## **PREFACE**

This report covers the period of January 1 through December 31, 2008. Personnel of the Nebraska Public Power District made all sample collections. Analyses were performed and reports of analyses were prepared by Teledyne Brown Engineering – Environmental Services and forwarded to Nebraska Public Power District. Environmental Thermoluminescent Dosimeter (TLD) analyses were performed and reports of analyses were prepared by Global Dosimetry Solutions.

- **SECTION I. INTRODUCTION**

## **I. INTRODUCTION**

This report contains a complete tabulation of data collected during the period January through December 2008, for the operational Radiological Environmental Monitoring Program performed for the Cooper Nuclear Station (CNS) of the Nebraska Public Power District (NPPD) by Teledyne Brown Engineering - Environmental Services.

Cooper Nuclear Station is located in Nemaha County in the southeast corner of Nebraska on the Missouri River. A portion of the site extends into Missouri. The reactor is an 805-megawatt (net electrical) boiling water reactor. Initial criticality was attained on February 21, 1974.

Radiological environmental monitoring began in 1971 before the plant became operational and has continued to the present. The program monitors radiation levels in air, terrestrial and aquatic environments. All samples are collected by NPPD personnel. All samples are shipped for analysis to a contractor's laboratory where there exists special facilities required for measurements of extremely low levels of radioactivity. Teledyne Brown Engineering - Environmental Services has the responsibility for the analyses for Cooper Nuclear Station.

The United States Nuclear Regulatory Commission (USNRC) regulations (10CFR50.34a) require that nuclear power plants be designed, constructed, and operated to keep levels of radioactive material in effluents to unrestricted areas as low as is reasonably achievable (ALARA). Inplant monitoring is used to ensure that release limits are not exceeded. As a precaution against unexpected or undefined environmental processes, which might allow undue accumulation of radioactivity in the environment, a program for monitoring the plant environs is included in NPPD's CNS Offsite Dose Assessment Manual (ODAM).

### **A. Atmospheric Nuclear Tests**

Three atmospheric nuclear detonations in the People's Republic of China influenced program results significantly in late 1976 and in 1977. Two of these detonations occurred in late 1976 (September 26 and November 17) and one in late 1977 (September 17). As a consequence of these tests elevated activities of gross beta in air particulate filters and I-131 in milk were observed throughout most of the United States. No atmospheric nuclear tests have been conducted since 1980, thus no short-lived fission products were detected in air particulate samples.

On April 26, 1986 the fire and explosion of Chernobyl Reactor No. 4 in the Soviet Union resulted in the release of fission products to the atmosphere and worldwide fallout. Following the explosion, elevated levels of gross beta activities in air particulates and Iodine-131 in charcoal filters and milk samples were measured. Additionally, in 1986, Cesium-137 and the short-lived radionuclides Iodine-131, Ruthenium-106, and Cesium-134 were detected in broadleaf vegetation. Similar results occurred in other areas of the United States and the entire Northern Hemisphere.

### **B. Program Objectives and Data Interpretation**

The objective of the monitoring program is to detect and assess the impact of possible releases to the environs of radionuclides from the operations of the Cooper Nuclear Station. This objective requires measurements of low levels of radioactivity equal to or lower than pre-determined limits of detection. In addition the source of the environmental radiation must be established. Sources of environmental radiation include:

- (1) Natural background radiation from cosmic rays (Beryllium-7).
- (2) Terrestrial, primordial radionuclides from the environment (potassium-40, radium-226, thorium-228).
- (3) Fallout from atmospheric nuclear tests such as the September 1977 detonation by the Peoples' Republic of China and the atmospheric weapons test of October 16, 1980 (fission products and fusion products).
- (4) Releases from nuclear power plants such as CNS (fission products and neutron activation products).
- (5) Fallout from the Chernobyl Nuclear Reactor Accident.

Radiation levels measured in the vicinity of an operating power station are compared with preoperational measurements at the same locations to distinguish power plant effects from other sources. Also, results of the monitoring program are related to events known to cause elevated levels of radiation in the environment, e.g., atmospheric nuclear detonations or abnormal plant releases.

**SECTION II. SUMMARY**

## II. SUMMARY

Presented in this report are summaries and discussions of the data generated for the Radiological Environmental Monitoring Program (REMP) for the Cooper Nuclear Station (CNS) of the Nebraska Public Power District (NPPD) for 2008.

The sampling and analyses program is described in Section III. It contains the sampling schedule and required analyses in Table 1 and the site map.

A discussion of each type of sample analyzed and its impact, if any, on the environment is presented in Section IV. Included are graphs of the radionuclides of interest for the past several years and the statistical results for each quarter of the year.

Section V presents the yearly conclusions of the program.

Section VI is the Radiological Environmental Monitoring Program Summary. It contains the yearly summary of the program with the total number of samples of each type analyzed. It lists the yearly average and range for the control locations versus the indicator locations and the number of detections per total number of samples. It identifies the station with the highest yearly average, the distance and location of that station and provides the range of detection.

Section VII contains the complete data tables for the period.

References are presented in Section VIII.

**SECTION III. SAMPLING AND ANALYSES PROGRAM**

### III. SAMPLING AND ANALYSES PROGRAM

The 2008 sampling and analyses program is described in Table 1. Teledyne Brown Engineering - Environmental Services has a comprehensive quality assurance/quality control program designed to assure the reliability of data obtained. The results for the 2008 Interlaboratory Comparison Program conducted by the Analytics', Inc., MAPEP and Environmental Resource Associates are contained in Appendix B.

Sampling locations are indicated in the map labeled Figure 1. The sample types collected at each location and the approximate distance and direction from the reactor elevated release point are specified.

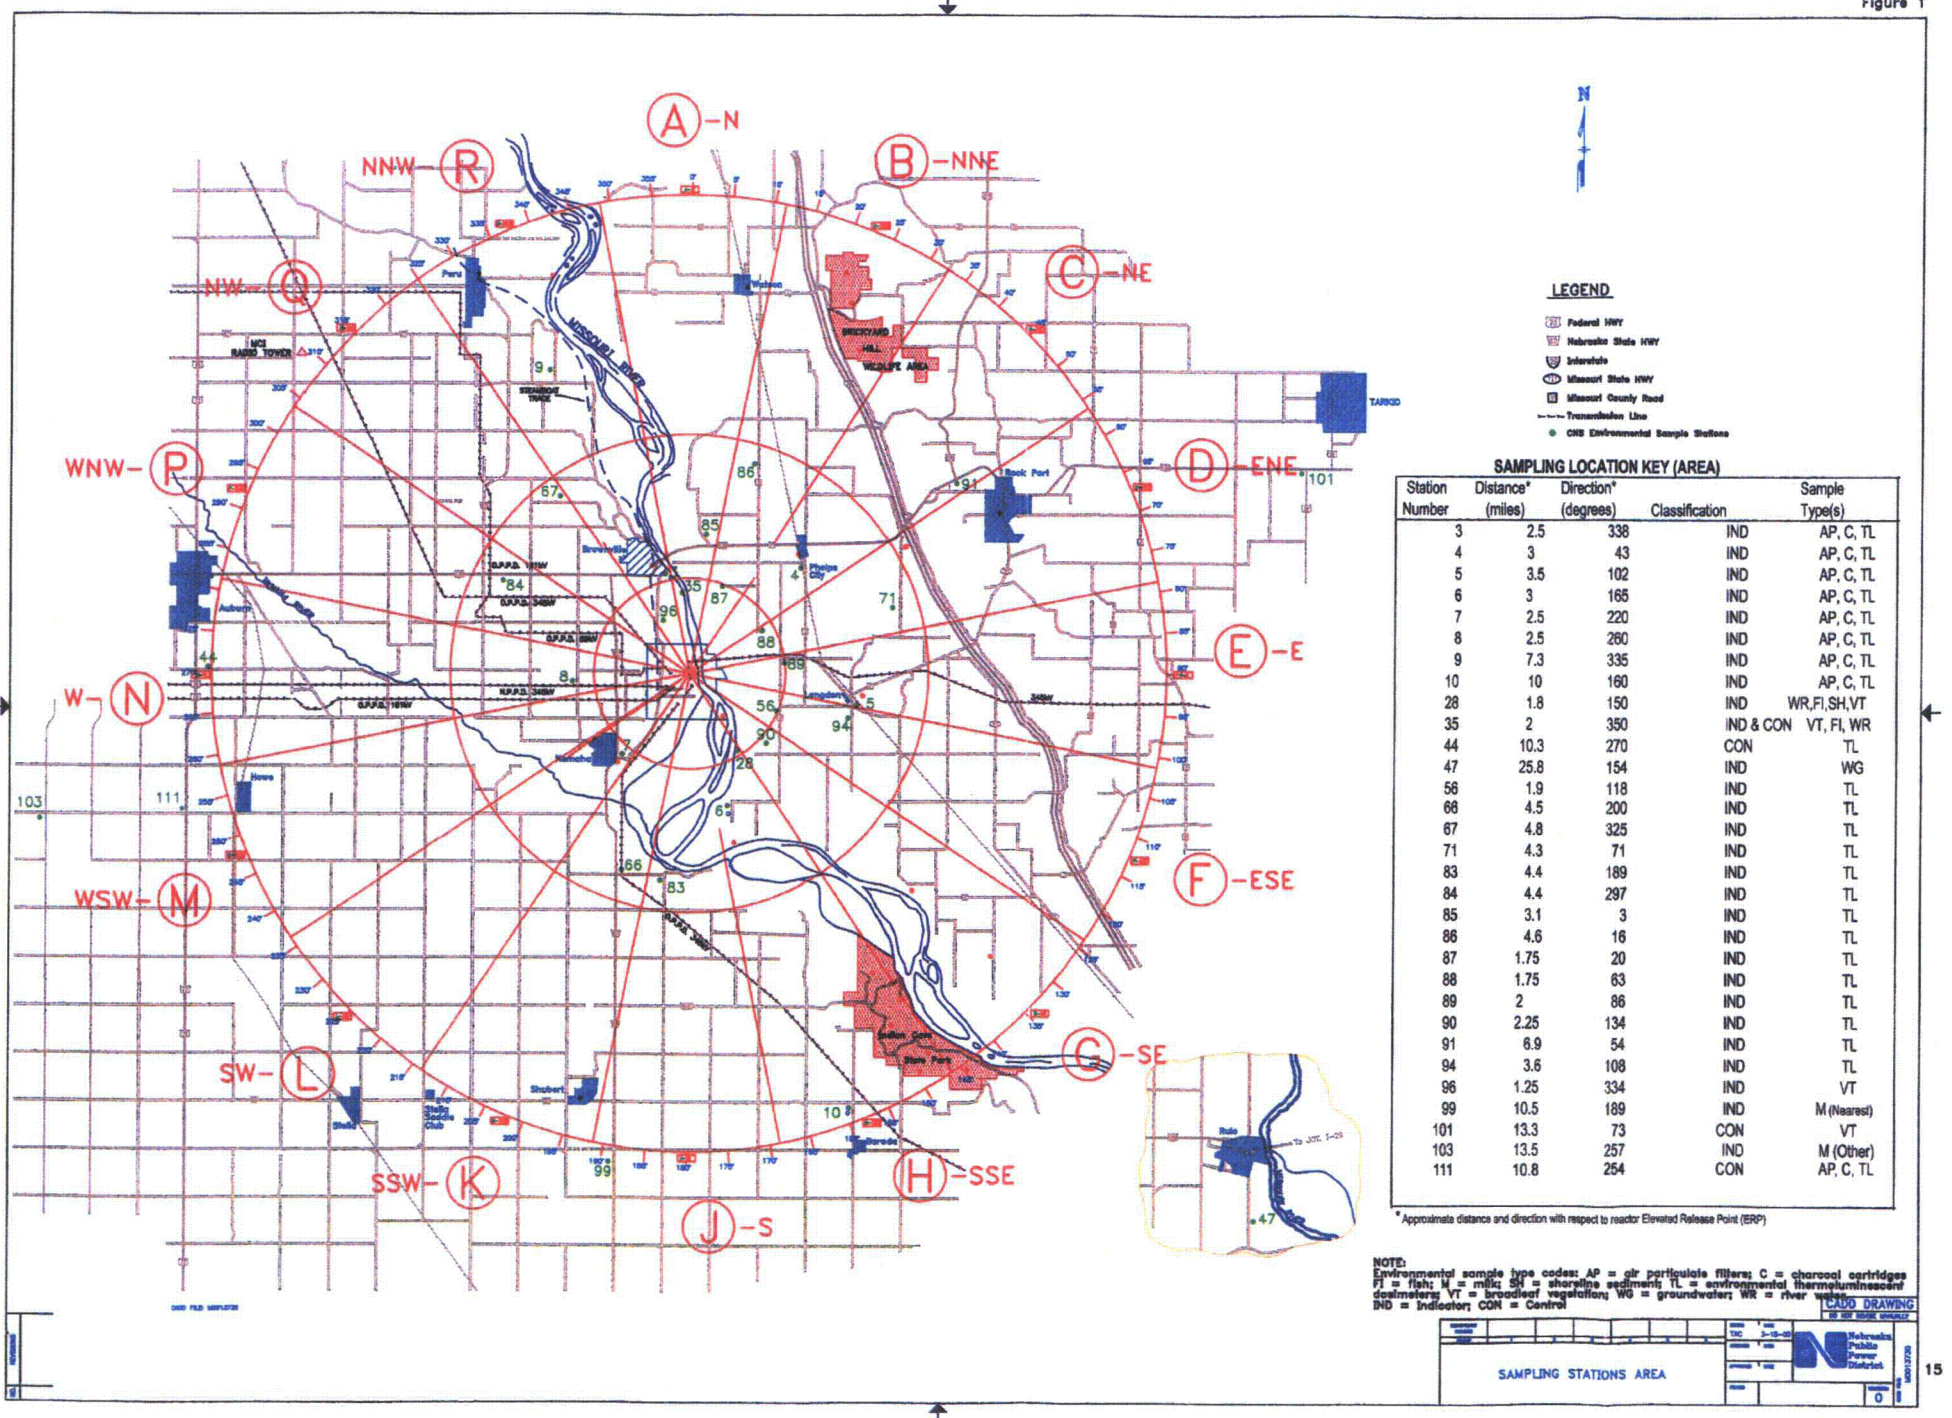

The annual land use census for 2008 is described in Appendix A. There were no milk animals found within three miles of CNS in 2008 and no evidence of potable water use from the river. The nearest garden to CNS is in sector L, 1.3 mile from CNS. Gardens were found in nine sectors during 2000, in eight sectors during 2001, in seven sectors during 2002, in eight sectors during 2003, in nine sectors during 2004, in five sectors during 2005, in nine sectors during 2006, in seven sectors during 2007 and in six sectors during 2008. The nearest resident to CNS is in sector Q, 0.9 miles from CNS.

All of the required 2008 environmental monitoring, including sampling and analyses, was conducted as specified in Table D4.1-1 of the CNS Offsite Dose Assessment Manual (ODAM), except as noted in Appendix E, REMP Sampling and Analytical Exceptions table.

**TABLE 1**

**NEBRASKA PUBLIC POWER DISTRICT**  
**COOPER NUCLEAR STATION**  
*Environmental Radiation Surveillance Program*  
*Sampling Schedule and Analyses*

<b>Sample Type</b>	<b>Station</b>	<b>Frequency</b>	<b>Analyses</b>
Airborne/ Particulate	1-10, 111	Once per 7 days	Gross beta. Gamma Isotopic on quarterly composite of each station, and on each sample in which gross beta activity is >10 times the yearly mean of control samples
Airborne/Iodine	1-10, 111	Once per 7 days	I-131
Milk / Nearest Producer peak pasture only	99	Once per 15 days	I-131 (low level), Gamma Isotopic analysis of each sample
River Water	28, 35	Once per 31 days	Gamma Isotopic, each sample Tritium on quarterly composite
Milk/ Nearest Producer Non-peak pasture	99	Once per 31 days	I-131 (low level), Gamma Isotopic analysis of each sample
Food Products / Broadleaf Vegetation	28, 35, 96, 101	Monthly when required	I-131 (low level), Gamma Isotopic analysis of each sample
Background Radiation Thermoluminescent Dosimeters	1-10, 20, 44, 56, 58, 59, 66, 67, 71, 79-91, 94, 111	Once per 92 days	TLD Readout (gamma dose)
Groundwater	11, 47	Once per 92 days	I-131 (low level), Gamma Isotopic, Tritium
Milk Other Producers	103	Once per 92 days	I-131 (low level), Gamma Isotopic
Fish (Summer and Fall)	28, 35	Two times per year	Gamma Isotopic on edible portions
Shoreline Sediment	28, 35	Two times per year	Gamma Isotopic

**SECTION IV. SUMMARY AND DISCUSSION OF 2008 ANALYTICAL RESULTS**

#### **IV. SUMMARY AND DISCUSSION OF 2008 ANALYTICAL RESULTS**

Data from the radiological analyses of environmental media collected during 2008 are tabulated and discussed below. The procedures and specifications followed in the laboratory for these analyses are as required in the Teledyne Brown Engineering Quality Assurance manual and are explained in the Teledyne Brown Engineering Analytical Procedures. A synopsis of analytical procedures used for the environmental samples is provided in Appendix C. In addition to internal quality control measures performed by Teledyne Brown Engineering, the laboratory also participates in an Interlaboratory Comparison Program. Participation in this program ensures that independent checks on the precision and accuracy of the measurements of radioactive material in environmental samples are performed. The results of the Interlaboratory Comparison are provided in Appendix B.

Radiological analyses of environmental media characteristically approach and frequently fall below the detection limits of state-of-the-art measurement methods. The "less than" values in the data tables were calculated from each specific analysis and are dependent on sample size, detector efficiency, length of counting time, chemical yield (when appropriate) and the radioactive decay factor from time of counting to time of collection. Teledyne Brown Engineering's analytical methods meet or are below the Lower Limit of Detection (LLD) requirements given in Table 2 of the USNRC Branch Technical Position, Radiological Monitoring Acceptable Program (November 1979, Revision 1). Appendix C contains a discussion of the LLD formulas.

The following is a discussion and summary of the results of the environmental measurements taken during the 2008 reporting period:

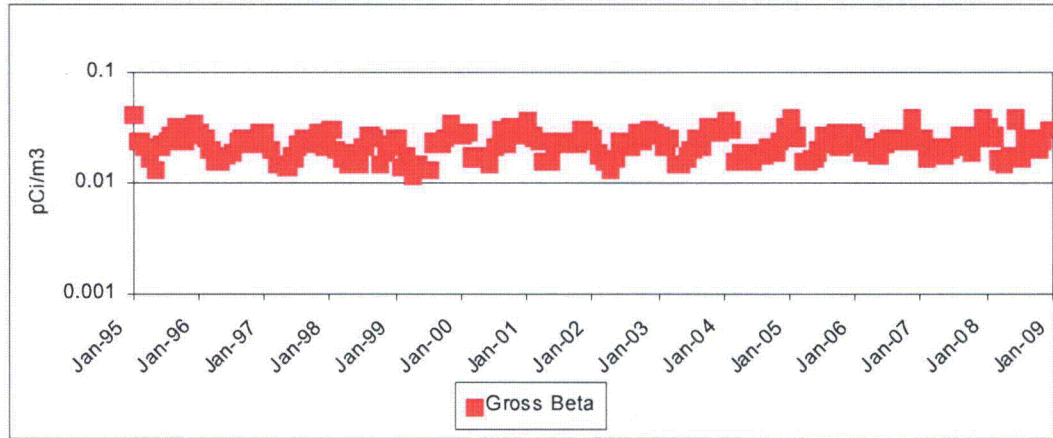

##### ***A. Airborne Particulates***

Gross beta activity was observed in 507 of the 513 indicator samples collected during 2008. The average concentration was 0.021 pCi/m<sup>3</sup> with a range of 0.006 to 0.049 pCi/m<sup>3</sup>. The results of the gross beta activities are presented in Section VII-1 and Trending Graph 1. The gross beta activities for 2008 were comparable to levels measured in the previous several years. Prior to that period the gross beta activities were higher due to atmospheric nuclear weapons testing performed in other countries. The preoperational period of 1971 through 1974 averaged 0.098 pCi/m<sup>3</sup> gross beta.

Air particulate filters were collected weekly and composited by locations on a quarterly basis. They were analyzed by gamma ray spectroscopy. The results are presented in Section VII-2. Beryllium-7, which is produced continuously in the upper atmosphere by cosmic radiation, was measured in 38 of 40 composite samples. The indicator locations had an average concentration of 0.149 pCi/m<sup>3</sup> with a range of 0.083 to 0.270 pCi/m<sup>3</sup>. During the preoperational period, beryllium-7 was measured at comparable levels. Thorium-228 was measured in one sample at an average concentration of 0.008 pCi/m<sup>3</sup>. All other gamma emitters were below the detection limits.

TRENDING GRAPH 1

**GROSS BETA IN AIR PARTICULATES**  
MONTHLY AVERAGE – ALL LOCATIONS

**B. Airborne Iodine**

Charcoal cartridges used to collect airborne iodine were collected weekly and analyzed by gamma spectrometry for iodine-131. Stations 01 through 10 and 111 were monitored. The results are presented in Section VII-1 and Trending Graph 2. All results were below the required lower limit of detection.

TRENDING GRAPH 2

**IODINE-131 IN CHARCOAL FILTERS**  
MONTHLY AVERAGE – ALL LOCATIONS

**C. Fish**

Aquatic biota can be sensitive indicators of radionuclide accumulation in the

environment because of their ability to concentrate certain chemical elements, which have radioisotopes. The results are presented in Table VII-3 and Trending Graph 3. Eight samples of fish were collected during the summer and fall of 2008. A middle-top feeding fish (carp) and a bottom feeding fish (catfish) were collected in July and October. These samples were analyzed by gamma ray spectroscopy. Naturally occurring potassium-40 was detected in all samples. The average concentration at the upstream control location was 3000 pCi/kg (wet weight) with a range of 2830 to 3170 pCi/kg (wet weight). The average concentration for the six indicator samples was 3467 pCi/kg (wet weight) with a range of 2210 to 4200 pCi/kg (wet weight). The preoperational period of 1971 through 1974 averaged 2400 pCi/kg potassium-40. All other gamma emitters were below their detection levels.

TRENDING GRAPH 3

**CESIUM-137 IN FISH**  
ALL LOCATIONS

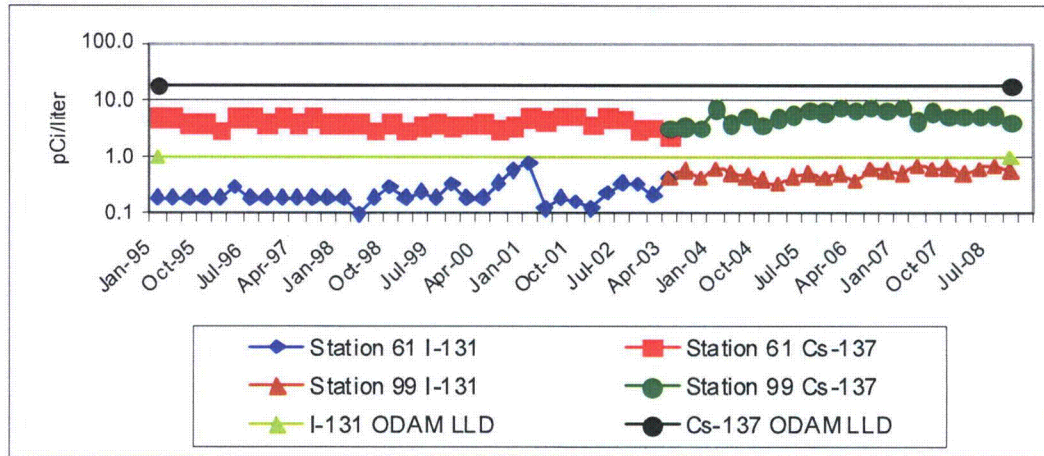

**D. Milk – Nearest Producer**

Milk samples are collected once every 15 days in peak pasture season and once every 31 days the rest of the year from Station 99. The results are presented in Table VII-4 and Trending Graph 4. Seventeen samples were analyzed by gamma ray spectroscopy and for low-level iodine-131 by radiochemical separation. Naturally occurring potassium-40 was measured in all samples with an average concentration of 1241 pCi/liter and a range of 969 to 1440 pCi/liter. All other gamma emitters were below their detection levels.

TRENDING GRAPH 4

**IODINE-131 AND CESIUM-137 IN MILK – NEAREST PRODUCER**  
STATIONS 61 & 99

Station 61 went out of business in May of 2003. Station 99 replaced station 61 in May of 2003. 07/11/06 I-131 LLD missed due to technical problems with I-131 filter paper in the laboratory.

**E. Milk – Other Producers**

Four milk samples were collected from one location of other producers during 2008 and results are presented in Table VII-5 and Trending Graph 5. Station 103 was sampled quarterly in 2008. Naturally occurring potassium-40 was detected in all four samples analyzed with an average concentration of 1295 pCi/liter and a range of 1210 to 1420 pCi/liter. All other gamma emitters were below their detection levels. The operation of the Cooper Nuclear Station has no discernable impact on milk samples.

TRENDING GRAPH 5

**IODINE-131 AND CESIUM-137 IN MILK – OTHER PRODUCERS**  
QUARTERLY AVERAGE – ALL LOCATIONS

Due to delay in analysis, sample results for I-131 for the first quarter of 2001 were excluded and are not plotted. Milk station 102 went out of business April 2006. Vegetation samples are taken in lieu of milk.

**F. Ground Water**

Groundwater was collected from two stations quarterly and analyzed for tritium and for gamma emitting radionuclides. Station 11 is located 0.15 miles from the plant and station 47 is 25.8 miles from the plant. The results are presented in Table VII-6 and Trending Graph 6. Naturally occurring potassium-40 was detected in two of twenty-two samples analyzed, with a range of 44.4 to 179 pCi/liter. Naturally occurring Th-228 was detected in four of twenty-two samples analyzed, with a range of 7.55 to 13.5 pCi/liter. All other gamma emitters were below their detection levels.

TRENDING GRAPH 6

**TRITIUM IN GROUND WATER**  
QUARTERLY AVERAGE – ALL LOCATIONS

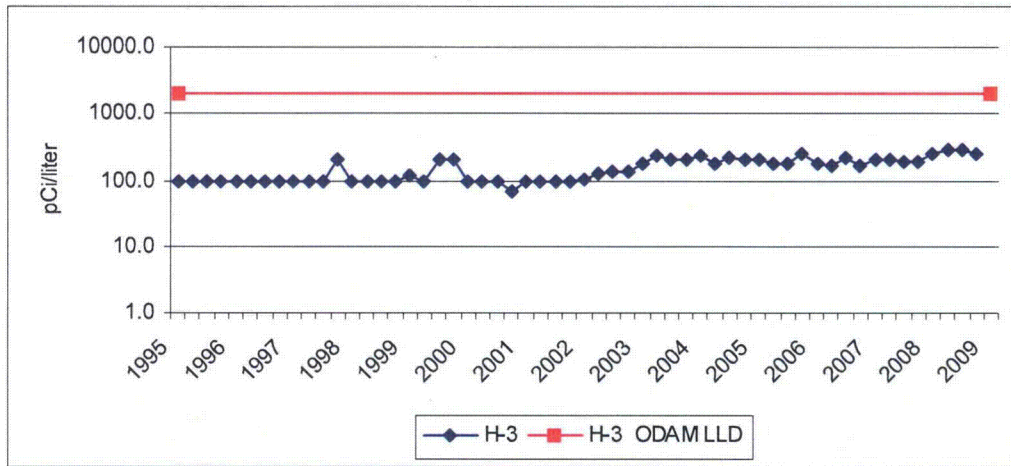

**G. River Water**

River water was collected monthly and monitored for gamma emitting radionuclides. A quarterly composite was measured for tritium. The results are presented in Table VII-7 and Trending Graph 7. All results were below the required lower limit of detection. Naturally occurring potassium-40 was detected in three of twenty-two samples analyzed, with a range of 99.4 to 221 pCi/liter. Naturally occurring Th-228 was detected in two of twenty-two samples analyzed, with a range of 7.76 to 12.3 pCi/liter. All other gamma emitters were below their detection levels.

TRENDING GRAPH 7

**TRITIUM IN RIVER WATER**  
QUARTERLY AVERAGE – ALL LOCATIONS

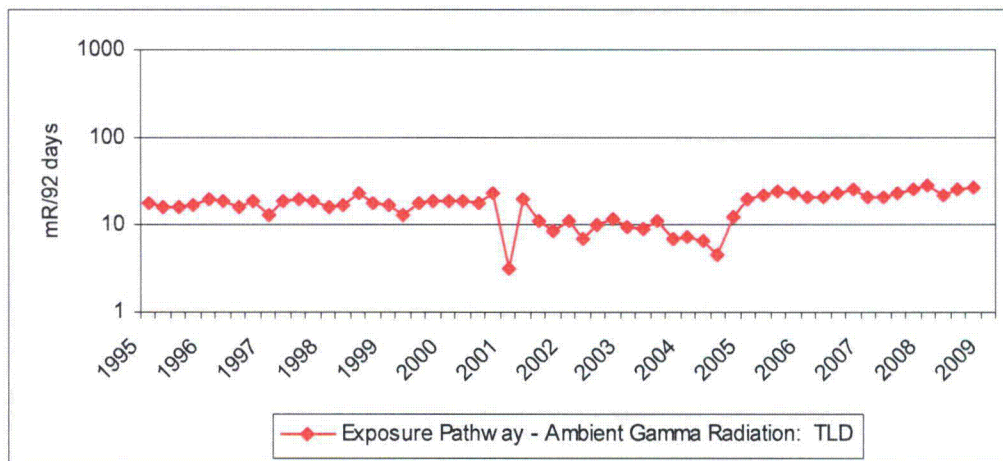

**H. Thermoluminescent Dosimeters**

Thermoluminescent dosimeters (TLDs) determine environmental radiation doses and the results are presented in Table VII-8 and Trending Graph 8. Ambient radiation was monitored at 33 locations within an 11 mile radius of the Cooper Nuclear Station and collected quarterly. The quarterly average for the indicator locations was 25.5 millirem/quarter and a range from 20.0 to 40.0 millirem/quarter. The control stations 44 and 111, which are located 10.3 miles, 270 degrees and 10.8 miles, 254 degrees, respectively, had an average of 25.5 millirem/quarter and a range from 21.0 to 29.0 millirem/quarter. The highest station was Station 67 with an average of 28.8 millirem/quarter and a range from 21.0 to 40.0 millirem/quarter. The preoperational period of 1971 through 1974 averaged 7.0 millirem/quarter. The data from year to year is in good agreement and indicates no adverse changes in radiation exposure to the population near the Cooper Nuclear Station.

## TRENDING GRAPH 8

### THERMOLUMINESCENT DOSIMETRY QUARTERLY AVERAGE – ALL LOCATIONS

First quarter 2001 TLD data low but still within acceptable limits due to possible dry conditions.

#### ***I. Food – Broadleaf Vegetation***

Fourteen broadleaf vegetation samples were collected in May and August from three locations during 2008, due to broadleaf vegetation samples being available in June, July and September. The samples were analyzed by gamma ray spectroscopy and for low-level iodine-131 by radiochemical separation. The results are presented in Table VII-9 and Trending Graph 9. Beryllium-7, which is produced continuously in the upper atmosphere by cosmic radiation was measured in 13 of 14 samples analyzed. The average concentration for the two indicator locations was 414 pCi/kg wet and a range of 178 to 784 pCi/kg wet. The average concentration for the control location was 330 pCi/kg wet with a range of 151 to 533 pCi/kg wet. Naturally occurring potassium-40 was measured in all fourteen samples analyzed. The average concentration for the two indicator locations was 5454 pCi/kg wet and a range of 4020 to 6900 pCi/kg. The average concentration for the control location was 5558 pCi/kg wet with a range of 4080 to 6640 pCi/kg wet. Naturally occurring thorium-228 was measured in four of fourteen samples. The average concentration for the two indicator locations was 20.7 pCi/kg wet and a range of 20.4 to 21.0 pCi/kg. The average concentration for the control location was 19.1 pCi/kg wet with a range of 12.5 to 25.7 pCi/kg wet. All other gamma emitters were below their detection levels. The operation of the Cooper Nuclear Station has no discernable impact on broadleaf vegetation samples.

TRENDING GRAPH 9

**IODINE-131 AND CESIUM-137 IN FOOD – BROADLEAF VEGETATION**  
ALL LOCATIONS

The low Cs-137 value reported in July 2001 was due to the wrong aliquot being entered for the gamma analysis resulted in an invalid analysis and is not reported  
 Due to delay in sample receipt, the I-131 had decayed away, resulting in an invalid analysis for May 2002 and is not reported.  
 Milk samples were collected in lieu of broadleaf vegetation samples in 2004 and 2005.  
 Due to delay in counting sample, the I-131 had decayed away, resulting in an invalid analysis for June 2006 and is not reported. The I-131 by chemical separation met required I-131 LLD.

**J. Shoreline Sediment**

Sediment samples were collected during June and October from Stations 28 and 35 and were analyzed by gamma spectrometry. The results are presented in Table VII-10 and Trending Graph 10. A number of naturally occurring radionuclides were detected in these samples. Naturally occurring potassium-40 was observed in all samples. The concentration for the one supplemental station was 15700 pCi/kg (dry weight). The concentration for the one indicator station was 17900 pCi/kg (dry weight). Thorium-228 was observed in both samples. The concentration for the supplemental station was 846 pCi/kg (dry weight). The concentration for the indicator station was 936 pCi/kg (dry weight). Radium-226 was observed in the indicator station at a concentration of 3040 pCi/kg (dry weight). All other gamma emitters were below their detection limits.

TRENDING GRAPH 10

 STATIONS 28 AND 35

**K. Errata Data**

This section provides corrections to the 2007 Annual Radiological Environmental Monitoring Program (REMP) report.

The gross beta activity for air particulate station 07 for the week of 08/07/08 – 08/14/08 was incorrectly reported as 0.245 pCi/m<sup>3</sup>. The correct gross beta activity was 0.0245 pCi/m<sup>3</sup>. The correction for this deviation involved the following sections in the 2007 REMP report:

Page 30, Environmental Radiological Monitoring Program Summary  
 Page 49, Table VII-1

**SECTION V. CONCLUSIONS**

## V. CONCLUSIONS

The results of the 2008 Radiological Environmental Monitoring Program (REMP) for the Cooper Nuclear Station (CNS) of the Nebraska Public Power District (NPPD) have been presented. The report contains data tables, summaries, and discussions of the data and trending graphs.

Naturally occurring radioactivity and residual traces of fallout were observed in sample media in the expected ranges. They have been discussed individually in the text. Observed radioactivity was at very low concentrations.

The results of the analyses have been presented. Based on the evidence of the Radiological Environmental Monitoring Program, the Nebraska Public Power District, Cooper Nuclear Station has had no discernable radiological impact on the environment and is operating within regulatory limits.

Docket No. 50-298  
 Reporting Period January 1 2008 to December 31 2008

Medium of Pathway Sampled (Unit of Measurement)	Type & Total No. of Analysis Performed	Lower Limit of Detection(1) (LLD)	All Indicator Locations Mean(2) Range(2)	Location with Highest Annual Mean		Control Location Mean()(2) Range(2)	No. of Reportable Occurrences	
				Name	Mean()(2) Range(2)			
<b>Fish</b> (pCi/kg Wet)	Th-228	8	NA	ND(0/6) (ND-ND)	NA	NA(0/0) (NA-NA)	ND(0/2) (ND-ND)	0
<b>Milk Nearest</b> (pCi/L)	I-131	17	NA	ND(0/17) (ND-ND)	NA	NA(0/0) (NA-NA)	NA(0/0) (NA-NA)	0
	K-40	17	NA	1241(17/17) (969/1440)	Sta. 99 10.5 mi.	1241(17/17) (969/1440)	NA(0/0) (NA-NA)	0
	Ra-226	17	NA	ND(0/17) (ND-ND)	NA	NA(0/0) (NA-NA)	NA(0/0) (NA-NA)	0
	Th-228	17	NA	ND(0/17) (ND-ND)	NA	NA(0/0) (NA-NA)	NA(0/0) (NA-NA)	0
<b>Milk Others</b> (pCi/L)	I-131	4	1	ND(0/4) (ND-ND)	NA	NA(0/0) (NA-NA)	NA(0/0) (NA-NA)	0
	K-40	4	NA	1295(4/4) (1210/1420)	Sta. 103 13.5 mi.	1295(4/4) (1210/1420)	NA(0/0) (NA-NA)	0
	Ra-226	4	NA	ND(0/4) (ND-ND)	NA	NA(0/0) (NA-NA)	NA(0/0) (NA-NA)	0

(1) Nominal Lower Limit of Detection (LLD), as stated in ODAM.

(2) Mean and Range based upon detectable measurements only. Fraction of detectable measurements at specified location indicated in brackets().

(3) ND = Non Detectable.

(4) NA = Not Applicable.

## ENVIRONMENTAL RADIOLOGICAL MONITORING PROGRAM SUMMARY

Name of Facility Cooper Nuclear Station  
 Location of Facility Nemaha Nebraska  
 (County/State)

**APPENDIX A**  
**2008 LAND USE CENSUS**

## **2008 LAND USE CENSUS**

Conducted July 21, 2008  
0-3 miles

Cooper Nuclear Station (CNS) Offsite Dose Assessment Manual (ODAM) requires an annual land use census. This census identifies the location of the nearest garden that is greater than 500 square feet in area and yields leafy green vegetables, the nearest milk animal, and the location of the nearest resident in each of the 16 meteorological sectors within 3 miles of CNS.

A land use census was performed on July 21, 2008, in accordance with the CNS ODAM. The nearest residence was found in sector Q, 0.9 miles from CNS, and the nearest garden was found in sector L, 1.3 miles from CNS.

No milk animals were found within 3 miles of CNS and there was no evidence of potable water use from the Missouri River within three miles of CNS.

**APPENDIX B**  
**SUMMARY OF INTERLABORATORY COMPARISONS**

**The Teledyne Brown Engineering ICP report is presented in this section**

## **INTERLABORATORY COMPARISION PROGRAM**

The purpose of the Interlaboratory Comparison Program (ICP) is to confirm the accuracy of results produced by Teledyne Brown Engineering. Samples of various matrices (i.e. soil, water, vegetation, air filters, and milk) are spiked with known amounts of radioactivity by commercial vendors of this service and by departments within the government. TBE participates in three programs. Two are commercial, Analytics Inc. and Environmental Resource Associates (ERA) and one is a government sponsored program, the Department of Energy's (DOE) Mixed Analyte Performance Evaluation Program (MAPEP). The DOE's Idaho National Engineering Laboratory administers the MAPEP. All three programs are blind performance evaluation studies in which samples with known activities are sent to TBE for analysis. Once analyzed, TBE submits the results to the respective agency for evaluation. The results of these evaluations are published in TBE's quarterly and annual QA reports.

The 2008 Interlaboratory Comparison Program includes all contractually required matrices and analyses we supply to customers.

The US Environmental Protection Agency (EPA) discontinued their Interlaboratory Comparison Program in December 1998. However, on May 1, 2001, accreditation was granted to Environmental Resource Associates' (ERA) RadChem Proficiency Testing Program to complete the process of replacing the USEPA-LV Nuclear Radiation Assessment Division program.

The Department of Energy's Environmental Measurement Laboratory (EML) program terminated performance assessments at the end of the March 2004 test session. The MAPEP sample distribution was expanded to include water, soil, vegetation and air particulate testing material previously provided by DOE/EML. In 2008, the samples were received in January with a required reporting date in April and in August with a reporting date of October.

The National Institute of Standards and Technology (NIST) is the approval authority for laboratory providers participating in Intercomparison Study Programs; however, at this time, there are no approved laboratories for environmental and/or radiochemical isotope analyses.

Trending graphs are provided in this section for the Analytics and ERA Programs.

**ANALYTICS ENVIRONMENTAL RADIOACTIVITY CROSS CHECK PROGRAM  
TELEDYNE BROWN ENGINEERING ENVIRONMENTAL SERVICES**

(PAGE 3 OF 3)

Month/Year	Identification Number	Matrix	Nuclide	Units	Reported Value (a)	Known Value (b)	Ratio (c) TBE/Analytics	Evaluation (d)
December 2008	E6417-396	Charcoal	I-131	pCi	65.8	74.1	0.89	A

(1) NCR 09-02 initiated to investigate the failure.

(a) Teledyne Brown Engineering reported result.

(b) The Analytics known value is equal to 100% of the parameter present in the standard as determined by gravimetric and/or volumetric measurements made during standard preparation.

(c) Ratio of Teledyne Brown Engineering to Analytics results.

(d) Analytics evaluation based on TBE internal QC limits: A= Acceptable. Reported result falls within ratio limits of 0.80-1.20. W=Acceptable with warning. Reported result falls within 0.70-0.80 or 1.20-1.30. N = Not Acceptable. Reported result falls outside the ratio limits of < 0.70 and > 1.30.

(1) Not evaluated by MAPEP.

(2) Not detected - reported a statistically zero result.

(3) Pu-239/240 in soil moved to NCR 08-09 - fused 1g rather than 2g - rerun results were acceptable. Tc-99 in soil - Enhanced prep procedure. Am-241 & Iso Pu in veg - Experimental only - no clients currently request these analyses in vegetation. NCR 08-04

(4) False positive test.

(5) Rerun was a non-detect. No cause for Am-241 in vegetation failure. No client data affected. NCR 08-11

(6) Fe-55 activity very close to our detection limit. Use of 50 mL aliquot rather than 30 mLs should help quantify low activity samples in the future. NCR 08-12

(7) Rerun within acceptance criteria. No cause for Pu-2239/240 in water failure. No client samples affected. NCR 08-13

(8) Designed to test the Safe Drinking Water screening levels. Labs reporting values less than ref values were found to be acceptable.

(9) Biased high due to nature Fe in soil. No clients currently request Fe-55 in soil. NCR 08-10

(10) Checking experimental prep for vegetation samples. No clients currently request Iso U in vegetation. NCR 08-14

(a) Teledyne Brown Engineering reported result.

(b) The MAPEP known value is equal to 100% of the parameter present in the standard as determined by gravimetric and/or volumetric measurements made during standard preparation.

(c) DOE/MAPEP evaluation: A=acceptable, W=acceptable with warning, N=not acceptable.

**APPENDIX C**  
**SYNOPSIS OF ANALYTICAL PROCEDURES**

## SYNOPSIS OF ANALYTICAL PROCEDURES

Appendix C is a synopsis of the analytical procedures performed during 2008 on samples collected for the Nebraska Public Power Nuclear Plant's Radiological Environmental Monitoring Program. All analyses have been mutually agreed upon by Nebraska Public Power District and Teledyne Brown Engineering and include those recommended by the USNRC Branch Technical Position, Rev. 1, November 1979.

## GROSS BETA ANALYSIS OF AIR PARTICULATE SAMPLES

### **Air Particulates**

After a delay of five or more days, allowing for the radon-222 and radon-220 (thoron) daughter products to decay, the filters are counted in a gas-flow proportional counter.

Calculations of the results, the two sigma error and the lower limit of detection (LLD):

$$\text{RESULT (pCi/m}^3\text{)} = ((S/T) - (B/t))/(2.22 V E)$$

$$\text{TWO SIGMA ERROR (pCi/m}^3\text{)} = 2((S/T)^2 + (B/t^2))^{1/2}/(2.22 V E)$$

$$\text{LLD (pCi/m}^3\text{)} = 4.66(B^{1/2})/(2.22 V E t)$$

where:

- S = Gross counts of sample including blank
- B = Counts of blank
- E = Counting efficiency
- T = Number of minutes sample was counted
- t = Number of minutes blank was counted
- V = Sample aliquot size (cubic meters)

## **DETERMINATION OF GROSS BETA ACTIVITY IN WATER SAMPLES**

### **Introduction**

The procedures described in this section are used to measure the overall radioactivity of water samples without identifying the radioactive species present. No chemical separation techniques are involved.

One liter of the sample is evaporated on a hot plate. A smaller volume may be used if the sample has a significant salt content as measured gravimetrically. If requested by the customer, the sample is filtered through No. 54 filter paper before evaporation, removing particles greater than 30 microns in size.

After evaporating to a small volume in a beaker, the sample is rinsed into a 2-inch diameter stainless steel planchette, which is stamped with a concentric ring pattern to distribute residue evenly. Final evaporation to dryness takes place under heat lamps.

Residue mass is determined by weighing the planchette before and after mounting the sample. The planchette is counted for beta activity on an automatic proportional counter. Results are calculated using empirical self-absorption curves which allow for the change in effective counting efficiency caused by the residue mass.

### **Detection Capability**

Detection capability depends upon the sample volume actually represented on the planchette, the background and the efficiency of the counting instrument, and upon self-absorption of beta particles by the mounted sample. Because the radioactive species are not identified, no decay corrections are made and the reported activity refers to the counting time.

The minimum detectable level (MDL) for water samples is nominally 1.6 picoCuries per liter for gross beta at the 4.66 sigma level (1.0 pCi/L at the 2.83 sigma level), assuming that 1 liter of sample is used and that ½ gram of sample residue is mounted on the planchette. These figures are based upon a counting time of 50 minutes and upon representative values of counting efficiency and background of 0.2 and 1.2 cpm, respectively

The MDL becomes significantly lower as the mount weight decreases because of reduced self-absorption. At a zero mount weight, the 4.66 sigma MDL for gross beta is 0.9 picoCuries per liter. These values reflect a beta counting efficiency of 0.38.

**ANALYSIS OF SAMPLES FOR TRITIUM**  
(Liquid Scintillation)

**Water**

Ten milliliters of water are mixed with 10 ml of a liquid scintillation "cocktail" and then the mixture is counted in an automatic liquid scintillator.

Calculation of the results, the two sigma error and the lower limit detection (LLD) in pCi/L:

RESULT =  $(N-B)/(2.22 V E)$

TWO SIGMA ERROR =  $2((N + B)/\Delta t)^{1/2} / (2.22 V E)$

LLD =  $4.66(B/\Delta t)^{1/2} / (2.22 V E)$

where:

N	=	the gross cpm of the sample
B	=	the background of the detector in cpm
2.22	=	conversion factor changing dpm to pCi
V	=	volume of the sample in ml
E	=	efficiency of the detector
$\Delta t$	=	counting time for the sample

## ANALYSIS OF SAMPLES FOR IODINE-131

### Milk or Water

Two or more liters of sample are first equilibrated with stable iodide carrier. A batch treatment with anion exchange resin is used to remove iodine from the sample. The iodine is then stripped from the resin with sodium hypochlorite solution, is reduced with hydroxylamine hydrochloride and is extracted into carbon tetrachloride as free iodine. It is then back-extracted as iodide into sodium bisulfite solution and is precipitated as palladium iodide. The precipitate is weighed for chemical yield and is mounted on a nylon planchette for low-level beta counting.

Calculations of results, two sigma error and the lower limit of detection (LLD) in pCi/L:

$$\begin{aligned}\text{RESULT} &= (N/\Delta t - B)/(2.22 E V Y DF) \\ \text{TWO SIGMA ERROR} &= 2((N/\Delta t + B)/\Delta t)^{1/2}/(2.22 E V Y DF) \\ \text{LLD} &= 4.66(B/\Delta t)^{1/2}/(2.22 E V Y DF)\end{aligned}$$

where:	N	=	total counts from sample (counts)
	$\Delta t$	=	counting time for sample (min)
	B	=	background rate of counter (cpm)
	2.22	=	dpm/pCi
	V	=	volume or weight of sample analyzed
	Y	=	chemical yield of the mount or sample counted
	DF	=	decay factor from the collection to the counting date
	E	=	efficiency of the counter for I-131, corrected for self absorption effects by the formula
	E	=	$E_s(\exp(-0.0061M))/(\exp(-0.0061M_s))$
	$E_s$	=	efficiency of the counter determined from an I-131 standard mount
	$M_s$	=	mass of $\text{PdI}_2$ on the standard mount, mg
	M	=	mass of $\text{PdI}_2$ on the sample mount, mg

## **GAMMA SPECTROMETRY OF SAMPLES**

### **Milk or Water**

A 1.0 liter Marinelli beaker is filled with a representative aliquot of the sample. The sample is then counted for approximately 1000 minutes with a shielded high purity germanium (HPGe) detector coupled to a VAX-based data acquisition system, which performs pulse height analysis.

### **Dried Solids other than Soils and Sediments**

A large quantity of the sample is dried at a low temperature, less than 100°C. As much as possible (up to the total sample) is loaded into a tared 1-liter Marinelli and weighed. The sample is then counted for approximately 1000 minutes with a shielded HPGe detector coupled to a VAX-based data acquisition system, which performs pulse height analysis.

### **Fish**

As much as possible (up to the total sample) of the edible portion of the sample is loaded into a tared Marinelli and weighed. The sample is then counted for approximately 1000 minutes with a shielded HPGe detector coupled to a VAX-based data acquisition system, which performs pulse height analysis.

### **Soils and Sediments**

Soils and sediments are dried at a low temperature, less than 100°C. The soil or sediment is loaded fully into a tared, standard 300 cc container and weighed. The sample is then counted for approximately six hours with a shielded HPGe detector coupled to a VAX-based data acquisition system, which performs pulse height and analysis.

### **Charcoal Cartridges (Air Iodine)**

Charcoal cartridges are counted up to five at a time, with one positioned on the face of an HPGe detector and up to four on the side of the HPGe detector. Each HPGe detector is calibrated for both positions. The detection limit for I-131 of each charcoal cartridge can be determined (assuming no positive I-131) uniquely from the volume of air, which passed through it. In the event I-131 is observed in the initial counting of a set, each charcoal cartridge is then counted separately, positioned on the face of the detector.

## Air Particulates

The thirteen airborne particulate filters for a quarterly composite for each field station are aligned one in front of another and then counted for at least six hours with a shielded HPGe detector coupled to a VAX-based data acquisition system which performs pulse height analysis.

A VAX software program defines peaks by certain changes in the slope of the spectrum. The program also compares the energy of each peak with a library of peaks for isotope identification and then performs the radioactivity calculation using the appropriate fractional gamma ray abundance, half-life, detector efficiency, and net counts in the peak region.

The calculation of results, two sigma error and the lower limit of detection (LLD) in pCi/volume or pCi/mass:

$$\text{RESULT} = (S-B)/(2.22 t E V F DF)$$

$$\text{TWO SIGMA ERROR} = 2(S+B)^{1/2} / (2.22 t E V F DF)$$

$$\text{LLD} = 4.66(B)^{1/2} / (2.22 t E V F DF)$$

where:

S	=	Area, in counts, of sample peak and background (region of spectrum of interest)
B	=	Background area, in counts, under sample peak, determined by a linear interpolation of the representative backgrounds on either side of the peak
t	=	length of time in minutes the sample was counted
2.22	=	dpm/pCi
E	=	detector efficiency for energy of interest and geometry of sample
V	=	sample aliquot size (liters, cubic meters, kilograms, or grams)
F	=	fractional gamma abundance (specific for each emitted gamma)
DF	=	decay factor from the mid-collection date to the counting date

## **ADDENDUM TO GAMMA SPECTROMETRY PROCEDURE**

Ba-140 (half-life = ~12.8d) decays to La-140 (half-life ~40 hrs) and the daughter radionuclide, La-140 approaches ~ 90 % of the Ba-140 activity within ~ 6 days. The La-140 photon energy at 1596 keV is used to quantify the Ba-140 activity due to its high photon emission probability yield (96%) producing a higher count rate when present and therefore, a smaller associated counting error.

Zr-95 (half-life = ~65d) decays to Nb-95 (half-life = ~35d). The photon energy of Nb-95 (~765 keV) is used to quantify Zr-95 because of the high photon emission probability yield (~100%) yielding a higher count rate and an associated lower counting error. The daughter radionuclide, Nb-95 approaches the Zr-95 activity after a time period of ~65 days, an estimated time interval occurring between sample exposure, collection and shipping, and analysis.

## ENVIRONMENTAL DOSIMETRY

Environmental Dosimetry services are provided by Global Dosimetry Solutions, Inc. (GDS). GDS uses a thermoluminescent dosimeter (TLD) manufactured by Panasonic, Inc. Panasonic identifies it as an UD-814A1 TLD. The TLD has four elements, numbered 1-4. Elements and their filtration are composed of:

ELEMENT	MATERIAL	FILTRATION
1	${}^6\text{Li}_2\text{}^{10}\text{B}_4\text{O}_7\text{-Cu}$	Thin plastic
2	$\text{CaSO}_4\text{-Tm}$	Lead
3	$\text{CaSO}_4\text{-Tm}$	Lead
4	$\text{CaSO}_4\text{-Tm}$	Lead

This material has a high light output, negligible thermally induced signal loss (fading) and negligible self-dosing. The energy response curve (as well as other features) satisfies NRC Regulatory Guide 4.13. Transit doses are accounted for by use of separate TLDs.

Prior to being sent to Cooper Nuclear Station, the GDS badges are exposed to Cs-137, to known a dose and read in the Panasonic UD-710 reader, with reference badges to establish an element response level for each badge. Badges are then re-annealed for assignment and distribution to Cooper Nuclear Station.

Following the field exposure the badges are returned to GDS for processing in a Panasonic UD-710 reader. Each element is heated and the measured light emission is recorded. The transit controls are read in the same manner. Total exposure for each badge is the average of Elements 2, 3, and 4.

Transit Controls are calculated using the following equation:

$$\text{TRANSDOSE} = \frac{(E_{3_1} + E_{4_1} + E_{3_2} + E_{4_2})}{4} - \frac{(E_{3_{\text{trans}}} + E_{4_{\text{trans}}})}{2}$$

### **LOWER LIMIT of DETECTION FORMULAS**

The LLD formulas in Appendix C are consistent with the LLD discussion in the ODAM. The term  $s_b$  in the ODAM equals  $\sqrt{B}/t$  by Poisson statistics, where B = blank counts and t = blank counting intervals. The decay factor term  $e^{-\lambda\Delta t}$  in the ODAM is the same as the DF terms in Appendix C, but does not appear in certain analyses such as gross beta because decay does not apply. In the tritium analysis, decay is not considered because of the relatively long half-life.

Efficiencies and volumes are consistent between the two documents. Chemical yields appear in Appendix C where applicable but do not apply to other analyses such as tritium and gross beta.

**APPENDIX E**  
**REMP SAMPLING AND ANALYTICAL EXCEPTIONS**

## **EXCEPTIONS**

Appendix E contains the exceptions to the 2008 REMP Program. Where possible, causes of the deviation have been corrected to prevent recurrence.

Any deviations from the sampling schedule are documented on the data tables. Data Tables are in Section VII.

### **Exceptions for Scheduled REMP Sampling and Analysis During 2008, NPPD Cooper Nuclear Station**

Air Station 1 pump failed (total seizure failure). Week end 02/26/08

Air Station 1 clock failed. Replaced pump. Week end 10/28/08

Air Station 2 experienced minor power failure. Week end 04/08/08 and 04/29/08

Air Station 2 experienced power failure. Week end 10/28/08

Air Station 3 replaced pump due to failed clock. Week end 05/29/08

Air Station 3 was not accessible due to flooding from the Missouri River. Week end 06/02/08 through 07/16/08

Air Station 4 experienced minor power failure. Week end 05/27/08

Air Station 4 experienced pump failure. Week end 06/17/08

Air Station 5 experienced pump failure. Week end 07/29/08

Air Station 5 experienced pump failure (vane failure). Week end 10/28/08

Air Station 6 experienced minor pump failure. Week end 01/08/08

Air Station 6 clock failed. Replaced pump. Week end 05/27/08

Air Station 7 experienced pump failure (vane failure). Week end 02/19/08

Air Station 8 pump failed (total seizure failure). Week end 03/18/08

Air Station 9 experienced minor pump failure. Week end 04/15/08, 05/27/08

Air Station 10 experienced minor power failure. Week end 05/27/08

## Exceptions for Scheduled REMP Sampling and Analysis During 2008, NPPD Cooper Nuclear Station

Air Station 10 experienced minor power failure. Week end 09/30/08

River Water Station 28 no sample available due to flooding. 06/05/08

River Water Station 35 no sample available due to flooding. 06/05/08

Vegetation Station 35 only had one species of vegetation available. 08/07/08

Vegetation Station 35 only had two species of vegetation available. 08/20/08

Vegetation Station 35 no broadleaf vegetation was available. 09/23/08

Vegetation Station 96 no broadleaf vegetation was available. 05/20/08, 09/23/08

Vegetation Station 96 only had one species of vegetation available. 08/07/08

Vegetation Station 96 only had one species of vegetation available. 08/20/08

Vegetation Station 101 only had one species of vegetation available. 08/07/08

Vegetation Station 101 only had two species of vegetation available. 08/20/08

Vegetation Station 101 no broadleaf vegetation was available. 09/23/08

Air Station 111 experienced pump failure. Week end 08/27/08

Air Station 111 experienced power outage. Week end 09/02/08

TLD station 59 was lost due to farmer "incident". Third quarter 2008

APPENDIX F

SUMMARY OF DOSES TO A MEMBER OF THE PUBLIC OFFSITE

## LIQUID EFFLUENT DOSE CALCULATIONS

Doses to the maximum individual and 0 to 50 - mile population resulting from the release of radioactive material in liquid effluents from Cooper Nuclear Station were calculated using the LADTAP II computer program. The LADTAP II program implements the radiological dose models of Regulatory Guide 1.109 for determining the radiation exposure to man from three principal exposure pathways in the aquatic environment -- potable water, aquatic foods, and recreational water use. Doses to both the maximum individual and 0 to 50 mile population are calculated as a function of age group and pathway for significant body organs, and are presented in Tables 1 - 6.

Assumptions and data sources used for input to the LADTAP II code are described in a separate section of this appendix (see page F-52).

## **GASEOUS EFFLUENT DOSE CALCULATIONS**

Doses to the maximum individual and 0 to 50 mile population resulting from the release of radioactive material in gaseous effluents from the Cooper Nuclear Station were calculated using the GASPARG computer code. Four sites were selected for individual dose calculations: the site boundary, the nearest residence, the nearest garden and the nearest cow. GASPARG implements the radiological dose models of Regulatory Guide 1.109 for determining the radiation exposure to man from four principal atmospheric exposure pathways: plume, ground, inhalation, and ingestion. Doses to the maximum individual and the population are calculated as a function of age group and pathway for significant body organs.

Tables 1 through 7 present maximum individual doses. Population doses are given in Tables 8 through 14.

Assumptions and data used for input to the GASPARG code are described in a separate section of this appendix (see page F-52).

## DOSE CALCULATION MODELS

To evaluate the radiological consequences of the routine release of liquid and gaseous effluents from the Cooper Nuclear Station, two computer codes were used: LADTAP II for liquid doses and GASPAR for gaseous doses. Both of these computer codes implement the dose calculational methodologies of U.S. NRC Regulatory Guide 1.109, Revision 1.

Source terms for each quarter are combined with station-specific demographic data and either hydrological dilution factors, for liquid dose calculations, or atmospheric diffusion estimates, for gaseous dose calculations.

For liquid dose calculations, the hydrological dilution factors used for input to LADTAP II, as well as other input parameters, are listed in Table 15. Other inputs not specifically listed in this table are taken from Regulatory Guide 1.109, Revision 1. Semiannual doses are obtained by summing the contributions from the appropriate quarters.

For gaseous dose calculations, atmospheric diffusion estimates are obtained from the reduction and processing of onsite meteorological data, as described in Appendix B. Source terms for the semiannual period are obtained by summing source terms for the appropriate quarters. Additional input to GASPAR includes the following station-supplied data:

- 0 to 50 mile population distribution
- 0 to 50 mile meat, milk, and vegetable distributions
- Absolute humidity at Cooper Nuclear Station ( $14.61 \text{ g/m}^3$ )
- The fraction of the year that the vegetables are grown (0.5)
- The fraction of the daily feed intake derived from pasture for milk and meat animals (0.5)

Other values used for input to GASPAR are default values from Regulatory Guide 1.109, Rev. 1.

TABLE 15. Values of Parameters Used to Make Dose Estimates Resulting From Liquid Discharges at Cooper Nuclear Station January-December 2008

Parameter	Values Assigned	
	Individual	Population
Cooling flow rate (cfs) * (Average daily value)	Q1 1213.76	1213.76
	Q2 836.77	836.77
	Q3 NR	NR
	Q4 NR	NR
Dilution factor*	Q1 1	22.47
	Q2 1	81.58
	Q3 NR	NR
	Q4 NR	NR
Holding time:		
Fish	24 hr ***	168 hr ***
Drinking water	12 hr ***	22.4 hr **
Shoreline exposure	0 hr ***	22.4 hr **
Swimming	0 hr ***	22.4 hr **
Boating	0 hr ***	22.4 hr **

\* Q1, Q2, Q3, and Q4 represent first, second, third and fourth quarter station data for 2008, respectively.

\*\* Based on an average Missouri River water flow of 5.5 ft/sec, 84 miles down the river.

\*\*\* Values from Regulatory Guide 1.109, Revision 1.

**REMP SAMPLE STATION DESCRIPTIONS**

## **REMP SAMPLE STATION DESCRIPTIONS**

The following pages contain descriptions of the CNS REMP Sample Stations that were active or were used for part or all of 2008.

**REMP SAMPLE STATION DESCRIPTIONS**  
**SAMPLE TYPES AND SAMPLE LOCATIONS**

<u>Sample Station (a)</u>	<u>Sample Description – Type and Location</u>
No. 1	Type: (1) Air Particulate and Charcoal Filters (2) Environmental Thermoluminescent Dosimetry  Location: Outside the northwest edge of fence, east of the gate to the LLRW storage pad on the CNS site, NW ¼, S32, T5N, R16E, Nemaha County, Nebraska. Lon. 095.38.634 W – Lat. 40.21.523 N
No. 2	Type: (1) Air Particulate and Charcoal Filters (2) Environmental Thermoluminescent Dosimetry  Location: North side of county road to the south portion of CNS site, SW ¼, S32, T5N, R16E, Nemaha County, Nebraska. Lon. 095.38.954 W – Lat. 40.21.126 N
No. 3	Type (1) Air Particulate and Charcoal Filters (2) Environmental Thermoluminescent Dosimetry  Location: Located on the north side of the Brownville State Recreation Park access road near water gauging station, SE ¼, S18, T5N, R16E, Nemaha County, Nebraska. Lon. 095.39.108 W – Lat. 40.23.777 N
No. 4	Type (1) Air Particulate and Charcoal Filters (2) Environmental Thermoluminescent Dosimetry  Location: Located ½ mile south of Phelps City, Missouri, on west side of highway “U”, NE ¼, S2, T64N, R42W, Atchison County, Missouri. Lon. 095.35.792 W – Lat. 40.23.797 N
No. 5	Type (1) Air Particulate and Charcoal Filters (2) Environmental Thermoluminescent Dosimetry  Location: Located ¼ mile south and ¼ mile east of Langdon, Missouri, on north side of road, west of railroad tracks, SW ¼, T64N, R41W, Atchison County, Missouri. Lon. 095.34.434 W – Lat. 40.21.151 N

NOTES:

(a) Sample station numbers missing from the sequence are for inactive or discontinued sampling locations.

<u>Sample Station (a)</u>	<u>Sample Description – Type and Location</u>
No. 6	<p>Type (1) Air Particulate and Charcoal Filters (2) Environmental Thermoluminescent Dosimetry</p> <p>Location: One mile west of the end of Missouri State Highway “U”, SW corner of the intersection, NW ¼, S34, T64N, R42W, Atchison County, Missouri. Lon. 095.37.620 W – Lat. 40.19.459 N</p>
No 7	<p>Type (1) Air Particulate and Charcoal Filters (2) Environmental Thermoluminescent Dosimetry</p> <p>Location: 300 yards east of Highway 67 on north side of road, SW ¼, S6, T4N, R16E, Nemaha, Nebraska. Lon. 095.40.207 W – Lat. 40.20.287 N</p>
No. 8	<p>Type (1) Air Particulate and Charcoal Filters (2) Environmental Thermoluminescent Dosimetry</p> <p>Location: ½ mile north, ¾ mile west and ¾ mile north of Nemaha, on west side of road adjacent to transmission line, NE ¼, S35, T5N, R15E, Nemaha County, Nebraska. Lon. 095.41.220 W – Lat. 40.21.570 N</p>
No. 9	<p>Type (1) Air Particulate and Charcoal Filters (2) Environmental Thermoluminescent Dosimetry</p> <p>Location: Four miles north of Highway 136, on Highway 67. Then 1 mile east of Highway 67 and ½ mile north on west side of road, SW ¼, S26, T6N, R15E, Nemaha County, Nebraska. Lon. 095.41.810 W – Lat. 40.27.259 N</p>
No. 10	<p>Type (1) Air Particulate and Charcoal Filters (2) Environmental Thermoluminescent Dosimetry</p> <p>Location: One mile north of Barada, Nebraska, in SW corner of intersection, NE ¼, S14, T3N, R16E, Richardson County, Nebraska. Lon. 095.34.723 W – Lat. 40.13.970 N</p>

NOTES:

(a) Sample station numbers missing from the sequence are for inactive or discontinued sampling locations.

<u>Sample Station (a)</u>	<u>Sample Description – Type and Location</u>
No. 11	<p>Type: (1) Water – Ground</p> <p>Location: Plant well water supply header at well pits, NW ¼, S32, T5N, R16E, Nemaha County, Nebraska. Lon. 095.53.866 W – Lat. 40.18.970 N</p>
No. 12	<p>Type: (1) Water – River</p> <p>Location: Sample (1) taken from the Missouri River immediately upstream from the Plant Intake Structure (River Mile 532.5). During periods when unsafe conditions warrant, Station 35 may be used as an alternate upstream collection site. Lon. 095.53.866 W – Lat. 40.18.970 N</p>
No.20	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: On NNW boundary of NPPD property, east side of county road, SE, S30, T5N, R16E, Nemaha County, Nebraska. Lon. 095.39.226 W – Lat. 40.22.260 N</p>
No.28	<p>Type (1) Water – River, (2) Fish (3) Sediment from Shoreline (4) Food Products – Broadleaf Vegetation</p> <p>Location: Samples (1), (3), and (4) are taken from the Missouri River or its shore downstream near River Mile 530, Sample (2) is taken from the Missouri River ½ to 3 miles downstream of the plant site. Lon. 095.37.301 W – Lat. 40.20.336 N</p>

## NOTES:

(a) Sample station numbers missing from the sequence are for inactive or discontinued sampling locations.

<u>Sample Station (a)</u>	<u>Sample Description – Type and Location</u>
No. 35	<p>Type (1) Fish (2) Water – River (Alternate Site) (3) Food Products – Broadleaf Vegetation</p> <p>Location: Sample (1) will be taken from the Missouri River about 1 to 3 miles above the CNS intake structure. During periods when unsafe conditions warrant, Station 35 may be used as an alternate to Station 12 (upstream collection site) for sample type (2). Sample (3) is taken about ¼ mile south of the Brownville State Recreation Area in Sector A. Lon. 095.39.046 W – Lat. 40.23.737 N</p>
No. 44	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: ¼ mile south of Auburn Country Club on Highway 75, then ½ mile east of Highway 75 at fence line north of county road, SE1/4, S27, T5N; R14E, Nemaha County, Nebraska. Lon. 095.49.759 W – Lat. 40.21.840 N</p>
No. 47	<p>Type: (1) Water – Ground</p> <p>Location: At Falls City Municipal water supply well. Lon. 095.25.537 W – Lat. 40.01.939 N</p>
No. 56	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: 1 ¼ miles SW of Langdon, Missouri, on Highway “U”, on the right side of the highway, NW ¼, S23, T64N, R42W, Atchison County, Missouri. Lon. 095.36.383 W – Lat. 40.21.157 N</p>
No. 58	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: Three miles south of Brownville, Nebraska, on county road, at the SE corner of the intersection with the farm road leading to Sample Station No. 2, SE1/4, S31, T5N, R16E, Nemaha County, Nebraska. Lon. 095.39.338 W – Lat. 40.21.126 N</p>

## NOTES:

(a) Sample station numbers missing from the sequence are for inactive or discontinued sampling locations.

Sample Station (a)	<u>Sample Description – Type and Location</u>
No. 59	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: One mile SSE of the CNS Elevated Release Point, in the vicinity of the levee at the south boundary of NPPD property, SE ¼, S32, T5N, R16E, Nemaha County, Nebraska. Lon. 095.38.223 W – Lat. 40.20.986 N</p>
No. 66	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: Two miles south of Nemaha, Nebraska, on Highway 67 east side of road, NW1/4, S19, T4N, R16E, Nemaha County, Nebraska. Lon. 095.40.307 W – Lat. 40.18.277 N</p>
No. 67	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: 2 miles west of Brownville, Nebraska, on Highway 136, then north 1 ½ miles on county road and east ½ mile, on north side of road, NE1/4, S11, T5N, R15E, Nemaha County, Nebraska. Lon. 095.41.520 W – Lat. 40.24.898 N</p>
No. 71	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: Two miles east of Phelps City, Missouri, on Highway 36, then south 1 ½ miles on county road and west ¼ mile, SE1/4, S6, T64N, R41W, Atchison County, Missouri. Lon. 095.34.727 W – Lat. 40.21.664 N</p>
No. 79	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: 1 7/8 miles south of Brownville, NE, on east side of paved road, NPPD property, SE1/4, S30, T5N, R16E, Nemaha County, Nebraska. Lon. 095.39.238 W – Lat. 40.22.006 N</p>

NOTES:

(a) Sample station numbers missing from the sequence are for inactive or discontinued sampling locations.

Sample Station (a)	<u>Sample Description – Type and Location</u>
No. 80	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: 2 1/8 miles south of Brownville, on east side of paved road, NPPD property, NE1/4, S31, T5N, R16E, Nemaha County, Nebraska. Lon. 095.39.259 W – Lat. 40.21.834 N</p>
No. 81	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: 2 3/8 miles south of Brownville, Nebraska, in the NE corner of the intersection of the paved county road and CNS access road, NPPD property, NE1/4, S31, T5N, R16E, Nemaha County, Nebraska. Lon. 095.39.291 W – Lat. 40.21.582 N</p>
No. 82	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: 7/8 mile south of CNS in a field, on NPPD property, SW1/4, S32, T5N, R16E, Nemaha County, Nebraska. Lon. 095.38.395 W – Lat. 40.20.961 N</p>
No. 83	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: 2 ¼ miles south of Nemaha, Nebraska, on Highway 67, then east 1 mile to the junction of the driveway and county road (east side of drive), NE1/4, S19, T4N, R16E, Nemaha County, Nebraska. Lon. 095.39.411 W – Lat. 40.18.119 N</p>
No. 84	<p>Type: (1) Environmental Thermoluminescent Dosimetry</p> <p>Location: 2 ½ miles west of Brownville, NE, south side of Highway 136 west of Locust Grove School, NW1/4, S22, T5N, R15E, Nemaha County, Nebraska. Lon. 095.42.993 W – Lat. 40.23.564 N</p>

NOTES:

## I. Summary

In 2008, the Cooper Nuclear Station (CNS) of the Nebraska Public Power District (NPPD) Nebraska Public Power District instituted a comprehensive program to evaluate the impact of station operations on groundwater and surface water in the vicinity of CNS.

This report covers groundwater samples, collected outside of the Licensee required Off-Site Dose Assessment Manual (ODAM) requirements, both on and off station property in 2008. During that time period, 194 analyses were performed on 36 samples from 13 locations. The tritium data from the initial groundwater sampling, which occurred in the last quarter of 2007, is also included in this 2008 report. Tritium was not detected in any of the 4 locations (Table B-1).

In assessing all the data gathered for this report, it was concluded that the operation of CNS had no adverse radiological impact on the environment, and there are no known active releases into the groundwater or surface water at Nebraska Public Power District.

Gross alpha was not detected in any of the groundwater samples.

Tritium was not detected in any of the groundwater or surface water samples at concentrations greater than the United States Environmental Protection Agency (USEPA) drinking water standard (and the Nuclear Regulatory Commission Reporting Limit) of 20,000 pCi/L. Background levels of tritium were not detected at concentrations greater than the self-imposed LLD of 2000 pCi/L in any of the 14 groundwater monitoring locations. The tritium concentrations ranged from  $190 \pm 122$  pCi/L to  $1130 \pm 174$  pCi/L.

Strontium-89 and strontium-90 were not detected at concentrations greater than the Lower Limit of Detection (LLD) as specified in NUREG-1302 in any of the groundwater samples.

Iron-55 was not detected in any of the groundwater samples.

Nickel-63 was not detected in any of the groundwater samples.

Gamma-emitting radionuclides associated with licensed plant operations were not detected at concentrations greater than their respective Lower Limits of Detection (LLDs) as specified in NUREG-1302 in any of the groundwater samples. In the case of tritium, CNS specified that the independent laboratory achieve a lower limit of detection 10 times lower than that required by the United States Environmental Protection Agency (USEPA) regulation.

Intentionally left blank

## II. Characteristics of Tritium (H-3)

Tritium (chemical symbol H-3) is a radioactive isotope of hydrogen. The most common form of tritium is tritium oxide, which is also called "tritiated water." The chemical properties of tritium are essentially those of ordinary hydrogen.

Tritiated water behaves the same as ordinary water in both the environment and the body.

Tritium can be taken into the body by drinking water, breathing air, eating food, or absorption through skin. Once tritium enters the body, it disperses quickly and is uniformly distributed throughout the body. Tritium is excreted primarily through urine with a clearance rate characterized by an effective biological half-life of about 14 days. Within one month or so after ingestion, essentially all tritium is cleared. Organically bound tritium (tritium that is incorporated in organic compounds) can remain in the body for a longer period.

Tritium is produced naturally in the upper atmosphere when cosmic rays strike air molecules. Tritium is also produced during nuclear weapons explosions, as a by-product in reactors producing electricity, and in special production reactors, where the isotopes lithium-7 and/or boron-10 are activated to produce tritium. Like normal water, tritiated water is colorless and odorless. Tritiated water behaves chemically and physically like non-tritiated water in the subsurface, and therefore tritiated water will travel at the same velocity as the average groundwater velocity.

Tritium has a half-life of approximately 12.3 years. It decays spontaneously to helium-3 ( $^3\text{He}$ ). This radioactive decay releases a beta particle (low-energy electron). The radioactive decay of tritium is the source of the health risk from exposure to tritium. Tritium is one of the least dangerous radionuclides because it emits very weak beta radiation and leaves the body relatively quickly. Since tritium is almost always found as water, it goes directly into soft tissues and organs. The associated dose to these tissues is generally uniform and is dependent on the water content of the specific tissue.

## III. Introduction

Cooper Nuclear Station is located in Nemaha County in the southeast corner of Nebraska on the Missouri River. A portion of the site extends into Missouri. The reactor is an 805-megawatt (net electrical) boiling water reactor. Initial criticality was attained on February 21, 1974.

This report covers those analyses performed by Teledyne Brown Engineering (TBE) on samples collected in 2008.

A. Objectives of the Radiological Groundwater Protection Program (RGPP)

The long-term objectives of the RGPP are as follows:

1. Identify suitable locations to monitor and evaluate potential impacts from station operations before significant radiological impact to the environment and potential drinking water sources.
2. Understand the local hydrogeologic regime in the vicinity of the station and maintain up-to-date knowledge of flow patterns on the surface and shallow subsurface.
3. Perform routine water sampling and radiological analysis of water from selected locations.
4. Report new leaks, spills, or other detections with potential radiological significance to stakeholders in a timely manner.
5. Regularly assess analytical results to identify adverse trends.
6. Take necessary corrective actions to protect groundwater resources.

B. Implementation of the Objectives

The objectives identified have been implemented at CNS as discussed below:

1. Cooper Nuclear Station will continue to perform routine sampling and radiological analysis of water from selected locations.
2. Cooper Nuclear Station has implemented new procedures to identify and report new leaks, spills, or other detections with potential radiological significance in a timely manner.
3. Cooper Nuclear Station staff assesses analytical results on an ongoing basis to identify adverse trends.

C. Program Description

1. Sample Collection

Sample locations can be found in Appendix A Table A-1 and Map A-1.

Groundwater and Surface Water

Samples of water are collected, managed, transported and analyzed in

accordance with approved procedures following regulatory methods. Both groundwater and surface water are collected. Sample locations, sample collection frequencies and analytical frequencies are controlled in accordance with approved station procedures. Contractor and/or station personnel are trained in the collection, preservation management, and shipment of samples, as well as in documentation of sampling events. Analytical laboratories are subject to internal quality assurance programs, inter-laboratory cross-check programs, as well as nuclear industry audits. Station personnel review and evaluate all analytical data deliverables after initial review by the contractor.

Analytical data results are reviewed by both station personnel for adverse trends or changes to hydrogeologic conditions.

#### IV Program Description

##### A. Sample Analysis

This section describes the general analytical methodologies used by TBE to analyze the environmental samples for radioactivity for the CNS RGPP in 2008.

In order to achieve the stated objectives, the current program includes the following analyses:

1. Concentrations of gross alpha in groundwater.
2. Concentrations of tritium in groundwater.
3. Concentrations of strontium-89 and strontium-90 in groundwater.
4. Concentrations of iron-55 in groundwater.
5. Concentration of nickel-63 in groundwater.
6. Concentrations of gamma emitters in groundwater and surface water.

##### B. Data Interpretation

The radiological data collected prior to CNS becoming operational were used as a baseline with which these operational data were compared. For the purpose of this report, CNS was considered operational at initial criticality. Several factors were important in the interpretation of the data:

1. Lower Limit of Detection and Minimum Detectable Concentration

The lower limit of detection (LLD) is specified by federal regulation as a minimum sensitivity value that must be achieved routinely by the analytical parameter.

2. Laboratory Measurements Uncertainty

The estimated uncertainty in measurement of tritium in environmental samples is frequently on the order of 50% of the measurement value.

Statistically, the exact value of a measurement is expressed as a range with a stated level of confidence. The convention is to report results with a 95% level of confidence. The uncertainty comes from calibration standards, sample volume or weight measurements, sampling uncertainty and other factors. CNS reports the uncertainty of a measurement created by statistical process (counting error). Each result has two values calculated. CNS reports the result with plus or minus ( $\pm$ ) the estimated sample standard deviation.

Analytical uncertainties are reported at the 95% confidence level in this report for reporting consistency with the REMP.

Gamma spectroscopy results for each type of sample were grouped as follows:

For groundwater 18 nuclides, Be-7, K-40, Mn-54, Co-58, Fe-59, Co-60, Zn-65, Zr-95, Ru-103, Ru-106, I-131, Cs-134, Cs-137, Ba-140, Ce-141, Ce-144, Ra-226 and Th-228 were reported.

V. Results and Discussion

A. Groundwater Results

Gross Alpha

Samples from 13 locations were analyzed for gross alpha (Table B-2, Appendix B). Gross alpha was not detected at concentrations greater than the LLD.

Tritium

Samples from 13 locations were analyzed for tritium activity (Table B-2 Appendix B). Tritium values ranged from 190 pCi/liter to 1130 pCi/liter.

All values were below the CNS imposed LLD of 2000 pCi/liter.

#### Strontium

Samples from 13 locations were analyzed for strontium-89 and strontium-90 (Table B-2, Appendix B). Strontium-89 and strontium-90 were not detected at concentrations greater than the LLD.

#### Iron-55

Samples from 13 locations were analyzed for iron-95 (Table B-2 Appendix A). Iron-95 was not detected at concentrations greater than the LLD.

#### Nickel-63

Samples from 13 locations were analyzed for nickel-63 (Table B-2 Appendix B). Nickel-63 was not detected at concentrations greater than the LLD.

#### Gamma Emitters

Naturally occurring potassium-40 was detected in three of 13 samples. The concentrations ranged from 42.5 pCi/liter to 85.2 pCi/liter. Thorium-228 was detected in three of 13 samples. The concentrations ranged from 4.74 pCi/liter to 11.1 pCi/liter. No other gamma emitting nuclides were detected. (Table B-2, Appendix B).
