SUBJECT: Annual Radiological Environmental Operating Report for 2010
Arkansas Nuclear One – Units 1 and 2
Docket Nos. 50-313 and 50-368
License Nos. DPR-51 and NPF-6

REFERENCE: 1. Arkansas Nuclear One, Unit 1, Technical Specification 5.6.2
2. Arkansas Nuclear One, Unit 2, Technical Specification 6.6.2

Dear Sir or Madam:

The referenced Arkansas Nuclear One (ANO) Technical Specifications (TSs) require the submittal of an annual radiological environmental operating report for the previous year by May 15 of each year. Attached is the subject ANO report for the calendar year 2010.

This report fulfills the reporting requirements of the TSs referenced above.

The radionuclides detected by the radiological environmental monitoring program during 2010 were significantly below the regulatory limits. The operation of the ANO station during 2010 had no harmful effects nor resulted in any irreversible damage to the local environment.

Based on ANO's review, no environmental samples from the monitoring program equaled or exceeded the reporting levels for radioactivity concentration due to ANO effluents when averaged over any calendar quarter. Therefore, the 2010 results did not require any Radiological Monitoring Program special reports.

This letter contains no new commitments.

If you have any questions or require additional information, please contact me.

Sincerely,

Original signed by Stephenie L. Pyle

Summary

The Annual Radiological Environmental Operating Report (AREOR) presents data obtained through analyses of environmental samples collected for Arkansas Nuclear One's (ANO's) Radiological Environmental Monitoring Program (REMP) for the period January 1, 2010 through December 31, 2010. This report fulfills the requirements of ANO Unit 1 Technical Specification (TS) 5.6.2 and Unit 2 TS 6.6.2.

During 2010, as in previous years, ANO detected radionuclides attributable to plant operations at the discharge location (Station 8) where previously monitored liquid radioactive effluent from the plant is periodically discharged in accordance with the regulatory criteria established in the Offsite Dose Calculation Manual (ODCM). ANO personnel routinely monitor results from this area in order to note any trends. The review of results from this area indicates the following:

- Tritium levels in the surface water media continue to be below regulatory reporting limits and are consistent with concentrations that would typically be seen at this location as discussed in Section 2.3 of this AREOR

Gross beta concentrations at the Station 14 (City of Russellville) indicator drinking water location continue to remain consistent with previous operational measurements and similar to the levels detected at the Station 57 (City of Danville) control drinking water location.

Radiological Environmental Monitoring Program

ANO established the REMP prior to the station becoming operational (1974) to provide data on background radiation and radioactivity normally present in the area. ANO has continued to monitor the environment by sampling air, water, sediment, fish and food products, as well as measuring radiation directly. ANO also samples milk if milk-producing animals are present commercially within five miles of the plant.

The REMP includes sampling indicator and control locations within an approximately 20-mile radius of the plant. The REMP utilizes indicator locations near the site to show any increases or buildup of radioactivity that might occur due to station operation, and control locations farther away from the site to indicate the presence of only naturally occurring radioactivity. ANO personnel compare indicator results with control and preoperational results to assess any impact ANO operation might have had on the surrounding environment.

In 2010, ANO personnel collected environmental samples for radiological analysis. They compared results of indicator locations with control locations and previous studies and concluded that overall no significant relationship exists between ANO operation and effect on the plant environs. The review of 2010 data, in many cases, showed undetectable radiation levels in the environment and in all instances, no definable trends related to significant pathways associated with ANO.

Harmful Effects or Irreversible Damage

The REMP monitoring did not detect any harmful effects or evidence of irreversible damage in 2010. Therefore, no analysis or planned course of action to alleviate problems was necessary.

Reporting Levels

ANO's review indicates that no samples equaled or exceeded reporting levels for radioactivity concentration in environmental samples due to ANO effluents, as outlined in ODCM Table 2.6-3, when averaged over any calendar quarter. Therefore, 2010 results did not trigger any Radiological Monitoring Program Special Reports.

Radioactivity Not Attributable to ANO

The ANO REMP has detected radioactivity attributable to other sources. These include the 25th Chinese nuclear test explosion in 1980 and the radioactivity plume release due to reactor core degradation at the Chernobyl Nuclear Power Plant in 1986. Prior to 1981, the ANO REMP detected radioactivity resulting from nuclear weapons testing, with Cesium-137 continuing to be periodically detected.

Comparison to Federal and State Programs

ANO personnel compared REMP data to state monitoring programs as results became available. Historically, the programs used for comparison have included the U.S. Nuclear Regulatory Commission (NRC) Thermoluminescent Dosimeter (TLD) Direct Radiation Monitoring Network and the Arkansas Department of Health (ADH).

The NRC TLD Network Program was discontinued in 1998. Historically these results have compared to those from the ANO REMP. ANO TLD results continue to remain similar to the historical average and continue to verify that plant operation is not affecting the ambient radiation levels in the environment.

The ADH and the ANO REMP entail similar radiological environmental monitoring program requirements. These programs include collecting air samples and splitting or sharing sample media such as water, sediment and fish. Both programs have obtained similar results over previous years.

Sample Deviations

◆ **Milk**

The REMP did not include milk sampling within five miles of ANO in 2010 due to unavailability. The ODCM requires collection of milk samples if available commercially within 5 miles of the plant. ANO personnel collected vegetation samples to monitor the ingestion pathway, as specified in the ODCM, because of milk unavailability.

◆ **Required Lower Limit of Detection (LLD) Values**

LLDs during this reporting period were within the acceptable limits required by Table 2.6-2 of the ODCM.

◆ **Air Samples**

Listed below are air sampler deviations that occurred during 2010 due to electrical power outages and equipment failure. These deviations did not result in the exceedance of the LLD values specified in the ODCM. As described in footnote (a) to ODCM Table 2.6-1, deviations are permitted from the required sampling schedule due to malfunction of sampling equipment and other legitimate reasons.

Station	Sampling Period	Comment
02	02/02/2010 – 02/16/2010	Identified power failure at 1139 on 2/16/11 Air. Entergy Arkansas notified. Power restored at 1330. (CR-ANO-C-2010-00323)
01	08/03/2010 – 08/17/2010	Air sample pump discovered not operating (seized up). Replaced sample pump. (CR-ANO-C-2010-02102)
01	10/26/2010 – 11/09/2010	Pump running with fewer than expected run time hours recorded. Indicates a power outage during sampling period. (CR-ANO-C-2010-02888)
01	11/09/2010 – 11/23/2010	Runtime meter did not advance during sample period. Replaced runtime meter. (CR-ANO-C-2010-03016)
02	12/07/2010 – 12/21/2010	Pump running with fewer than expected run time hours recorded. Indicates a power outage during sampling period. (CR-ANO-C-2010-03240)

◆ **Missed Samples**

During the first quarter 2010 change out of environmental TLD's, TLD # 148 along with the TLD holder were missing. A replacement TLD holder and TLD was installed.

(CR-ANO-C-2010-0077).

◆ **Unavailable Results**

ANO received analytical results in adequate time for inclusion in this report. In addition, ANO's review identified no missing results.

Program Modifications

ANO made no modifications to the REMP during 2010.

Attachments

Attachment 1 contains results of air, TLD, water, sediment, fish, and food product samples collected in 2010. TLDs were analyzed by a vendor (AREVA). All remaining samples were analyzed by River Bend Station's (RBS) Environmental Laboratory.

Attachment 2 also contains RBS' participation in the interlaboratory comparison program during 2010.

Attachment 3 contains dose calculations performed for sediment using a generalized equation from Regulatory Guide 1.109, "Calculation of Annual Doses to Man from Routine Releases of Reactor Effluents for the Purpose of Evaluating Compliance with 10 CFR Part 50, Appendix I," Revision 1.

1.0 Introduction

1.1 Radiological Environmental Monitoring Program

ANO established the REMP to ensure that plant operating controls properly function to minimize any associated radiation endangerment to human health or the environment. The REMP is designed for:

- Analyzing applicable pathways for anticipated types and quantities of radionuclides released into the environment.
- Considering the possibility of a buildup of long-lived radionuclides in the environment and identifying physical and biological accumulations that may contribute to human exposures.
- Considering the potential radiation exposure to plant and animal life in the environment surrounding ANO.
- Correlating levels of radiation and radioactivity in the environment with radioactive releases from station operation.

1.2 Pathways Monitored

The airborne, direct radiation, waterborne and ingestion pathways are monitored as required by the ODCM. A description of the ANO REMP utilized to monitor the exposure pathways is described in Table 1.1 and shown in Figures 1-1, 1-2 and 1-3.

Section 2.0 of this report provides a discussion of 2010 sampling results and Section 3.0 provides a summary of results for the monitored exposure pathways.

1.3 Land Use Census

ANO personnel conducts land use census' biannually (once every two years) as required by ODCM Section 2.6.2. The latest land use census was conducted in 2009. The purpose of this census is to identify changes in uses of land within five miles of ANO that would require modifications to the REMP or ODCM. The most important criteria during this census are to determine location in each sector of the nearest:

- 1) Residence
- 2) Animal milked for human consumption
- 3) Garden of greater than 500 square feet producing fresh leafy (broadleaf) vegetables*

* ANO personnel do not perform a garden census since ODCM Section 2.6.2 allows the routine sampling of broadleaf vegetation in the highest D/Q sector near the site boundary in lieu of the garden census.

The method used by ANO personnel for conducting the land use census is as follows:

- ANO personnel conducted door-to-door (drive by) field surveys in order to locate the nearest resident in each meteorological sector.
- Consultation with local agricultural authorities is used for the identification of commercial milk providers within five-miles of the Unit-1 reactor building.
- As a result of these surveys, the following information is obtained in each meteorological sector:
 - 1) Nearest permanent residence
 - 2) Nearest milking animal
- ANO personnel identify locations on the map, measure distances to ANO (or use a GPS system) and record results.
- Locations, if any, are identified which yield a calculated dose or dose commitments greater than those currently calculated in the ODCM.
- ANO personnel compare results to previous census.

Table 1.1

Radiological Environmental Sampling Program

Exposure Pathway	Requirement	Sample Point Description, Distance and Direction	Sampling and Collection Frequency	Type and Frequency Of Analyses
Airborne	<u>Radioiodine and Particulates</u> 2 samples close to the Site Boundary, in (or near) different sectors with the highest calculated annual average ground level D/Q.	Station 2 (243° - 0.5 miles) - South of the sewage treatment plant. Station 56 (264° - 0.4 miles) – West end of the sewage treatment plant.	Continuous operation of sampler with sample collection as required by dust loading but at least once per 14 days.	Radioiodine Canister – Analyze at least once per 14 days for I-131. Particulate Sampler – Analyze for gross beta radioactivity following filter change.
	<u>Radioiodine and Particulates</u> 1 sample from the vicinity of a community having the highest calculated annual average groundlevel D/Q.	Station 1 (88° - 0.5 miles) - Near the meteorology tower.		
	<u>Radioiodine and Particulates</u> 1 sample from a control location 15-30 km (10 – 20 miles) distance.	Station 7 (210° - 19.0 miles) – Entergy Supply Yard on Highway 10 in Danville.		
	<u>Radioiodine and Particulates</u> One location sampled voluntarily by ANO.	Station 6 (111° - 6.8 miles) - Entergy local office in Russellville (305 South Knoxville Avenue).		
Direct Radiation	<u>Thermoluminescent dosimetry (TLDs)</u> 16 inner ring stations with two or more dosimeters in each meteorological sector in the general area of the Site Boundary	Station 1 (88° - 0.5 miles) - On a pole near the meteorology tower. Station 2 (243° - 0.5 miles) - South of the sewage treatment plant. Station 3 (5° - 0.7 miles) – West of ANO Gate #2 on Highway 333 (approximately 0.35 miles)	Once per 92 days.	Gamma Dose – Once per 92 days.

Table 1.1
Radiological Environmental Sampling Program

Exposure Pathway	Requirement	Sample Point Description, Distance and Direction	Sampling and Collection Frequency	Type and Frequency Of Analyses
Direct Radiation	<p>TLDs 16 inner ring stations with two or more dosimeters in each meteorological sector in the general area of the Site Boundary</p>	<p>Station 4 (181° - 0.5 miles) – West of May Cemetery entrance on south side of the road.</p> <p>Station 56 (264° - 0.4 miles) - West end of the sewage treatment plant.</p> <p>Station 108 (306° - 0.9 miles) - South on Flatwood Road on a utility pole.</p> <p>Station 109 (291° - 0.6 miles) - Utility pole across from the junction of Flatwood Road and Round Mountain Road.</p> <p>Station 110 (138° - 0.8 miles) - Bunker Hill Lane on the first utility pole on the left.</p> <p>Station 145 (28° - 0.6 miles) - Near west entrance to the RERTC on a utility pole.</p> <p>Station 146 (45° - 0.6 miles) - South end of east parking lot at RERTC on a utility pole.</p> <p>Station 147 (61° - 0.6 miles) - West side of Bunker Hill Road, approximately 100 yards from intersection with State Highway 333.</p> <p>Station 148 (122° - 0.6 miles) - Intersection of Bunker Hill Road with Scott Lane on county road sign post.</p>	Once per 92 days.	Gamma Dose – Once per 92 days.

Table 1.1

Radiological Environmental Sampling Program

Exposure Pathway	Requirement	Sample Point Description, Distance and Direction	Sampling and Collection Frequency	Type and Frequency Of Analyses
Direct Radiation	<p>TLDs 16 inner ring stations with two or more dosimeters in each meteorological sector in the general area of the Site Boundary</p>	<p>Station 149 (156° - 0.5 miles) – On a utility pole on the south side of May Road.</p> <p>Station 150 (205° - 0.6 miles) – North side of May Road on a utility pole past the McCurley Place turn.</p> <p>Station 151 (225° - 0.4 miles) – West side of sewage treatment plant near the lake on a metal post.</p> <p>Station 152 (338° - 0.8 miles) – South side of State Highway 333 on a road sign post.</p>	Once per 92 days.	Gamma Dose – Once per 92 days.
	<p>TLDs 8 stations with two or more dosimeters in special interest areas such as population centers, nearby residences, schools, and in 1 – 2 areas to serve as control locations.</p>	<p>Station 6 (111° - 6.8 miles) - Entergy local office in Russellville (305 South Knoxville Avenue).</p> <p>Station 7 (210° - 19.0 miles) – Entergy Supply Yard on Highway 10 in Danville.</p> <p>Station 111 (120° - 2.0 miles) – Marina Road on a utility pole on the left just prior to curve.</p> <p>Station 116 (318° - 1.8 miles) - Highway 333 and Highway 64 in London on a utility pole north of the railroad tracks.</p>		

Table 1.1

Radiological Environmental Sampling Program

Exposure Pathway	Requirement	Sample Point Description, Distance and Direction	Sampling and Collection Frequency	Type and Frequency Of Analyses
Direct Radiation	<p>TLDs 8 stations with two or more dosimeters in special interest areas such as population centers, nearby residences, schools, and in 1 – 2 areas to serve as control locations.</p>	<p>Station 125 (46° - 8.7 miles) - College Street on a utility pole at the southeast corner of the red brick school building.</p> <p>Station 127 (100° - 5.2 miles) - Arkansas Tech Campus on a utility pole across from Paine Hall.</p> <p>Station 137 (151° - 8.2 miles) – On a speed limit sign on the right in front of the Morris R. Moore Arkansas National Guard Armory.</p> <p>Station 153 (304° - 9.2 miles) - Knoxville Elementary School near the school entrance gate on a utility pole.</p>	Once per 92 days.	Gamma Dose – Once per 92 days.
Waterborne	<p>Surface Water 1 indicator location (influenced by plant discharge)</p> <p>1 control location (uninfluenced by plant discharge)</p>	<p>Station 8 (166° - 0.2 miles) - Plant discharge canal.</p> <p>Station 10 (95° - 0.5 miles) – Plant intake canal.</p>	Once per 92 days.	Gamma isotopic and tritium analyses once per 92 days.
	<p>Drinking Water 1 indicator location (influenced by plant discharge)</p> <p>1 control location (uninfluenced by plant discharge)</p>	<p>Station 14 (70° - 5.1 miles) - Russellville city water system from the Illinois Bayou.</p> <p>Station 57 (208° - 19.5 miles) - Danville public water supply treatment on Fifth Street.</p>	Once per 92 days.	I-131, gross beta, gamma isotopic and tritium analyses once per 92 days.

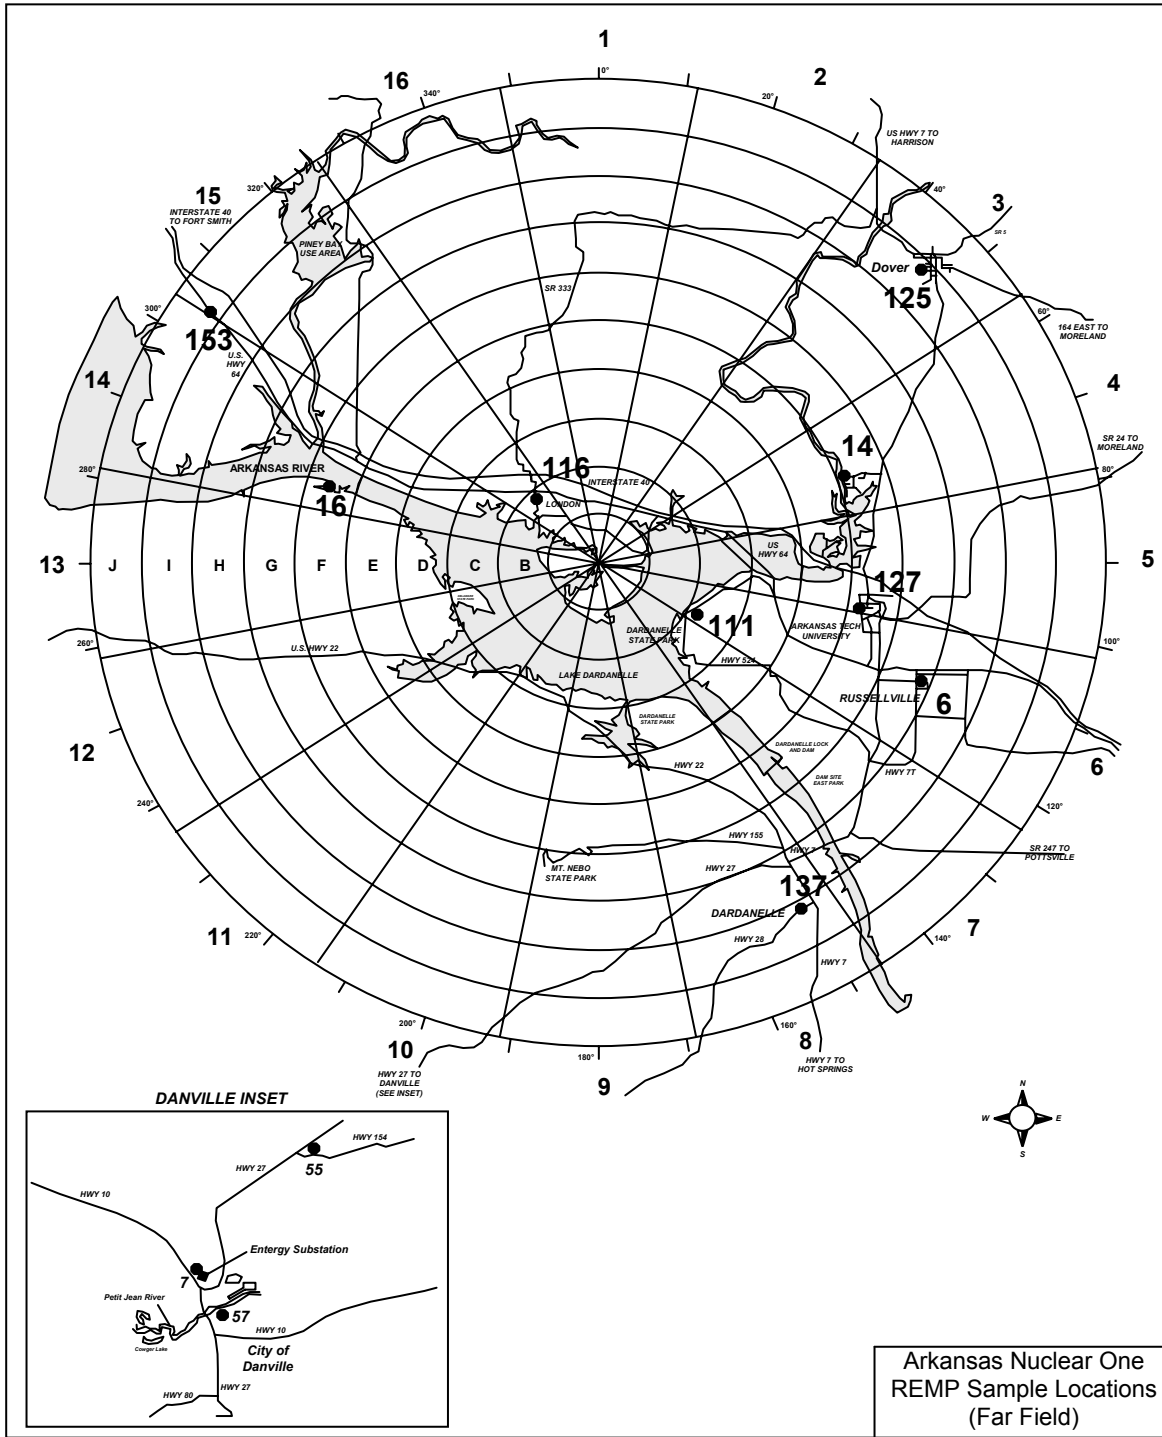

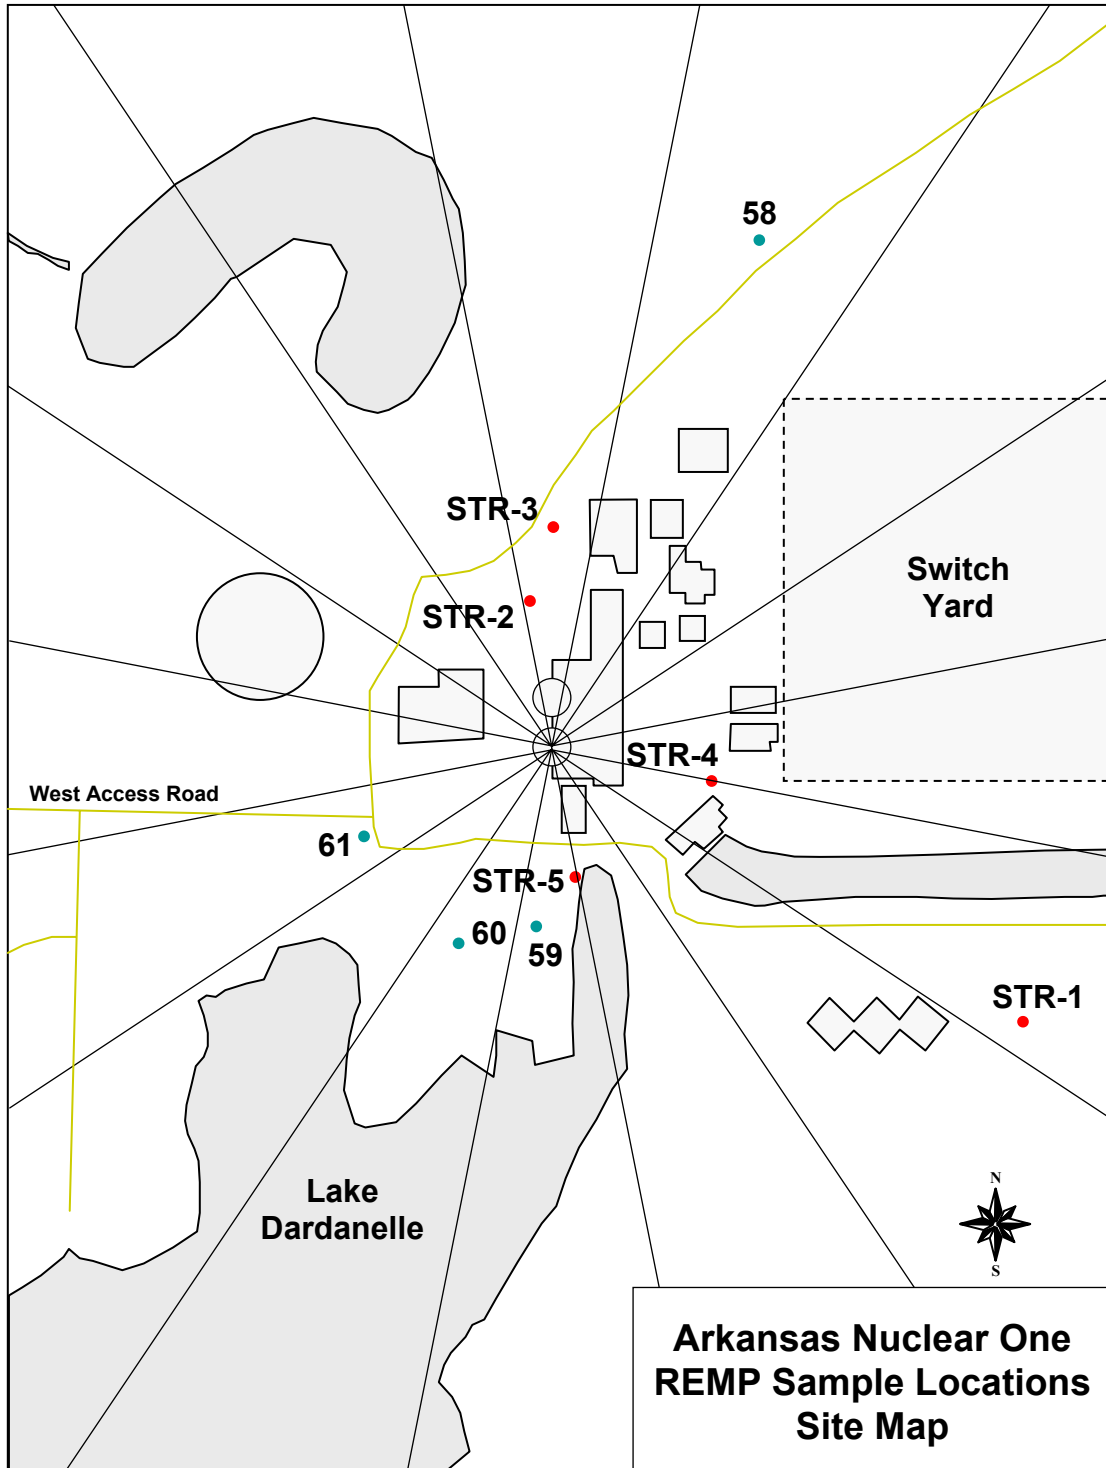

FIGURE 1-3
SAMPLE COLLECTION SITES – SITE MAP

2.0 Interpretation and Trends of Results

2.1 Air Particulate and Radioiodine Sample Results

The REMP has detected radioactivity in the airborne pathway attributable to other sources. These include the 25th Chinese nuclear test explosion in 1980 and the radioactive plume release due to reactor core degradation at Chernobyl Nuclear Power Plant in 1986.

During 2010, Iodine-131 was not detected in the radioiodine cartridges, as has been the case in previous years. In addition, indicator gross beta air particulate results for 2010 were within the range of levels obtained in previous years of the operational REMP and well below preoperational levels as seen below. Results are reported as annual average picocuries per cubic meter (pCi/m³).

<u>Monitoring Period</u>	<u>Result</u>
2000 – 2009 (Minimum Value)	0.020
2010 Value	0.030
2000 – 2009 (Maximum Value)	0.032
Preoperational	0.050

In the absence of plant-related gamma radionuclides, gross beta activity is attributed to naturally occurring radionuclides. Table 3.1, which include gross beta concentrations and provide a comparison of the indicator and control means and ranges, emphasizes the consistent trends seen in this pathway to support the presence of naturally occurring activity. Therefore, it can be concluded that the airborne pathway continues to be unaffected by ANO operations.

2.2 Thermoluminescent Dosimetry (TLD) Sample Results

ANO reports measured dose as net exposure (field reading less transit reading) normalized to 92 days and relies on comparison of the indicator locations to the control as a measure of plant impact. ANO's comparison of the inner ring and special interest area TLD results to the control, as seen in Table 3.1, identified no noticeable trend that would indicate that the ambient radiation levels are being affected by plant operations. In addition, the inner ring value of 8.3 millirem (mrem) shown in Table 3.1 is within the historical bounds of 2000 – 2009 annual average results, which have ranged from 6.7 to 8.8 mrem.

Overall, ANO concluded that the ambient radiation levels are not being affected by plant operations.

2.3 Water Sample Results

Analytical results for 2010 surface water and drinking water samples were similar to those reported in previous years.

Surface water samples were collected and analyzed for gamma radionuclides and tritium. Gamma radionuclides were below detectable limits which is consistent with results seen in

previous operational years. Tritium continues to be detected at the indicator location (Station 8) where previously monitored liquid radioactive effluent from the plant is periodically discharged in accordance with the regulatory criteria established in the ODCM. However, the levels detected are consistent with concentrations that would typically be seen at this location as shown below. Results are reported as annual average picocurie per liter (pCi/l).

<u>Monitoring Period</u>	<u>Concentration</u>
2000 – 2009 (Minimum Value)	272.0
2010 Value	985.0
2000 – 2009 (Maximum Value)	1023.4
Preoperational Value	200.0

ANO personnel have noted no definable increasing trends associated with the tritium levels at the discharge location. Levels detected during 2010 and previous operational years have been well below regulatory reporting limits. Therefore, the operation of ANO had no definable impact on this waterborne pathway during 2010 and levels of radionuclides remain similar to those obtained in previous operational years.

Drinking water samples were collected from two locations (indicator and control). Although ANO personnel utilize Station 14 (City of Russellville) as an indicator location due to the potential for the drinking water pathway to exist, the City of Russellville has not withdrawn water from Lake Dardanelle in the past several years.

Drinking water samples were analyzed for gross beta radionuclides, Iodine-131, gamma radionuclides and tritium. Gamma radionuclides, Iodine-131 and tritium concentrations were below the LLD limits at the indicator and control locations, which is consistent with preoperational and operational years. Gross beta concentrations at the indicator and control locations are similar as shown in Table 3.1. Listed below is a comparison of 2010 indicator results to preoperational and operational years. Results are reported as annual average pCi/l.

<u>Radionuclide</u>	<u>2010</u>	<u>2000 – 2009</u>	<u>Preoperational</u>
Gross Beta	1.55	2.97	2.0
Iodine-131	<LLD	<LLD	<LLD
Gamma	<LLD	<LLD	<LLD
Tritium	<LLD	<LLD	200.0

ANO personnel have noted no definable trends associated with drinking water results at the indicator location. Therefore, the operation of ANO had no definable impact on this waterborne pathway during 2010 and levels of radionuclides remain similar to those obtained in previous operational years.

Groundwater samples were collected from four locations (1 control, and 3 indicator locations). Sample data was compiled, organized and is reviewed annually as a minimum to:

- Analyze for increasing or decreasing trends at individual sample points, wells or groups of wells.
- Review the radionuclides detected to determine whether changes should be made to the analysis suites or sampling frequencies for each sampling location.
- Evaluate the locations of radionuclides in ground water to determine if changes should be made to the sampling locations.
- Review current investigation levels and determine if changes should be made.
- Determine if any change to the ODCM is required.
- Determine if a corrective actions/remediation is required.

Groundwater samples were analyzed for Tritium and Gamma radionuclides. Tritium and Gamma concentrations were below the LLD limits at the indicator and control locations. Listed below is a comparison of 2010 indicator results to past operational years. Results are reported as annual average pCi/l. Groundwater data is captured in Tables 8.1 and 8.2. Therefore, ANO operations had no significant impact on the environment or public by this waterborne pathway.

<u>Radionuclide</u>	<u>2010</u>	<u>2006 – 2009</u>
Iodine-131	<LLD	<LLD
Gamma	<LLD	<LLD
Tritium	<LLD	<LLD

2.4 Sediment Sample Results

Sediment samples were collected from two locations in 2010 and analyzed for gamma radionuclides. Listed below is a comparison of 2010 indicator results to past operational years. Therefore, ANO operations had no significant impact on the environment or public by this waterborne pathway. Results are reported as pCi/kg.

<u>Monitoring Period</u>	<u>Concentration</u>
2000 – 2009 (Minimum Value)	41.79
2010 Value	65.55
2000 – 2009 (Maximum Value)	1170.0

Since reporting levels for radionuclides in sediment have not been established, an evaluation of potential dose to the public from this media was performed as shown in Attachment 2.

2.5 Milk Sample Results

Milk samples were not collected during 2010 due to the unavailability of indicator locations within five-miles of ANO.

2.6 Fish Sample Results

Fish samples were collected from two locations and analyzed for gamma radionuclides. In 2010, gamma radionuclides were below detectable limits which are consistent with the preoperational monitoring period and operational results since 1997. Therefore, based on these measurements, ANO operations had no significant radiological impact upon the environment or public by this ingestion pathway.

2.7 Food Product Sample Results

The REMP has detected radionuclides prior to 1990 that are attributable to other sources. These include the radioactive plume release due to reactor core degradation at Chernobyl Nuclear Power Plant in 1986 and atmospheric weapons testing.

In 2010, food product samples were collected when available from two locations and analyzed for iodine-131 and gamma radionuclides. The 2010 levels remained undetectable, as has been the case in previous years. Therefore, based on these measurements, ANO operations had no significant radiological impact upon the environment or public by this ingestion pathway.

2.8 Interlaboratory Comparison Results

RBS' Environmental Laboratory analyzed interlaboratory comparison samples for ANO to fulfill the requirements of ODCM Section 2.6.3. Attachment 2 contains these results. ANO's review of RBS' interlaboratory comparison indicated that 100% of the sample results (42 of 42) were within the acceptable control limits.

2.9 Land Use Census Results

The latest land use census (performed in 2009) did not identify any new locations that yielded a calculated dose or dose commitment greater than those currently calculated. (See Table 2.1)

Also, the land use census identified no milk-producing animals within a five-mile radius of the plant site. ANO personnel chose not to perform a garden census in 2009, which is allowed by ODCM Section 2.6.2, in lieu of broadleaf vegetation sampling in the meteorological sector (Sector 13) with the highest D/Q.

3.0 Radiological Environmental Monitoring Program Summary

3.1 2010 Program Results Summary

Table 3.1 summarizes the 2010 REMP results. ANO personnel did not use values reported as <LLD when determining ranges and means for indicator and control locations.

TABLE 3.1

Radiological Environmental Monitoring Program Summary

Name of Facility: ANO - Units 1 and 2 Docket No: 50-313 and 50-368.
Location of Facility: Pope County, Arkansas Reporting Period: January - December 2010

- a** GB = Gross beta; I-131 = Iodine-131; H-3 = Tritium; GS = Gamma scan.
- b** LLD = Required lower limit of detection based on ANO Units 1 and 2 ODCM Tables 2.6-2.
- c** Mean and range based upon detectable measurements only. Fraction of detectable measurements at specified locations is indicated in parenthesis (F).
- d** Locations are specified (1) by name and (2) degrees relative to reactor site.
- e** Non-routine results are those which exceed ten times the control station value. If no control station value is available, the result is considered non-routine if it exceeds ten times the preoperational value for the location.
- f** LLD is not defined in ANO Units 1 and 2 ODCM Tables 2.6-2.

CHEMISTRY SURVEILLANCE PROGRAM
RADIOCHEMISTRY QUALITY CONTROL ACCEPTANCE CRITERIA

This attachment provides criteria for comparing results of capability tests and verification measurements. The criteria are based on an empirical relationship which combines prior experience and the accuracy needs of this program.

In these criteria, the judgment limits are variable in relation to the comparison of the NRC Reference Laboratory's value to its associated uncertainty. As that ratio, referred to in this program as "Resolution", increases the acceptability of a licensee's measurement should be more selective. Conversely, poorer agreement must be considered acceptable as the resolution decreases.

RESOLUTION ⁽¹⁾	RATIO FOR AGREEMENT ⁽²⁾
<4	No Comparison
4 to 7	0.5 to 2.0
8 to 15	0.6 to 1.66
16 to 50	0.75 to 1.33
51 to 200	0.80 to 1.25
>200	0.85 to 1.18

⁽¹⁾ Resolution = (NRC Reference Value/Reference Uncertainty)
⁽²⁾ Ratio = (Licensee Value/NRC Reference Value)

Interlaboratory Comparison Program Summary

RBS' Environmental Laboratory analyzed interlaboratory comparison samples to fulfill the requirements of the ODCM. The interlaboratory comparison results indicated that 100% of the sample results for accuracy and precision were within the acceptable control limits.

ATTACHMENT 3

Sediment Dose Calculations

Sediment Dose Calculations

Sediment Sample Results

Dose calculation for the discharge sediment was performed using generalized equation found in Regulatory Guide 1.109, Revision 1, Appendix A as follows:

R = (40) × (C) × (U) × (D) × (W)

R = Annual dose to skin or total body in mrem/year;

40 = Area-mass conversion factor given in Appendix A of Regulatory Guide 1.109 in Kg/m²;

C = 2010 maximum radionuclide concentration in pCi/kg;

U = Maximum exposure time given in Table E-5 of Regulatory Guide 1.109 (67 hours for teenager);

D = External dose conversion factor for standing on contaminated ground given in Table E-6 of Regulatory Guide 1.109 in mrem/hr per pCi/m², and

W = Shore-width factor (0.1) given in Table A-2 of Regulatory Guide 1.109.

(Dose from Sediment in mrem/Year)

Radionuclide	2010 Maximum Concentration	Conversion Factor For Skin	Total Skin Dose	Conversion Factor For Total Body	Total Body Dose
Cs-137	65.55	4.90 E-09	8.61 E-05	4.20 E-09	7.38 E-05
TOTAL			8.61 E-05		7.38 E-05
