Annual Radiological Environmental Operating Report

This report is submitted in accordance with Section 5.9.4.b of the Technical Specifications of Fort Calhoun Station Unit No. 1, Facility Operating License DPR-40 for the period January 01, 2006 through December 31, 2006.

In addition, this report provides any observations and anomalies that occurred during the monitoring period.

Annual Radiological Environmental Operating Report

In accordance with Technical Specification 5.9.4.b, herein is the Fort Calhoun Station (FCS) Annual Radiological Environmental Operating Report for year 2006. The data provided is consistent with the objectives as specified in Section 5.2.2 of the Offsite Dose Calculation Manual (ODCM), "Annual Radiological Environmental Operating Report." The report is presented as follows:

- 1) An introductory discussion of the implementation of the Radiological Environmental Monitoring Program (REMP), including program observations and environmental impact relevant to the operation of FCS.
- 2) The sample class, sample collection frequency, number of sample locations, and the number of samples collected this reporting period for each parameter are delineated in Table 1.0.
- 3) A statistical evaluation of REMF data is summarized in Table 2.0, in accordance with Regulatory Guide 4.8, Table 1. For each type of sample media and analysis, Table 2.0 presents data separately for all **indicator** locations, all **control** (background) locations, and the location having the highest annual mean result. For each of these classes, Table 2.0 specifies the following:
 - a. The total number of analyses
 - b. The fraction of analyses yielding detectable results (i.e., results above the highest Lower Limit of Detection (LLD) for this period
 - c. The maximum, minimum, and average results
 - d. Locations with the highest annual mean are specified by code, name, and by distance and direction from the center of plant reactor containment building
- 4) Table 3.0 is a listing of missed samples and explanations
- 5) Table 4.0 is the 2006 Land Use Survey
- 6) Review of Environmental Inc. Quality Assurance Program
- 7) Appendix A describes the Interlaboratory Comparison Program
- 8) Appendix B describes the vendor Data Reporting Conventions utilized
- 9) Appendix C reports the information required when primary coolant specific activity has exceeded the limits of Technical Specification 2.1.3
- 10) Appendix D is the Sample Location Maps

INTRODUCTION

Radiological Environmental Monitoring Program (REMP) – 2006

This report gives the results of the Radiological Environmental Monitoring Program (REMP) for the year 2006. The REMP is a requirement of the Fort Calhoun Station (FCS) operating license. It was initiated prior to plant operation in 1973.

The main purpose of the REMP is to ensure public safety by monitoring plant discharges and assessing the effect, if any, of plant operations, on the environment. Samples are collected that would account for various exposure pathways such as ingestion, inhalation, adsorption and direct exposure. Samples collected on a regular basis include: air, water, milk, vegetation, fish, sediment, food crops, and field crops. Direct radiation is measured by thermoluminescent dosimeters (TLDs). These samples and TLDs are sent to an independent vendor laboratory for analysis. The vendor uses analytical methods that are sensitive enough to detect a level of activity far below that which would be considered harmful. Locations for sample collection are based on radiological and meteorological data from the Annual Radiological Effluent Release Report and information obtained from the Environmental Land Use Survey.

Most samples, particularly indicator samples, are collected in a circular area within a five-mile radius of plant containment. (However, control locations are usually outside of five miles.) This circle is divided into sixteen equal sectors, each assigned an identification letter "A" through "R" (note: letters "I" and "O" are not used, as they may be mistaken for the numbers "1" and "0"). Sector "A" is centered on North or zero degrees. Sectors are also given directional labels such as "West-Southwest" ("WSW"). Sample locations are listed by number along with their respective distances and direction from plant containment, in the Offsite Dose Calculation Manual (ODCM).

When assessing sample results, data from indicator locations (those most likely to be affected by plant operations) are compared to those from control locations (those least or not likely to be effected). Results from an indicator location which were significantly higher than those from a control location, could indicate a plant-attributable effect, and could require additional investigation.

The results of the sample analyses, as required by the ODCM, are presented in the attached statistical tables in accordance with Table 1 of Regulatory Guide 4.8, "Environmental Technical Specifications for Nuclear Power Plants." Sample collection was conducted by plant chemistry/environmental staff. A contract vendor (Environmental Inc., Northbrook, Illinois) performed sample analyses, preparation of monthly reports and the statistical evaluation of sample results. All vendor analysis techniques met the sensitivity requirements as stated in the ODCM.

Results for 2006 were within expected ranges and compared closely with historical results. The following is a review of specific sample results.

1) **Ambient Gamma Radiation**

Ambient gamma radiation is measured by thermoluminescent dosimeters (TLDs) provided by the vendor laboratory. These dosimeters contain calcium sulfate phosphors and are processed quarterly.

All results for 2006 were within historical ranges. The indicator locations had results ranging from 1.2 to 1.8 mrem per week. The control location (OTD-L) had an annual mean of 1.3 mrem per week. Results from indicator locations are within the range of results from the control location. No plant-attributable results were observed.

2) **Milk/Pasture**

Milk samples are collected every two weeks from the beginning of May through September when dairy animals are in pasture. Indicator samples are collected from a herd of milk goats at a family farm located approximately 0.7 miles from the plant in Sector K (South-Southwest). The control samples are collected from a commercial dairy cow herd located approximately 9.9 miles from the plant in Sector J (South). These locations are unchanged from last year. There were no missed milk samples this year, therefore, no pasture samples were needed.

The milk sample collected from Bansen Farm on June 30, 2006, had some leakage during shipping. Final sample volume was 0.6 liter. Enough sample volume was available to determine appropriate LLD.

All milk sample results for Iodine-131, Cesium-134, Cesium-137 and other gammas were less than LLD for both indicator and control locations. No plant-related effects were observed.

3) **Fish**

Fish are collected on an annual basis. Control samples are collected at a location approximately twenty miles upstream of the plant (river miles 665-667). Indicator samples are collected in the immediate vicinity of the power plant (river miles 644-646). Several species of fish, important to commercial and recreational interest, representing all levels of the aquatic food chain are collected at both locations. Results from both locations were less than LLD for all gamma emitters, indicating no plant-related effects.

4) **Food Crops**

Food crops samples are collected from three locations annually, two indicator locations and one control location. Based on the results of the 2006 Land Use Survey, the nearest high deposition pathway for food crops is the Ellis Acreage in Sector J (0.74 miles, 182°). Accordingly, vegetable samples were collected at Ellis Acreage for the purposes of the 2006 REMP. All results were less than LLD for all isotopes. No plant-related effects were observed.

5) **Onsite Field Crops**

In addition, onsite field crops were sampled near the plant boundary in Sector F (0.52 miles, 118°).

Sample results were comparable with historical results and within the range of results reported from the control location garden at Mohr Dairy in Sector J (9.86 miles, 186°). All results were less than LLD for all isotopes. No plant-related effects were observed.

6) **Sediment**

River sediment samples are collected twice a year at an upstream control location and a downstream indicator location. All results were less than LLD, and no plant-related effects were observed.

7) **Air Monitoring**

Air sample results for 2006 were well within historical limits for all locations. Additionally, all indicator locations showed results very similar to the control location. No plant-related effects were observed.

Three incidents were reported to the Plant Corrective Action Group in 2006 relating to air sampling problems. Each is discussed below.

When samples were being collected on February 8, 2006, it was found that the ground-fault interrupt (GFI) switch had tripped at location OAP-K-(I) after only 45 hours of run time. This resulted in a sample volume of only 155 cubic meters. The sample was analyzed and activity calculated for actual volume, yielding a Beta result of 0.017 pCi/L. This result is within the historical range of all sample locations. This sample was handled in accordance with the ODCM Section 4.1.1A(7) which addresses lost and non-standard samples. No significant airborne effluents were discharged from the plant during the time period in question. There were no violations of the ODCM or regulatory requirements. There was no effect on public safety or the Public Radiation Safety Cornerstone.

When the technician arrived at location OAP-K-(I) to change out the GFI switch on February 28, they found it had again tripped off after 70.32 hours of run time. The GFI was replaced and the system checked back to the transformer for potential grounds. In addition to the suspected malfunctioning GFI, a loose side lug was found in the meter. This could have contributed to the GFI tripping. The unit was re-started after repairs and monitored daily to verify continuous operation. The sample was collected at the regular day and time. Total sample collection time was 92.12 hours and total sample volume was 313 cubic meters. Sample activity was calculated accordingly, yielding a result of 0.040 pCi/L, which is within historical seasonal results. There was no violation of ODCM or regulatory requirements. The sample was completed in accordance with the ODCM Section 4.1.1A(7) which addresses lost or non-standard samples. There was no effect on public safety of the Public Radiation Safety Cornerstone.

On July 27, 2006, when the technician arrived at location OAP-B-(I), the rotometer on the air pump was showing a flow of 2.5 cubic feet per minute. The technician replaced the pump and returned the potentially malfunctioning pump to the instrument shop. When the pump was tested with the Teledyne flow standard equipment, to verify actual flow, it was found to be operating at 2.07 cubic feet per minute, well within the acceptance criteria. The self-contained rotometers on the air pumps are known to have a degree of accuracy problems. They are also subjected to temperature changes, humidity, and the potential for in-leakage of fine dust particles. As a result, the Teledyne flow standard equipment is considered the determiner of actual flow rates. Since actual flow rates were within limits, no correction was needed to sample volume results and this is considered a rotometer problem only.

8) **Surface Water**

Water samples are collected upstream of the plant (control location) as well as half-mile downstream, and at a municipal water treatment plant on the north edge of Omaha.

Results for Cs-134, Cs-137, and other gammas were all less than LLD. Tritium results were also less than LLD. No plant-related effects were detected.

9) **Ground Water**

Ground water monitoring for tritium is performed per the Site Ground Water Protection Program. Analysis results for ground water samples collected are presented in the 2006 Annual Radiological Effluent Release Report.

^a GB = gross beta, GS = gamma scan.

^b LLD = nominal lower limit of detection based on a 95% confidence level.

^c Mean and range are based on detectable measurements only (i.e., >LLD) Fraction of detectable measurements at specified locations is indicated in parentheses (F).

^d Locations are specified: (1) by code, (2) by name, and (3) by distance and direction relative to the Reactor Containment Building.

^e Non-routine results are those which exceed ten times the control station value. If no control station value is available, the result is considered non-routine if it exceeds the typical pre-operational value for the medium or location.

Table 3.0 Listing of Missed Samples (samples scheduled but not collected)

Sample Type	Date	Location	Reason
-------------	------	----------	--------

All required samples for the REMP were collected as scheduled for 2006.

Review of Environmental Inc., Quality Assurance Program

Fort Calhoun Station contracts with Environmental Inc., Midwest Laboratory (vendor) to perform radioanalysis of environmental samples. Environmental Inc. participates in interlaboratory comparison (cross-check) programs, as part of its quality control program. These programs are operated by agencies such as the Department of Energy, which supply blind-spike environmental type samples such as milk or water containing concentrations of radionuclides unknown to the testing laboratory. This type of program provides an independent check of the analytical laboratory's procedures and processes, and provides indication of possible weaknesses. In addition, Environmental Inc. has its own in-house QA program of blind-spike and duplicate analyses.

Of the 52 samples analyzed in the Interlaboratory Comparison Crosscheck program, one had a failed result. An I-131 sample was analyzed three times, with an average result of 28.4 ± 1.2 pCi/L. Control limits were 16.9 – 27.3 pCi/L. When the sample was analyzed a fourth time and re-averaged, results were 24.89 pCi/L and were within limits. These QA results had no impact on Fort Calhoun sample results.

The vendor laboratory performed approximately 168 In-House duplicate samples for the year. Of these, two were listed as failures, a Gross Beta sample and a K-40 sample. The vendor reviewed their results, and determined that the failures were due to a 200-minute or longer count time, which resulted in a lower error. The vendor investigated and reported the results properly. These sample results had no impact on Fort Calhoun sample results.

The vendor laboratory also participated in the Department of Energy's Mixed Analyte Performance Evaluation Program. Of the 106 samples submitted to the vendor, six failed the acceptance criteria. These samples contained Pu-238, Pu-239/40, U-233/4 and U-238. The vendor investigated and determined that the cause of the failures was due to the incomplete dissolution of the samples. When four of the samples, which were of soil, were re-analyzed, the results were satisfactory. These test results had no impact on Fort Calhoun samples and were documented by the vendor.

APPENDIX A

INTERLABORATORY COMPARISON PROGRAM RESULTS

NOTE: Environmental Inc., Midwest Laboratory participates in intercomparison studies administered by Environmental Resources Associates, and serves as a replacement for studies conducted previously by the U.S. EPA Environmental Monitoring Systems Laboratory, Las Vegas, Nevada. Results are reported in Appendix A. TLD Intercomparison results, in-house spikes, blanks, duplicates and mixed analyte performance evaluation program results are also reported. Appendix A is updated four times a year; the complete Appendix is included in March, June, September and December monthly progress reports only.

January, 2006 through December, 2006

Appendix A

Interlaboratory Comparison Program Results

Environmental, Inc., Midwest Laboratory has participated in interlaboratory comparison (crosscheck) programs since the formulation of its quality control program in December 1971. These programs are operated by agencies which supply environmental type samples containing concentrations of radionuclides known to the issuing agency but not to participant laboratories. The purpose of such a program is to provide an independent check on a laboratory's analytical procedures and to alert it of any possible problems.

Participant laboratories measure the concentration of specified radionuclides and report them to the issuing agency. Several months later, the agency reports the known values to the participant laboratories and specifies control limits. Results consistently higher or lower than the known values or outside the control limits indicate a need to check the instruments or procedures used.

Results in Table A-1 were obtained through participation in the environmental sample crosscheck program administered by Environmental Resources Associates, serving as a replacement for studies conducted previously by the U.S. EPA Environmental Monitoring Systems Laboratory, Las Vegas, Nevada.

The results in Table A-2 list results for thermoluminescent dosimeters (TLDs), via International Intercomparison of Environmental Dosimeters, when available, and internal laboratory testing.

Table A-3 lists results of the analyses on in-house "spiked" samples for the past twelve months. All samples are prepared using NIST traceable sources. Data for previous years available upon request.

Table A-4 lists results of the analyses on in-house "blank" samples for the past twelve months. Data for previous years available upon request.

Table A-5 list results of the in-house "duplicate" program for the past twelve months. Acceptance is based on the difference of the results being less than the sum of the errors. Data for previous years available upon request.

The results in Table A-6 were obtained through participation in the Mixed Analyte Performance Evaluation Program.

Attachment A lists acceptance criteria for "spiked" samples.

Out-of-limit results are explained directly below the result.

Attachment A

ACCEPTANCE CRITERIA FOR "SPIKED" SAMPLES

LABORATORY PRECISION: ONE STANDARD DEVIATION VALUES FOR VARIOUS ANALYSES^a

Analysis	Level	One standard deviation for single determination
Gamma Emitters	5 to 100 pCi/liter or kg > 100 pCi/liter or kg	5.0 pCi/liter 5% of known value
Strontium-89 ^b	5 to 50 pCi/liter or kg > 50 pCi/liter or kg	5.0 pCi/liter 10% of known value
Strontium-90 ^b	2 to 30 pCi/liter or kg > 30 pCi/liter or kg	5.0 pCi/liter 10% of known value
Potassium-40	≥ 0.1 g/liter or kg	5% of known value
Gross alpha	≤ 20 pCi/liter > 20 pCi/liter	5.0 pCi/liter 25% of known value
Gross beta	≤ 100 pCi/liter > 100 pCi/liter	5.0 pCi/liter 5% of known value
Tritium	≤ 4,000 pCi/liter > 4,000 pCi/liter	± 1σ = (pCi/liter) = 169.85 x (known) ^{0.0933} 10% of known value
Radium-226,-228	≥ 0.1 pCi/liter	15% of known value
Plutonium	≥ 0.1 pCi/liter, gram, or sample	10% of known value
Iodine-131, Iodine-129 ^b	≤ 55 pCi/liter > 55 pCi/liter	6.0 pCi/liter 10% of known value
Uranium-238, Nickel-63 ^b Technetium-99 ^b	≤ 35 pCi/liter > 35 pCi/liter	6.0 pCi/liter 15% of known value
Iron-55 ^b	50 to 100 pCi/liter > 100 pCi/liter	10 pCi/liter 10% of known value
Others ^b	---	20% of known value

^a Results obtained by Environmental, Inc., Midwest Laboratory as a participant in the crosscheck program for proficiency testing in drinking water conducted by Environmental Resources Associates (ERA).

^b Unless otherwise indicated, the laboratory result is given as the mean ± standard deviation for three determinations.

^c Results are presented as the known values, expected laboratory precision (1 sigma, 1 determination) and control limits as provided by ERA.

^d The reported result was an average of three analyses, results ranged from 25.36 to 29.23 pCi/L. A fourth analysis was performed, result of analysis, 24.89 pCi/L.

^a Liquid sample results are reported in pCi/Liter, air filters(pCi/filter), charcoal (pCi/m³), and solid samples (pCi/g).

^b Laboratory codes as follows: W (water), MI (milk), AP (air filter), SO (soil), VE (vegetation), CH (charcoal canister), F (fish).

^c Results are based on single determinations.

^d Control limits are based on Attachment A, Page A2 of this report.

NOTE: For fish, Jello is used for the Spike matrix. For Vegetation, cabbage is used for the Spike matrix.

^a Liquid sample results are reported in pCi/Liter, air filters(pCi/filter), charcoal (pCi/charcoal canister), and solid samples (pCi/kg).

^b I-131(G); iodine-131 as analyzed by gamma spectroscopy.

^c Activity reported is a net activity result. For gamma spectroscopic analysis, activity detected below the LLD value is not reported

^d Low levels of Sr-90 are still detected in the environment. A concentration of (1-5 pCi/L) in milk is not unusual.

Note: Duplicate analyses are performed on every twentieth sample received in-house. Results are not listed for those analyses with activities that measure below the LLD.

^a Results are reported in units of pCi/L, except for air filters (pCi/Filter), food products, vegetation, soil, sediment (pCi/g).

^b 200 minute count time or longer, resulting in lower error.

^a Results obtained by Environmental, Inc., Midwest Laboratory as a participant in the Department of Energy's Mixed Analyte Performance Evaluation Program, Idaho Operations office, Idaho Falls, Idaho

^b Results are reported in units of Bq/kg (soil), Bq/L (water) or Bq/total sample (filters, vegetation).

^c Laboratory codes as follows: STW (water), STAP (air filter), STSO (soil), STVE (vegetation).

^d MAPEP results are presented as the known values and expected laboratory precision (1 sigma, 1 determination) and control limits as defined by the MAPEP.

^e Included in the MAPEP as a false positive.

^f Difficulties with the analyses for transuranics isotopes in solid samples (Filters, Soil and vegetation), were attributed to incomplete dissolution of the samples. Soil samples were repeated, results of reanalyses: Pu-238, 53.1 ± 5.3 bq/kg. Pu-239/240, 42.4 ± 4.7 bq/kg. U-233/4, 33.3 ± 3.5 bq/kg. U-238, 35.5 ± 3.6 bq/kg.

^g The July vegetation sample was provided in two separate geometries, (100 ml. and 500 ml.). Results reported here used the 500 ml. standard size geometry. Results for the 100 ml. geometry showed approximately a 15% higher bias.

APPENDIX B

DATA REPORTING CONVENTIONS

Data Reporting Conventions

1.0. All activities, except gross alpha and gross beta, are decay corrected to collection time or the end of the collection period.

2.0. Single Measurements

Each single measurement is reported as follows: $x \pm s$

where: x = value of the measurement;

s = 2s counting uncertainty (corresponding to the 95% confidence level).

In cases where the activity is less than the lower limit of detection L , it is reported as: $<L$, where L = the lower limit of detection based on 4.66s uncertainty for a background sample.

3.0. Duplicate analyses

3.1 Individual results: For two analysis results; $x_1 \pm s_1$ and $x_2 \pm s_2$

Reported result: $x \pm s$; where $x = (1/2)(x_1 + x_2)$ and $s = (1/2)\sqrt{s_1^2 + s_2^2}$

3.2. Individual results: $<L_1, <L_2$ Reported result: $<L$, where L = lower of L_1 and L_2

3.3. Individual results: $x \pm s, <L$ Reported result: $x \pm s$ if $x \geq L$; $<L$ otherwise.

4.0. Computation of Averages and Standard Deviations

4.1 Averages and standard deviations listed in the tables are computed from all of the individual measurements over the period averaged; for example, an annual standard deviation would not be the average of quarterly standard deviations. The average \bar{x} and standard deviation s of a set of n numbers $x_1, x_2 \dots x_n$ are defined as follows:

$$\bar{x} = \frac{1}{n} \sum x \qquad s = \sqrt{\frac{\sum (x - \bar{x})^2}{n-1}}$$

4.2 Values below the highest lower limit of detection are not included in the average.

4.3 If all values in the averaging group are less than the highest LLD, the highest LLD is reported.

4.4 If all but one of the values are less than the highest LLD, the single value x and associated two sigma error is reported.

4.5 In rounding off, the following rules are followed:

4.5.1. If the figure following those to be retained is less than 5, the figure is dropped, and the retained figures are kept unchanged. As an example, 11.443 is rounded off to 11.44.

4.5.2. If the figure following those to be retained is equal to or greater than 5, the figure is dropped and the last retained figure is raised by 1. As an example, 11.445 is rounded off to 11.45.

4.6 Composite samples which overlap the next month or year are reported for the month or year in which most of the sample is collected.

APPENDIX C

TECHNICAL SPECIFICATION 2.1.3

REACTOR COOLANT DOSE EQUIVALENT IODINE
ABOVE TECHNICAL SPECIFICATION LIMIT

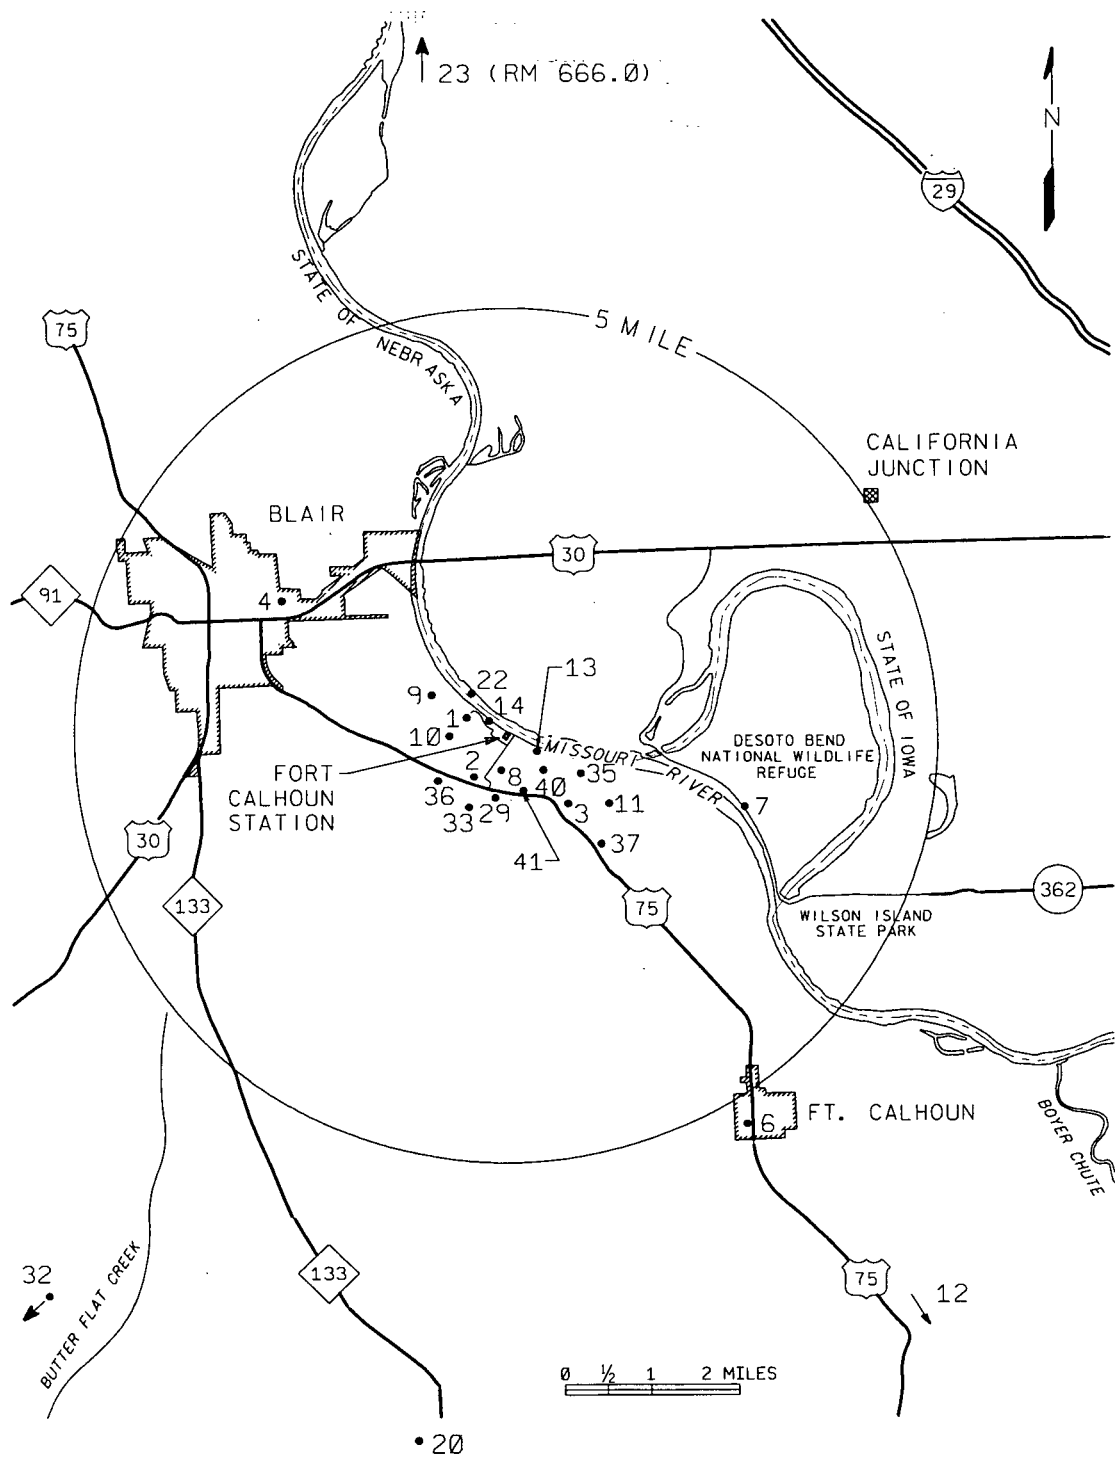

During the 2006 reporting period, radioactivity of primary coolant did not exceed the limits of Technical Specification 2.1.3.
