All categories surveyed out to a five-mile radius from the St. Lucie Plant.
- b. The following format is used to denote the location:

distance (miles)/bearing (degrees)

For example, a residence located in the southeast sector at a distance of 1.5 miles bearing 142 degrees is recorded as 1.5/142.

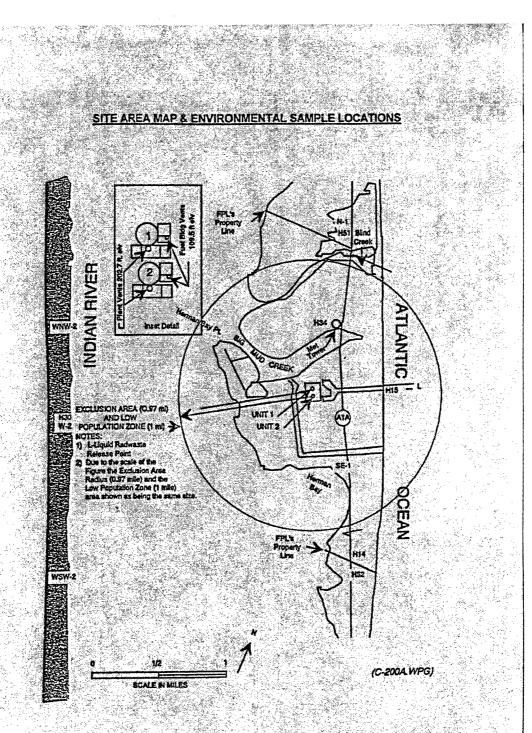

- c. Potential milk animal locations.
- d. Gardens with an estimated growing area of 500 square feet or more.
- e. O denotes that the sector area is predominantly an ocean area.
- f. L denotes that the sector area is predominantly a land area unoccupied by the category type.
- g. Non-residential occupied buildings in these sectors include the following:

| <u>Sector</u> | <u>Distance</u> | <u>Description</u>  |
|---------------|-----------------|---|
| SSE           | 1.8/147         | Fire Station  |
| NNW           | 2.8/348         | A new community is being developed. At the current time, there are no houses available for occupancy. |

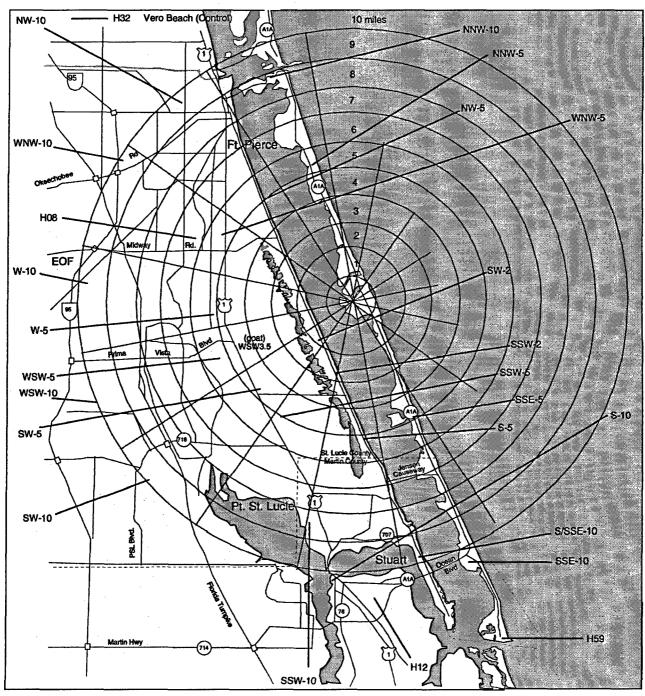

h. The garden is just 500 square feet; it is a herb garden in a residence's backyard. The owner is unwilling to provide a sample; field sampling technician feels garden is incapable of supplying sufficient sample to satisfy LLD requirements. It is not included in the REMP program.

Total: 189

### NOTE:

Measurement results having magnitudes that are significantly above the background of the measurement system are reported as net values plus or minus a one-standard-deviation error term. Measurement results that are <u>not</u> significantly above background are reported as less than a Lower Limit of Detection (<LLD), which is an estimated upper limit (with at least 95% confidence) for the true activity in the sample.

The marine fauna listed in this report were collected in part, under Florida FWC SAL030.

<sup>(</sup>A) These tabulated LLD values for Zr/Nb-95 are the higher of the individual parent or daughter LLDs.

<sup>(</sup>B) These tabulated LLD values are for Ba-140, either based on direct measurement of Ba-140 or based on ingrowth of La-140, whichever method yields the greater sensitivity for a given sample.

Total: 182

NOTE: Measurement results having magnitudes that are significantly above the background of the measurement system are reported as net values plus or minus a one-standard-deviation error term. Measurement results that are <u>not</u> significantly above background are reported as less than a Lower Limit of Detection (<LLD), which is an estimated upper limit (with at least 95% confidence) for the true activity in the sample.

The marine fauna listed in this report were collected in part, under Florida FWC SAL030.

<sup>(</sup>A) These tabulated LLD values for Zr/Nb-95 are the higher of the individual parent or daughter LLDs.

<sup>(</sup>B) These tabulated LLD values are for Ba-140, either based on direct measurement of Ba-140 or based on ingrowth of La-140, whichever method yields the greater sensitivity for a given sample.

#### 3.b. SHORELINE SEDIMENT - (pCi/kg, dry weight)

Sample Collection

Site Date Be-7 K-40 Co-58 Co-60 Cs-134 Cs-137 Pb-210 Ra-226 Th-232 U-238

These samples were previously collected.

#### 4.a.1. CRUSTACEA - (pCi/kg, wet weight)

Sample Collection Site \_Date\_ K-40 <u>Mn-54</u> Co-58 Fe-59 Co-60 Zn-65 Cs-134 Cs-137 Ra-226 Ra-228 H15 23-Apr-04 1481 ± 104 <10 <10 <22 <11 <20 <11 <10 <190 <37 H59 This sample was previously collected.

#### 4.a.2. FISH - (pCi/kg, wet weight)

Sample Collection
Site Date K-40 Mn-54 Co-58 Fe-59 Co-60 Zn-65 Cs-134 Cs-137 Ra-226 Ra-228

These samples were previously collected.

### 4.b. BROADLEAF VEGETATION - Brazilian Pepper - (pCi/kg, wet weight)

Total: 186

NOTE: Measurement results having magnitudes that are significantly above the background of the measurement system are reported as net values plus or minus a one-standard-deviation error term. Measurement results that are <u>not</u> significantly above background and with greater than a 50% error term are reported as less than a Lower Limit of Detection (<LLD), which is an estimated upper limit (with at least 95% confidence) for the true activity in the sample.

The marine fauna listed in this report were collected in part, under Florida FWC SAL030.

# 1. DIRECT RADIATION - TLDs - (µR/hour)

 <sup>(</sup>A) These tabulated LLD values for Zr/Nb-95 are the higher of the individual parent or daughter LLDs.
 (B) These tabulated LLD values are for Ba-140, either based on direct measurement of Ba-140 or based on ingrowth of La-140, whichever method yields the greater sensitivity for a given sample.

Total: 182

NOTE: Measurement results having magnitudes that are significantly above the background of the measurement system are reported as net values plus or minus a one-standard-deviation error term. Measurement results that are <u>not</u> significantly above background are reported as less than a Lower Limit of Detection (<LLD), which is an estimated upper limit (with at least 95% confidence) for the true activity in the sample.

The marine fauna listed in this report were collected in part, under Florida FWC SAL030.

<sup>(</sup>A) These tabulated LLD values for Zr/Nb-95 are the higher of the individual parent or daughter LLDs.

<sup>(</sup>B) These tabulated LLD values are for Ba-140, either based on direct measurement of Ba-140 or based on ingrowth of La-140, whichever method yields the greater sensitivity for a given sample.

#### From the MAPEP handbook:

Acceptance criteria were developed from a review of precision and accuracy data compiled by other PEPs, the analytical methods literature, from several MAPEP pilot studies, and from what is considered reasonable, acceptable, and achievable for routine analyses among the more experienced laboratories.
