ATTN: Document Control Desk
U.S. Nuclear Regulatory Commission
11555 Rockville Pike
Rockville, Maryland 20852

Subject: Duke Energy Carolinas, LLC (Duke Energy)
Oconee Nuclear Station (ONS), Units 1, 2, and 3
Docket Numbers 50-269, 50-270, 50-287
Renewed License Numbers DPR-38, DPR-47, DPR-55
Application for Subsequent Renewed Operating Licenses

Ladies and Gentlemen:

Pursuant to the *Code of Federal Regulations,* Title 10, Parts 50, 51, and 54, Duke Energy Carolinas, LLC (Duke Energy) is submitting this application for Subsequent Renewed Operating Licenses for Oconee Nuclear Station (ONS) Units 1, 2, and 3. The existing Renewed Facility Operating Licenses, Numbers DPR-38, DPR-47, and DPR-55, are currently set to expire as follows:

- At midnight on February 6, 2033, for Oconee Nuclear Station Unit 1 (Renewed Facility Operating License Number DPR-38).
- At midnight on October 6, 2033, for Oconee Nuclear Station Unit 2 (Renewed Facility Operating License Number DPR-47).
- At midnight on July 19, 2034, for Oconee Nuclear Station Unit 3 (Renewed Facility Operating License Number DPR-55).

Duke Energy seeks to extend the respective operating terms by 20 years beyond the current renewal licensed expiration dates.

The enclosed Subsequent License Renewal Application contains the information required by 10 CFR Parts 54 and 51 and meets the submittal timeliness requirements of 10 CFR 54.17(c) and 10 CFR 2.109(b). This submittal provides appropriate administrative, technical and environmental information sufficient to support NRC findings required by 10 CFR 54.29.

This application has been prepared, to the extent feasible, in a format compatible with NUREG-2192, "Standard Review Plan for Review of Subsequent License Renewal Applications for Nuclear Power Plants," Regulatory Guide 1.188, Revision 2 "Standard Format and Content for Applications to Renew Nuclear Power Plant Operating Licenses," and guidance provided by Nuclear Energy Institute 17-01, "Industry Guideline for Implementing the Requirements of 10 CFR Part 54 for Subsequent License Renewal."

Enclosure 5 contains information that is being withheld from public disclosure under 10 CFR 2.390. Upon separation from Enclosure 5, this letter is decontrolled.

As required by 10 CFR 54.21(b), current licensing basis changes which have a material effect on the content of this application will be submitted at least annually while the application is under NRC review and at least three months prior to the scheduled completion of the NRC review.

Appendix A, Table A6.0-1, “Subsequent License Renewal Commitments”, of the enclosed Oconee Nuclear Station Subsequent License Renewal Application provides a list of commitments made in this application. This list will be updated as required throughout the SLRA review process.

The Application for Subsequent Renewed Operating Licenses for ONS Units 1, 2, and 3 consists of the following five Enclosures:

Enclosure 1: Oconee Nuclear Station Subsequent License Renewal Application Enclosure Summary (details of the contents of each enclosure)
Enclosure 2: Application for Withholding Proprietary Information from Public Disclosure Pursuant to 10 CFR 2.390
Enclosure 3: Oconee Nuclear Station Subsequent License Renewal Application
Enclosure 4: Non-proprietary Reference Documents and a Redacted Version of a Proprietary Reference Document (Public Version)
Enclosure 5: 10 CFR 2.390 Withheld Proprietary Documents (Non-Public Version)

Since Enclosure 5 contains proprietary information, it is supported by an affidavit signed by the owner of the information (Enclosure 2). The affidavit sets forth the basis on which the information may be withheld from public disclosure by the Commission and addresses with specificity the considerations listed in 10 CFR 2.390(b)(4) and consistent with NRC Regulatory Issue Summary 2014-11, Regulatory Requirements for Withholding of Proprietary Information form Public Disclosure. Accordingly, it is respectfully requested that the proprietary information be withheld from public disclosure in accordance with 10 CFR 2.390. A redacted, non-proprietary version is provided in Enclosure 4 as noted above. Correspondence with respect to the copyright or proprietary aspects of the vendor information or affidavits should be addressed to the vendor representative identified in the respective affidavit.

The NRC has issued four Interim Staff Guidance documents that update aging management criteria for pressurized-water reactor vessel internal components, mechanical, structural, and electrical structures and components in the NRC’s subsequent license renewal guidance documents. Specifically, the Interim Staff Guidance documents revise guidance contained in NUREG–2191, ‘‘Generic Aging Lessons Learned for Subsequent License Renewal (GALL–SLR) Report,’’ and NUREG–2192, ‘‘Standard Review Plan for Review of Subsequent License Renewal Applications for Nuclear Power Plants.’’ These Interim Staff Guidance documents are intended to facilitate preparation of subsequent license renewal applications by clarifying existing guidance for aging management and adding new guidance, which also will facilitate the NRC staff’s review of subsequent license renewal applications. The information in the Subsequent License Renewal Interim Staff Guidance documents has been incorporated into the SLRA where applicable.

1. SLR–ISG–2021–01–PWRVI, “Updated Aging Management Criteria for Reactor Vessel Internal Components for Pressurized-Water Reactors”, (ADAMS Accession Number ML20217L203).
2. SLR–ISG–2021–02–MECHANICAL, “Updated Aging Management Criteria for Mechanical Portions of Subsequent License Renewal Guidance”, (ADAMS Accession Number ML20181A434).

3. SLR–ISG–2021–03–STRUCTURES, “Updated Aging Management Criteria for Structures Portions of Subsequent License Renewal Guidance”, (ADAMS Accession Number ML20181A381).
4. SLR–ISG–2021–04–ELECTRICAL, “Updated Aging Management Criteria for Electrical Portions of Subsequent License Renewal Guidance”, (ADAMS Accession Number ML20181A395).

Should you have any questions regarding this submittal, please contact Paul Guill at (704) 382 4753 or by email at paul.guill@duke-energy.com.

I declare under penalty of perjury that the foregoing is true and correct. Executed on June 7, 2021.

Sincerely,

Steven M. Snider
Site Vice President

OCONEE NUCLEAR STATION
AFFIDAVIT FOR FRAMATOME TOPICAL REPORTS ANP 3898P, REVISION 0 AND ANP 3899P, REVISION 0

A F F I D A V I T

1. My name is Philip A. Opsal. I am Manager, Product Licensing for Framatome Inc. (formally known as AREVA Inc.), and as such I am authorized to execute this Affidavit.

2. I am familiar with the criteria applied by Framatome to determine whether certain Framatome information is proprietary. I am familiar with the policies established by Framatome to ensure the proper application of these criteria.

3. I am familiar with the Framatome information contained in the following documents referred to herein as "Documents":

- Framatome Document ANP-3898P, Revision 0, "Framatome Reactor Vessel and RCP TLAA and Aging Management Review Input to the ONS SLRA"
- Framatome Document ANP-3899P, Revision 0, "Framatome Reactor Vessel Internals TLAA Input to the ONS SLRA"

Information contained in these Documents has been classified by Framatome as proprietary in accordance with the policies established by Framatome for the control and protection of proprietary and confidential information.

4. These Documents contain information of a proprietary and confidential nature and is of the type customarily held in confidence by Framatome and not made available to the public. Based on my experience, I am aware that other companies regard information of the kind contained in these Documents as proprietary and confidential.

5. These Documents have been made available to the U.S. Nuclear Regulatory Commission in confidence with the request that the information contained in these Documents be withheld from public disclosure. The request for withholding of proprietary information is

made in accordance with 10 CFR 2.390. The information for which withholding from disclosure is requested qualifies under 10 CFR 2.390(a)(4) "Trade secrets and commercial or financial information."

6. The following criteria are customarily applied by Framatome to determine whether information should be classified as proprietary:

(a) The information reveals details of Framatome's research and development plans and programs or their results.

(b) Use of the information by a competitor would permit the competitor to significantly reduce its expenditures, in time or resources, to design, produce, or market a similar product or service.

(c) The information includes test data or analytical techniques concerning a process, methodology, or component, the application of which results in a competitive advantage for Framatome.

(d) The information reveals certain distinguishing aspects of a process, methodology, or component, the exclusive use of which provides a competitive advantage for Framatome in product optimization or marketability.

(e) The information is vital to a competitive advantage held by Framatome, would be helpful to competitors to Framatome, and would likely cause substantial harm to the competitive position of Framatome.

The information in these Documents is considered proprietary for the reasons set forth in paragraphs 6(b), 6(c), 6(d) and 6(e) above.

7. In accordance with Framatome's policies governing the protection and control of information, proprietary information contained in these Documents has been made available, on a limited basis, to others outside Framatome only as required and under suitable agreement providing for nondisclosure and limited use of the information.

8. Framatome policy requires that proprietary information be kept in a secured file or area and distributed on a need-to-know basis.

9. The foregoing statements are true and correct to the best of my knowledge, information, and belief.

I declare under penalty of perjury that the foregoing is true and correct.

Executed on May 6, 2021.

OCONEE NUCLEAR STATION
DUKE ENERGY AFFIDAVIT FOR SLR-ONS-TLAA-0306P-NP, REVISION 0

AFFIDAVIT OF STEVE SNIDER

1. I am Site Vice President, Oconee, Duke Energy Carolinas, LLC ("Duke Energy"), and as such have the responsibility of reviewing proprietary information sought to be withheld from public disclosure in connection with nuclear plant licenses and am authorized to apply for its withholding on behalf of Duke Energy.

2. I am making this affidavit in conformance with the provisions of 10 CFR 2.390 of the regulations of the Nuclear Regulatory Commission ("NRC") and in conjunction with Duke Energy's application for withholding which accompanies this affidavit.

3. I have knowledge of the criteria used by Duke Energy in designating information as proprietary or confidential. I am familiar with the Duke Energy information contained in Table 4.3.4-1 of Attachment 3 to Enclosures 4 and 5 of the Oconee Subsequent License Renewal submittal.

4. Pursuant to the provisions of 10 CFR 2.390(b)(4), the following is furnished for consideration by the NRC in determining whether the information sought to be withheld from public disclosure should be withheld.

   (i) The information sought to be withheld from public disclosure is owned by Duke Energy and has been held in confident by Duke Energy and its consultants.

   (ii) The information is of a type that would customarily be held in confidence by Duke Energy. Information is held in confidence if it falls in one or more of the following categories.

      (a) The information requested to be withheld reveals distinguishing aspects of a process (or component, structure, tool, method, etc.) whose use by a vendor or consultant, without a license from Duke Energy, would constitute a competitive economic advantage to that vendor or consultant.

      (b) The information requested to be withheld consist of supporting data, including test data, relative to a process (or component, structure, tool, method, etc.), and the application of the data secures a competitive economic advantage for example by requiring the vendor or consultant to perform test measurements, and process and analyze the measured test data.

      (c) Use by a competitor of the information requested to be withheld would reduce in the competitor's expenditure of resources, or improve its competitive position, in the design, manufacture, shipment, installation assurance of quality or licensing of a similar product.

(d) The information requested to be withheld reveals cost or price information, productive capacities, budget levels or commercial strategies of Duke Energy or its customers or suppliers.

(e) The information requested to be withheld reveals aspect of the Duke Energy funded (either wholly or as part of a consortium) development plans or programs of commercial value to Duke Energy.

(f) The information requested to be withheld consists of patentable ideas.

The information in this submittal is held in confidence for the reasons set forth in paragraphs 4(ii)(a), 4(ii)(b), and 4(ii)(c) above. Rationale for this declaration is the use of this information by Duke Energy provides a competitive advantage to Duke Energy over vendors and consultants, its public disclosure would diminish the information's marketability, and its use by a vendor or consultant would reduce their expenses to duplicate similar information. The information consist of analysis methodology detains that provides a competitive advantage to Duke Energy.

(iii) The information was transmitted to the NRC in confidence under the provisions of 10 CFR 2.390, it is to be received in confidence by the NRC.

(iv) The information sought to be protected is not available in public to the best of our knowledge and belief.

(v) The proprietary information sought to be withheld is that which is marked in Table 4.3.4-1 of Attachment 3 to Enclosures 4 and 5 of the Oconee Subsequent License Renewal submittal. This information enables Duke Energy to support the Oconee Subsequent License Renewal Application.

(vi) The proprietary information sought to be withheld from public disclosure has substantial commercial value to Duke Energy.

(a) Duke Energy uses this information to reduce vendor and consultant expenses associated with supporting the operation and licensing of nuclear plants.

(b) The subject information could only be duplicated by competitors at similar expense to that incurred by Duke Energy.

5. Public disclosure of this information is likely to cause harm to Duke Energy because it would allow competitors in the nuclear industry to benefit from the results of a significant development program without requiring a commensurate expense of allowing Duke Energy to recoup a portion of its expenditures or benefit from the sale of the information.

Steve Snider affirms that he is the person who subscribed his name to the foregoing statement, and that all matters and facts set forth herein are true and correct to the best of his knowledge.

I declare under penalty of perjury that the foregoing is true and correct.

Executed on May 18, 2021.

List of Figures

1.0 ADMINISTRATIVE INFORMATION

1.1 GENERAL INFORMATION - 10 CFR 54.19

1.1.1 NAME OF APPLICANT

Duke Energy Carolinas, LLC (Duke Energy) hereby applies for subsequent renewed facility operating licenses for Oconee Nuclear Station (ONS), Units 1, 2, and 3.

1.1.2 ADDRESS OF APPLICANT

Duke Energy Carolinas, LLC
526 South Church Street
Charlotte, North Carolina 28202-1803

1.1.3 ADDRESS OF OCONEE NUCLEAR STATION

Duke Energy Carolinas, LLC
Oconee Nuclear Station
7800 Rochester Highway
Seneca, South Carolina 29672

1.1.4 DESCRIPTION OF BUSINESS OR OCCUPATION OF APPLICANT

Duke Energy is a limited liability company duly organized and existing under the laws of the State of North Carolina (NC) and is qualified to do business in the State of South Carolina (SC). Duke Energy is engaged in the business of generating, transmitting, distributing and selling electric power and energy. Duke Energy is a “public utility” under the laws of NC and SC. Duke Energy is subject to the jurisdiction of the North Carolina Utilities Commission (NCUC) with respect to its operations in that State. The company also transacts business and is an “electrical utility” under the laws of the State of SC; accordingly, its operations in that state are subject to the jurisdiction of the Public Service Commission of South Carolina (PSCSC). The company owns and operates regulated electric facilities, including seven (7) nuclear units licensed by the Nuclear Regulatory Commission (NRC), as well as electric distribution and transmission facilities.

The initial Oconee Nuclear Station Units renewed facility operating licenses will expire as follows:

- At midnight on February 6, 2033, for Oconee Nuclear Station Unit 1 (Renewed Facility Operating License Number DPR-38).
- At midnight on October 6, 2033, for Oconee Nuclear Station Unit 2 (Renewed Facility Operating License Number DPR-47).
- At midnight on July 19, 2034, for Oconee Nuclear Station Unit 3 (Renewed Facility Operating License Number DPR-55).

Duke Energy will continue as the licensed operator for the subsequent renewed facility operating licenses.

1.1.5 DESCRIPTION OF ORGANIZATION AND MANAGEMENT OF APPLICANT

Duke Energy is not owned, controlled, or dominated by any alien, foreign corporation, or foreign government. Duke Energy makes this subsequent license renewal application (SLRA) on its own behalf and is not acting as an agent or representative of any other person.

The names and business addresses of Duke Energy's Board of Directors and Principal Officers as of April 30, 2021 are listed below in Table 1.1-1 and Table 1.1-2, respectively. All persons listed are U.S. citizens.

Steve Snider	Site Vice President - Oconee Nuclear Station	Duke Energy Carolinas, LLC Mail Code ON1VP Oconee Nuclear Station 7800 Rochester Highway Seneca, SC 29672

1.1.6 CLASS OF LICENSE, USE OF FACILITY AND PERIOD OF TIME FOR WHICH THE LICENSE IS SOUGHT

Duke Energy requests subsequent renewal of the operating licenses issued under Section 104b of the Atomic Energy Act of 1954, as amended, for ONS Unit 1, Unit 2, and Unit 3 (License Numbers DPR-38, DPR-47 and DPR-55, respectively), for a period of 20 years beyond the expiration of the initial renewed facility operating licenses. This would extend the renewed facility operating license as follows:

- Oconee Nuclear Station Unit 1 from midnight on February 6, 2033, to midnight on February 6, 2053.
- Oconee Nuclear Station Unit 2 from midnight on October 6, 2033, to midnight on October 6, 2053.
- Oconee Nuclear Station Unit 3 from midnight on July 19, 2034, to midnight on July 19, 2054.

This SLRA includes a request for renewal of those NRC source material, special nuclear material, and by-product material licenses that are subsumed into or combined with the current renewed operating licenses and that were issued pursuant to Chapter 10 of the Code of Federal Regulations (CFR) Parts 30, 40, and 70. The facility will continue to be known as ONS and will continue to generate electric power during the subsequent license renewal (SLR) period.

1.1.7 EARLIEST AND LATEST DATES FOR ALTERATIONS

Duke Energy proposes to implement a modification to abandon the buried copper alloy instrument air system piping (Section 2.3.3.1.4) within the scope of the *Buried and Underground Piping and Tanks* (B2.1.26) program on a schedule established in Table A6.0-1.

1.1.8 RESTRICTED DATA

Regarding the requirements of 10 CFR 54.17(f), this application does not contain any “Restricted Data,” as that term is defined in the Atomic Energy Act of 1954, as amended, or other defense information, and it is not expected that any such information will be part of the licensed activities.

In accordance with the requirements of 10 CFR 54.17(g), the applicant will not permit any individual to have access to or any facility to possess restricted data or classified national security information until the individual and/or facility has been approved for such access under the provisions of 10 CFR Parts 25 and/or 95.

1.1.9 REGULATORY AGENCIES

The Federal Energy Regulatory Commission, United States Securities and Exchange Commission, NCUC, and PSCSC are the principal regulators of Duke Energy’s electric operations in NC and SC. The names and addresses of these regulatory agencies are as follows:

Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

United States Securities and Exchange Commission
100 F Street NE
Washington, DC 20549

North Carolina Utilities Commission
430 North Salisbury Street
Dobbs Building 5th Floor
Raleigh, NC 27603-5918

Public Service Commission of South Carolina
101 Executive Center Drive, Suite 100.
Columbia, SC 29210

1.1.10 LOCAL NEWS PUBLICATIONS

News publications in circulation near ONS that are considered appropriate to give reasonable notice of the SLRA include:

The Journal
Eagle Media
210 W. N. 1st St.,
Seneca, SC 29678

Anderson Independent

103 Ram Cat Alley
Seneca, SC 29679

1.1.11 CONFORMING CHANGES TO STANDARD INDEMNITY AGREEMENT

10 CFR 54.19(b) requires that “each application must include conforming changes to the standard indemnity agreement, 10 CFR 140.92, Appendix B, to account for the expiration term of the proposed renewed license.” The current indemnity agreement (No. B-44) for ONS states, in Article VII, that the agreement “shall terminate at the time of expiration of that license specified in Item 3 of the Attachment.” Item 3 of the Attachment to the indemnity agreement, as updated in Amendment 16, lists license number DPR-38 (for ONS Unit 1), DPR-47 (for ONS Unit 2) and

DPR-55 (for ONS Unit 3). Duke Energy has reviewed the original Indemnity Agreement and the Amendments. Neither Article VII nor Item 3 of the Attachment specifies an expiration date for license numbers DPR-38, DPR-47 and DPR-55. Therefore, no changes to the Indemnity Agreement are deemed necessary as part of this application. Should the license numbers be changed by NRC upon issuance of the subsequent renewed licenses, Duke Energy requests that the NRC amend the Indemnity Agreement to include conforming changes to Item 3 of the Attachment and other affected sections of the Agreement.

1.2 GENERAL LICENSE INFORMATION

1.2.1 APPLICATION UPDATES, RENEWED LICENSE AND RENEWAL TERM OPERATION

In accordance with 10 CFR 54.21(b), during NRC review of this SLRA, an annual update to the application to reflect any change to the current licensing basis (CLB) that materially affects the content of the SLRA will be provided.

In accordance with 10 CFR 54.21(d), Duke Energy will maintain a summary description in the ONS Updated Final Safety Analysis Report (UFSAR) of programs and activities that are required to manage the effects of aging for the systems, structures or components during the subsequent period of extended operation (SPEO) and summaries of the time-limited aging analyses (TLAA) evaluations.

1.2.2 INCORPORATION BY REFERENCE

Except for the following three instances in the Environmental Report, there are no documents incorporated by reference as part of the SLRA:

- The analyses for certain impacts codified by rulemaking (61 FR 28483) for Category 1 issues
- The findings in NUREG-1437, Revision 1, for the applicable issues
- The NRC findings for the 53 Category 1 issues that apply to ONS (plus the one uncategorized issue for which the NRC came to no generic conclusion)

Other document references, either in text or in general references provided in Sections 1 and 4, are listed for information only.

1.2.3 CONTACT INFORMATION

Any notices, questions, or correspondence regarding this filing should be directed to:

Steve Snider
Site Vice President - Oconee Nuclear Station
Oconee Nuclear Station

1.3 PURPOSE

This document provides information required by 10 CFR Part 54 to support the SLRA for ONS, Units 1, 2, and 3. The application contains technical information required by 10 CFR 54.21 and environmental information required by 10 CFR 54.23. The information contained herein is intended to provide the NRC with an adequate basis to make the findings required by 10 CFR 54.29.

1.4 DESCRIPTION OF THE PLANT

Descriptions of ONS and two of its major facilities, Keowee hydroelectric station and standby shutdown facility, are provided as background. The description of ONS is provided in Section 1.4.1. The emergency power source for ONS is provided by Keowee hydroelectric station which is described in Section 1.4.2. The standby shutdown facility, which was installed after the initial plant licensing, is located adjacent to ONS Unit 2 and is described in Section 1.4.3.

1.4.1 DESCRIPTION OF OCONEE NUCLEAR STATION

ONS is in Oconee County in northwestern SC, approximately 8 miles northeast of Seneca, SC at latitude 34°-47'-38.2” North and longitude 82°-53'- 55.4" West. ONS is situated on the shore of Lake Keowee. Lake Keowee was formed by impounding the water of the Little River and the Keowee River. Duke Energy’s Lake Keowee occupies the area immediately north and west of the site. The United States Army Corps of Engineer's Hartwell Reservoir is south of the site. Duke Energy's Lake Jocassee lies approximately 11 miles to the north.

Construction of ONS 1, 2, and 3 was authorized by the United States Atomic Energy Commission (USAEC) by issuance of construction permits CPPR-33, 34, and 35, on November 6, 1967, in Dockets 50-269, 270, and 287. The three-unit nuclear station was constructed from 1967 to 1974. Operation of ONS 1, 2, and 3 was authorized by the USAEC by issuance of operating licenses DPR-38, 47, and 55 on February 6, 1973, October 6, 1973, and July 19, 1974, respectively. Each unit consists of a Babcock & Wilcox (B&W) pressurized water reactor (PWR) nuclear steam supply system (NSSS) designed to generate 2568 megawatt (MW) thermal, or approximately 860 MW electric. The NSSS is a pressurized water type using chemical shim and control rods for reactivity control. B&W supplied the NSSS and the initial fuel cores and some reloads. Framatome Inc., as successor to B&W, supplies reloads for each of the three units. Replacement steam generators and reactor vessel heads were supplied by Babcock & Wilcox Canada (BWC).

The three units share a common design except for certain auxiliary systems which are shared. Sharing of these systems and components is not detrimental to the safe operation of any unit. General arrangements of major equipment and structures, including the reactor building, auxiliary building, and turbine building, are provided in UFSAR Figures 1-2 through 1-9.

The ONS units are generally similar to those of other current PWRs. Differences include the generation of superheated steam in once through steam generators, the use of Keowee hydroelectric station as an emergency power source, and the use of the standby shutdown facility for use under certain emergency conditions.

ONS consists of three individual reactor buildings, a common turbine building serving all three units, a shared auxiliary building for Units 1 and 2, and a Unit 3 auxiliary building. The reactor and NSSS for each unit are contained within its respective reactor building.

In 1990, Duke Energy received a Part 72 license from the NRC that permitted the construction and operation of an independent spent fuel storage installation at ONS. Materials License Number SNM-2503 was issued to Duke Energy on January 29, 1990 and was renewed on May 29, 2009. In addition, Duke Energy notified the NRC by letter dated November 7, 1996, of its intent to store spent fuel under the general license pursuant to 10 CFR 72.210 (NRC Certificate of Compliance No. 1004). Because the ONS independent spent fuel storage installation is a separately licensed facility (site specific license and general license), it is not within the scope of review as defined by 10 CFR Part 54.

1.4.2 DESCRIPTION OF KEOWEE HYDROELECTRIC STATION

The onsite emergency power source for ONS is Keowee hydroelectric station, which is located at the Keowee dam on Lake Keowee within the owner controlled area for ONS. Keowee was initially licensed (Project Number 2503) by the Federal Power Commission (now the Federal Energy Regulatory Commission) on September 26, 1966, with a license term of fifty years. A renewed license for Keowee was issued by the Federal Energy Regulatory Commission on August 16, 2016 (effective September 1, 2016) with a license term of thirty years.

The station consists of two hydroelectric units that generate electricity at 13.8 kilovolt (kV) and are rated at 87.5 megavolt amp (MVA) each. Electricity is supplied from both Keowee hydroelectric station units to ONS through two separate and independent power paths. One route is through buried cables to transformer CT4; the other route is through a 230 kV overhead transmission line, through the 230 kV switchyard at ONS, to transformers CT1, CT2, and CT3.

The Keowee hydroelectric station units are located in a building that contains all of the necessary systems and components for the units to operate. Remote startup controls and monitoring instrumentation are located in the ONS control rooms. Except for the common penstock, each Keowee hydroelectric station unit is independent of the other unit including separate electrical and mechanical support systems. The integrated plant assessments (IPAs) of the Keowee hydroelectric station mechanical, civil/structural, and electrical/instrumentation and control (I&C) components are provided in Sections 2.3, 2.4, and 2.5 of the SLRA, respectively.

1.4.3 DESCRIPTION OF STANDBY SHUTDOWN FACILITY

The standby shutdown facility is designed as a standby system for use under certain emergency conditions. It provides additional “defense in depth” protection by serving as a backup to existing safety systems. The standby shutdown facility is designed to provide an alternate means to achieve and maintain hot shutdown conditions following a fire; sabotage; turbine building flood; station blackout (SBO); and tornado events. Because the standby shutdown facility is a backup to existing safety systems, the single failure criterion is not required. Failures in the standby shutdown facility systems will not cause failures or inadvertent operations in other plant systems. The standby shutdown facility requires manual activation and can be activated if the relevant emergency systems are not available.

The standby shutdown facility is designed to achieve and maintain the reactor in a safe shutdown (SSD) condition for a period of 72 hours in accordance with criteria of its design basis events. SSD is accomplished by:

- Re-establishing and maintaining cooling of the reactor coolant pump seals to ensure natural circulation and core cooling by maintaining the primary coolant system filled to a sufficient level in the pressurizer while also maintaining sufficient secondary side cooling water, and
- Maintaining the reactor subcritical by isolating all sources of makeup water to the reactor coolant system except from the reactor coolant makeup system, which supplies water with a sufficient boron concentration.

The standby shutdown facility is primarily comprised of the structure and the auxiliary service water system; the reactor coolant makeup system; the electrical power systems; the support systems; and the diesel generator. These systems are described further in Section 2.3 of SLRA. The standby shutdown facility structure is described in Section 2.4.7.6.

1.5 APPLICATION STRUCTURE

In accordance with the requirements of 10 CFR Part 54, this SLRA provides the technical and environmental information required for renewal of the initial renewed operating licenses for an additional 20 years.

This SLRA is structured in accordance with Regulatory Guide (RG) 1.188, "Standard Format and Content for Applications to Renew Nuclear Plant Operating Licenses," and NEI 17-01, "Industry Guideline for Implementing the Requirements of 10 CFR Part 54 for Subsequent License Renewal." In addition, Section 3.0, "Aging Management Review Results" and Appendix B, "Aging Management Programs" are structured to address the guidance provided in NUREG-2192, "Standard Review Plan for Review of Subsequent License Renewal Applications for Nuclear Power Plants." NUREG-2192 references NUREG-2191, "Generic Aging Lessons Learned for Subsequent License Renewal (GALL-SLR) Report." NUREG-2191 was used to determine the adequacy of existing programs for purposes of managing aging and which existing programs should be augmented for SLR. The results of the aging management review (AMR), using NUREG-2191, have been documented and are illustrated in table format in Section 3.0, "Aging Management Review Results" of this application.

ONS Units 1, 2, and 3 are constructed of similar materials with similar environments. Unless otherwise noted throughout this SLRA, plant systems and structures discussed in this SLRA apply to all three units.

This SLRA and supporting environmental report are intended to provide sufficient information for the NRC to complete its technical and environmental reviews and enable the NRC to make the findings required by 10 CFR 54.29 in support of renewal of the initial renewed operating licenses.

The SLRA is organized into four sections and five appendices as follows:

Section 1.0 - Administrative Information

Section 1.0 provides the administrative information required by 10 CFR 54.17 and 10 CFR 54.19. The section describes the plant and states the purpose for this application. Included in this chapter are the names, addresses, business descriptions, organization, and management descriptions of the applicant, as well as other administrative information. Also provided is an overview of the structure of the SLRA, acronyms and general references used throughout the SLRA.

Section 2.0 - Scoping and Screening Methodology for Identifying Structures and Components Subject to Aging Management Review and Implementation Results

This section describes and justifies the methods used in the IPA to identify those structures and components subject to an AMR in accordance with the requirements of 10 CFR 54.21(a)(2). These methods consist of: (1) scoping, which identifies the systems, structures, and components (SSCs) that are within the scope of 10 CFR 54.4(a), and (2) screening under 10 CFR 54.21(a)(1), which identifies those in-scope SSCs that perform intended functions without moving parts or a change in configuration or properties, and that are not subject to replacement based on a qualified life or specified time period. In addition, the scoping results for systems and structures are described in Section 2.0. Scoping results are presented in Section 2.2, Table 2.2-1, and Table 2.2-2. Screening results are presented in Sections 2.3, 2.4, and 2.5.

The screening results consist of lists of component types that require AMR. Descriptions of mechanical systems and structures within the scope of SLR are provided as background information. The descriptions of systems identify SLR drawings that document the in-scope mechanical components. The SLR drawings are provided in a separate submittal. For each in-scope system and structure, component types requiring an AMR are identified, associated component intended functions are identified, and the appropriate reference to the Section 3.0 table providing the AMR results is provided.

Selected structural and electrical component types, such as component supports and cables, were evaluated as commodities. Under the commodity approach, selected structural and electrical component types were evaluated based upon common environments and materials. For each of these commodities, the component types requiring AMR are presented in Sections 2.4 and 2.5.

Section 3.0 – Aging Management Review Results

10 CFR 54.21(a)(3) requires a demonstration that the effects of aging will be adequately managed so that the intended functions will be maintained consistent with the CLB throughout the PEO. Section 3.0 presents the results of the AMRs. Section 3.0 is the link between the scoping and screening results provided in Section 2.0 and the aging management programs (AMP) described in Appendix B.

AMR results are presented in tabular form, in a format in accordance with Standard Review Plan for Review of License Renewal Applications for Nuclear Power Plants (NUREG-2192). For mechanical systems, AMR results are provided in Sections 3.1, 3.2, 3.3, and 3.4 for the reactor vessel, reactor vessel internals, and reactor coolant system; engineering safety features; auxiliary systems; and steam and power conversion system, respectively. AMR results for containment, structures, and component supports are provided in Section 3.5. AMR results for electrical and I&C are provided in Section 3.6.

Section 4.0 – Time Limited Aging Analyses

TLAA, as defined by 10 CFR 54.3, are listed in this section. Section 4.0 includes each of the TLAA identified in SRP-2192 and in plant-specific analyses. This section includes a summary of the time dependent aspects of the analyses. A demonstration is provided to show that: (1) each of the analyses remains valid for the SPEO, (2) the analyses have been projected to the end of the SPEO, or (3) the effects of aging on the intended function(s) will be adequately managed for the SPEO.

Section 4.0 also confirms that no 10 CFR 50.12 exemption involving a TLAA as defined in 10 CFR 54.3 is required during the SPEO. The information in Section 4.0 fulfills the requirements in 10 CFR 54.21(c).

Appendix A – Updated Final Safety Analysis Report Supplement

As required by 10 CFR 54.21(d), the UFSAR supplement is found in Appendix A and contains a summary of activities credited for managing the effects of aging for the SPEO. In addition, summary descriptions and dispositions of TLAA evaluations and a summary of SLR commitments are provided. The SLR commitments are identified in Table A6.0-1, Subsequent License Renewal Commitments List. The information in Appendix A fulfills the requirements in 10 CFR 54.21(d).

Appendix B – Aging Management Programs

Appendix B describes the programs and activities that are credited for managing aging effects for components or structures during the SPEO based upon the AMR results provided in Section 3.0 and the TLAA results provided in Section 4.0. The information in Section 2.0, Section 3.0, and Appendix B fulfills the requirements of 10 CFR 54.21(a).

Appendix C – MRP-227-A Gap Analysis

Appendix B2.1.7 satisfies the guidance of NUREG-2192 Section 3.1.2.2.9 to provide a gap analysis of the components that are within the scope of the PWR Vessel Internals program and consistent with Interim Staff Guidance (ISG) SLR–ISG–2021–01–PWRVI, "Updated Aging Management Criteria for Reactor Vessel Internal Components for Pressurized-Water Reactors." Using an MRP-227-A based program (i.e. EPRI 1022863, Materials Reliability Program: Pressurized Water Reactor Internals Inspection and Evaluation Guidelines) as a starting point, the gap analysis is a basis for identifying and justifying potential changes to the program that will manage aging degradation effects for reactor vessel internal components during the SPEO. Since the gap analysis is provided in Appendix B2.1.7, Appendix C is not used for the ONS SLRA.

Appendix D – Technical Specification Changes

Appendix D satisfies the requirements of 10 CFR 54.22 to identify whether any technical specification changes or additions are necessary to manage the effects of aging during the SPEO. Since no technical specification changes are requested, Appendix D is not used.

Appendix E – Environmental Report—Subsequent Operating License Renewal Stage

Appendix E satisfies the requirements of 10 CFR 54.23 to provide a supplement to the Environmental Report that complies with the requirements of subpart A of 10 CFR 51.

2.0 SCOPING AND SCREENING METHODOLOGY FOR IDENTIFYING STRUCTURES AND COMPONENTS SUBJECT TO AGING MANAGEMENT REVIEW AND IMPLEMENTATION RESULTS

This section describes the process for identifying structures and components subject to AMR in the ONS IPA. For the SSCs within the scope of SLR, 10 CFR 54.21(a)(1) requires the SLR applicant to identify and list those structures and components subject to AMR. Furthermore, 10 CFR 54.21(a)(2) requires that the methods used to implement the requirements of 10 CFR 54.21(a)(1) be described and justified. Section 2.0 of this application satisfies these requirements.

The IPA process is performed in two steps. Scoping refers to the process of identifying the plant SSCs that are to be included within the scope of SLR in accordance with 10 CFR 54.4. The intended functions that are the bases for including the SSCs within the scope of SLR are also identified during the scoping process. Screening refers to the process of determining structures and components that are subject to AMR in accordance with 10 CFR 54.21(a)(1) requirements. Mechanical and structures scoping is performed at the system and structure level; scoping is also performed before screening in the IPA. In contrast, electrical scoping is performed at the component level; screening is also performed before scoping. Additionally, electrical scoping initially includes all electrical components within the scope of SLR and selectively scopes out components that do not perform an intended function meeting 10 CFR 54.4. A detailed description of the Oconee scoping and screening process is provided in Section 2.1.

The scoping and screening methodology is implemented in accordance with NEI 17-01, *"Industry Guideline for Implementing the Requirements of 10 CFR Part 54 for Subsequent License Renewal"* (Reference 1.7.6). The plant level scoping results identify the mechanical systems, structures, and electrical components within the scope of SLR in Section 2.2. The screening results identify components subject to AMR in the following SLRA sections:

- Section 2.3 for mechanical systems
- Section 2.4 for containments, structures, and component supports
- Section 2.5 for electrical and I&C components

2.1 SCOPING AND SCREENING METHODOLOGY

2.1.1 INTRODUCTION

This introduction provides an overview of the scoping and screening process used at ONS. Subsequent sections provide details on how the process was implemented.

For mechanical systems and structures, the initial step in the scoping process was to define the entire plant in terms of systems and structures. Each of the identified mechanical systems and structures were then evaluated against the scoping criteria in 10 CFR 54.4(a)(1), (a)(2), and (a)(3), to determine if the mechanical system or structure is relied upon to remain functional during and following a DBE, if the mechanical system or structure failure could prevent the satisfactory accomplishment of a function described in 10 CFR 54.4(a)(1)(i), (ii), or (iii) or if the mechanical system or structure is relied on in safety analysis or plant evaluation to perform a function that demonstrates compliance with the Commission's regulations for fire protection (10 CFR 50.48), environmental qualification (EQ) (10 CFR 50.49), pressurized thermal shock (PTS) (10 CFR 50.61), anticipated transients without scram (ATWS) (10 CFR 50.62), or station blackout (SBO) (10 CFR 50.63). The intended function(s) that are the bases for including mechanical systems and structures within the scope of SLR were also identified.

Systems that contain mechanical components such as pumps, piping, valves, are addressed as mechanical systems. A mechanical system was included within the scope of SLR if any portion of the system met the scoping criteria in 10 CFR 54.4(a)(1), (a)(2), or (a)(3). Mechanical systems determined to be within the scope of SLR were then further evaluated to determine the system components that are required to perform or support the identified systems intended function(s). The in-scope boundaries of mechanical systems were identified and are described in Section 2.3. These boundaries are depicted on the SLR boundary drawings. Additional details on scoping evaluations and boundary drawing development are provided in Section 2.1.4.

Structures were included within the scope of SLR if any portion of a structure met the scoping criteria in 10 CFR 54.4(a)(1), (a)(2), or (a)(3). Structures were then further evaluated to determine the structural components that are required to perform or support the identified structures intended function(s). The portions of each structure within the scope of SLR that are required to perform or support the identified structures intended function(s) were identified and are described in Section 2.4. Structures that are within the scope of SLR are shown on a SLR boundary drawing (SLR-C-001). Additional details on scoping evaluations and boundary drawing development are provided in Section 2.1.4.

After completion of scoping, the screening process was performed to evaluate the structures and mechanical components within the scope of SLR to identify the long-lived and passive structures and components subject to AMR. In addition, the passive intended functions of structures and components subject to AMR were identified. Additional details on the screening process are provided in Section 2.1.5.

Electrical scoping was not performed at the system level but rather at the component level using a bounding or spaces approach. As discussed in the Statement of Consideration to the License Renewal Rule (60FR22462), the term “systems, structures, and components” is used in 10 CFR 54.4 to allow an applicant to scope at a system or structure level or at a component level. Whether dividing the electrical portions of the plant by systems or other means, the objective is to ensure that no electrical components that perform an intended function are excluded from the review. This approach initially includes all electrical components within scope and selectively scopes out electrical components that do not perform an intended function that meets 10 CFR 54.4. Furthermore, for efficiency of review, 10 CFR 54.4(a) is applied to electrical components only after they have been screened under 10 CFR 54.21(a)(1). Additional details on electrical and I&C scoping and screening are provided in Sections 2.1.4 and 2.1.5, respectively.

Selected components, such as equipment supports, structural items, and passive electrical components, were scoped and screened as commodities. As such, they were not evaluated with the structures or as individual components but were evaluated collectively as a commodity group. Passive structural commodities are identified in Section 2.4, and passive electrical commodities are identified in Section 2.5. Commodity groups utilized are consistent with NUREG-2192, *"Standard Review Plan for Review of Subsequent License Renewal Applications for Nuclear Power Plants"*, Table 2.1-6 (Reference 1.7.2).

2.1.2 INFORMATION SOURCES USED FOR SCOPING AND SCREENING

Several different CLB and design basis information sources were utilized in the scoping and screening process. The CLB for ONS is consistent with the definition provided in 10 CFR 54.3. The CLB includes applicable NRC regulations and appendices thereto; orders; license conditions; exemptions; and technical specifications. The CLB also includes plant-specific design basis information defined in 10 CFR 50.2 as documented in the most recent UFSAR as required by 10 CFR 50.71 and the commitments remaining in effect that were made in docketed licensing correspondence such as responses to NRC bulletins, generic letters (GLs), and enforcement actions, as well as commitments documented in NRC safety evaluations or licensee event reports (LERs). A brief discussion of the significant source documentation is provided below.

2.1.2.1 Updated Final Safety Analysis Report

The ONS UFSAR, which is updated regularly in accordance with the requirements of 10 CFR 50.71(e), provided significant input for system and structure descriptions and functions.

2.1.2.2 Flow Diagrams

The flow diagrams provide mechanical systems details for ONS, including Keowee and the standby shutdown facility. These drawings were utilized to determine functional requirements, equipment location, environments and materials of construction in support of scoping, screening and AMR evaluations.

2.1.2.3 Design Basis Documents

Design Basis Documents (DBDs) are available for selected ONS systems and structures. The DBDs provide detailed descriptions of the associated system and structure design basis, including system functions and design requirements. The system and structure DBDs were reviewed, when available, during the scoping review.

2.1.2.4 Equipment Database

The Equipment Database (EDB) is a database used to store and maintain a broad array of component level information. Component quality classification, seismic qualification, equipment type and association with various regulated events are examples of information contained in the EDB.

2.1.2.5 Maintenance Rule Database

The Maintenance Rule Database documents the results of Maintenance Rule scoping for ONS systems and structures. The Maintenance Rule Database provided an additional source of information to identify system and structure functions.

2.1.2.6 Environmental Qualification Documentation

The scope of the electrical equipment and components that must be environmentally qualified for use in a harsh environment at ONS is identified in a site-specific list of equipment in the EQ program pursuant to 10 CFR 50.49.

2.1.2.7 NFPA 805 Fire Protection Program

NFPA 805 Fire Protection Program incorporates both deterministic and risk-informed, performance-based methods to establish a comprehensive set of requirements. The fire protection program describes the fire protection configuration for the confinement, detection, suppression of fires, and demonstrates the capability to achieve and maintain SSD conditions in the event of a fire, in support of the fire protection program functions. The scope of the ONS fire protection program is based on 10 CFR 50.48(a) and NFPA 805 as referenced in 10 CFR 50.48(c). Fundamental elements of the NFPA 805 fire protection program are discussed in the following key documents:

- UFSAR Section 9.5.1.
- Design Basis Specification for Fire Protection.
- NRC SER for Transition to Risk-Informed, Performance Based Fire Protection Program.

2.1.2.8 Other References

Other references utilized in the scoping and screening process included:

- Application for Renewed Operating Licenses, ONS Units 1, 2 and 3 (Initial License Renewal Application (LRA)).
- NUREG-1723, Safety Evaluation Report Related to the License Renewal of ONS, Units 1, 2 and 3.
- NRC SERs, including NRC staff review of ONS licensing submittals. Some of these documents may contain licensee commitments.
- Licensing Correspondence, including relief requests, LER, and responses to NRC communications such as NRC bulletins, GLs, or enforcement actions. Some of these documents may contain licensee commitments.
- ONS Technical Specifications and Bases
- ONS Selected Licensee Commitments

- Engineering drawings, specifications and calculations. These can provide additional information about the requirements or characteristics associated with the evaluated SSCs.
- Walkdown reports documenting the configuration and material properties of plant SSCs.

2.1.3 TECHNICAL BASIS DOCUMENTS

Technical basis documents were prepared in support of the SLR project. Technical basis documents contain technical evaluations and bases for decisions or positions associated with SLR requirements. Technical basis documents are prepared, reviewed, and approved in accordance with project procedures, and are based on the source documents described in Section 2.1.2.

2.1.3.1 Subsequent License Renewal Scoping Methodology

The following sections primarily describe the ONS scoping and screening methodology for mechanical systems and structures which are scoped at system and structure level. In contrast, electrical scoping is performed at the component level using a bounding or spaces approach. All electrical components are initially scoped-in, with selected components scoped-out based on function. Furthermore, 10 CFR 54.4(a) is applied to selectively remove electrical components from scope after electrical commodity groups are screened out as active or short-lived in accordance with 10 CFR 54.21(a)(1). Additional details on electrical and instrumentation and control scoping are provided in Section 2.1.4. A technical basis document was prepared to describe the scoping and screening methodology.

One of the first steps necessary to begin the SLR scoping process is to identify a comprehensive list of mechanical plant systems and structures to be evaluated for scoping. For ONS, this list resides and is maintained in a DBD, whose purpose is to provide the complete list of systems and structures for the Oconee site, including Keowee, and to be used as a starting point to ensure that all systems and structures are evaluated against the inclusion criteria of rules such as the Maintenance Rule and LR Rule. The Oconee UFSAR, Flow Diagram Drawings, I&C Drawings, Civil Structural Drawings, Electrical Elementary Drawings, Maintenance Rule Database, first Oconee LRA, Oconee DBDs, EDB, and plant walkdowns were utilized to ensure a complete list of mechanical systems and structures were compiled for scoping.

Once the mechanical systems and structures are identified, the technical basis document assures systems and structures included in the scoping review are associated with a system, structure, or commodity group. The technical basis document grouped in-scope mechanical systems and structures into the following categories:

- Reactor vessel, internals, and reactor coolant system
- Engineered safety features
- Auxiliary systems
- Steam and power conversion system
- Containments, structures, and component supports

This grouping of the in-scope mechanical systems and structures is based on NEI 17-01, *"Industry Guideline for Implementing the Requirements of 10 CFR Part 54 for Subsequent License Renewal"* and the guidance of NUREG-2191 *"Generic Aging Lessons Learned for Subsequent License Renewal (GALL-SLR) Report,"* Final Report. The complete list of mechanical systems and structures evaluated for SLR is provided in Section 2.2 of this application.

The methodology used to identify mechanical systems and structures at ONS within the scope of SLR is consistent with the guidance provided by NEI 17-01. NEI 17-01 has been endorsed by the NRC in RG 1.188, Revision 2 as an acceptable method for complying with the requirements of 10 CFR Part 54.

The review to identify mechanical systems and structures that satisfy the criteria contained in 10 CFR 54.4(a)(1), (a)(2) and (a)(3) is briefly discussed in Sections 2.1.3.2, 2.1.3.3, and 2.1.3.4, respectively.

2.1.3.2 10 CFR 54.4(a)(1) Scoping Criterion

Systems and structures are included within the scope of SLR in accordance with the 10 CFR 54.4(a)(1) scoping criterion. A technical basis document was prepared to ensure complete and consistent application of this scoping criterion. As noted in NEI 17-01 and consistent with NUREG-2192, an applicant's CLB definition of safety related may not match the 10 CFR 54.4(a)(1) definition. This is the case for ONS. Oconee was designed prior to the issuance of 10 CFR Part 50 Appendix A, *"General Design Criteria for Nuclear Power Plants"*, Appendix B, *"Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants"*, and the NRC's Standard Review Plan (NUREG 0800). In the absence of regulations and standards, ONS and other early commercial nuclear power plants developed their own definitions of "safety related" using a code-based approach based on correspondence from the USAEC and available mechanical, civil, and electrical codes. For this reason, rather than simply sorting the plant systems and structures based on safety classification, all functions required for mitigating the consequences of design basis events and the systems and components relied upon to complete those functions were identified.

A summary of the methodology for identifying functions required to mitigate design basis events for ONS is provided in Section 2.1.4.1. This method was used to identify mechanical systems and structures that meet the 10 CFR 54.4(a)(1) scoping criteria. The technical basis document provides appropriate guidance to assure that SLR scoping for 10 CFR 54.4(a)(1) met the requirements of the license renewal rule and the guidance of NEI 17-01.

2.1.3.3 10 CFR 54.4(a)(2) Scoping Criterion

Non-safety related systems and structures whose failure could prevent satisfactory accomplishment of any of the functions identified in 10 CFR 54.4(a)(1) were included within the scope of SLR in accordance with 10 CFR 54.4(a)(2) requirements. A technical basis document was prepared to ensure complete and consistent application of this scoping criterion.

Based on NRC guidance and on industry guidance contained in NEI 17-01, systems and structures meeting the scoping criterion of 10 CFR 54.4(a)(2) will fall into the following three categories:

- Non-safety related systems and structures whose functional failure prevents satisfactory accomplishment of a 10 CFR 54.4(a)(1) function.
- Non-safety related systems directly connected to and providing structural support for systems and structures that perform a 10 CFR 54.4(a)(1) function and whose failure could directly affect the 10 CFR 54.4(a)(1) function.
- Non-safety related systems with a potential for spatial interaction with systems and structures and whose failure could create a spatial interaction with a 10 CFR 54.4(a)(1) function.

The first item is addressed during the scoping process, by identifying the non-safety related systems and structures required to functionally support the accomplishment of an intended function under 10 CFR 54.4(a)(1), and then including these supporting systems and structures within the scope of SLR under 10 CFR 54.4(a)(2). These non-safety related systems and structures are identified by reviewing the ONS UFSAR and other CLB documents. The remaining two items concern non-safety related systems with potential physical (connected to and spatial) interaction with safety related systems and structures. Scoping of these systems is the subject of NEI 95-10, Revision 6, Appendix F, as referred to in NEI 17-01.

A summary of the methodology for identifying non-safety related systems and structures with a potential for physical (connected to and spatial) interaction with a 10 CFR 54.4(a)(1) function for ONS is provided in Section 2.1.4.2. This method was used to identify mechanical systems and structures that meet the 10 CFR 54.4(a)(2) scoping criteria. The technical basis document provides appropriate guidance to assure that SLR scoping met the requirements of 10 CFR 54.4(a)(2) and the guidance in NEI 17-01.

2.1.3.4 10 CFR 54.4(a)(3) Scoping Criterion

10 CFR 54.4(a)(3) requires that plant SSCs within the scope of SLR include all systems and structures relied on in safety analyses or plant evaluations to perform a function that demonstrates compliance with the regulations for fire protection (10 CFR 50.48), EQ (10 CFR 50.49), PTS (10 CFR 50.61), ATWS (10 CFR 50.62), and SBO (10 CFR 50.63). The methodology for identifying functions required to demonstrate compliance with fire protection, EQ, ATWS, SBO, and PTS regulations for ONS is provided in Section 2.1.4.3.

Technical basis documents were prepared to address SLR scoping of systems and structures relied on in safety analyses or plant evaluations to perform a function that demonstrates compliance with the NRCs regulations for fire protection, EQ, ATWS, SBO, and PTS. CLB and other documents were evaluated to identify the mechanical systems and structures that are relied upon to demonstrate compliance with each of these regulations. These technical basis documents are summarized below:

Fire Protection (10 CFR 50.48)

10 CFR 54.4(a)(3) requires that all SSCs relied on in safety analysis or plant evaluations to perform a function that demonstrates compliance with the regulations for fire protection (10 CFR 50.48) be included within the scope of SLR.

ONS has transitioned to a risk-informed, performance-based fire protection program conforming to the guidance of NFPA 805. The design of the ONS fire protection program is based upon the defense-in-depth concept. Multiple levels of protection are provided so that should a fire occur, it will not prevent SSD and will minimize the risk of a radioactive release to the environment. These levels of protection include fire prevention, fire detection and mitigation, and the capability to provide reasonable assurance that a fire during any operational mode and plant configuration will not prevent the plant from achieving and maintaining the fuel in a safe and stable condition should a fire occur. This protection is provided through commitments made to NFPA 805. Fire protection features and commitments are described in UFSAR Section 9.5.1, Fire Protection Design Basis Specification and the NRC SER for *Transition to Risk-Informed, Performance Based Fire Protection Program*.

The scoping process to identify systems and structures relied upon and/or specifically committed to for fire protection for ONS is consistent with and satisfies the associated criterion in 10 CFR 54.4(a)(3). The fire protection technical basis document summarizes results of a detailed review of the plant's fire protection program documents that demonstrate compliance with the requirements of 10 CFR 50.48. The technical basis document provides a list of mechanical systems and structures credited in the plant's fire protection program documents. For the listed mechanical systems and structures, the technical basis document also identifies appropriate references. The identified mechanical systems and structures are included within the scope of SLR in accordance with 10 CFR 54.4(a)(3).

Environmental Qualification (10 CFR 50.49)

10 CFR 54.4(a)(3) requires that all SSCs relied on in safety analysis or plant evaluations to perform a function that demonstrates compliance with the regulations for EQ (10 CFR 50.49) be included within the scope of SLR.

10 CFR 50.49 defines electrical equipment important to safety that is required to be environmentally qualified to mitigate certain accidents that would result in harsh environmental conditions in the plant. NUREG-0588 provides guidance on the regulatory requirements for 10 CFR 50.49 at nuclear power plants and outlines the scope of equipment covered. This NUREG requires that all plant electrical equipment that is in a harsh environment and must function to mitigate DBEs, be qualified to operate in that environment. The equipment included in the EQ program includes both safety related and non-safety related electrical equipment required for accident mitigation, post-accident monitoring, and SSD.

The EQ program controls the maintenance of the list of EQ components. Therefore, it was used to identify components in scope for EQ per 10 CFR 54.4(a)(3).

The EQ technical basis document summarizes the results of a review of ONS EQ program documents. The EQ technical basis document provides a list of EQ components and structures included within the scope of SLR in accordance with 10 CFR 54.4(a)(3).

Pressurized Thermal Shock (10 CFR 50.61)

10 CFR 54.4(a)(3) requires that all SSCs relied on in safety analysis or plant evaluations to perform a function that demonstrates compliance with the regulations for PTS (10 CFR 50.61) be included within the scope of SLR.

Fracture toughness requirements specified in 10 CFR 50.61 state that licensees of PWRs evaluate the reactor vessel beltline materials against specific criteria to ensure protection from brittle fracture. 10 CFR 50.61 requires that the reference temperature evaluated at the end-of-license fluence, defined as the reference temperature for PTS (RT_{PTS}), remain below the screening criterion for each of the reactor vessel beltline and beltline extended materials to allow continued operation without specific justification. PTS is a potential PWR event or transient causing vessel failure due to severe over-cooling (thermal shock) concurrent with, or followed by, significant pressure in the reactor vessel.

The CLB shows that the ONS reactor vessel has been demonstrated to meet the toughness requirements of 10 CFR 50.61 through its current 60-year end-of-license period. Eighty-year end-of-license fluence projections were prepared, and the components that are projected to meet the definition of beltline material after 80-years were identified. The PTS technical basis document summarizes the results of a review of the ONS CLB with respect to PTS. The reactor vessel is included within the scope of SLR in accordance with 10 CFR 54.4(a)(3).

Anticipated Transients Without Scram (10 CFR 50.62)

10 CFR 54.4(a)(3) requires that all SSCs relied on in safety analysis or plant evaluations to perform a function that demonstrates compliance with the regulations for ATWS (10 CFR 50.62) be included within the scope of SLR.

ATWS is a postulated operational transient that generates an automatic scram signal, accompanied by a failure of the reactor protection system to automatically shut down the reactor. The ATWS rule (10 CFR 50.62) requires improvements in the design and operation of light-water cooled water reactors to reduce the likelihood of failure to automatically shut down the reactor following anticipated transients, and to mitigate the consequences of an ATWS event.

This requirement has been satisfied by the addition of the ATWS Mitigating System Actuating Circuitry (AMSAC) and the Diverse Scram System (DSS). AMSAC automatically initiates the emergency feedwater system and trips the reactor. The DSS serves as a non-safety related backup to the reactor protective system. AMSAC serves as a non-safety related backup protective system to the reactor protection system by preventing over-pressurization of the reactor coolant system, conservation of steam generator inventory, and insertion of the reactor control rods following an ATWS event.

Systems and components that provide input to AMSAC or respond to an output from AMSAC are part of the NRC approved design for meeting the requirements of 10 CFR 50.62, and are thus within the scope of SLR. The ATWS SLR scoping boundary includes the electrical/I&C components that actuate the interfacing mitigation systems, but does not include the specific components in the host mitigation system, such as the emergency feedwater system pumps, turbine standard, and control rod drives. Identification of SSCs required for ATWS is performed through a review of the UFSAR, DBDs, plant procedures, EDB, instrumentation drawings, and docketed correspondence. Likewise, the structures that house ATWS components provide support for components that are credited for 10 CFR 50.62 and are therefore in the scope of SLR.

The ATWS technical basis document includes a list of systems and structures associated with AMSAC. Systems and structures classified as satisfying 10 CFR 54.4(a)(3) related to ATWS are included within the scope of SLR.

Station Blackout (10 CFR 50.63)

10 CFR 54.4(a)(3) requires that all SSCs relied on in safety analysis or plant evaluations to perform a function that demonstrates compliance with the regulations for SBO (10 CFR 50.63) be included within the scope of SLR.

10 CFR 50.63 requires that each light-water-cooled nuclear power plant be able to withstand, for a specified duration, and recover from an SBO. The objective of this requirement is to assure that nuclear power plants can withstand an SBO and maintain adequate reactor core cooling and containment integrity for the specified duration. An SBO event is a complete loss of AC electric power to the essential and nonessential switchgear buses in a nuclear power plant (i.e., loss of the offsite electric power system concurrent with generator trip and unavailability of the onsite emergency AC power sources).

SBO is the hypothetical case where all offsite power and both Keowee units are lost. Electrical power is available immediately from the battery systems and within 10 minutes from the standby shutdown facility diesel generator. The primary element of the event response is that the SBO duration is 4 hours and relies on the standby shutdown facility diesel generator as the alternate AC power source.

The standby shutdown facility is a stand-alone system that is designed to maintain the plant in a safe and stable condition following certain postulated events. The standby shutdown facility provides additional “defense in-depth” protection by serving as a backup to existing safety systems. The standby shutdown facility is credited as an alternate AC power source during an SBO.

Manual actions are necessary to start the standby shutdown facility diesel generator from the standby shutdown facility control room and to strip loads from vital power supplies to ensure Class 1E batteries have sufficient capacity for the 4-hour SBO coping duration and recovery. As documented in the NRC SER dated March 10, 1992 and the NRC Supplemental SER dated December 3, 1992, ONS is in compliance with 10 CFR 50.63 and conforms to the guidance of NUMARC Report 87-00 and RG 1.155.

Consistent with NUREG-2192 Section 2.5.2.1.1, the ONS SBO recovery path boundary is the equipment out to the first circuit breaker that connects to the offsite distribution system at transmission system level voltage. This path typically includes the circuit breakers that connect to the offsite system power transformers (startup transformers), the transformers themselves, the intervening overhead or underground circuits between circuit breaker and transformer and between the transformer and onsite electrical distribution system, and the associated control circuits and structures.

Off-site Power System

The ONS primary transmission system consists of a highly integrated 525 kV and 230 kV loop network. Each unit is provided with two physically independent circuits from the switching station. One circuit is from the 230 kV switching station through the startup transformer. The second circuit is the path from the switchyard through the main step-up transformer, the main generator bus and the unit's auxiliary transformer with the generator disconnected from the main bus.

ONS Unit 3 generates electric power at 19 kV that is fed through an isolated phase bus to the Unit 3 step-up transformer where it is stepped up to the transmission voltage of 525 kV. From the step-up transformer an overhead transmission line feeds power to the 525 kV switching station through two circuit breakers connecting the unit to the 525 kV transmission network. Three transmission lines connect to the ONS 525 kV switching station; one circuit goes east-northeast to Jocassee, one east to the Newport Station and one southeast to Georgia Power Company. In addition, a 230/525kV autotransformer connects the 525 kV switching station to the 230 kV switching station. The 525 kV buses, disconnect switches, and circuit breakers are arranged into a breaker-and-a-half configuration.

ONS Units 1 and 2 also generate electric power at 19 kV that is fed through an isolated phase bus on each unit to its own step-up transformer, where it is stepped up to the transmission voltage of 230 kV. From each step-up transformer, an overhead transmission line feeds power to the 230 kV switching station through two circuit breakers connecting each unit to the 230 kV transmission network. Eight transmission lines connect to the ONS 230 kV switching station; two circuits are installed east-northeast to North Greenville, four east-southeast to Central, and two north-northwest to Jocassee. The 230 kV buses, disconnect switches, and circuit breakers are arranged into a breaker-and-a-half configuration.

The Units 1, 2, and 3 auxiliary transformers and the Units 1, 2, and 3 startup transformers have two isolated secondary windings rated 6.9 kV and 4.16 kV each. The normal power supply to a unit's auxiliary load can be provided through the unit auxiliary transformer connected to the generator bus. If power is not available from the unit's generator through the unit's auxiliary transformer or operating preference is to use the start-up transformer, power is supplied to the unit’s auxiliary power system through its startup transformer fed from either or both of the buses in the 230 kV switching station. Power to the startup transformer can flow through the 230 kV switching station from any one of thirteen supplies. These include eight 230 kV transmission circuits, two nuclear generating units if operating, two Keowee hydroelectric units and the 525 kV switching station. Each unit's auxiliary startup transformer is sized to carry full load auxiliaries for one nuclear generating unit plus the engineered safeguards equipment of another unit. In addition, each unit's startup transformer can backup another unit's startup transformer through emergency startup buses and dual isolating disconnect switches.

Underlying the primary transmission system is an extensive 100 kV sub-transmission network integrated into the primary system by means of a 230/100 kV tie station. Power is available to the standby power buses either directly from the 100 kV Central Tie Substation or from W. S. Lee Natural Gas Plant via a 100 kV transmission line connected to transformer CT5. This single 100 kV circuit is connected to the 100 kV transmission system through the Central Substation. Central Substation is connected to W. S. Lee Natural Gas Plant through a similar 100 kV line. If an emergency occurs that would require the use of the 100 kV transmission system, this line can either be isolated from the balance of the transmission system to supply emergency power to ONS from W. S. Lee Natural Gas Plant, or emergency power can be supplied directly from the 100 kV system from the Central Tie Substation.

Restoration Path Boundaries

Each ONS unit has a startup circuit that connects the 230 kV switching station to the two 4.16 kV Main Feeder Buses (MFBs) 1 and 2 through the Startup Transformer for each unit. Each startup circuit includes 230 kV power circuit breakers (PCBs) in the 230 kV switching station. The startup transformers have two secondary windings, 6.9 kV and 4.16 kV. The 4.16 kV windings are connected to MFB 1 via breaker E1 and to MFB 2 via breaker E2. The 6.9 kV windings associated with the reactor coolant pumps are not part of the restoration path. In addition, MFB 1 and MFB 2 buses for each unit can also be energized from a 100 kV offsite circuit. Transformer CT5 is fed from 100 kV circuit breaker OCB-101. Transformer CT5 feeds Standby Bus 1 via medium voltage breaker SL1 and Standby Bus 2 via medium voltage breaker SL2. The two standby buses can be aligned to feed MFB 1 and MFB 2 of each unit via medium voltage breakers S1 and S2.

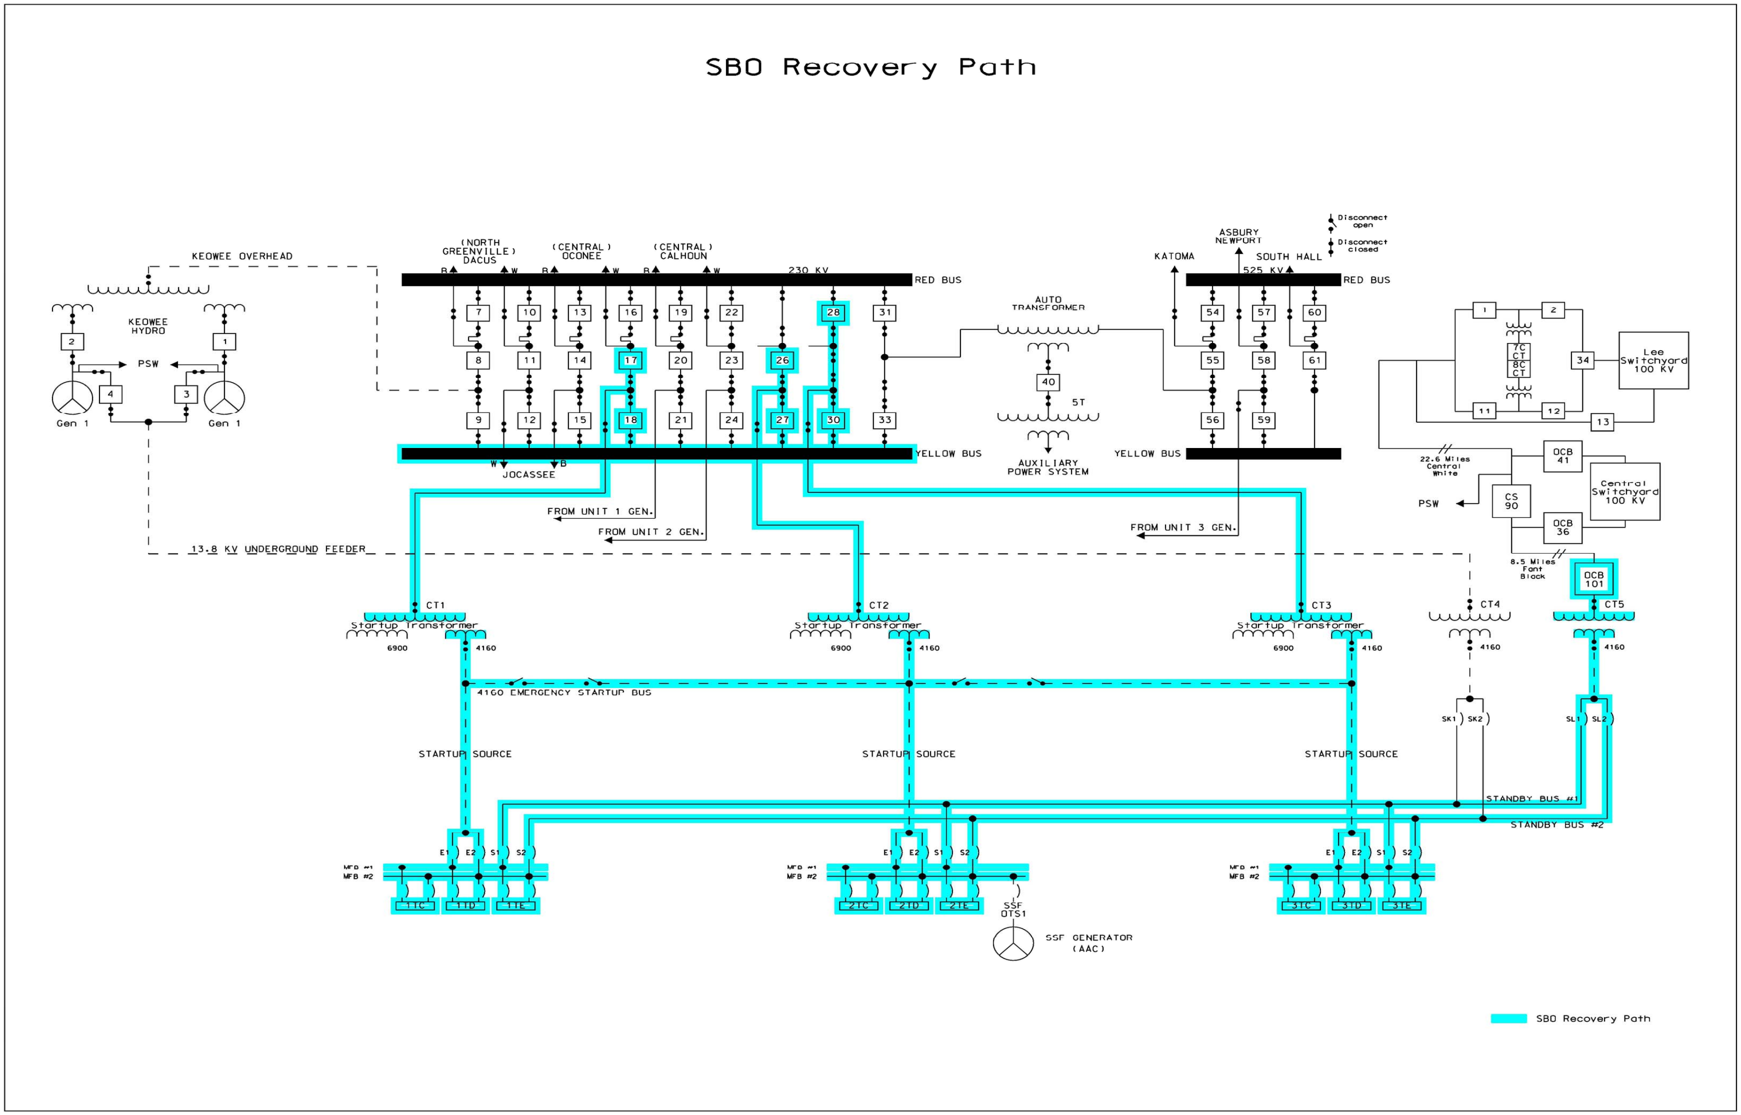
The 525 kV switching station and the switchyard auxiliary power system are not required for any of the four recovery paths. The boundaries of the four identified recovery paths are:

- PCB-17 and PCB-18
- PCB-26 and PCB-27
- PCB-28 and PCB-30
- OCB-101

See Figure 2.1.3-1 for a simplified electrical diagram of the offsite and onsite power sources, switching stations (switchyards), plant electrical distribution systems required for SBO recovery and the alternate AC source (standby shutdown facility). The 230 kV and 525 kV switchyards have two electrical buses designated as Red and Yellow. PCBs connect the two buses in a breaker-and-a-half configuration to allow removal of a PCB from service without deenergizing the circuit. The blue highlighting indicates Station Blackout recovery paths.

The SBO technical basis document summarizes the coping and recovery requirements and includes a list of systems and structures associated with SBO. Systems and structures classified as satisfying criterion 10 CFR 54.4(a)(3) related to SBO are included within the scope of SLR. The scoping methodology used is consistent with the requirements of 10 CFR 54.4 and is based on NEI 17-01 and current NRC guidance.

Figure 2.1.3-1 Simplified Electrical Diagram of the Offsite and Onsite Power Sources - SBO Recovery Paths



2.1.4 SCOPING METHODOLOGY

The scoping process is the systematic process used to identify the ONS SSCs within the scope of the LR rule. For mechanical systems and structures the scoping process was initially performed at the system and structure level, in accordance with the scoping criteria identified in 10 CFR 54.4(a). System and structure level intended functions were identified from a review of the CLB and DBDs. In-scope boundaries were established and documented in the scoping evaluations, based on the identified intended functions. The in-scope boundaries form the basis for identification of the in-scope components, which is the first step in the screening process described in Section 2.1.5. The mechanical system and structure scoping results are provided in Section 2.2.

The ONS scoping process began with the development of a comprehensive list of plant systems and structures, as described in Section 2.1.3.1. The systems and structures were grouped into one of the following categories:

- Reactor Vessel, Internals and Reactor Coolant System
- Engineered Safety Features
- Auxiliary Systems
- Steam and Power Conversion Systems
- Containments, Structures, and Component Supports

Each ONS system and structure was scoped for SLR using the criteria of 10 CFR 54.4(a). These criteria are briefly identified as follows:

- 10 CFR 54.4(a)(1) - Safety Related
- 10 CFR 54.4(a)(2) - Non-Safety Related affecting Safety Related
- 10 CFR 54.4(a)(3) - Regulated Events:
    - Fire Protection (10 CFR 50.48)
    - EQ (10 CFR 50.49)
    - PTS (10 CFR 50.61)
    - ATWS (10 CFR 50.62)
    - SBO (10 CFR 50.63)

The application of each of these criteria to the scoping of mechanical systems and structures is discussed in Sections 2.1.4.1, 2.1.4.2, and 2.1.4.3 below:

As described in Section 2.1.1, electrical and I&C components were scoped at the component level using a bounding or spaces approach. This methodology precludes the need for identifying systems for electrical and I&C components that are within the scope of SLR. The basic philosophy used in the electrical and I&C component integrated plant assessment process is that all plant electrical and I&C components are included in the review unless they are specifically scoped out per 10 CFR 54.4 or screened out per 10 CFR 54.21(a)(1). The 10 CFR 54.4(a) scoping criteria is applied only to scope out specific electrical and I&C components that do not perform an intended function. This method contrasts with the approach of applying the scoping criteria to all electrical and I&C components to determine those that are scoped in.

Also, because significant efficiencies can be gained by delaying scoping until after the larger reduction of such components which screen out per 10 CFR 54.21(a)(1), electrical and I&C components were scoped out after screening was applied to electrical commodity groups.

2.1.4.1 Safety Related – 10 CFR 54.4(a)(1)

In accordance with 10 CFR 54.4(a)(1), the SSCs within the scope of SLR include:

> *Safety related systems, structures, and components which are those relied upon to remain functional during and following design-basis events (as defined in 10 CFR 50.49(b)(1)) to ensure the following functions*
>
> *(i) The integrity of the reactor coolant pressure boundary;*
> *(ii) The capability to shut down the reactor and maintain it in a safe shutdown condition; or*
> *(iii) The capability to prevent or mitigate the consequences of accidents which could result in potential offsite exposures comparable to those referred to in 10 CFR 50.34(a)(1), 10 CFR 50.67(b)(2), or 10 CFR 100.11 of this chapter, as applicable.*

The 10 CFR 54.4(a)(1) scoping for systems and structures was performed consistent with the guidance in NUREG-2192 and NEI 17-01. As described in Section 2.1.3.1, Oconee's definition of safety related does not match the definition in 10 CFR 54.4(a)(1) and therefore the 10 CFR 54.4(a)(1) scoping methodology relies on identifying all functions required for mitigating the consequences of DBEs and the systems and components relied upon to complete those functions. The scoping process used to identify SSCs that met the safety related criteria under 10 CFR 54.4(a)(1) included safety related QA-1 SSCs and non-QA-1 SSCs as the initial starting point.

The ONS CLB definition of DBE differs from the definition contained in 10 CFR 50.49; Oconee's set of DBEs is equal to the set of events listed and described in UFSAR Chapter 15. The set of DBEs contained in UFSAR Chapter 15 complies with the requirements of 10 CFR 54.4(a)(1) and meets the definition in 10 CFR 50.49(b)(1). The set of DBEs for which SSCs are relied upon for accident mitigation were identified in the supplemental response to Generic Letter 83-28 dated April 12, 1995 (ADAMS Accession Number ML15238A066). The NRC staff concluded that this approach to safety classification of SSCs was acceptable as described in the Safety Evaluation Report dated August 3, 1995 (ADAMS Accession Number ML16141A935). The methodology employed for SLR scoping considers an expanded set of events based on plant-specific insights consistent with the guidance in NUREG-2192, which includes conditions of normal operation, internal events, anticipated operational occurrences, DBA, external events, and natural phenomena as described in the CLB. This methodology is employed consistently to scope for current regulations that refer to the definition of "design basis events" as defined in 10 CFR 50.49, including 10 CFR 54.4 and 10 CFR 50.65 (Maintenance Rule). This scoping methodology has also been previously accepted by the NRC staff as described in NUREG-1723, "Safety Evaluation Report Related to the License Renewal of Oconee Nuclear Station, Units 1, 2 and 3".

The UFSAR Chapter 15 Accident Analyses were originally performed to address 10 CFR 100 guidelines. UFSAR Section 15.1.10 contains the following discussion of the offsite dose analysis methodology for the Chapter 15 accident events:

> Calculation of Accident Doses
>
> *The Code of Federal Regulations, Title 10, Part 100, Section 11 (Section 15.1, Ref. 34) requires a dose consequence evaluation of postulated accidents resulting in fission product releases to the environment. Two types of doses are calculated for purposes of analyzing these accidents: internal doses to the thyroid resulting from inhalation of iodines and external whole body doses resulting from submersion in noble gases and iodines.*
>
> *The dose consequences of a Maximum Hypothetical Accident, a Rod Ejection Accident, Large and Small Main Steam Line Break Accidents and Fuel Handling Accidents have been evaluated using an Alternative Source Term in accordance with the Code of Federal Regulations, Title 10, Part 50, Section 67 (Reference 39). For these evaluations, a total effective dose equivalent (TEDE) dose is calculated. Control room doses are also reported for these accidents.*

Using the complete list of mechanical systems and structures, functions that are required during and following DBEs as described in the plant's CLB were identified. For mechanical systems, the DBDs identify the system level event mitigation functions and the unique events for which the event mitigation function is required. Additional sources, primarily the UFSAR and Maintenance Rule database, were utilized in this functional review. Structures that house systems that meet the (a)(1) scoping criteria also meet the (a)(1) scoping criteria, as the structure provides a support function.

The ONS methodology for scoping identifies the SSCs relied upon to remain functional during and following DBEs and therefore meets the 10 CFR 54.4(a)(1) criterion. Scoping of mechanical systems and structures is performed at a system or structure level. Electrical and I&C systems that meet the 10 CFR 54.4(a)(1) scoping criteria (and likewise for the (a)(2) and (a)(3) criteria) are not identified since the approach is to perform electrical scoping at the component level. The scoping approach is consistent with guidance contained in NEI 17-01 and NUREG-2192. The ONS methodology for scoping under the 10 CFR 54.4(a)(1) criterion meets the requirements of 10 CFR Part 54.

2.1.4.2 Non-Safety Related Affecting Safety Related – 10 CFR 54.4(a)(2)

In accordance with 10 CFR 54.4(a)(2), the SSCs within the scope of SLR include:

- Non-safety related SSCs whose failure could prevent satisfactory accomplishment of any of the functions identified in 10 CFR 54.4(a)(1)(i), (ii), or (iii).

This scoping criterion requires an assessment of non-safety related SSCs with respect to the following categories:

- Non-safety related SSCs that perform or provide support for 10 CFR 54.4(a)(1) functions
- Non-safety related SSCs that are connected to and provide structural support for safety related SSCs
- Non-safety related SSCs that have the potential for spatial interactions with safety related SSCs

Each of these categories are discussed below:

<u>Non-safety related SSCs that perform or provide support for 10 CFR 54.4(a)(1) functions</u>

This category addresses non-safety related SSCs that are required to function in support of a safety related SSC intended function. The functional requirement distinguishes this category from the other categories, where the non-safety related SSCs are required only to maintain adequate integrity to preclude structural failure or spatial interactions. The ONS UFSAR, CLB and DBDs were reviewed to identify non-safety related mechanical systems required to support satisfactory accomplishment of a safety related function. Non-safety related mechanical systems, or non-safety related portions of safety related systems credited in CLB documents to support a safety related function have been included within the scope of SLR for 10 CFR 54.4(a)(2) and are described in Section 2.3.

<u>Non-safety related SSCs that are connected to and provide structural support for safety related SSCs</u>

The guidance of NEI 95-10, Appendix F (as referenced in NEI 17-01) was used to identify the endpoints of non-safety related piping components that are directly attached to, and provide support for safety related piping components. The attached non-safety related piping components must be included within scope up to and including the first seismic or equivalent anchor. NEI 95-10, Appendix F lists the following configurations that correspond to this requirement:

1. A seismic anchor is defined as a device or structure that ensures that forces and moments are restrained in three orthogonal directions.

2. An equivalent anchor may be defined in the CLB and can be credited for the 10 CFR 54.4(a)(2) evaluation.

3. An equivalent anchor may also consist of a large piece of plant equipment (e.g., a heat exchanger) or a series of supports that have been evaluated as a part of a plant-specific piping design analysis to ensure that forces and moments are restrained in three orthogonal directions.

4. In cases where an equivalent anchor is not clearly described within the existing CLB information or original design basis, a combination of restraints or supports such that the non-safety related piping and associated structures and components attached to the safety related piping is included in scope up to an endpoint that encompasses at least two supports in each of three orthogonal directions.

An alternative to specifically identifying a seismic anchor or equivalent anchor is to include enough of the non-safety related piping run to ensure that these anchors are included and thereby ensure the piping and anchor intended functions are maintained. The following methods provide assurance that the included piping encompasses the non-safety related piping included in the design basis seismic analysis and is consistent with the CLB:

- A base-mounted component (e.g., pump, heat exchanger, tank, etc.) that is a rugged component and is designed not to impose loads on connecting piping. The SLR scope should include the base-mounted component as it has a support function for the safety related piping.
- A flexible connection is considered a pipe stress analysis model end point where the flexible connection decouples the piping systems (i.e., does not support loads or transfer loads across it to connecting piping).
- A free end of non-safety related piping.
- For non-safety related piping runs that are connected at both ends to safety related piping include the entire run of non-safety related piping.
- A point where the buried piping exits the ground. The buried portion of the piping should be included in the scope of SLR.
- A smaller branch line where the moment of inertia ratio of the larger piping to the smaller piping is equal to or greater than the acceptable ratio defined by the CLB (for ONS, section modulus ratio greater than 10 is used), because significantly smaller piping does not impose loads on larger piping and does not support larger piping.

These scoping boundaries are determined from review of the physical installation details, design drawings, plant specific piping analyses, seismic analysis calculations, or were identified through plant walkdowns.

Failure in non-safety related piping beyond the above anchor locations would not impact structural support for the safety related piping. Symbols identifying the anchor locations and the CLB seismic analysis boundaries (or support boundaries) that define the structural support boundary for safety related piping systems are shown on the SLR boundary drawings. When the connected non-safety related piping system contains water, steam, or oil, then the in-scope boundary may extend beyond the locations described above due to potential for spatial interaction with safety related SSCs.

Non-safety related SSCs that have the potential for spatial interactions with safety related SSCs

Non-safety related systems that are not connected to safety related piping or components, or are outside the structural support boundary for the attached safety related piping system, and have a spatial relationship such that their failure could adversely impact the performance of a safety related SSC intended function, must be included within the scope of SLR in accordance with 10 CFR 54.4(a)(2) requirements. As described in NEI 95-10, Appendix F, there are two options when performing this scoping evaluation: a mitigative option and a preventive option.

The mitigative option involves crediting plant mitigative features to protect safety related SSCs from failures of non-safety related SSCs. Examples of plant mitigative features include pipe whip restraints, jet impingement shields, spray and drip shields, seismic supports, flood barriers, and physical barriers (e.g., floors, interior walls, doors, dampers). This option requires a demonstration that the mitigating features are adequate to protect safety related SSCs from failures of non-safety related SSCs regardless of the failure location. If this level of protection can be demonstrated, then only the mitigative features need be included within the scope of SLR. The preventive option involves identifying the non-safety related SSCs that have a spatial relationship such that failure could adversely impact the performance of a safety related SSC intended function, and including the identified non-safety related SSCs within the scope of SLR without consideration of plant mitigative features.

Oconee applied a combination of the preventive and mitigative option for 10 CFR 54.4(a)(2) scoping. The preventive option as implemented at Oconee is based upon a “spaces” approach for determining potential for spatial interactions with safety related SSCs. The boundaries for the “spaces” are entire structures, or in limited cases a room within a structure that acts as physical barriers and separates safety related targets from non-safety related hazards. Mitigative features(e.g., pipe whip restraints, jet impingement shields, spray and drip shields, seismic supports, flood barriers, and physical barriers) were included for 10 CFR 54.4(a)(2) scoping and are addressed as structural components. Mitigative features in the scope of SLR included those credited in the plant’s CLB for protecting essential equipment or physical barriers relied upon to exclude non-safety related components from 10 CFR 54.4(a)(2) scoping under the preventive option.

Non-safety related piping and components that contain water, oil, or steam are not excluded from scope unless it can be demonstrated that they are not in proximity to safety related SSCs. This is demonstrated by confirming that there are no safety related SSCs located within the same space (e.g., structure or room) as the non-safety related piping or component containing water, oil, or steam. This demonstration is based on confirming that there are adequate physical barriers (e.g., structural boundaries) separating the non-safety related piping or component from safety related SSCs, thereby preventing the potential spatial interaction. The structural barrier components are included in scope. No credit is taken for separation by distance alone without a physical barrier capable of preventing the spatial interaction. The structures of concern for potential spatial interaction were identified based on a review of the CLB to determine which structures contained active or passive safety related SSCs.

Non-safety related piping and components that contain water, oil, or steam, and are located inside structures that contain safety related SSCs are included within the scope of SLR for potential spatial interaction in accordance with the requirements of criterion 10 CFR 54.4(a)(2), as recommended by NEI 95-10, Appendix F. High energy lines located within structures that contain safety related equipment are included within the scope of SLR, in accordance with 10 CFR 54.4(a)(1) or (a)(2), depending on their safety classification. Safety related high-energy lines are in scope in accordance with 10 CFR 54.4(a)(1), and non-safety related high-energy lines are in scope in accordance with 10 CFR 54.4(a)(2).

Potential spatial interaction due to leakage or spray is assumed regardless of the system’s pressure. Supports for non-safety related SSCs within structures containing safety related SSCs are included in scope.

Air and gas systems (non-liquid) are not a hazard to other plant equipment, and do not have potential for spatial interactions with safety related SSCs. SSCs containing air or gas cannot adversely affect safety related SSCs due to leakage or spray, since gas systems contain no liquids that could spray or leak onto safety related systems to cause shorts or other malfunctions. Over 10 years of ONS OE was reviewed and confirmed that there have been no failures due to aging in systems containing air or gas that have adversely impacted the accomplishment of a safety related function. The non-safety related systems containing air or gas are not included within the scope of SLR for spatial interaction, except in cases where accumulation of condensation drainage can occur. The supports are included in scope to prevent the non-safety related piping from falling and potentially impacting safety related SSCs.

Scoping of abandoned mechanical components

A limited number of mechanical fluid components at ONS have been abandoned in place. Abandoned components within structures containing safety related components were excluded from scope when the following conditions were met:

1. The abandoned components do not provide structural or seismic support to attached safety related piping, and

2. The abandoned components are physically separated from sources of water through blanks, blind flanges or pipe caps. Closed valves are not credited for isolation of fluid from abandoned components, and

3. The abandoned components are empty and drained of all fluid. This was verified by establishing configuration (such as the piping being open-ended at the low point), by review of documents that abandoned the equipment, or by inspection by methods capable of confirming the absence of fluid.

If these conditions are not met, the abandoned systems or portions thereof are included within the scope of SLR. Abandoned equipment is not relied on to perform any function delineated in 10 CFR 54.4(a)(1) or (a)(3) as it is no longer in operation.

2.1.4.3 Regulated Events – 10 CFR 54.4(a)(3)

In accordance with 10 CFR 54.4(a)(3), the SSCs within the scope of SLR include:

> *All systems, structures and components relied on in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for fire protection (10 CFR 50.48), environmental qualification (10 CFR 50.49), pressurized thermal shock (10 CFR 50.61), anticipated transients without scram (10 CFR 50.62), and station blackout (10 CFR 50.63).*

For each of the five regulations, a technical basis document was prepared to provide input into the scoping process. Each of the regulated event technical basis documents (described in Section 2.1.3) identifies the systems and structures that are relied upon to demonstrate compliance with the applicable regulation. The technical basis documents also identify the source documentation used to determine the scope of components within the system that are credited in demonstrating compliance with each of the applicable regulated events. Guidance provided by the technical basis documents was incorporated into the system and structure scoping evaluations to determine the SSCs credited for each of the regulated events. SSCs credited in the regulated events have been classified as satisfying criteria of 10 CFR 54.4(a)(3) and have been included within the scope of SLR.

2.1.4.4 System and Structure Intended Functions

For the mechanical systems and structures within the scope of SLR, the intended functions that are the bases for including them within the scope of SLR are identified and documented in the scoping evaluation. The system or structure intended functions are based on the applicable CLB reference documents. The component level intended functions are the passive component functions that are necessary to support the system or structure intended function(s). The component and structure intended functions are further described in Section 2.1.5.2.

2.1.4.5 Scoping Boundary Determination

SLR boundary drawings were developed to convey the mechanical systems and major components that were determined to be within the scope of SLR. This was accomplished by review of various information sources and the scoping technical basis documents to determine intended functions and the flow paths necessary to fulfill intended functions. The initial step in the process was to identify the systems and structures that met the scoping criteria in 10 CFR 54.4(a)(1), (a)(2), and (a)(3). The intended function(s) that are the bases for including systems and structures within the scope of SLR were identified.

Boundary drawings were prepared for each mechanical system within the scope of SLR. The system flow paths required to perform or support the system intended function(s) were mapped as flow paths on the system flow diagrams. The flow paths were mapped using a two-color highlighting convention. Systems and components that met the (a)(1), the functional part of the (a)(2), or the (a)(3) scoping criterion are highlighted blue while those that met the physical (connected to and spatial) interaction part of the (a)(2) scoping criteria are highlighted magenta.

A site layout drawing was used as the starting point for identifying the structures within the scope of SLR. Structures were identified as in-scope based on any portion of the structure performing an intended function. The in-scope structures were highlighted on the layout drawing, creating the structural SLR boundary drawing.

No boundary drawings were prepared for electrical or I&C systems. The approach for electrical and I&C was to initially include all the electrical components in scope and scope out per 10 CFR 54.4 or screen out per 10 CFR 54.21(a). Evaluations were then performed on a commodity level.

A technical basis document was prepared to provide appropriate guidance, describe the methodology for preparing boundary drawings and contain the boundary drawings.

2.1.5 SCREENING METHODOLOGY

Once the SSCs within the scope of SLR have been determined, the next step is to determine which structures and components are subject to an AMR.

2.1.5.1 Identifications of Structures and Components Subject to Aging Management Review

SSCs that were determined to be within the scope of SLR were then screened to determine which structures and components are subject to an AMR.

The requirement to identify structures and components subject to an AMR is specified in 10 CFR 54.21(a)(1), which states:

> *(a) An integrated plant assessment (IPA). The IPA must*
>
> *1. For those system, structures, and components within the scope of this part, as delineated in §54.4, identify and list those structures and components subject to an aging management review. Structures and components subject to an aging management review shall encompass those structures and components*
>
> *i. That perform an intended function, as described in §54.4, without moving parts or without a change in configuration or properties. These structures and components include, but are not limited to, the reactor vessel, the reactor coolant system pressure boundary, steam generators, the pressurizer, piping, pump casings, valve bodies, the core shroud, component supports, pressure retaining boundaries, heat exchangers, ventilation ducts, the containment, the containment liner, electrical and mechanical penetrations, equipment hatches, seismic Category I structures, electrical cables and connections, cable trays, and electrical cabinets, excluding, but not limited to, pumps (except casing), valves (except body), motors, diesel generators, air compressors, snubbers, the control rod drive, ventilation dampers, pressure transmitters, pressure indicators, water level indicators, switchgears, cooling fans, transistors, batteries, breakers, relays, switches, power inverters, circuit boards, battery chargers, and power supplies; and*
>
> *ii. That are not subject to replacement based on a qualified life or specified time period.*

Structures and components that perform an intended function without moving parts or without a change in configuration or properties are defined as passive for SLR. Passive structures and components that are not subject to replacement based on a qualified life or specified time period are defined as long-lived for SLR. Screening is the process used to identify the passive, long-lived structures and components within the scope of SLR. These structures and components are subject to AMR.

NUREG-2192 Table 2.1-6 was used as the basis for the identification of passive structures and components, as recommended by NEI 17-01, Section 1.1. Most passive structures and components are long-lived. The IPA technical basis documents identify the cases where a passive component is determined not to be long-lived.

The ONS structures and components subject to AMR have been identified in accordance with the requirements of 10 CFR 54.21(a)(1) described above. The process implemented to meet these requirements for mechanical systems, structures, and electrical commodities is described as follows:

Mechanical Systems

The mechanical system screening process began with the results from the scoping process. For in-scope mechanical systems, the written descriptions and marked up system flow diagrams identify the in-scope system boundary of passive components for SLR. The marked-up system flow diagrams are the SLR boundary drawings. These system boundary drawings were reviewed to identify the passive, long-lived components, and the identified components were evaluated in the IPA technical basis documents.

The screening results for mechanical systems either identify: 1) the component name for major process equipment (e.g., air handling units, fans, heat exchangers, pumps, tanks, etc.), or 2) the component types (as depicted on the boundary drawings) for in-line piping components (e.g. flow elements, sight glasses, orifices, strainers, traps, and valves, etc.) that are subject to AMR. Additionally, the component type “Piping and Piping Components” has been developed to represent piping and in-line piping components within the system that are susceptible to aging effects of wall thinning (due to erosion or flow accelerated corrosion) or cumulative fatigue damage. In contrast to other aging mechanisms, these aging mechanisms are not applicable to all components or component types of a given material and environment combination. Susceptibility to these mechanisms are only manifested when certain conditions (e.g. geometry, velocity, temperature, pressure, two-phase flow, etc.) are present. Susceptibility to these aging effects is determined through analyses or plant operating experience.

Component listings from the EDB were also reviewed to confirm that all system components were considered during the process. In cases where the flow diagrams did not provide sufficient detail, such as for some large vendor supplied components (e.g., compressors, emergency diesel generators), the associated mechanical piping layout drawings, component drawings or vendor manuals were also reviewed. Plant walkdowns were performed when required for confirmation. Short-lived components were excluded from AMR. The bases for their exclusion were documented in the IPA technical basis documents.

A complex assembly is a predominantly active assembly where the performance of its components is closely linked to that of the intended function of the entire assembly, such that testing and monitoring of the assembly is sufficient to identify degradation of these components. Examples of complex assemblies include diesel generators and chiller units. Complex assemblies are considered active and can be excluded from the requirements of AMR. However, to the extent that complex assemblies include piping or components that interface with external equipment, or components that cannot be adequately tested or monitored as part of the complex assembly, those components are identified and subject to AMR. This follows the screening methodology for complex assemblies as described in Table 2.1-2 of NUREG-2192.

Note that the majority of safety related air operated valves normally fail to their safety position. For these components, the supply of compressed air does not support the system intended function. Safety related components such as solenoid valves whose only function is to vent the air from these valve operators are within-scope, but the function is performed by active internal components, and the passive pressure boundary of the valve body or piping components does not contribute to the safety related function. These components are not subject to AMR. However, a limited number of safety related air-operated valves do not fail to their safety position. For these components, the compressed air supply to the air-operated valves support the system intended function and are identified on the boundary drawings as being within the scope of SLR. The passive and long-lived components in the compressed air supply system to these components are subject to AMR.

Mechanical components are screened with the system in which they were scoped. For heat exchangers, the entire heat exchanger is evaluated within the system in which it is identified by the tag number on the flow diagrams.

Structures

Structures and structural components typically perform their functions without moving parts and without a change in configuration or properties. When a structure or structural component was determined to be within the scope of SLR by the scoping process described in Section 2.1.4, the structure screening methodology classified the component as active or passive. Active components do not require aging management. This is consistent with guidance found in NUREG-2192 Table 2.1-6, as referenced by NEI 17-01. During the structure screening process, the intended function(s) of passive structural components were documented. In the structure screening process, an evaluation was made to determine whether in-scope structural components were subject to replacement based on a qualified life or specified time period. If an in-scope structural component was determined to be subject to replacement based on a qualified life or specified time period, the component was identified as short-lived and was excluded from an AMR. In such a case, the basis for determining that the structural component was short-lived was documented.

Electrical Commodities

Screening of electrical and I&C components used a bounding approach as described in NEI 17-01. Electrical and I&C components were assigned to commodity groups based on the listing in NUREG-2192, Table 2.1-6. Commodities subject to an AMR were identified by applying 10 CFR 54.21(a)(1) to identify those commodities that perform their function without moving parts or a change in configuration (passive components). This method provides the most efficient means for determining the electrical commodities subject to an AMR since many electrical and I&C components are active. Passive commodity groups were reviewed, and any that did not perform an intended function were determined to not require an AMR. The remaining passive commodity groups were screened consistent with 10 CFR 54.21(a)(1)(ii) to exclude those commodities that are subject to replacement based on a qualified life or specific time period from the requirements of an AMR. After screening of electrical commodities was performed, 10 CFR 54.4(a) was applied to selected electrical components to remove from scope based on function. The remaining passive commodities were determined to be subject to AMR. The electrical commodities that require an AMR are identified in Section 2.5

2.1.5.2 Intended Function Definitions

The intended functions that the components and structures must fulfill are those functions that are the bases for including them within the scope of SLR. A component intended function is defined as a passive component function that must be performed in order for the system or structure to be able to perform the system or structure intended function(s). For example, pressure boundary failure of a component would cause loss of inventory from the system, and the system would subsequently be unable to perform its intended function(s). Structures and components may have multiple intended functions. Oconee has considered multiple intended functions where applicable, consistent with the staff guidance provided in Table 2.1-3 of NUREG-2192.

Table 2.1.5-1 provides expanded definitions of structure and component passive intended functions identified in this application.

Table 2.1.5-1 Passive Structure and Component Intended Function Definitions

Intended Function	Definition
Core Support	Provide structural support to maintain core configuration and flow distribution.
Direct Flow	Provide spray shield or curbs for directing flow
Electrical Continuity	Provide electrical connections to specified sections of an electrical circuit to deliver voltage, current, or signals
Electrical Insulation	Insulate and support an electrical conductor
Filtration	Provide filtration
Fire Barrier	Provide rated fire barrier to confine or retard a fire from spreading to or from adjacent areas of the plant
Flood Barrier	Provide flood protection barrier (internal/external flooding event)
Flow Distribution	Distribute or divide flow

Table 2.1.5-1 Passive Structure and Component Intended Function Definitions

Intended Function	Definition
Flow Restriction	Flow restriction/throttling
Gaseous Release Path	Provide path for release of filtered and unfiltered gaseous discharge
Heat Sink	Provide heat sink during SBO or DBE
Heat Transfer	Provide heat transfer
Maintain Coating Integrity	Maintain coating integrity to prevent clogging emergency core cooling systems
Missile Barrier	Provide missile barrier (internally or externally generated)
Pressure Boundary	Provide pressure-retaining boundary so that sufficient flow at adequate pressure is delivered, or provide fission product barrier for containment pressure boundary, or provide containment isolation for fission product retention
Shelter, Protection	Provide shelter/protection to safety related components (including radiation shielding for civil structures)
Spray Pattern	Provide adequate flow in a properly distributed spray pattern
Structural Integrity	Maintains mechanical and structural integrity to prevent spatial interactions that could cause failure of safety related SSCs (i.e. leakage boundary) or provides structural support to attached safety related piping and components. This function applies to non-safety related components
Structural Pressure Boundary	Provide pressure boundary or essentially leak tight barrier to protect public health and safety in the event of any postulated DBEs

Table 2.1.5-1 Passive Structure and Component Intended Function Definitions

Intended Function	Definition
Structural Support	Provide structural and/or functional support to safety related and/or non-safety related components
Thermal Resistance	Provide insulation/thermal resistance

The component's intended function(s) are provided in the tables of Sections 2.3, 2.4, and 2.5.

2.1.5.3 Stored Equipment

Stored equipment is evaluated with the applicable system. Some non-plant equipment is staged for use by the Fire Brigade, such as smoke ejectors and ventilation trunks, but is not relied upon for fire protection or SSD. Other fire-fighting equipment, such as extinguishers, air packs and fire hoses are addressed as consumables.

ONS stores several components for mitigation of events that perform functions described in 10 CFR 54.4(a):

- The protected service water portable pump is utilized to refill the Unit 2 condenser circulating water intake piping during events requiring the protected service water system. The equipment, consisting of the portable pump and associated fire hose, cable reel and connectors, are stored in a warehouse.
- The standby shutdown facility submersible pump is utilized to refill the Unit 2 condenser circulating water intake piping during events requiring the standby shutdown facility system. The equipment, consisting of a submersible pump, fire hose, piping and fitting, and cables, are stored in the standby shutdown facility.
- Temporary alternate chilled water equipment is utilized to provide cooling to auxiliary building air handling units in the east and west cable rooms during a fire event. The equipment, consisting of hoses, fittings, valves, and flow meter, are stored in the Unit 2 cable room.
- The low pressure service water system utilizes a portable pumping system to provide reactor building cooling during events requiring extended operation of the protected service water system. The equipment consists of hoses, piping skid, and a trailer mounted diesel driven pump.

These components are within the scope of SLR. The flow meter and trailer mounted diesel driven pump are considered active and is not subject to AMR. The other equipment is subject to AMR. Mechanical stored equipment is evaluated with the associated mechanical systems. The cables and connectors are evaluated with electrical equipment.

2.1.5.4 Consumables

The evaluation process for consumables is consistent with the guidance provided in NUREG-2192, Table 2.1-3. Consumables have been divided into the following four (4) groups for the purpose of SLR: (a) packing, gaskets, component seals, and O-rings; (b) structural sealants; (c) oil, grease, and components filters; and (d) system filters, fire extinguishers, fire hoses, and air packs.

- Group (a) subcomponents (packing, gaskets, component seals, and O-rings): Managing loss of leak tightness due to degraded packing, gaskets, component seals, and O-rings for the pressure boundary and leakage boundary intended functions is not required. It is unlikely that leakage from packing, gaskets, component seals, and O-rings would result in failure of the system to deliver sufficient flow at adequate pressure. In regard to leakage, ONS routinely conducts tours of the operating spaces. When leakage is detected, these issues are entered into the corrective action program. The leakage is corrected by replacing the packing, gaskets, component seals, and O-rings as consumables. Therefore, these subcomponents are not subject to AMR.
- Group (b) structural sealants: AMR was required for structural sealants in structures within the scope of SLR.
- Group (c) subcomponents (oil, grease, and component filters): These subcomponents are short-lived and are periodically replaced. Various plant procedures are used in the replacement of oil, grease, and filters in components that are in-scope for SLR. Therefore, these subcomponents are not subject to an AMR.
- Group (d) consumables (system filters, fire extinguishers, fire hoses, and air packs): System filters are replaced in accordance with plant procedures based on vendor manufacturers' requirements and system testing. Fire extinguishers, self-contained breathing air packs, and fire hoses are within the scope of SLR, but are not subject to aging management because they are replaced based on condition. These components are periodically inspected in accordance with NFPA 10 for portable fire extinguishers, 29 CFR 1910 Subpart L for self-contained breathing air packs, and NFPA 1962 for fire hoses. These standards require replacement of equipment based on their condition or performance during testing and inspection. These components are subject to replacements implemented by controlled procedures, and are therefore not long-lived and not subject to AMR.

2.1.6 INTERIM STAFF GUIDANCE DISCUSSION

As discussed in NEI 17-01, the NRC has encouraged applicants to address Subsequent License Renewal Interim Staff Guidance (SLR-ISG) documents in the SLRA. These ISGs update NUREG–2191, *“Generic Aging Lessons Learned for Subsequent License Renewal (GALL–SLR) Report,”* and NUREG–2192, *“Standard Review Plan for Review of Subsequent License Renewal Applications for Nuclear Power Plants.”* The staff has reviewed the first three SLRAs that were based on the previously noted guidance documents. During these reviews, the staff and applicants identified improvements to the guidance that would assist in preparing and reviewing future SLRAs more effectively and efficiently. These ISGs provide interim updates to NUREG–2191 and NUREG–2192 to implement these improvements. These ISGs are not intended for standalone use. They provide revisions to NUREG–2191 and NUREG–2192 sections and tables that supersede the content in the NUREGs and are intended to be used within the context of the NUREGs. As of March 31, 2021, the following four SLR-ISGs have been issued:

1. SLR–ISG–2021–01–PWRVI, *"Updated Aging Management Criteria for Reactor Vessel Internal Components for Pressurized-Water Reactors"*, (Effective on February 18, 2021).

2. SLR–ISG–2021–02–MECHANICAL, *"Updated Aging Management Criteria for Mechanical Portions of Subsequent License Renewal Guidance"*, (Effective on March 29, 2021).

3. SLR–ISG–2021–03–STRUCTURES, *"Updated Aging Management Criteria for Structures Portions of Subsequent License Renewal Guidance"*, (Effective on March 29, 2021).

4. SLR–ISG–2021–04–ELECTRICAL, *"Updated Aging Management Criteria for Electrical Portions of Subsequent License Renewal Guidance"*, (Effective on March 29, 2021).

The revisions captured in these ISGs include:

- Updates to recommended GALL-SLR aging management programs;
- Changes to aging management review items in NUREG–2191 tables and corresponding summary tables in NUREG–2192;
- New aging management review items in NUREG–2191 tables and corresponding summary tables in NUREG–2192;
- Changes to NUREG–2192 "further evaluation" guidance sections;
- Updates to references listed in affected NUREG–2191 sections; and
- Editorial corrections to relevant sections.

The information provided in these ISGs has been incorporated into the SLRA where applicable. The following sub-sections provide summaries of the revisions to the GALL-SLR Report and SRP-SLR.

2.1.6.1 SLR–ISG–2021–01–PWRVI, *"Updated Aging Management Criteria for Reactor Vessel Internal Components for Pressurized-Water Reactors"*

The guidance document changes issued in SLR–ISG–2021–01–PWRVI are based on the updated inspection and evaluation guidelines in Electric Power Research Institute (EPRI) Materials Reliability Program Topical Report No. 3002017168, *"Materials Reliability Program: Pressurized Water Reactor Internals Inspection and Evaluation Guidelines (MRP-227, Revision 1-A),"* issued June 2020, which the NRC staff found acceptable for referencing in licensing applications in its safety evaluation dated April 25, 2019, and approved for use in the staff's letters to the EPRI Materials Reliability Program dated February 19, 2020, and July 7, 2020. The NRC issued SLR–ISG–2021–01–PWRVI to accomplish the following five objectives:

1. GALL-SLR Report and SRP-SLR guidance changes: Update the staff's guidance for PWR reactor vessel internal components in the GALL-SLR Report and SRP-SLR to account for changes in inspection and evaluation criteria for PWR reactor vessel internal

components made in MRP-227, Revision 1-A, and in other relevant industry documents (e.g., EPRI Materials Reliability Program expert panel reports for 80-year reactor vessel internals component assessments or in relevant industry interim guidance documents or alert letters).

2. Clarification on the use of MRP-227, Revision 1-A: Clarify whether incorporation and adoption of MRP-227, Revision 1-A, may be used as the starting basis for the PWR vessel internals AMP (B2.1.7) and whether reference to the criteria in MRP-227, Revision 1-A, in a PWR applicant's SLRA will need to be subject to the performance of an reactor vessel internal component-specific gap analysis.

3. Reduction of unnecessary burden for PWR SLRAs: Provide additional clarifications on PWR vessel internals AMP (B2.1.7) programmatic change bases that are considered to be administrative and that will no longer need to be within the scope of AMP-identified exceptions or enhancements.

4. Resolution of applicant/licensee action items: Resolve whether the staff's applicant/ licensee action items in its safety evaluation for the inspection and evaluation guidelines in EPRI Topical Report 1022863, "Materials Reliability Program: Pressurized Water Reactor Internals Inspection and Evaluation Guidelines (MRP-227-A)," dated December 16, 2011, and applicant/licensee action item Number 1 in the staff's safety evaluation for the inspection and evaluation guidelines in MRP-227, Revision 1-A, dated April 25, 2019, need to be addressed in an initial LRA or an SLRA.

5. Closure of Regulatory Information Summary (RIS) 2011-07: Provide the staff's basis for closing previous guidance matters raised in RIS 2011-07, "License Renewal Submittal Information for Pressurized Water Reactor Internals Aging Management," dated July 21, 2011.

2.1.6.2 SLR–ISG–2021–02–MECHANICAL, "Updated Aging Management Criteria for Mechanical Portions of Subsequent License Renewal Guidance"

This SLR-ISG includes revisions to the following GALL-SLR Report and SRP-SLR sections:

- Aging Management Program (AMP) X.M2, *"Neutron Fluence Monitoring"*
- AMP XI.M2, *"Water Chemistry"*
- AMP XI.M12, *"Thermal Aging Embrittlement of Cast Austenitic Stainless Steel (CASS)"*
- AMP XI.M21A, *"Closed Treated Water System"*
- Aging Management Review Line Items Associated with AMP XI.M26, *"Fire Protection"*
- SRP-SLR Table 3.3-1 and GALL-SLR Table VII H2 to Address Reduction of Heat Transfer for Heat Exchanger Tubes in a Fuel Oil Environment
- SRP-SLR Table 3.3-1 and GALL-SLR Table VII H2 to Address Loss of Material in Nickel Alloy Strainer Components in Fuel Oil
- AMP XI.M42, *"Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"*

2.1.6.3 SLR–ISG–2021–03–STRUCTURES, *"Updated Aging Management Criteria for Structures Portions of Subsequent License Renewal Guidance"*

This SLR-ISG includes revisions to the following GALL-SLR Report and SRP-SLR sections:

- SRP-SLR Section 3.5.2.2.1.5, *"Cumulative Fatigue Damage,"* SRP-SLR Section 3.5.3.2.1.5, *"Cumulative Fatigue Damage,"* SRP-SLR Section 3.5.6, "References," GALL-SLR Report Chapter II, and aging management review (AMR) items associated with cracking due to cyclic loading in SRP-SLR Table 3.5-1, *"Summary of Aging Management Programs for Containments, Structures and Component Supports Evaluated in Chapters II and III of the GALL-SLR Report"*
- GALL-SLR Report Aging Management Program (AMP) XI.S8, *"Protective Coating Monitoring and Maintenance"*
- GALL-SLR Report Chapter II to Allow Plant-Specific Aging Management Options
- GALL-SLR Report Chapter III to Allow Plant-Specific Aging Management Options
- SRP-SLR Section 3.5 and Table 3.5-1 to Allow Plant-Specific Aging Management Options and Provide Option to Perform Further Evaluation Related to Fatigue Waiver Analyses

2.1.6.4 SLR–ISG–2021–04–ELECTRICAL, *"Updated Aging Management Criteria for Electrical Portions of Subsequent License Renewal Guidance"*

This SLR-ISG includes revisions to the following GALL-SLR Report and SRP-SLR sections:

- Aging Management Program (AMP) XI.E3A, *"Electrical Insulation for Inaccessible Medium-Voltage Power Cables Not Subject to 10 CFR 50.49 Environmental Qualification Requirements"*
- AMP XI.E3B, *"Electrical Insulation for Inaccessible Instrument and Control Cables Not Subject to 10 CFR 50.49 Environmental Qualification Requirements"*
- AMP XI.E3C, *"Electrical Insulation for Inaccessible Low-Voltage Power Cables Not Subject to 10 CFR 50.49 Environmental Qualification Requirements"*
- AMP XI.E7, *"High-Voltage Insulators"*

2.1.7 GENERIC SAFETY ISSUES

Consistent with guidance provided in NEI 17-01 and Appendix A.3 of NUREG-2192, *"Standard Review Plan for Review of Subsequent License Renewal Applications for Nuclear Power Plants,"* a review of NRC Generic Safety Issues (GSIs) is performed as part of the SLR process to satisfy 10 CFR 54.29 requirements. The guidance states that GSIs involving issues related to SLR AMR and/or TLAA should be addressed in SLR applications. Based on Nuclear Energy Institute (NEI) and NRC guidance, NUREG-0933 *"Resolution of Generic Safety Issues,"* Supplement 34 (Reference 1.7.13) and more recent NRC Generic Issue Management Control System Reports, the following GSIs are addressed for Oconee subsequent license renewal:

- GSI-186, *Potential Risk and Consequences of Heavy Load Drops*. This GSI addresses heavy load handling issues related to crane design and operation. Aging effects are not central to these issues. The issues do not involve time-limited aging analyses, including typical crane-related TLAAs such as cyclic loading analyses. GSI-186 is now closed.

- GSI-189, *Susceptibility of Ice Condenser Containments to Early Failure from Hydrogen Combustion During a Severe Accident*. This issue is not applicable to ONS. Oconee Nuclear Station, Units 1, 2, and 3 do not have ice condenser containments. GSI-189 is now closed.
- GSI-191, *Assessment of Debris Accumulation on PWR Sump Performance*. This GSI addresses the potential for blockage of containment sump strainers that filter debris from cooling water supplied to safety injection and containment spray pumps following a postulated LOCA. The issue is based on the identification of new potential sources of debris, including failed containment coatings, which may block the sump strainers. The modified containment sump strainers are evaluated with the low pressure injection system as described in Section 2.3.2.4. The protective coatings inside containment are evaluated with the reactor building as described in Section 2.4.2. The issue is not related to the 60-year term of the current operating license and is not a TLAA. This issue has been closed out for ONS.
- GSI-193, *BWR ECCS Suction Concerns*. This GSI addresses the possible failure of low pressure emergency core cooling systems due to unanticipated, large quantities of entrained gas in suction piping from the pressure suppression chamber (torus) in BWR Mark I containments. This issue is not applicable to ONS. Oconee Nuclear Station, Units 1, 2 and 3 are PWRs. GSI-193 is now closed.
- GSI-199, *Implications of Updated Probabilistic Seismic Hazard Estimates in Central and Eastern United States for Existing Plants*. This GSI addresses how current estimates of the seismic hazard level at some nuclear sites in the central and eastern United States might be higher than the values used in their original designs and previous evaluations. Aging effects are not relevant to this issue. This issue does not involve time limited aging analyses. Activities associated with this issue are covered by a 10 CFR 50.54(f) letter dated March 12, 2012 (ADAMS Accession Number ML12053A340) concerning the Japan Near Term Task Force Recommendations. By letter dated December 21, 2018 (ADAMS Accession Number ML19004A127), Duke Energy submitted a Seismic Probabilistic Risk Assessment in response to Enclosure 1, Item (8) of the 50.54(f) letter, for Oconee. The NRC Staff review of the SPRA for Oconee is provided in NRC Letter dated November 29, 2019 (ADAMS Accession Number ML19267A022). The NRC staff concluded that no further response or regulatory actions are required. This issue has been closed out for Oconee.
- GSI-204, *Flooding of Nuclear Power Plant Sites Following Upstream Dam Failures.* This GSI addresses the potential flooding effects from upstream dam failure(s) on nuclear power plant sites, spent fuel pools, and sites undergoing decommissioning with spent fuel stored in spent fuel pools. Aging effects are not central to this issue. This issue does not involve time-limited aging analyses. Activities associated with this issue are covered by the Japan Near Term Task Force Recommendations. On March 12, 2012, NRC issued a request for information (10 CFR 50.54(f) letter) in connection with implementing lessons learned from the 2011 accident at the Fukushima Dai-ichi nuclear power plant. Enclosure 2 to the 10 CFR 50.54(f) letter requested that licensees reevaluate flood hazards for their sites using present-day methods and regulatory guidance. As part of the response to the 10 CFR 50.54(f) letter, a flooding analysis for Oconee was provided by letter dated July 31, 2017 (ADAMS Accession Number ML17222A068). In a letter dated June 18, 2018 (ADAMS Accession Number

ML18141A755), the NRC staff concluded that Oconee has demonstrated effective flood protection exists for a beyond-design-basis external flooding event. This issue has been closed out for Oconee.

2.1.8 CONCLUSIONS

The scoping and screening methodology described above was used at ONS to identify the systems and structures that are within the scope of SLR and to identify those structures and components that are subject to an AMR. The methods are consistent with and satisfy the requirements of 10 CFR 54.4 and 10 CFR 54.21(a)(1).

2.2 PLANT LEVEL SCOPING RESULTS

Table 2.2-1 and Table 2.2-2 lists the ONS mechanical systems and structures that were evaluated to determine if they were within the scope of SLR, using the methodology described in Section 2.1. A reference to the section of the application that contains the scoping and screening results is provided for each in-scope mechanical system and structure.

As discussed in Section 2.1.4, plant level scoping results for electrical and I&C systems are not presented since scoping is performed at a component level. All plant electrical and I&C components are included in the review unless they are specifically scoped out per 10 CFR 54.4 or screened out per 10 CFR 54.21(a)(1). The following electrical and I&C components do not perform an intended function meeting 10 CFR 54.4 and are selectively scoped out from SLR:

- Electrical components associated with the 525kV Switchyard
- Electrical components associated with the Jocassee, Calhoun, Oconee, and Dacus 230kV transmission lines
- Electrical components associated with the Radwaste Facility
- Electrical components associated with the 44kV Oconee Retail Substation
- Electrical components associated with various plant structures with no 10 CFR 54.4(a) function (i.e., structures that are not within the scope of SLR per Table 2.2-2)

2.3 SCOPING AND SCREENING RESULTS: MECHANICAL SYSTEMS

2.3.1 REACTOR VESSEL, REACTOR INTERNALS AND REACTOR COOLANT SYSTEM

2.3.1.1 Reactor Vessel

System Description

The Unit 1, 2, and 3 reactor vessels are categorized as B&W lowered loop reactor vessels. Each reactor vessel consists of a cylindrical shell, a spherically dished bottom head, and a ring flange to which a removable reactor closure head is bolted. Each reactor vessel is supported by a cylindrical support skirt.

The original reactor vessel heads were replaced in 2003-2004 because of cracking discovered in a number of penetration nozzles. Each replacement reactor vessel closure head is a one-piece low alloy steel forging clad with stainless steel. All internal surfaces of the reactor vessel and closure head are clad with stainless steel or nickel-chromium-iron weld deposit. The replacement penetration nozzles are made from Alloy 690 which are more resistant to primary water stress corrosion cracking than the original Alloy 600 nozzles.

All major reactor vessel nozzles are installed with full penetration welds. All control rod drive and incore instrumentation nozzles are installed with partial penetration welds. The gasket leakage tap is installed in each reactor vessel flange with a partial penetration weld. The reactor vessels are constructed of a combination of formed plates and forgings.

The core support assembly is supported by a ledge on the inside of the vessel flanges, and its location is maintained on this elevation by the closure head flange. The core support assembly directs coolant flow through the reactor vessel and core, supports the core, and guides the control rods in the withdrawn position.

The vessel has two outlet nozzles through which the reactor coolant is transported to the steam generators and four inlet nozzles through which reactor coolant reenters the reactor vessel. Two smaller nozzles located between the reactor coolant inlet nozzles serve as inlets for decay heat cooling and emergency cooling water injection (core flooding and low pressure injection engineered safety features functions). The reactor coolant and the control rod drive penetrations are located above the top of the core to maintain a flooded core in the event of a rupture in a reactor coolant pipe or a control rod drive pressure housing. The reactor vessel is vented through the control rod drives.

The bottom head of the vessel is penetrated by instrumentation nozzles. The closure head is penetrated by flanged nozzles which provide for attaching the control rod drive mechanisms and for control rod extension shaft movement.

Guide lugs welded inside the reactor vessel's lower head limit a vertical drop of the reactor internals and core to 1/2 inch or less and prevent rotation about the vertical axis in the unlikely event of a major internals component failure.

The reactor vessel shell material is protected from fast neutron flux and gamma heating effects by a series of water annuli and stainless steel barriers located between the core and the vessel's wall. The interior surface of the shell assembly is clad with austenitic stainless steel weld deposits, except for a horizontal band underneath the guide lugs which is clad with Alloy 82/182. The 12 Alloy 600 guide lugs are welded at equal spacings to the Alloy 82/182 cladding along the bottom of the inner surface of the lower shell assembly.

System Intended Functions

Portions of the reactor vessel are relied upon to maintain the reactor coolant system pressure boundary and provide structural support for the reactor vessel internals and core. Therefore, the reactor vessel is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the reactor vessel are relied upon for compliance with regulations for fire protection (10 CFR 50.48), PTS (10 CFR 50.61), EQ (10 CFR 50.49), ATWS (10 CFR 50.62) and SBO (10 CFR 50.63). Therefore, the reactor vessel is within the scope of SLR in accordance with 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the reactor vessel can be found in the UFSAR Section 5.3, Figures 5-1, 5-2, 5-14, 5-15, and 5-16, and Table 5-11.

System Evaluation Boundary

The evaluation boundary for the reactor vessel components subject to aging management includes the reactor vessel shell, lower vessel head, closure head, nozzles (and safe ends, if provided), interior attachments, and all associated pressure retaining bolting.

Subsequent License Renewal Boundary Drawings

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

To ensure an entire system has been analyzed, both primary and secondary drawings are displayed for the given systems below:

2.3.1.2 Reactor Vessel Internals

System Description

The reactor vessel internals are designed to support the core, maintain fuel assembly alignment, limit fuel assembly movement, and maintain control rod assembly guide tube alignment between fuel assemblies and control rod drives. They also direct the flow of reactor coolant, provide gamma and neutron shielding, provide guides for incore instrumentation between the reactor vessel lower head and the fuel assemblies, and support the internals vent valves. The vent valves are designed to vent the steam generated within the core, thereby permitting the rapid re-covering of the core by coolant following a reactor coolant inlet pipe rupture. All reactor internal components can be removed from the reactor vessel to allow inspection of the reactor internals and the reactor vessel internal surface.

The reactor vessel internal components include the plenum assembly and the core support assembly. The core support assembly consists of the core support shield, vent valves, core barrel, lower grid, flow distributor, incore instrumentation guide tubes, and thermal shield. The plenum assembly consists of the upper grid plate, the control rod guide assemblies, and a plenum cover. Reactor vessel internals do not include fuel assemblies, control rod assemblies, or incore instrumentation.

To minimize lateral deflection of the lower end of the core support assembly as a result of horizontal seismic loading, integral weld-attached, deflection-limiting guide lugs are welded on the reactor vessel inside wall. These blocks limit the rotation of the lower end of the core support assembly which could result from flow-induced torsional loadings. The lugs allow free vertical movement of the lower end of the internals for thermal expansion throughout all ranges of reactor operating conditions. In the unlikely event that a flange, circumferential weld, or bolted joint might fail, the lugs limit the possible core drop to 1/2 inch or less. The elevation plane of these lugs was established near the elevation of the vessel support skirt attachment to minimize dynamic loading effects on the vessel shell or bottom head. A 1/2 inch core drop does not allow the lower end of the control rod assembly rods to disengage from their respective fuel assembly guide tubes, even if the control rod assemblies are in the full position. In this rod position, approximately 6 1/2 inches of rod length remains in the fuel assembly guide tubes. A core drop of 1/2 inch does not result in a significant reactivity change. The core cannot rotate and bind the drive lines, because rotation of the core support assembly is prevented by the guide lugs.

System Intended Functions

Portions of the reactor vessel internals are relied upon to provide support and orientation of the reactor core and control rod assemblies. The reactor vessel internals also provide a passageway for distribution of the reactor coolant flow, guidance and protection for the incore instrumentation, secondary support for limiting the downward displacement of the core support structure in the event of a postulated failure of the core barrel, and gamma and neutron shielding. Therefore, the reactor vessel internals are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

UFSAR References

Additional details of the reactor vessel internals can be found in the UFSAR Section 4.5.1.3 and Figures 4-26, 4-27, and 4-28.

System Evaluation Boundary

The evaluation boundary for the reactor vessel internals system components includes the two major structural sub-assemblies that are located within, but not integrally attached to (i.e., not welded to) the reactor vessel. These major sub-assemblies are the plenum assembly and the core support assembly. For the purpose of defining materials, fasteners, construction, and assembly, the core support assembly may be further divided into seven sub-assemblies as defined in UFSAR Section 4.5.1.3.2: the core support shield assembly, the core barrel assembly, the lower grid assembly, the flow distributor, the thermal shield, the incore instrument guide tube assembly, and the internals vent valves. The mechanical fasteners (bolting) joining these sub-assemblies and associated items are within the evaluation boundary. The evaluation boundary also includes the major structural welds that form or join the major sub-assembly cylinders and flanges and minor structural welds joining parts such as lifting lugs, support pipes and tubes to the major sub-assemblies.

Subsequent License Renewal Boundary Drawings

No SLR boundary drawings are provided for the reactor vessel internals.

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.3.1-2, Reactor Vessel Internals.

The AMR results for these component types are indicated in Table 3.1.2-2, Reactor Vessel, Reactor Internals and Reactor Coolant System - Reactor Vessel Internals - Aging Management Evaluation.

2.3.1.3 Reactor Coolant System

System Description

The reactor coolant system consists of the reactor vessel, two vertical steam generators, four shaft-sealed reactor coolant pumps, an electrically heated pressurizer and interconnecting piping. The system is arranged in two heat transport loops, each with two reactor coolant pumps and one steam generator. The reactor coolant is transported through piping connecting the reactor vessel to the steam generators and flows downward through the steam generator tubes transferring heat to the steam and water on the shell side of the steam generator. In each loop, the reactor coolant is returned to the reactor through two lines, each containing a reactor coolant pump, to the reactor vessel. In addition to serving as a heat transport medium, the coolant also serves as a neutron moderator and reflector, and a solvent for the soluble poison (boron in the form of boric acid).

The ONS Unit 2 and 3 reactor coolant pumps are Bingham pumps in agreement with the original design. Because of manufacturing delays, Westinghouse Model 93A pumps were substituted for ONS Unit 1 only. For Unit 1, the reactor coolant piping was modified slightly to accommodate the substituted pumps. The flow configuration for both sets of pumps is the same with both the substituted Unit 1 pumps and the Unit 2 and 3 pumps being bottom suction and side discharge. The original motors were utilized for the pumps on all three units.

During normal operation, the reactor coolant pumps circulate coolant through the reactor vessel and steam generators. The coolant is heated by the reactor core inside the reactor vessel, and is cooled by the steam generators which transfer the heat to the main steam system. Pressure in the reactor coolant system is maintained above the saturation pressure of the reactor coolant in order to prevent departure from nucleate boiling in the reactor core and cavitation in the reactor coolant pumps.

Reactor coolant system pressure is controlled and maintained in the pressurizer. Steam and water are kept in thermal equilibrium inside the pressurizer by the coordinated operation of electric heaters and a subcooled water spray. Pressurizer heaters are sequenced on in stages when system pressure decreases below normal and are sequenced off as the pressure recovers. Similarly, the spray of subcooled water into the pressurizer vapor space is increased when system pressure rises above normal and is reduced as the pressure decreases toward normal. These features maintain system pressure during normal operation and limit pressure variations due to plant transients.

System Intended Functions

Portions of the reactor coolant system are relied upon to maintain containment and reactor coolant pressure boundary integrity. Portions of the reactor coolant system are relied upon to provide core decay, latent and reactor coolant pump heat removal during normal operations, shutdown, and following a design basis event. The reactor coolant system also provides venting of non-condensible gases and steam following postulated design basis events, and indication and isolation of the reactor coolant system boundary to prevent inventory loss. Therefore, the reactor coolant system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the reactor coolant system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the reactor coolant system provide low temperature overpressure protection. Portions of the reactor coolant system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the reactor coolant system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(2).

Portions of the reactor coolant system are relied upon for compliance with regulations for fire protection (10 CFR 50.48), EQ (10 CFR 50.49), SBO (10 CFR 50.63), and ATWS (10 CFR 50.62). Therefore, the reactor coolant system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the reactor coolant system can be found in the UFSAR Section 5.1, Figures 5-1, 5-2, 5-3, 5-4, 5-5, 5-6, 5-7, 5-8, and Tables 5-20, 5-21, and 5-22.

System Evaluation Boundary

The Class 1 reactor coolant system boundary includes all pipes, fittings, branch connections, safe ends, thermal sleeves, flow restricting orifices, and pressure retaining parts of valves and associated bolting. This includes the main coolant piping, pressurizer surge piping, pressurizer spray piping, incore monitoring system, vents, drains, instrumentation lines, and Class 1 sections of ancillary systems attached to the main coolant piping and reactor coolant pumps. Ancillary systems include low pressure injection, core flood, high pressure injection, and chemical addition and sampling.

The Class 1 reactor coolant system boundary extends to either the first or second isolation valve within the ancillary piping: that is, low pressure injection/core flood injection (including decay heat drop line and dump-to-sump), high pressure injection letdown piping, and chemical addition and sampling piping.

Subsequent License Renewal Boundary Drawings

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

To ensure an entire system has been analyzed, both primary and secondary drawings are displayed for the given systems below:

2.3.1.4 Steam Generators

System Description

The steam generators supply superheated steam and provide a barrier to prevent fission products and activated corrosion products from entering the main steam system.

The original steam generators were replaced by B&W Canada between 2003-2004. The steam generator is a once-through, vertical, straight tube, tube-and-shell heat exchanger which produces superheated steam at constant pressure over the power range. Reactor coolant flows downward through the tubes and transfers heat to generate steam on the shell side. The high pressure (reactor coolant pressure) parts of the unit are the hemispherical heads, the tubesheets, and the tubes between the tubesheets. Tube support plates maintain the tubes in a uniform pattern along their length. The steam generators are supported by a pedestal.

The shell, the outside of the tubes, and the tubesheets form the boundaries of the steam-producing section of the vessel. Within the shell, the tube bundle is surrounded by a cylindrical baffle. There are openings in the baffle at the feedwater inlet nozzle elevation to provide a path for steam to afford contact feedwater heating. The upper part of the annulus formed by the baffle plate and the shell is the superheat steam outlet, while the lower part is the feedwater inlet heating zone.

Secondary side nozzles (vent, drain, and instrumentation nozzles) and inspection handholes are provided on the shell side of the unit. The reactor coolant side has manway openings in both the top and bottom heads. The steam generators have a flat bottom lower head that eliminated the need for a drain nozzle. Venting of the reactor coolant side of the unit is accomplished by a vent connection on the reactor coolant inlet pipe to each unit.

Feedwater or emergency feedwater is supplied to the steam generator through an emergency feedwater ring located at the top of the steam generator to ensure natural circulation of the reactor coolant following the unlikely event of the loss of all reactor coolant pumps.

System Intended Functions

Portions of the steam generators are relied upon to maintain the primary and secondary pressure boundaries and to transfer heat from the primary fluid to the secondary fluid. Therefore, the steam generators are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the steam generators are relied upon for compliance with regulations for fire protection (10 CFR 50.48), EQ (10 CFR 50.49), SBO (10 CFR 50.63), and ATWS (10 CFR 50.62). Therefore, the steam generators are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the steam generators can be found in UFSAR Section 5.4.2, Figure 5-25, and Table 5-20.

System Evaluation Boundary

The evaluation boundary for the steam generator components includes the hemispherical heads, secondary shell, tubes, plugs, mechanical sleeves, tubesheets, primary nozzles, main and auxiliary feedwater nozzles, steam outlet nozzles, instrumentation nozzles, main and auxiliary feedwater nozzles, steam outlet nozzles, instrumentation nozzles, all associated pressure retaining bolting, and integral attachments. The main and auxiliary feedwater headers and riser piping are non-Class 1 items and are addressed in Section 2.3.4.

Subsequent License Renewal Boundary Drawings

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

2.3.2 ENGINEERED SAFETY FEATURES

2.3.2.1 Reactor Building Spray System

System Description

The reactor building spray system along with reactor building cooling system is designed to remove heat from the containment atmosphere after a design basis event by delivering borated water through spray nozzles in upper containment. The system also removes the fission product iodine from the post accident containment atmosphere.

System Intended Functions

Portions of the reactor building spray system are relied upon to maintain containment integrity. Portions of the reactor building spray system are relied upon to remain functional during and following design basis events to reduce inventory of fission products from the containment atmosphere and provide containment pressure and temperature reduction. Therefore, the reactor building spray system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the reactor building spray system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the reactor building spray system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the reactor building spray system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the reactor building spray system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and EQ (10 CFR 50.49). Therefore, the reactor building spray system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the reactor building spray system can be found in the UFSAR Sections 1.2.2.4, 6.1.1, 6.2.1.1.2, and Figure 6-2.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

ONS flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the reactor building spray system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.2.2 Core Flood System

System Description

The core flood system acts as a portion of the overall emergency core cooling system with the high pressure injection system and the low pressure injection system. The core flood system is designed to inject water directly into the reactor vessel when the reactor coolant system pressure drops below a certain level following an accident. The core flood system is self contained, self actuating, and passive in nature. The driving force to inject the stored borated water into the reactor vessel is supplied by a pressurized nitrogen cover in the core flood tanks. After an accident, when the reactor coolant system pressure decreases below the nitrogen cover pressure, the contents of the core flood tanks will be injected directly into the reactor vessel.

System Intended Functions

Portions of the core flood system are relied upon to maintain containment integrity and reactor coolant pressure boundary integrity. Portions of the core flood system are relied upon to remain functional during and following design basis events to inject borated water into the reactor coolant system. Therefore, the core flood system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the core flood system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the core flood system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the core flood system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the core flood system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and EQ (10 CFR 50.49). Therefore, the core flood system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the core flood system can be found in the UFSAR Sections 1.2.2.4, 3.6.1.2.1, 5.4.7.3, 6.3.2.2.3, 6.3.3.2, Table 6-10, and Figure 6-1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

ONS flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the core flood system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.2.3 High Pressure Injection System

System Description

The high pressure injection system acts as a portion of the overall emergency core cooling system with the low pressure injection system and the core flood system. This system is comprised of the high pressure injection system and the standby shutdown reactor coolant makeup system. The high pressure injection system operates during normal reactor operation to recirculate reactor coolant for purification and boric acid concentration control and to supply seal water to the reactor coolant pumps. Letdown flow is directed to the letdown storage tank, which provides suction flow to the operating high pressure injection pump. The letdown storage tank is normally supplied with a hydrogen overpressure. The high pressure injection pump supplies water directly to the reactor coolant system and also supplies seal injection water to the reactor coolant pumps.

During emergency operation, the high pressure injection system automatically injects borated water into the reactor vessel through the reactor coolant system cold legs and reactor coolant pump seals, on low reactor coolant pressure or high reactor building pressure. The water added directly to the system makes up for water lost due to a primary side leak or from shrinkage of the reactor coolant system due to cooling caused by a secondary side break.

During an event when normal makeup system becomes inoperable, the standby shutdown facility reactor coolant makeup system is designed to supply borated water to the reactor coolant system to provide reactor coolant pump seal cooling and reactor coolant system inventory for all three units simultaneously. The standby shutdown facility reactor coolant makeup system is capable of delivering borated water from the spent fuel pool to the reactor coolant pump seal injection lines. A portion of this seal injection flow is used to makeup for reactor coolant pump seal leakage while the remainder flows into the reactor coolant system to makeup for other reactor coolant system leakage.

System Intended Functions

Portions of the high pressure injection system are relied upon to maintain containment and reactor coolant pressure boundary integrity. Portions of the high pressure injection system inject borated water into the reactor coolant pump seals and the reactor coolant system during postulated design basis events. Portions of the high pressure injection system also provide a flow path from the letdown storage tank to the reactor building emergency sump for LOCA mitigation. The standby shutdown facility reactor coolant makeup system supplies makeup water from the spent fuel pool to the reactor coolant system for inventory control and supplies cooling water from the spent fuel pool to the reactor coolant pump seals to prevent seal LOCA. The standby shutdown facility reactor coolant makeup system also provides a flow path to letdown the reactor coolant system into the spent fuel pool. Therefore, the high pressure injection system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the high pressure injection system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the high pressure injection system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the high pressure injection system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the high pressure injection system are relied upon for compliance with regulations for fire protection (10 CFR 50.48), SBO (10 CFR 50.63) and EQ (10 CFR 50.49). Therefore, the high pressure injection system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the high pressure injection system can be found in the UFSAR Sections 1.2.2.4, 3.2.2.1, 5.4.7.2, 6.1.1, 6.3.2.2.1, 6.3.3.1, Table 6-8, and Figure 6-1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

ONS flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the high pressure injection system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.2.4 Low Pressure Injection System

System Description

The low pressure injection system acts as a portion of the overall emergency core cooling system with the high pressure injection system and the core flood system. The low pressure injection system is used during hot shutdown, cold shutdown, and refueling operations to remove decay heat. During power operation, the system is idle.

During unit cooldown, the reactor coolant temperature and pressure are reduced via the steam generators. At approximately 250°F and 300 psig, the low pressure injection system is placed in service. Reactor coolant is drawn from the reactor coolant system via the decay heat drop line and cooled by the decay heat removal coolers and returned to the reactor coolant system.

Upon initiation of an accident, the low pressure injection system takes suction from the borated water storage tank and injects the tank contents into the reactor vessel. When the borated water storage tank level becomes low, system suction is manually transferred to the reactor building emergency sump. Water from the sump is cooled by the decay heat removal coolers and injected back into the reactor vessel.

System Intended Functions

Portions of the low pressure injection system are relied upon to maintain containment and reactor coolant system integrity. Portions of the low pressure injection system inject borated water into the reactor vessel during and following design basis events while rejecting decay heat to the low pressure service water system. Portions of the low pressure injection system also circulate the reactor coolant system to prevent boron precipitation post LOCA. Portions of the low pressure injection system also provide borated water to the high pressure injection and reactor building spray pumps during design basis events. The low pressure injection system also provides reactor coolant system pressure control following a steam generator tube rupture event.Therefore, the low pressure injection system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the low pressure injection system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the low pressure injection system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the low pressure injection system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the low pressure injection system are relied upon for compliance with regulations for fire protection (10 CFR 50.48), SBO (10 CFR 50.63) and EQ (10 CFR 50.49). Therefore, the low pressure injection system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the low pressure injection system can be found in the UFSAR Sections 1.2.2.4, 3.2.2.1, 3.6.1.2.1, 5.4.7.1, 6.1.1, 6.3.1, 6.3.2.2.2, 6.3.2.5, 6.3.3.2, Table 6-9, and Figure 6-1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

2.3.3 AUXILIARY SYSTEMS

2.3.3.1 Air Gas Related Systems

2.3.3.1.1 Auxiliary Instrument Air System

System Description

The auxiliary instrument air system provides a reliable source of instrument air to selected components in order to minimize operator burden during a loss of instrument air while reaching and maintaining a safe shutdown.

System Intended Functions

Portions of the auxiliary instrument air system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the auxiliary instrument air system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the auxiliary instrument air system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

Additional details of the auxiliary instrument air system can be found in UFSAR Section 9.5.2.2.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

2.3.3.1.2 Breathing Air System

System Description

The breathing air system provides a source of breathing air for plant personnel in support of maintenance and operations activities. Breathing air is supplied to all areas and elevations by headers and individual supply stations where the pressure is regulated for personnel use. Units 1 and 2 have one primary and one backup compressor package total for both Units, and Unit 3 has one primary and one backup compressor package. The breathing air systems are cross connected in such a way that any of the compressors can supply either of the Units' breathing air needs.

System Intended Functions

Portions of the breathing air system are relied upon to maintain containment integrity. Therefore, the breathing air system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the breathing air system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the breathing air system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the breathing air system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

Additional details of the breathing air system can be found in UFSAR Section 9.5.2.2.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. 2.3.3.1.3 Hydrogen System

System Description

The hydrogen system uses hydrogen gas to pressurize the high pressure injection letdown storage tanks to maintain the dissolved hydrogen concentration in the reactor coolant system within acceptable limits to inhibit corrosion caused by dissolved oxygen gas. The hydrogen system also provides hydrogen gas to the main generator of each unit. The portion of the hydrogen supply piping connecting to the letdown storage tanks is within the boundary of the high pressure injection system.

System Intended Functions

Portions of the hydrogen system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the hydrogen system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the hydrogen system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

No additional details of the hydrogen system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the hydrogen system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

Component/Commodity Group	Intended Functions
Bolting	Structural Integrity
Heat Exchanger (hydrogen cooler) Water Box	Structural Integrity
Piping	Structural Integrity
Sight Glass	Structural Integrity
Trap Body	Structural Integrity
Valve Body	Structural Integrity

The AMR results for these component types are indicated in Table 3.3.2-3, Auxiliary Systems - Hydrogen System - Aging Management Evaluation.

2.3.3.1.4 Instrument Air System

System Description

The instrument air system provides a reliable source of clean, dry, oil free compressed air at the proper pressure to air-operated valves, instruments, and other components connected to the instrument air system. The instrument air system is shared between all three Oconee units.

The Unit 1, Unit 2, and Unit 3 startup and main feedwater control valves are supplied with backup compressed air from accumulator tanks.

System Intended Functions

Portions of the instrument air system are relied upon to maintain containment integrity. Portions of the instrument air system provide feedwater isolation during a main steam line break design basis event. Therefore, the instrument air system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the instrument air system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the instrument air system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the instrument air system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the instrument air system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and SBO (10 CFR 50.63). Therefore, the instrument air system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the instrument air system can be found in UFSAR Section 9.5.2.2.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the instrument air system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

The AMR results for these component types are indicated in Table 3.3.2-4, Auxiliary Systems - Instrument Air System - Aging Management Evaluation.

2.3.3.1.5 Keowee Air Breaker System

System Description

The Keowee air breaker system maintains design pressure on the Keowee air breaker system reservoirs which contain a supply of air for the operation of the air circuit breakers. The air circuit breakers provide the electrical connection for the Keowee units to provide emergency power to the ONS units.

System Intended Functions

Portions of the Keowee air breaker system are relied upon to ensure sufficient pressure and volume of compressed air in the Keowee air breaker system reservoirs to cycle (open/close) the air circuit breakers following a loss of offsite power in conjunction with a design basis event. Therefore, the Keowee air breaker system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the Keowee air breaker system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Non-safety related components in the Keowee air breaker system are periodically relied upon to make up air to the reservoirs to compensate for system losses. Portions of the Keowee air breaker system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related piping components connected to and providing support for the safety related functional boundary of the system. Therefore, the Keowee air breaker system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the Keowee air breaker system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the Keowee air breaker system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the Keowee air breaker system can be found in UFSAR Section 8.3.1.1.1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the Keowee air breaker system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

Valve Body	Pressure Boundary

The AMR results for these component types are indicated in Table 3.3.2-5, Auxiliary Systems - Keowee Air Breaker System - Aging Management Evaluation.

2.3.3.1.6 Keowee Depressing Air System

System Description

The Keowee depressing air system supplies controlled air to the Keowee turbine generator solenoid-operated cooling water control valves and serves as a backup for the Keowee station air system.

System Intended Functions

Portions of the Keowee depressing air system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the Keowee depressing air system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the Keowee depressing air system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

No additional details of the Keowee depressing air system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Valve Body	Structural Integrity

The AMR results for these component types are indicated in Table 3.3.2-6, Auxiliary Systems - Keowee Depressing Air System - Aging Management Evaluation.

2.3.3.1.7 Keowee Governor Air System

System Description

The Keowee governor air system maintains a cover pressure in the governor oil pressure tank. Following a loss of offsite power in conjunction with a design basis event requiring Keowee to supply emergency power, the Keowee governor air system maintains a pressure boundary to retain an adequate blanket of pressurized air in the governor oil pressure tank. The Keowee governor oil system depends on the air cushion to provide sufficient governor oil pressure to control the Keowee turbine.

System Intended Functions

Portions of the Keowee governor air system are relied upon to provide a blanket of pressurized air in the governor oil pressure tank to enable Keowee hydro station to start. Therefore, the Keowee governor air system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the Keowee governor air system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the Keowee governor air system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the Keowee governor air system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the Keowee governor air system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the Keowee governor air system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

No additional details of the Keowee governor air system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. Trap Body	Structural Integrity
Valve Body	Pressure Boundary Structural Integrity

The AMR results for these component types are indicated in Table 3.3.2-7, Auxiliary Systems - Keowee Governor Air System - Aging Management Evaluation.

2.3.3.1.8 Keowee Station Air System

System Description

The Keowee station air system provides compressed air to various Keowee hydro station components including an air warning horn and the Keowee main generator air brakes. In addition, the Keowee station air system supplies compressed air to the Keowee instrument air system and the Keowee depressing air system.

System Intended Functions

Portions of the Keowee station air system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the Keowee station air system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the Keowee station air system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

No additional details of the Keowee station air system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. Valve Body	Structural Integrity

The AMR results for these component types are indicated in Table 3.3.2-8, Auxiliary Systems - Keowee Station Air System - Aging Management Evaluation.

2.3.3.1.9 Nitrogen Purge and Blanket System

System Description

The nitrogen purge and blanket system vaporizes liquified nitrogen from a storage tank in the yard to supply high and low-pressure headers which distribute nitrogen in the plant. The high-pressure header supplies the pressurizer and the core flood tanks inside the reactor building. The low-pressure header supplies the steam generators (primary and secondary sides), pressurizer, quench tank, and various components outside the reactor building. Bottled nitrogen is provided to the emergency feedwater steam generator level control valves and the turbine driven emergency feedwater pump steam admission valve.

System Intended Functions

Portions of the nitrogen purge and blanket system are relied upon to maintain containment integrity. Portions of the nitrogen purge and blanket system isolate steam supply to turbine-driven main feedwater pump to prevent feedwater flow to the steam generators on an automatic feedwater isolation signal and to ensure capability to throttle or close emergency feedwater level control valves to regulate feedwater flow to the steam generators. Therefore, the nitrogen purge and blanket system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(1).

Portions of the nitrogen purge and blanket system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the nitrogen purge and blanket system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the nitrogen purge and blanket system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the nitrogen purge and blanket system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the nitrogen purge and blanket system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the nitrogen purge and blanket system can be found in UFSAR Sections 6.3.2.2.3 and 7.4.3.1.2.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the nitrogen purge and blanket system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.1.10 Service Air System

System Description

The service air system provides compressed air throughout the plant for use with portable air-powered equipment. The service air system acts as a backup compressed air supply for the instrument air system. If the instrument air header pressure decreases to below the setpoint, the service air system automatically supplies compressed air to the instrument air header.

System Intended Functions

Portions of the service air system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the service air system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the service air system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the service air system are relied upon for compliance with regulations for SBO (10 CFR 50.63). Therefore, the service air system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the service air system can be found in UFSAR Section 10.4.7.2.7.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

2.3.3.1.11 Standby Shutdown Facility Fire Protection System

System Description

The standby shutdown facility contains two fire protection systems, a water system and a carbon dioxide system. The water system is evaluated with the high pressure service water system. The carbon dioxide system is evaluated with the standby shutdown facility fire protection system.

The standby shutdown facility diesel generator room is equipped with a carbon dioxide fire suppression system. The carbon dioxide system is actuated by thermal detectors to automatically flood the standby shutdown facility diesel area. Carbon dioxide is stored in a refrigerated storage tank in sufficient quantity to provide twice the required coverage for the area.

System Intended Functions

Portions of the standby shutdown facility fire protection system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) regulations. Therefore, the standby shutdown facility fire protection system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the standby shutdown facility fire protection system can be found in UFSAR Section 9.6.3.6.2.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. 2.3.3.2 Ancillary Related Systems

2.3.3.2.1 Chemical Addition System

System Description

The chemical addition system is designed to mix, store, and inject chemicals into the reactor coolant system and auxiliary systems. The system also functions as a central location for sampling various fluids throughout the plant to ensure chemical concentrations are maintained within the prescribed limits. Following a LOCA, trisodium phosphate stored in the reactor building basement is dissolved during reactor building flooding to maintain the pH of the water for post accident iodine removal and retention. The post accident sampling system is evaluated within the chemical addition system.

System Intended Functions

Portions of the chemical addition system are relied upon to maintain containment and reactor coolant pressure boundary integrity. Portions of the chemical addition system provide pH adjustment to the water within the reactor building emergency sump following a design basis event. Therefore, the chemical addition system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the chemical addition system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the chemical addition system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the chemical addition system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

Additional details of the chemical addition system can be found in UFSAR Sections 5.1.1.4.6, 5.1.1.4.7, 5.4.7.5, 9.3.1, and 10.4.8.2, and Figures 9-15 and 9-16, and Table 9-5.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

2.3.3.2.2 Coolant Storage System

System Description

The coolant storage system is designed to accommodate the accumulated coolant bleed over a core cycle, including startup expansion and coolant letdown to storage for boric acid reduction.

System Intended Functions

Portions of the coolant storage system are relied upon for containment integrity. Therefore, the coolant storage system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the coolant storage system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the coolant storage system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the coolant storage system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the coolant storage system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and EQ (10 CFR 50.49) regulations. Therefore, the coolant storage system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the coolant storage system can be found in UFSAR Sections 6.3.2.3.5 and 9.3.4, and Figure 9-20, and Table 9-10.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the coolant storage system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

The AMR for these component types are indicated in Table 3.3.2-13, Auxiliary Systems - Coolant Storage System - Aging Management Evaluation.

2.3.3.2.3 Coolant Treatment System

System Description

The coolant treatment system stores reactor coolant bleed. The coolant treatment header also facilitates the processing of liquid waste from the liquid waste disposal system.

System Intended Functions

Portions of the coolant treatment system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the coolant treatment system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the coolant treatment system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

Additional details of the coolant treatment system can be found in UFSAR Sections 9.3.5 and 11.2.2.1, and Figure 9-21.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

2.3.3.2.4 Demineralized Water System

System Description

The purpose of the demineralized water system is to supply demineralized water to the plant for use in water systems and hose stations.

System Intended Functions

Portions of the demineralized water system are relied upon to maintain containment integrity. Therefore, the demineralized water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the demineralized water system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the demineralized water system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the demineralized water system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

No additional details of the demineralized water system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

2.3.3.2.5 Essential Siphon Vacuum System

System Description

The essential siphon vacuum system supports the condenser circulating water system by removing air from the condenser circulating water intake header during normal and siphon modes of operation. In the event condenser circulating water pumps are not available, a siphon is required to convey water from Lake Keowee through the condenser circulating water pumps and lines in order to supply water for the low pressure service water pumps. During normal operation, the essential siphon vacuum system removes air from the condenser circulating water intake headers to ensure that the operable intake headers are primed at the start of an event requiring the siphon mode of operation. During siphon mode of operation, the essential siphon vacuum system also removes air from the condenser circulating water intake headers to ensure that the siphon does not fail due to air accumulation during a design basis event involving loss of power to the condenser circulating water pumps.

System Intended Functions

Portions of the essential siphon vacuum system are relied upon to remove air from the essential siphon vacuum siphon headers. Therefore, the essential siphon vacuum system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the essential siphon vacuum system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the essential siphon vacuum system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the essential siphon vacuum system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

Additional details of the essential siphon vacuum system can be found in UFSAR Sections 7.5.2.59, 7.5.2.60, 7.5.2.61, 9.2.2.1, 9.2.2.2.2, and 9.2.2.2.5, and Figure 9-42.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the essential siphon vacuum system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.2.6 Spent Fuel Cooling System

System Description

The primary function of the spent fuel cooling system is to provide decay heat removal for the spent fuel stored in the spent fuel pools. Spent fuel pool heat removal is accomplished by recirculating spent fuel coolant water through heat exchangers and then back to the pool. In addition to decay heat removal, the system provides for purification of the spent fuel pool water, the fuel transfer canal water, and the content of the borated water storage tank, in order to remove fission and corrosion products and to maintain water clarity for fuel handling operations. The system also provides inventory makeup for the fuel transfer canal and the incore instrument handling tank.

System Intended Functions

Portions of the spent fuel cooling system are relied upon to maintain containment integrity. Portions of the spent fuel cooling system also provide a source of makeup water to the standby shutdown facility and letdown storage capability for reactor coolant system inventory, drain accumulated reactor building spray water (post actuation) from the fuel transfer canal, and provide emergency makeup to the spent fuel pool to maintain shielding. Therefore, the spent fuel cooling system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the spent fuel cooling system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the spent fuel cooling system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the spent fuel cooling system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the spent fuel cooling system are relied upon for compliance with fire protection (10 CFR 50.48) regulations and SBO (10 CFR 50.63) regulations. Therefore, the spent fuel cooling system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the spent fuel cooling system can be found in UFSAR Sections 9.1.3 and 9.1.3.3.1, and Figure 9-5.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

2.3.3.3 Closed Cycle Water Related Systems

2.3.3.3.1 Alternate Chilled Water System

System Description

The alternate chilled water system provides defense in depth for the existing environmental cooling systems in the auxiliary building, control complex, and reactor buildings.

Two (2) skid-mounted air-cooled chillers produce chilled water that is then routed through dedicated header piping to air handling units of identified plant areas.

System Intended Functions

Portions of the alternate chilled water system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the alternate chilled water system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the alternate chilled water system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the alternate chilled water system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the alternate chilled water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the alternate chilled water system can be found in UFSAR Sections 9.2.5, 9.2.5.3, and 9.4.1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

The AMR results for these component types are indicated in Table 3.3.2-18, Auxiliary Systems – Alternate Chilled Water System - Aging Management Evaluation.

2.3.3.3.2 Component Cooling Water System

System Description

The component cooling water system provides cooling water to various components in the reactor building.

Five component coolers are provided for the three units. Units 1 and 2 each have a single cooler with a third as a common spare. Unit 3 has one cooler and one spare.

System Intended Functions

Portions of the component cooling water system are relied upon to maintain containment integrity. Therefore, the component cooling water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the component cooling water system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the component cooling water system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the component cooling water system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the component cooling water system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and EQ (10 CFR 50.49). Therefore, the component cooling water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the component cooling water system can be found in UFSAR Section 9.2.1.1 and Figure 9-8.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the component cooling water system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.3.3 Chilled Water (Non-Vital Loads) System

<u>System Description</u>

The chilled water (non-vital loads) system provides chilled water to various air handling units throughout non-vital areas of the auxiliary building and turbine building.

<u>System Intended Functions</u>

Portions of the chilled water (non-vital loads) system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the chilled water (non-vital loads) system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the chilled water (non-vital loads) system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the chilled water (non-vital loads) system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the chilled water (non-vital loads) system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the chilled water (non-vital loads) system can be found in UFSAR Sections 9.2.5 and 9.4.2.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the chilled water (non-vital loads) system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.3.4 Recirculating Cooling Water System

System Description

The recirculating cooling water system provides closed cycle cooling water to various components outside the reactor building.

The recirculating cooling water system consists of two parallel loops which are normally isolated from each other. One loop supplies cooling for shared station loads, Unit 1 and 2 loads, and secondary loads on Unit 3. The other loop supplies cooling for Unit 3 primary loads.

System Intended Functions

Portions of the recirculating cooling water system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the recirculating cooling water system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the recirculating cooling water system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the recirculating cooling water system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the recirculating cooling water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the recirculating cooling water system can be found in UFSAR Section 9.2.2.2.4 and Figure 9-13.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the recirculating cooling water system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

The AMR results for these component types are indicated in Table 3.3.2-21, Auxiliary Systems - Recirculating Cooling Water System - Aging Management Evaluation.

2.3.3.3.5 Sample Cooling Water System

System Description

The sample cooling water system is used to cool samples taken from the secondary side of Units 1, 2, and 3. The system is closed loop with a single cooling water chiller unit that chills water and provides the required pumping head to send the cooling water through several sample coolers.

System Intended Functions

Portions of the sample cooling water system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the sample cooling water system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the sample cooling water system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

No additional details of the sample cooling water system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the sample cooling water system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.3.6 Chilled Water (Vital Loads) System

System Description

The chilled water (vital loads) system provides chilled water for the control room ventilation system for all three units. The chilled water (vital loads) system is required for normal unit operation and to maintain temperatures below equipment operating limits during emergency operation. Two chillers are provided for the system, each with 100% capacity. The equipment is arranged in two parallel redundant trains with one supply and return line and each train capable of supplying the required cooling capacity.

System Intended Functions

Portions of the chilled water (vital loads) system provide chilled water to air handling units for control room envelope pressurization and cooling, as well as cooling for the cable and equipment rooms, for events where the control room remains occupied. Therefore, the chilled water (vital loads) system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the chilled water (vital loads) system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the chilled water (vital loads) system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the chilled water (vital loads) system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the chilled water (vital loads) system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the chilled water (vital loads) system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the chilled water (vital loads) system can be found in UFSAR Sections 9.2.5 and 9.4.1, and Figure 9-24.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

2.3.3.4 Fire Protection Related Systems

2.3.3.4.1 High Pressure Service Water System

System Description

The high pressure service water system provides a source of water for fire protection throughout the station. The high pressure service water system consists of two motor driven large capacity pumps and one motor driven small capacity (jockey) pump which, together with the elevated water storage tank, provide a reliable source of fire protection, bearing lubrication, sealing, and cooling water to the three Oconee units. The source of high pressure service water system is from the condenser circulating water crossover lines via headers shared with Units 1 and 2 low pressure service water pumps. A header and network of piping carries high pressure service water system throughout the station. A yard header forms a complete loop around the main station structure. The yard header serves primarily fire hydrants around the yard but also serves as a main header for branch lines to a variety of site structures.

The high pressure service water system supplies water at sufficient pressure and flow rate to sprinkler systems, mulsifyer systems, hose stations, fire hydrants, and deluge systems throughout the station and surrounding areas. High pressure service water system also supplies sealing or cooling water to various loads.

System Intended Functions

Portions of the high pressure service water system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Non-safety related components of the high pressure service water system are relied upon to prevent air in-leakage from air binding low pressure service water pumps if the elevated water storage tank is depleted. Portions of the high pressure service water system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the high pressure service water system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the high pressure service water system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) regulations. Therefore, the high pressure service water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the high pressure service water system can be found in UFSAR Sections 9.2.2.1, 9.2.2.2.2, 9.7.3.4.2, 10.4.7.2.2 and Figure 9-10.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the high pressure service water system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.4.2 Keowee Service Water System

System Description

The Keowee service water system provides cooling water from Lake Keowee to various Keowee plant components and pre-lubrication for unwatering sump pumps.

System Intended Functions

Portions of the Keowee service water system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the Keowee service water system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the Keowee service water system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

No additional details of the Keowee service water system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

2.3.3.4.3 Keowee Fire Detection/Protection System

System Description

The Keowee fire detection/protection system includes fire detection components that monitor for smoke and/or fire, and fire suppression components such as fire extinguishers, hydrants, hose racks, and a fire pump. Fire water is delivered to Keowee fire detection/protection system by the Keowee intake line. The system also includes passive fire protection features including fire doors and fire penetration seals.

System Intended Functions

Portions of the Keowee fire detection/protection system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the Keowee fire detection/protection system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the Keowee fire detection/protection system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the Keowee fire detection/protection system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) regulations. Therefore, the Keowee fire detection/protection system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the Keowee fire detection/protection system can be found in UFSAR Section 9.5.1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.3.3.4-3, Keowee Fire Detection/ Protection System.

Table 2.3.3.4-3 Keowee Fire Detection/Protection System

Component/Commodity Group	Intended Functions
Bolting	Pressure Boundary Structural Integrity
Fire Hydrant	Pressure Boundary
Flow Element	Flow Restriction Pressure Boundary
Piping	Pressure Boundary Structural Integrity
Pump Casing (fire protection)	Pressure Boundary
Sprinkler Head	Pressure Boundary Spray Pattern
Strainer Body	Pressure Boundary
Strainer Screen	Filtration
Valve Body	Pressure Boundary Structural Integrity

The AMR results for these component types are indicated in Table 3.3.2-26, Auxiliary Systems - Keowee Fire Detection/Protection System - Aging Management Evaluation.

2.3.3.5 Heating Ventilation and Air Conditioning Related Systems

2.3.3.5.1 Reactor Building Cooling and Ventilation Systems

System Description

The reactor building cooling and ventilation systems are divided into two systems as identified in the UFSAR, the reactor building cooling system and the reactor building ventilation system.

The reactor building cooling system consists of the reactor building cooling units that are designed to remove heat from the reactor building following a design basis accident. Heat removal is necessary to maintain acceptable internal reactor building pressure and temperatures.

The reactor building ventilation system consists of the reactor building auxiliary cooling units and the control rod drive structure fans. These cooling units and fans provide cooling for the reactor building atmosphere and control rod drive structures during normal plant operations, and do not have a post accident or regulated event function.

System Intended Functions

Portions of the reactor building cooling and ventilation system are relied upon to provide sufficient heat removal from the containment atmosphere during post accident conditions to assist in maintaining reactor building atmosphere within the environmental envelope to assure component operability. This intended function is limited to the reactor building cooling system. Therefore, the reactor building cooling and ventilation system is within the scope of license renewal in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the reactor building cooling and ventilation system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the reactor building cooling and ventilation system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the reactor building cooling and ventilation system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the reactor building cooling and ventilation system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and EQ (10 CFR 50.49). This intended function is limited to the reactor building cooling system. Therefore, the reactor building cooling and ventilation system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the reactor building cooling and ventilation systems can be found in UFSAR Sections 6.2.2, 9.4.6 and Figure 6-3.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the reactor building cooling and ventilation system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.5.2 Reactor Building Purge System

System Description

The reactor building purge system purges the reactor building with fresh air whenever desired during unit outages.

System Intended Functions

Portions of the reactor building purge system are relied upon to maintain containment integrity. Therefore, the reactor building purge system is within the scope of license renewal in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the reactor building purge system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the reactor building purge system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the reactor building purge system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the reactor building purge system are relied upon for compliance with regulations for EQ (10 CFR 50.49). Therefore, the reactor building purge system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional Details of the reactor building purge system can be found in UFSAR Sections 6.2.3, 9.4.5 and Figure 6-4.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the reactor building purge system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.5.3 Ventilation Systems

System Description

The ventilation systems includes the following systems:

The control room pressurization and filtration system maintains a suitable environment in the control room for personnel and equipment during normal operation. During emergency operation the system supplies the control room with 100% filtered outside air and maintains a positive pressure to prevent in-leakage of radioactive effluents or toxic gases.

The standby shutdown facility heating ventilation and air conditioning system provides ventilation and air conditioning to the standby shutdown facility when it is required for event mitigation. The system maintains standby shutdown facility temperatures within acceptable limits to prevent equipment failures.

The spent fuel pool area ventilation system maintains a suitable environment in the spent fuel pool area for the proper operation, maintenance and testing of equipment as well as for personnel access.

The auxiliary building ventilation system and auxiliary building air conditioning system maintain the auxiliary building at a negative pressure with respect to the turbine building and outside areas so that any potential contamination will be monitored and discharged through the Unit Vent. The auxiliary building ventilation system also maintains temperature limits in the auxiliary building during normal plant operations.

The penetration room ventilation system maintains a negative pressure in the penetration room. With the adoption of alternate source term, this function is no longer required for post accident operation. This system also provides cooling to the penetration rooms.

The turbine building ventilation system generally maintains a suitable environment in the turbine building for personnel and equipment, including the Unit 1 & 2 and Unit 3 blockhouses.

The miscellaneous structures heating ventilation and air conditioning system serves various structures, including Tech Support Offices, Interim Radwaste Building, guardhouse, contaminated tool storage, 525 KV relay house, lube oil station, Maintenance Support Building, Warehouse No. 6 and the 230 KV Relay House. The 230 KV relay house heating ventilation and air conditioning maintains temperatures within acceptable limits.

The protected service water building heating ventilation and air conditioning system supports operation of systems and equipment located in the protected service water building by maintaining temperatures within design limits. The protected service water building heating ventilation and air conditioning is designed to maintain the transformer and battery rooms within their design temperature range.

System Intended Functions

Portions of the ventilation systems are relied upon to maintain a suitable environment within acceptable limits in the control room, equipment room, standby shutdown facility, and protected service water building. Therefore, the ventilation systems are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the ventilation systems contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54(a)(1) function. Non-safety related components of the ventilation systems maintain temperatures for the control battery rooms, the 230 KV switchyard relay house, the CT4 blockhouse and switchgear room, and the Unit 3 blockhouse within acceptable limits. Portions of the ventilation systems contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the ventilation systems are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(2).

Portions of the ventilation systems are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and SBO (10 CFR 50.63). Therefore, the ventilation systems are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the ventilation systems can be found in UFSAR Sections 6.4, 6.5, 9.4.1, 9.4.2, 9.4.3, 9.4.4, 9.4.7, 9.4.8, 9.6.3.6.4, 9.7.3.4.3, Figures 6-4, 9-24, 9-25, 9-26, 9-27 and 9-28.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the ventilation system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.6 Lube Oil Related Systems

2.3.3.6.1 Lube Oil System

System Description

The lubrication oil system consists of the turbine oil subsystems for the main, emergency feedwater, and feedwater turbines.

Main Turbine Oil Subsystem

The main turbine oil subsystem provides lubrication of the journal and thrust bearings of the turbine, generator, and exciter.

An external, filter type, oil purification system is interconnected with the main, emergency feedwater, and feedwater turbine oil subsystems to provide makeup oil and removal of contaminants from the lubricating oil.

Emergency Feedwater Turbine Oil Subsystem

The emergency feedwater turbine oil subsystem supplies oil at constant pressure to the hydraulic system by means of positive displacement oil pumps driven by the turbine shaft or by means of an auxiliary motor. This oil is used to supply lubrication for the bearings and gears as well as to supply hydraulic power for the governing system.

Feedwater Turbine Oil Subsystem

The feedwater turbine oil subsystem provides oil for the turbine hydraulic and lube system during normal turbine operation. The low pressure section of the pump discharges to the control system and the lubrication system while the high pressure section furnishes hydraulic oil pressure to the governor system. An emergency oil pump is included in the lube oil system to provide lube oil when the turbine is on the turning gear.

The ATWS AMSAC interfaces with the feedwater turbine oil system to sense a loss of both feedwater pumps on low control oil pressure signals.

System Intended Functions

Portions of the lube oil system provide isolation of emergency feedwater flow following a design basis event. Portions of the lube oil system also prevent emergency feedwater pump runout and steam generator tube flow induced vibration. Therefore, the lube oil system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the lube oil system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the lube oil system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the lube oil system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the lube oil system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and ATWS (10 CFR 50.62). Therefore, the lube oil system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the lube oil system can be found in UFSAR Sections 7.8.2 and 10.4.7.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the lube oil system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.6.2 Keowee Turbine Guide Bearing Oil System

System Description

The Keowee turbine guide bearing oil system provides lubrication and heat removal for the Keowee turbine guide bearings. The Keowee turbine guide bearing oil system has an AC and a DC pump which draws oil from the lower oil reservoir and pumps it to the upper oil reservoir. The oil is pumped through the turbine guide bearing oil cooler, when in service, and is filtered before discharge to the upper oil reservoir. Gravity flow through the bearing shell provides bearing lubrication.

System Intended Functions

Portions of the Keowee turbine guide bearing oil system provide lubrication and heat removal for the Keowee turbine guide bearing. Therefore, the Keowee turbine guide bearing oil system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the Keowee turbine guide bearing oil system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the Keowee turbine guide bearing oil system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

No additional details of the Keowee turbine guide bearing oil system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the Keowee turbine guide bearing oil system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.3.3.6-2, Keowee Turbine Guide Bearing Oil System.

Table 2.3.3.6-2 Keowee Turbine Guide Bearing Oil System

Component/Commodity Group	Intended Functions
Bolting	Pressure Boundary
Flow Element	Flow Restriction Pressure Boundary
Heat Exchanger (Keowee turbine guide bearing oil cooler) Head	Pressure Boundary
Heat Exchanger (Keowee turbine guide bearing oil cooler) Shell	Pressure Boundary
Heat Exchanger (Keowee turbine guide bearing oil cooler) Tubes	Heat Transfer Pressure Boundary
Heat Exchanger (Keowee turbine guide bearing oil cooler) Tubesheet	Pressure Boundary
Piping	Pressure Boundary
Pump Casing (Keowee turbine guide bearing oil (AC))	Pressure Boundary
Pump Casing (Keowee turbine guide bearing oil (DC))	Pressure Boundary
Strainer Body	Pressure Boundary
Strainer Screen	Filtration
Tank (Keowee lower oil reservoir)	Pressure Boundary
Tank (Keowee upper oil reservoir)	Pressure Boundary
Valve Body	Pressure Boundary

The AMR results for these component types are indicated in Table 3.3.2-31, Auxiliary Systems - Turbine Guide Bearing Oil System - Aging Management Evaluation.

2.3.3.6.3 Keowee Lube Oil System

System Description

The Keowee lube oil system provides a supply of filtered and purified lubricating oil to the high pressure oil system, governor oil system, and Keowee turbine guide bearings.

System Intended Functions

Portions of the Keowee lube oil system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the Keowee lube oil system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the Keowee lube oil system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

No additional details of the Keowee lube oil system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the Keowee lube oil system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.7 Miscellaneous Related Systems

2.3.3.7.1 Filtered Water System

System Description

The filtered water system filters water taken from Lake Keowee via the low pressure service water or high pressure service water systems to reduce contaminants to a level acceptable for the demineralized water system influent.

System Intended Functions

Portions of the filtered water system are relied upon to maintain containment integrity. Therefore, the filtered water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the filtered water system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the filtered water system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the filtered water system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

No additional details of the filtered water system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the filtered water system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.7.2 Keowee Main Turbine System

System Description

The Keowee main turbine system provides motive power to turn the Keowee generator to supply emergency power to ONS during various events.

System Intended Functions

Portions of the Keowee main turbine system provide motive power to turn the Keowee generator to supply emergency power to ONS during various events. Therefore, the Keowee main turbine system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the Keowee main turbine system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the Keowee main turbine system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the Keowee main turbine system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the Keowee main turbine system are relied upon for compliance with regulations for Fire Protection (10 CFR 50.48). Therefore, the Keowee main turbine system is within the scope of license renewal in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the Keowee main turbine system can be found in UFSAR Section 8.3.1.1.1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

2.3.3.7.3 Leak Rate Test System

System Description

The leak rate test system supports performance of the reactor building integrated leak rate test required in accordance with 10 CFR Part 50 Appendix J. The function of the leak rate test system is to pressurize the containment vessel and monitor leakage rates to verify the maximum allowable leakage rate specified in technical specifications is not exceeded. When not in use for leak rate testing, the leak rate test system is isolated to maintain the containment pressure boundary.

System Intended Functions

Portions of the leak rate test system are relied upon to maintain containment integrity. Therefore, the leak rate test system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the leak rate test system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the leak rate test system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the leak rate test system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

Additional details of the leak rate test system can be found in UFSAR Sections 3.1.54, 3.8.1.7.4, and 6.2.4.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the leak rate test system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.7.4 Plant Drinking Water System

System Description

The plant drinking water system is a conventional potable water system supporting the entire Oconee facility. The system provides water primarily for consumption, toilets, sinks and showers. The source for the plant drinking water system is the Seneca, SC municipal water system. The Keowee plant drinking water and the standby shutdown facility drinking water systems are evaluated within the plant drinking water system.

System Intended Functions

Portions of the plant drinking water system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the plant drinking water system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system.

Therefore, the plant drinking water system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

Additional details of the plant drinking water system can be found in UFSAR Section 3.4.1.1.1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

Pump Casing (hot water recirculation)	Structural Integrity
Tank (package steam fired water heater)	Structural Integrity
Tank (standby shutdown facility water storage)	Structural Integrity
Tank (water heater 119 gallon)	Structural Integrity
Tank (water heater 30 gallon)	Structural Integrity
Valve Body	Structural Integrity

The AMR results for these component types are indicated in Table 3.3.2-36, Auxiliary Systems - Plant Drinking Water System - Aging Management Evaluation.

2.3.3.7.5 Radiation Monitoring System

System Description

The radiation monitoring system monitors both airborne and liquid activity in selected locations. These monitors can provide control room operators radioactivity information for personnel protection or for plant status.

System Intended Functions

Portions of the radiation monitoring system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the radiation monitoring system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the radiation monitoring system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2) for spatial interaction.

Portions of the radiation monitoring system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and EQ (10 CFR 50.49). Therefore, the radiation monitoring system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the radiation monitoring system can be found in UFSAR Sections 7.5.2, 11.5, 12.3.3 12.4.5.2, Tables 11-7 and 12-3.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

2.3.3.7.6 Stator Coolant System

System Description

The stator coolant system is a closed-loop system designed to circulate high purity water to cool the generator stator windings and the static rectifier units.

System Intended Functions

Portions of the stator coolant system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the stator coolant system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the stator coolant system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

No additional details of the stator coolant system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

2.3.3.7.7 Station Sewage Disposal System

System Description

The station sewage disposal system is a conventional sewage treatment system that serves the entire ONS facility. Station sanitary waste effluents are collected by the sewage ejectors and lift stations and pumped to the waste surge basin for further treatment. The standby shutdown facility sanitary lift system is evaluated within the station sewage disposal system.

System Intended Functions

Portions of the station sewage disposal system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the station sewage disposal system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the station sewage disposal system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

No additional details of the station sewage disposal system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

2.3.3.7.8 Keowee Turbine Sump Pump System

System Description

The Keowee turbine sump pump system pumps normal water accumulation from the Keowee turbine wheel pit to the Keowee tailrace.

System Intended Functions

Portions of the Keowee turbine sump pump system are relied upon to prevent water entering the turbine oil reservoir. Therefore, the Keowee turbine sump pump system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the Keowee turbine sump pump system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the Keowee turbine sump pump system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the Keowee turbine sump pump system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the Keowee turbine sump pump system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the Keowee turbine sump pump system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

No additional details of the Keowee turbine sump pump system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the Keowee turbine sump pump system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.7.9 Vacuum System

System Description

The main vacuum system uses vacuum pumps and condensate steam air ejectors to evacuate air and non-condensible gases from the main condenser, main turbine casing, and the upper surge tank during start up and normal operations.

System Intended Functions

Portions of the vacuum system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Non-safety related components of the vacuum system are relied upon to break vacuum in condenser hotwell "C" to allow suction for emergency feedwater pumps. Portions of the vacuum system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the vacuum system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the vacuum system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the vacuum system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the vacuum system can be found in UFSAR Sections 9.2.2.1, 10.4.2 and Figure 10-5.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the vacuum system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

The AMR results for these component types are indicated in Table 3.3.2-41, Auxiliary Systems - Vacuum System - Aging Management Evaluation.

2.3.3.8 Miscellaneous Oil Related Systems

2.3.3.8.1 Electro-Hydraulic Control System

System Description

The electro-hydraulic control system controls the high pressure turbine steam inlet stop and control valves, thereby, controlling operation of the high pressure turbine and effectively the downstream low pressure turbines. In addition to controlling the normal operation of the main turbine, the electro-hydraulic control system also develops signals for testing and for safeguards to protect the turbine.

System Intended Functions

Portions of the electro-hydraulic control system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the electro-hydraulic control system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the electro-hydraulic control system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the electro-hydraulic control system are relied upon for compliance with regulations for SBO (10 CFR 50.63) and ATWS (10 CFR 50.62). Therefore, the electro-hydraulic control system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the electro-hydraulic control system can be found in UFSAR Sections 10.2.1 and 10.4.6.5.1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the electro-hydraulic control system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.8.2 Fuel Oil System

System Description

The fuel oil system supplies adequate fuel oil from two oil tanks to the auxiliary boiler burners for combustion. The auxiliary boiler is used to supply steam for unit startup operations if auxiliary steam from another unit is unavailable.

System Intended Functions

Portions of the fuel oil system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the fuel oil system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the fuel oil system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

No additional details of the fuel oil system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

2.3.3.8.3 Keowee Generator High Pressure Oil System

System Description

The Keowee generator high pressure oil system is a lift system which provides a positive oil film between the generator thrust bearing shoes and the runner during starting and stopping to minimize wear and improve reliability. The oil is drawn from the oil reservoir, circulated under pressure through an oil filter and supplied to each thrust bearing shoe.

System Intended Functions

Portions of the Keowee generator high pressure oil system are relied upon to provide high pressure oil to the generator thrust bearing during starts and stops. Therefore, the Keowee generator high pressure oil system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the Keowee generator high pressure oil system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the Keowee generator high pressure oil system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the Keowee generator high pressure oil system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the Keowee generator high pressure oil system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the Keowee generator high pressure oil system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

No additional details of the Keowee generator high pressure oil system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the Keowee generator high pressure oil system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.8.4 Keowee Governor Oil System

System Description

The Keowee governor oil system provides sufficient hydraulic pressure to open and close the wicket gates on governor demand. The wicket gates control rate of flow of water through the Keowee turbines. During system operation, pressurized oil is supplied to the governor actuator which in turn feeds the servomotors which control movement of the wicket gates. The system is required for operation to supply emergency power generator for the Oconee plant as well as normal power generation for the system grid.

System Intended Functions

Portions of the Keowee governor oil system provide sufficient governor oil pressure to control the turbine. Therefore, the Keowee governor oil system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the Keowee governor oil system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the Keowee governor oil system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the Keowee governor oil system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the Keowee governor oil system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the Keowee governor oil system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the Keowee governor oil system can be found in UFSAR Section 3.1.1.1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

2.3.3.8.5 Refueling System

System Description

The refueling system consists of those components designed specifically for the process of receiving new (non-irradiated) nuclear fuel and transferring new and spent (irradiated) fuel between the reactor vessel and the spent fuel pool.

Separate fuel handling equipment is provided for each reactor. A common fuel storage area serves Units 1 and 2, while a separate fuel storage area is provided for Unit 3.

System Intended Functions

Portions of the refueling system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the refueling system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the refueling system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

Additional details of the refueling system can be found in UFSAR Sections 9.1.4.1.1 and 9.1.4.1.4.

System Evaluation Boundary

The SLR evaluation boundaries of the refueling system include only those components associated with the hydraulic refueling equipment that are not depicted on system evaluation boundary drawings. Therefore, no system evaluation boundary drawings are provided for the refueling system.

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.3.3.8-5, Refueling System.

2.3.3.8.6 Hydrogen Seal Oil System

System Description

The hydrogen seal oil system prevents leakage of hydrogen from the main generator interior. A floating, radial ring type seal is used to prevent hydrogen leakage from the main generator along the shaft. Oil is supplied to the seals at a pressure slightly higher than that of the hydrogen in the generator.

System Intended Functions

Portions of the hydrogen seal oil system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the hydrogen seal oil system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the hydrogen seal oil system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

UFSAR References

No additional details of the hydrogen seal oil system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

2.3.3.9 Raw Water Related Systems

2.3.3.9.1 Condenser Circulating Water System

System Description

The condenser circulating water system utilizes lake water that serves as the ultimate heat sink during normal operation and for decay heat removal during plant cooldown. This system also provides cooling water to various plant equipment and is the suction source for other service water systems, including the high pressure service water, low pressure service water, and protected service water. The condenser circulating water system is capable of providing sufficient flow to meet emergency cooling requirements through unassisted siphon flow if the system pumps are lost. The standby shutdown facility auxiliary service water system, turbine building sumps system, and standby shutdown facility sump system are evaluated with the condenser circulating water system. The standby shutdown facility auxiliary service water system is designed to provide decay heat removal by supplying cooling water to the steam generators if normal and emergency feedwater cooling of the steam generators are lost. The turbine building sumps system is designed to process radioactively contaminated water from the turbine building sump. The standby shutdown facility sump system discharges water collected from floor drains located in the standby shutdown facility to the yard drain system for release.

System Intended Functions

Portions of the condenser circulating water system are relied on to provide a suction source for the low pressure service water system and standby shutdown facility auxiliary service water system during emergency operations. The standby shutdown facility auxiliary service water subsystem provides steam generator secondary side cooling and cooling water to support standby shutdown facility operations. Therefore, the condenser circulating water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the condenser circulating water system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Non-safety related components of the condenser circulating water system provide the suction source required for control, cable and equipment room cooling and prevent backflow of water from the yard drain system to the standby shutdown facility pump room during a turbine building flood event. Portions of the condenser circulating water system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/ or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the condenser circulating water system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the condenser circulating water system are relied upon for compliance with regulations for EQ (10 CFR 50.49), Fire Protection (10 CFR 50.48), and SBO (10 CFR 50.63). Therefore, the condenser circulating water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the condenser circulating water system can be found in UFSAR Sections 9.2.2 and 9.6.3.3.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

2.3.3.9.2 Low Pressure Service Water System

System Description

The low pressure service water system provides cooling water to a variety of safety related components in the plant, including the reactor building cooling units, low pressure injection coolers, high pressure injection pump motor bearing coolers, the siphon seal water system, A and B chiller condensers, and motor driven emergency feedwater pump motor air coolers. The low pressure service water system also provides a source of water to non-safety related systems and components in the plant for cooling, sealing, inventory makeup, fire protection, backwash and flush.

System Intended Functions

Portions of the low pressure service water system are relied upon to maintain containment integrity. Portions of the low pressure service water system are also relied upon to supply cooling water to the reactor building cooling units, low pressure injection coolers, high pressure injection pump motor bearing coolers, motor driven emergency feedwater pump motor, reactor coolant pump motor, siphon seal water system, and the A and B chiller condensers. Therefore, the low pressure service water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the low pressure service water system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the low pressure service water system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the low pressure service water system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the low pressure service water system are relied upon for compliance with regulations for EQ (10 CFR 50.49) and Fire Protection (10 CFR 50.48). Therefore, the low pressure service water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the low pressure service water system can be found in UFSAR Section 9.2.2.2.3.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the low pressure service water system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.9.3 Protected Service Water System

System Description

The protected service water system is a standby system for use under emergency conditions which provides added “defense-in-depth” protection serving as a backup to existing safety systems. Protected service water system is not relied upon during design basis events. It is relied upon for decay heat removal and to support high pressure injection during fire scenarios.

System Intended Functions

Portions of the protected service water system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the protected service water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the protected service water system can be found in UFSAR Section 9.7.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the protected service water system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.9.4 Siphon Seal Water System

System Description

The siphon seal water system is designed to support the essential siphon vacuum system by providing operating liquid to the essential siphon vacuum pumps. The siphon seal water system also supports the condenser circulating water system by providing sealing and cooling water to the condenser circulating water system pumps and motors.

System Intended Functions

Portions of the siphon seal water system are relied upon to supply seal water to support operation of the essential siphon vacuum pumps during and following design basis events. Therefore, the siphon seal water system in within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the siphon seal water system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the siphon seal water system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the siphon seal water system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the siphon seal water system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the siphon seal water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the siphon seal water system can be found in UFSAR Section 9.2.2.2.5.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the siphon seal water system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.9.5 Keowee Turbine Generator Cooling Water System

System Description

The Keowee turbine generator cooling water system provides cooling water to the turbine packing box, generator thrust bearing coolers, generator air coolers, and turbine guide bearing oil coolers. It also provides a backup supply of cooling water to the governor air aftercooler. The Keowee turbine generator cooling water system is supplied from the penstock where gravity flow supplies the loads in the system and is discharged to Lake Hartwell. Operation of the Keowee turbine generator cooling water is required during all unit modes of Keowee operation.

System Intended Functions

Portions of the Keowee turbine generator cooling water system are relied upon to provide cooling water for the Keowee turbines and generators during emergency power generation. Therefore, the Keowee turbine generator cooling water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the Keowee turbine generator cooling water system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the Keowee turbine generator cooling water system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the Keowee turbine generator cooling water system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the Keowee turbine generator cooling water system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the Keowee turbine generator cooling water system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

No additional details of the Keowee turbine generator cooling water system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

2.3.3.10 Standby Shutdown Facility Diesel Generator Related Systems

2.3.3.10.1 Standby Shutdown Facility Air Intake and Exhaust System

System Description

The standby shutdown facility air intake and exhaust system provides combustion air for the standby shutdown facility diesel engines and removes exhaust gases from the engines.

System Intended Functions

Portions of the standby shutdown facility air intake and exhaust system are relied upon to provide an air intake and exhaust for the standby shutdown facility diesel engines. Therefore, the standby shutdown facility air intake and exhaust system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the standby shutdown facility air intake and exhaust system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and SBO (10 CFR 50.63). Therefore, the standby shutdown facility air intake and exhaust system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the standby shutdown facility air intake and exhaust system can be found in UFSAR Figure 9-30.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

2.3.3.10.2 Standby Shutdown Facility Diesel Engine System

System Description

The standby shutdown facility diesel engine system consists of two diesel engines (one with 16 cylinders, and the other with 12 cylinders) connected in tandem, jointly driving a generator located between them. The diesel engines are “V” type, two-cycle, turbocharged, positive scavenging air, solid unit injection, and high compression type. The generator is a two-bearing cradle type, horizontal, AC synchronous generator, non-self-exciting type, and has double shaft extensions for the tandem drive.

System Intended Functions

Portions of the standby shutdown facility diesel engine system are relied upon to provide motive power to supply the standby shutdown facility emergency generator during an event which requires operation of either the standby shutdown facility auxiliary service water system or the reactor coolant makeup system. Therefore, the standby shutdown facility diesel engine system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the standby shutdown facility diesel engine system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and SBO (10 CFR 50.63). Therefore, the standby shutdown facility diesel engine system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the standby shutdown facility diesel engine system can be found in UFSAR Section 9.6.3.4.2 and Figure 9-30.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

Components Subject to Aging Management Review

The standby shutdown facility diesel engine system includes only the diesel engines which are active components per 10 CFR 54.21(a)(1)(i) and not subject to AMR.

2.3.3.10.3 Standby Shutdown Facility Diesel Jacket Water Cooling System

System Description

The standby shutdown facility diesel jacket water cooling system removes heat from the standby shutdown facility diesel engines when the engines are operating and maintains the engines at standby temperatures when the engines are not operating.

System Intended Functions

Portions of the standby shutdown facility diesel jacket water cooling system are relied upon to provide jacket cooling and lube oil cooling for the standby shutdown facility diesel generator. Therefore, the standby shutdown facility diesel jacket water cooling system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the standby shutdown facility diesel jacket water cooling system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and SBO (10 CFR 50.63). Therefore, the standby shutdown facility diesel jacket water cooling system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the standby shutdown facility diesel jacket water cooling system can be found in UFSAR Section 9.6.3.4.2 and Figure 9-37.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. 2.3.3.10.4 Standby Shutdown Facility Diesel Lube Oil System

System Description

The standby shutdown facility diesel lube oil system provides lubrication and cooling of the standby shutdown facility diesel engine bearings, gears, turbocharger bearings, and provides cooling of the diesel engine pistons.

System Intended Functions

Portions of the standby shutdown facility diesel lube oil system are relied upon to provide lube oil supply to the standby shutdown facility diesel engines. Therefore, the standby shutdown facility diesel lube oil system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the standby shutdown facility diesel lube oil system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the standby shutdown facility diesel lube oil system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the standby shutdown facility diesel lube oil system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the standby shutdown facility diesel lube oil system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and SBO (10 CFR 50.63). Therefore, the standby shutdown facility diesel lube oil system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the standby shutdown facility diesel lube oil system can be found in UFSAR Section 9.6.3.4.2.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. 2.3.3.10.5 Standby Shutdown Facility Fuel Oil System

System Description

The standby shutdown facility fuel oil system supplies adequate fuel oil to each of the standby shutdown facility diesel engine fuel injectors for combustion and injector cooling. Excess fuel oil from the injector cooling is returned to the fuel oil day tank which serves as a heat sink for the standby shutdown facility fuel oil system. Fuel oil to the day tank is supplied from the underground fuel oil storage tank.

System Intended Functions

Portions of the standby shutdown facility fuel oil system are relied upon to provide fuel oil supply to the standby shutdown facility diesel engines. Therefore, the standby shutdown facility fuel oil system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the standby shutdown facility fuel oil system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the standby shutdown facility fuel oil system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the standby shutdown facility fuel oil system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the standby shutdown facility fuel oil system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and SBO (10 CFR 50.63). Therefore, the standby shutdown facility fuel oil system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the standby shutdown facility fuel oil system can be found in UFSAR Section 9.6.3.4.2 and Figure 9-30.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. 2.3.3.10.6 Standby Shutdown Facility Governor System

System Description

The standby shutdown facility governor system provides speed control for the standby shutdown facility diesel engines. An electro hydraulic governor with an integral backup mechanical hydraulic governor is provided on each diesel engine.

System Intended Functions

Portions of the standby shutdown facility governor system are relied upon to provide speed control for the standby shutdown facility diesel engines. Therefore, the standby shutdown facility governor system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the standby shutdown facility governor system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and SBO (10 CFR 50.63). Therefore, the standby shutdown facility governor system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

No additional details of the standby shutdown facility governor system can be found in the UFSAR.

System Evaluation Boundary

The standby shutdown facility governor system is part of the vendor-supplied standby shutdown facility diesel engine. Therefore, no SLR diagrams are provided for this system.

Components Subject to Aging Management Review

The standby shutdown facility governor system includes only the governors which are active components included within the evaluation boundaries of the standby shutdown facility diesel engines and not subject to AMR per 10 CFR 54.21(a)(1)(i).

2.3.3.10.7 Standby Shutdown Facility Starting Air System

System Description

The standby shutdown facility starting air system provides compressed air to start the standby shutdown facility diesel engines.

System Intended Functions

Portions of the standby shutdown facility starting air system are relied upon to provide starting air for the standby shutdown facility diesel engines. Therefore, the standby shutdown facility starting air system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the standby shutdown facility starting air system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the standby shutdown facility starting air system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the standby shutdown facility starting air system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the standby shutdown facility starting air system are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and SBO (10 CFR 50.63). Therefore, the standby shutdown facility starting air system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the standby shutdown facility starting air system can be found in UFSAR Section 9.6.3.4.2 and Figure 9-38.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the standby shutdown facility starting air system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.11 Waste Disposal Related Systems

2.3.3.11.1 Gaseous Waste Disposal System

System Description

The gaseous waste disposal system is designed to collect, hold-up, and process potentially radioactive gaseous waste generated in the plant. The system controls and minimizes releases of radioactivity to the environment by collecting potentially radioactive gases vented from various components in the reactor building and auxiliary building.

System Intended Functions

Portions of the gaseous waste disposal system are relied upon to maintain containment integrity. Therefore, the gaseous waste disposal system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the gaseous waste disposal system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the gaseous waste disposal system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the gaseous waste disposal system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the gaseous waste disposal system are relied upon for compliance with regulations for EQ (10 CFR 50.49). Therefore, the gaseous waste disposal system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the gaseous waste disposal system can be found in UFSAR Sections 1.2.2.9, 11.3 and Figure 11-3.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the gaseous waste disposal system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.3.11.2 Liquid Waste Disposal System

System Description

The liquid waste disposal system is a normally operating system designed to collect, sample, holdup for decay, evaporate, reclaim, reprocess or discharge all liquid waste generated at Oconee. The purpose of the system is to control and minimize releases of radioactivity to the environment.

System Intended Functions

Portions of the liquid waste disposal system are relied upon to maintain containment integrity. The liquid waste disposal system provides a flow path from letdown storage tank to reactor building emergency sump for LOCA mitigation. Therefore, the liquid waste disposal system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the liquid waste disposal system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the liquid waste disposal system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the liquid waste disposal system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the liquid waste disposal system are relied upon for compliance with regulations for EQ (10 CFR 50.49). Therefore, the liquid waste disposal system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the liquid waste disposal system can be found in UFSAR Sections 1.2.2.9, 11.2 and Figure 11-2.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the liquid waste disposal system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.4 STEAM AND POWER CONVERSION SYSTEM

2.3.4.1 Condensate System

System Description

The condensate system delivers condensate from the condenser hotwells to the suction of the main feedwater pumps, purifies the condensate, removes non-condensible gases from the condensate, and heats the condensate to improve overall plant efficiency. The condensate system also supplies water to the emergency feedwater pumps during emergency operation.

System Intended Functions

The upper surge tank portion of the condensate system provides the primary source of emergency feedwater for the emergency feedwater pumps. Isolation of the upper surge tanks ensures minimum inventory for emergency feedwater. Therefore, the condensate system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the condensate system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the condensate system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the condensate system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the condensate system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the condensate system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the condensate system can be found in the UFSAR Section 10.4.6, Figure 10-6, and Table 10-1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the condensate system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.4.2 Feedwater System

System Description

The feedwater system is broken into two subgroups, the main feedwater system and the emergency feedwater system.

Main Feedwater System

The main feedwater system is designed to supply feedwater to the two steam generators at a temperature, pressure, and flow rate compatible with reactor power output, main steam demand, and required steam generator level.

The main feedwater system receives water from the condensate system. The system starts at the discharge of the final low pressure feedwater heaters (the C feedwater heaters) and raises the condensate’s pressure via the feedwater pumps.

The steam turbine driven main feedwater pumps deliver feedwater through two stages of high pressure feedwater heaters (B and A), to a single feedwater distribution header where the feedwater flow is divided into two lines to the steam generators.

Emergency Feedwater System

The emergency feedwater system provides sufficient feedwater supply to the steam generators of each unit, during events that result in a loss of the condensate/main feedwater, to remove energy stored in the core and primary coolant. Three emergency feedwater pumps are provided for each unit, two motor driven pumps and a turbine driven pump. Each motor driven pump normally serves a separate steam generator; while the turbine driven pump normally serves both steam generators. Emergency feedwater is supplied to each steam generator through its auxiliary feedwater header.

System Intended Functions

Portions of the feedwater system are relied upon to maintain containment integrity. The feedwater system provides isolation of feedwater flow following a main steam line break, tube leak, or reactor shutdown. The emergency feedwater system provides an assured source of feedwater to the steam generators to remove decay heat until the low pressure injection system may be operated or the main feedwater system is restored, provides isolation of emergency feedwater flow following certain events to prevent dilution of the reactor building sump, provides shell cooling of an isolated steam generator during plant cooldown when the main feedwater system is unavailable and prevents emergency feedwater pump runout and steam generator tube flow induced vibration. Therefore, the feedwater system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the feedwater system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the feedwater system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the feedwater system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the feedwater system are relied upon for compliance with regulations for SBO (10 CFR 50.63), fire protection (10 CFR 50.48), EQ (10 CFR 50.49), and ATWS (10 CFR 50.62).

Therefore, the feedwater system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the feedwater system can be found in the UFSAR Sections 10.1, 10.4.6, 10.4.7, and Figures 10-7 and 10-8.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the feedwater system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.4.3 Heater Drain System

System Description

The heater drain system collects the condensed extraction steam from the feedwater heaters and forwards it to the main condenser in the condensate system.

System Intended Functions

Portions of the heater drain system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the heater drain system contain non-safety related piping components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the heater drain system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the heater drain system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the heater drain system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the heater drain system can be found in the UFSAR Section 10.4.1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. 2.3.4.4 High Pressure Turbine Exhaust System

System Description

The high pressure turbine exhaust system routes high pressure turbine extraction steam to feedwater heaters to heat condensate.

System Intended Functions

Portions of the high pressure turbine exhaust system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the high pressure turbine exhaust system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related piping components connected to and providing support for the safety related functional boundary of the system. Therefore, the high pressure turbine exhaust system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the high pressure turbine exhaust system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the high pressure turbine exhaust system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the high pressure turbine exhaust system can be found in the UFSAR Section 10.2.2.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

2.3.4.5 Heater Vent System

System Description

The heater vent system provides for the removal of non-condensable gases from the feedwater heater shells to the main condenser.

System Intended Functions

Portions of the heater vent system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the heater vent system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related piping components connected to and providing support for the safety related functional boundary of the system. Therefore, the heater vent system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the heater vent system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the heater vent system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the heater vent system can be found in the UFSAR Section 10.4.1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. 2.3.4.6 Low Pressure Turbine Extraction System

System Description

The low pressure turbine extraction system routes low pressure turbine extraction steam to feedwater heaters to heat condensate.

System Intended Functions

Portions of the low pressure turbine extraction system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the low pressure turbine extraction system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the low pressure turbine extraction system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the low pressure turbine extraction system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the low pressure turbine extraction system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the low pressure turbine extraction system can be found in the UFSAR Section 10.2.2 and Figure 10-2.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

2.3.4.7 Auxiliary Steam System

System Description

The auxiliary steam system supplies startup steam as necessary when the main steam system is not available. Startup steam can be cross connected between the three ONS units to allow an operating unit's main steam system to supply startup steam to another unit. Additionally, a shared auxiliary boiler is provided in the event other sources of steam are not available.

The auxiliary steam system provides steam to the turbine driven emergency feedwater pump (as a backup source), the condensate steam air ejectors, the main feedwater pump turbines, the steam seal header, and low pressure feedwater heaters.

System Intended Functions

Portions of the auxiliary steam system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the auxiliary steam system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the auxiliary steam system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the auxiliary steam system are relied upon for compliance with regulations for SBO (10 CFR 50.63) and fire protection (10 CFR 50.48). Therefore, the auxiliary steam system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the auxiliary steam system can be found in the UFSAR Section 10.3.2 and Figure 10-1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

2.3.4.8 Main Steam System

System Description

The main steam system transports dry, superheated steam from the steam generators to the main turbine and main feedwater pump turbines. In addition, the main steam system supplies steam to drive the emergency feedwater pump turbine during emergency operation and a variety of other components during normal operation. The main steam system is relied upon to dissipate heat from the reactor coolant system following a load rejection, turbine or reactor trip by dumping steam to the condenser and/or atmosphere. The main steam system is also used to achieve normal cooldown to low pressure injection system initiation conditions.

System Intended Functions

Portions of the main steam system are relied upon to maintain containment integrity. Portions of the main steam system provide overpressure protection for the steam generators and the main steam piping. It provides main steam line isolation as well as decay heat removal via the main steam relief valves and the atmospheric dump valves. Therefore, the main steam system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the main steam system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the main steam system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the main steam system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the main steam system are relied upon for compliance with regulations for SBO (10 CFR 50.63), fire protection (10 CFR 50.48), and EQ (10 CFR 50.49). Therefore, the main steam system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the main steam system can be found in the UFSAR Section 10.3 and Figure 10-1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the main steam system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.4.9 Turbine and Auxiliaries System

System Description

The turbine and auxiliaries system converts the thermal energy of steam produced in the steam generators into mechanical shaft power for the generator. Each unit’s turbine-generator consists of a tandem (single shaft) arrangement of a double-flow high pressure turbine and three identical double-flow low pressure turbines driving a direct-coupled generator.

System Intended Functions

Portions of the turbine and auxiliaries system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the turbine and auxiliaries system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the turbine and auxiliaries system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the turbine and auxiliaries system are relied upon for compliance with regulations for ATWS (10 CFR 50.62) and fire protection (10 CFR 50.48). Therefore, the turbine and auxiliaries system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the turbine and auxiliaries system can be found in the UFSAR Section 10.2 and Figures 10-2 and 10-3.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the turbine and auxiliaries system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.3.4.10 Plant Heating System

System Description

The plant heating system distributes space heating throughout the plant via heat exchangers. The plant heating system steam is supplied from the auxiliary steam system or high pressure turbine exhaust system.

System Intended Functions

Portions of the plant heating system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the plant heating system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the plant heating system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the plant heating system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the plant heating system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

No additional details of the plant heating system can be found in the UFSAR.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. 2.3.4.11 Steam Drain System

System Description

The steam drain system provides steam traps, pumping traps, and condensate drains at various low points in the main steam system piping to remove accumulated condensate.

System Intended Functions

Portions of the steam drain system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the steam drain system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the steam drain system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the steam drain system are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the steam drain system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the steam drain system can be found in UFSAR Section 10.4.1.1.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system's primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

2.3.4.12 Steam Seal System

System Description

The steam seal system delivers steam to the main turbine shafts and feedwater pump turbine shafts for sealing purposes. The seal steam is condensed in the steam packing exhaust steam seal condenser and drains to the condensate storage tank.

System Intended Functions

Portions of the steam seal system contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the steam seal system contain non-safety related components that have the potential to cause an adverse spatial interaction with safety related equipment and/or non-safety related components connected to and providing support for the safety related functional boundary of the system. Therefore, the steam seal system is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the steam seal system are relied upon for compliance with regulations for SBO (10 CFR 50.63) and fire protection (10 CFR 50.48). Therefore, the steam seal system is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the steam seal system can be found in the UFSAR Section 10.1 and Figures 10-2 and 10-3.

System Evaluation Boundary

The system evaluation boundaries are identified by highlighted system flow diagrams that identify the flow paths associated with each of the system intended functions. The flow paths for (a)(1) functions, (a)(2) functions required to functionally support a 10 CFR 54.4(a)(1) function, and (a)(3) functions are highlighted blue. The flow paths for (a)(2) functions related to adverse physical interactions are highlighted magenta. The highlighted drawings constitute the SLR boundary drawings.

Oconee flow diagrams have multiple systems on one drawing. A system’s primary drawing has the name of the system in the title and the drawing consists of mostly the system flow paths. This would be an example of a primary drawing.

Since systems share drawings, system flow paths can be depicted on flow diagrams not labeled with the system in the title. This would be an example of a secondary drawing.

The SLR evaluation boundaries of the steam seal system include the components located within the flow diagram system boundary flags, or as modified by SLR system boundary flags.

2.4 SCOPING AND SCREENING RESULTS: CONTAINMENTS, STRUCTURES, AND COMPONENT SUPPORTS

2.4.1 AUXILIARY BUILDING

<u>System Description</u>

ONS has two auxiliary buildings. One structure is shared by the Unit 1 and 2 reactors; the other structure supports the Unit 3 reactor. The auxiliary buildings are essentially free-standing, reinforced concrete structures with no structural tie-ins to either the turbine buildings or the reactor buildings. The buildings are constructed on reinforced concrete mat foundations. Below grade, the buildings consist of reinforced concrete walls and slabs. Above grade, the buildings consist primarily of reinforced concrete columns, beams, and slabs. All below-grade construction joints in exterior walls are protected by cast-in-place water stops. Separation of the auxiliary building from the reactor building was established during construction by means of a cork expansion joint.

The auxiliary buildings serve as enclosures to protect the auxiliary systems supporting the reactor coolant system, the control room, and other systems necessary for the safe operation of the plant.

The auxiliary buildings also include the hot machine shop. The hot machine shop and its extension are located between the Unit 1 and 2 reactor buildings and are adjacent to the west side of the Units 1 and 2 spent fuel pool. The hot machine shop structure is constructed of reinforced concrete floor and roof slabs supported on concrete beams. The hot machine shop shares reinforced concrete walls on the east and north sides with the spent fuel pool and fuel loading area, respectively. The south and west sides consist of reinforced concrete columns with infilled concrete block walls. The hot machine shop extension is a steel frame structure with a metal deck built up roof and exterior block walls.

A reinforced concrete tunnel extends from the auxiliary building to the hot machine shop by passing under the units 1 and 2 spent fuel pool. This tunnel provides a sheltered and shielded passage for equipment between the auxiliary building areas to the machine shop work area.

The auxiliary buildings are comprised of structural components whose materials of construction are either reinforced concrete or steel. Fire barriers and lead shielding are structural components that are also within the evaluation boundary of the ONS auxiliary buildings. Fiber reinforced polymer exists on the exterior of the outside masonry block wall.

ONS has two spent fuel pools. Units 1 and 2 share a spent fuel pool, while Unit 3 has its own spent fuel pool. They are located within the auxiliary building. The east side spent fuel pool wall near column line "T" is a shared auxiliary building wall and is a support wall with the rest of the auxiliary building. The west side wall extends downward to a grade beam. The end walls are partially supported across the roof slabs of the auxiliary building first floor valve rooms. The end walls extend to the west side grade beam. For the combined Unit 1 and 2 spent fuel pool there are 3 interior column supports under the pool. The 2 end columns extend up from the valve room walls. For Unit 3 the north end wall is supported by a block concrete pour. The spent fuel pools also contain a steel liner, structural steel and the spent fuel storage racks. These components are all made from stainless steel.

The auxiliary building also includes the following cranes: decay heat cooler hoists, letdown filter hoists, low pressure injection hoist, high pressure injection hoist, reactor building spray hoist, spent fuel pool new fuel elevator hoist, spent fuel pool new fuel bridge with fuel hoist, spent fuel pool crane, spent fuel pool bridge hoists electric chain, spent fuel pool pie jib crane pendanty hoist, fuel storage building tran units, demineralizer area hoist, spent fuel pool handling auxiliary hoist chain, and control battery hoist cranes.

System Intended Functions

Portions of the auxiliary building perform safety related functions by providing structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the auxiliary building is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the auxiliary building contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the auxiliary building provide structural support, and shelter and protection for non-safety related SSCs whose failure could prevent performance of a function described in 10 CFR 54.4(a)(1). Therefore, the auxiliary building is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the auxiliary building are relied upon for compliance with regulations for fire protection (10 CFR 50.48), SBO (10 CFR 50.63), and ATWS (10 CFR 50.62). Therefore, the auxiliary building is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details of the auxiliary building can be found in UFSAR Sections 3.2, 3.4, 3.7, and 3.8.4.

System Evaluation Boundaries

The evaluation boundary for the auxiliary building includes the foundation, internal structural members, external walls and roof. Also included are the spent fuel pool, spent fuel storage racks, battery racks, auxiliary building cranes, doors, metal siding, masonry block walls, and fiber reinforced polymer. The low pressure injection room sumps and cover plates, in addition to waste tanks stainless steel lined cover slabs, are within the evaluation boundary of the auxiliary building.

The piping penetrations, electrical penetrations, heating and ventilation penetrations, seismic gap material (cork) and fire barriers (fire seals, fire stops, fire wraps, coatings) are addressed as bulk commodities in Section 2.4.8. Cable trays and conduit, electrical panels, equipment component supports (including the fuel transfer tube support), grout, louver frames, building drains, and pipe piles are also excluded from the evaluation boundaries as these structural components are addressed as bulk commodities in Section 2.4.8.

Subsequent License Renewal Boundary Drawings

The SLR boundary drawing for the auxiliary building is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.1-1, Auxiliary Building.

The AMR results for these component types are indicated in Table 3.5.2-1, Containments, Structures, and Component Supports - Auxiliary Building - Aging Management Evaluation.

2.4.2 REACTOR BUILDING

System Description

The reactor building is a free standing structure that encloses the reactor coolant system to provide an essentially leak tight barrier against uncontrolled release of radioactivity to the environment. The reactor building is constructed of reinforced concrete and structural liner plate steel. The major elements of the reactor building are described below.

Dome and Cylinder Walls

The reinforced concrete dome and cylinder walls are prestressed by a post-tensioning system. The concrete, conventional reinforcing steel, and the post-tensioning system is utilized to account for the design loads.

The ring girder serves as the anchorage area for the upper end of the vertical tendons and for both ends of the dome tendons. Six vertical buttresses are provided along the exterior face of the cylinder to serve as the anchorage points for the hoop tendons. The hoop tendons extend for 120 degrees.

Floor

A reinforced concrete floor is provided inside containment above the embedded portion of the liner plate to protect the liner plate from punctures and corrosion that could breech the essentially leak tight barrier.

Foundation Slab

The conventionally reinforced concrete foundation slab serves as the structural foundation support for the containment. The vertical tendons extend through the foundation slab thickness and are anchored on the underside of the slab. A reinforced concrete enclosure, the lower tendon access gallery is provided at the underside of the foundation slab for access to the lower vertical tendon anchorages for tendon installation and surveillance purposes. The function of the tendon access gallery is to provide access to the bottom of the vertical tendons so that they can be tested and inspected. The lower tendon access gallery does not support the intended functions of the Containment and is not within the scope of the SLR.

The Liner Plate

The interior of the containment is lined with steel plates that are welded together. The liner plate covers the dome, the cylinder wall and also runs between the floor and the foundation slab to form an essentially leak tight barrier. The containment liner plate is attached to the concrete by means of an angle grid system stitch welded to the liner plate and embedded in the concrete. All penetrations were continuously welded to the liner plate before the concrete in which they are embedded was placed. The liner plate is coated inside containment for corrosion protection.

Personnel Hatch

Two hatches are provided into each containment for personnel access and egress. The larger personnel hatch is used as the primary access point into the containment. The smaller personnel hatch is used for emergency egress.

The personnel hatch consists of a double door, welded steel assembly. Each personnel hatch door is provided with flexible seals. The exterior door is provided with double seals to allow for local leakage testing between the seals.

Equipment Hatch

A single 19 foot diameter equipment hatch is provided for each of the containments. The equipment hatch is furnished with a double sealed flange and bolted, dished head.

Penetrations

All penetrations through the containment pressure boundary are designed to maintain the leak tight barrier to prevent uncontrolled release of radioactivity. In addition to supporting the leak tight barrier function, each penetration performs service related functions depending on the particular type of penetration. Penetrations may also serve as support points for systems such as piping passing through the containment boundary.

Penetrations include mechanical penetrations, electrical penetrations, and fuel transfer tube penetrations. These three types of penetrations are discussed in more detail in the following sections.

Mechanical Penetrations

Mechanical penetrations provide the means for passage of process piping transmitting liquids or gases across the containment boundary. The penetrations are solidly anchored to the containment wall or foundation slab precluding any requirements for expansion bellows.

Mechanical penetration details are provided in UFSAR Section 3.8.1.5.4.

Spare penetrations consist of a sleeve with welded end cap closure(s) or bolted blind flange plate(s) with gaskets at both ends of the penetration sleeve.

The containment sump penetrations provide passage of the low pressure injection system and reactor building spray piping across the containment boundary. The low pressure injection system serves to remove heat from the containment in the event of an accident. During normal operation, the inside end of the sump piping is open.

Electrical Penetrations

Electrical penetrations provide the means for electrical and instrumentation conductors to cross the containment boundary while maintaining the essentially leak tight barrier.

Electrical penetrations are provided in UFSAR Section 3.8.1.5.4.

Fuel Transfer Tube

The fuel transfer tubes penetrate the containment and link the refueling canal in the containment with the fuel transfer canal in the fuel handling building. They serve as the underwater pathway for moving the fuel assemblies into and out of the containment as part of the refueling operations occurring during plant shutdown.

During normal operation, a blind flange is in place on the fuel transfer tube penetration and serves as part of the containment essentially leak tight barrier.

Unit Vent

The unit vent stack is a vertical cylinder constructed of ASTM A36 plate. The stack passes up through the auxiliary building roof and continues parallel to the reactor building buttress. Lateral support is provided by fabricated stiffened plate supports surrounding the vent stack and attached to the reactor building. Openings are provided which allow connections of reactor building purge, waste gas and auxiliary building ventilation. The function of the unit vent stack is to provide a path for release of filtered and unfiltered gaseous discharge at a height sufficient for proper diffusion.

Crane

Structural brackets provided for the reactor building polar crane runway are fabricated of A36 steel shapes and A516, Grade 70 insert plates. Structural brackets and thickened plates are welded into the ¼ inch liner plate similar to the penetration assemblies.The liner plate is thickened at large attachments such as the polar crane brackets to accommodate strength and welding requirements for the attachment and anchorage.

Reactor Building Internals

The reactor building internal structures consist of the reactor cavity, two steam generator compartments, and a refueling canal which is located between the steam generator compartments and above the reactor cavity for each reactor building.

The reactor cavity or primary shield houses the reactor vessel and serves as a biological shield wall.

The steam generator cavities, or secondary shield walls, house the steam generators, reactor coolant pumps, and associated NSSS piping. The pressurizer and quench tank are located in one cavity. Also located in the cavities are structural steel, platforms, ladders and grating for access to the various NSSS components. Six openings are provided in the lower shield walls to provide vent area. To ensure that no missile will impact on the reactor building containment liner plate, concrete shielding is provided for the liner plate area opposite the openings. The shielding extends beyond the openings so that any missile will impact on the shields. The secondary shield walls are designed so that sections can be removed to facilitate replacement of the steam generators. These removable sections are provided with post-tensioned tendon assemblies to provide structural adequacy.

The reactor coolant piping is self-supporting with respect to deadweight, seismic, and thermal loading. The reactor coolant pumps are partially supported by rod hangers with the remainder of the dead weight of the pump being supported by the piping. The pumps are supported laterally at the motor by means of hydraulic suppressors connected to the secondary shield wall. Structural steel is provided in the reactor building to allow access to the various elevations and areas inside containment for inspection and maintenance. The steel also provides support for several nuclear safety related components.

The floor surfaces of the structure consist of either reinforced concrete or galvanized steel grating. The floor beams are supported by columns or by attachments to the exterior surface of the secondary shield wall. Structural steel angle welded to the liner plate provides grating support.

System Intended Functions

Portions of the reactor building perform safety related functions by providing structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the reactor building is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the reactor building contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the reactor building provide structural support, and shelter and protection for non-safety related SSCs whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Therefore, the reactor building is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the reactor building are relied upon for compliance with regulations for fire protection (10 CFR 50.48), SBO (10 CFR 50.63), and EQ (10 CFR 50.49). Therefore, the reactor building is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the reactor building can be found in the UFSAR Sections 3.2, 3.4, 3.5, 3.6, 3.7, 3.8.1, 3.8.1.5.4, and 3.12, Figures 3-19, 3-20, 3-21, and Table 3-12.

System Evaluation Boundaries

The evaluation boundary for the reactor building includes the structural members of the containment, including the buttresses, dome, cylinder wall, floor, foundation slab, and ring girder. The reactor building also includes the liner, personnel and equipment hatches, mechanical and electrical penetrations, the unit vent stacks, lead shield support, cranes, anchorage (embedments and attachments), concrete elements (e.g. equipment pads, flood curbs, hatches, missile shields, reinforced concrete columns, slabs, wall, and sumps), doors, masonry walls, moisture barriers, steel elements (e.g. beams, plates, columns, stairs, ladders, grating, platforms, fuel transfer canal liner, and fuel transfer canal annulus seal plate), seals and gaskets, service level I coatings, tendon anchorage and tendon wires. Structural components not within the evaluation boundaries include: the fuel transfer tubes are evaluated with the spent fuel cooling system in Section 2.3.3; the emergency sump strainers are evaluated with the low pressure injection system in Section 2.3.2; and the cable tray and conduits and associated supports, equipment component supports (including sliding bearing plates), electrical and instrument panels and enclosures, instrument line support, instrument rack and frames, grout, and pipe supports are evaluated as bulk commodities in Section 2.4.8.

Subsequent License Renewal Boundary Drawings

The SLR boundary drawing for the reactor building is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.2-1, Reactor Building.

2.4.3 TURBINE BUILDING

System Description

The turbine buildings include the turbine building and the switchgear enclosures.

Turbine Buildings

The turbine building consists of a foundation and mat that is constructed of reinforced concrete. The turbine building substructure is founded on bedrock. Also, foundation dowels connect the mat foundation to the underlying bedrock. Above grade, the building consists of structural steel with metal siding.

The turbine building is bounded on the north side by the service building, on the west side by the auxiliary building. Both the south and east sides are primarily exposed to the environment. A sliding fire door exists on the north side that separates the service building from the turbine building.

The turbine building has three levels. The operating floor is constructed of a concrete pedestal for the turbine and generator. The other portions are concrete on steel framing. The mezzanine level consists of both concrete and metal grating on steel framed supports. The grade slab supports safety related equipment along with other equipment.

Switchgear Enclosures

The Unit 1 and 2 switchgear enclosure is a reinforced concrete structure. The walls contain penetrations for electrical bus, ventilation and personnel access. Ventilation for the structure and transformer CT 4 is provided by fans on the east and penetrations through the north and south walls. Ventilation penetrations are angled to provide missile protection. Interior walls provide missile protection at each personnel access door.

The switchgear enclosure is supported by battered pipe piles. The piles were filled with concrete during construction of the structure. The structure is divided into two separate rooms by a hollow concrete block firewall. Wide flange sections divide the firewall into three sections. The wide flanges and channels attached to plates embedded in the walls of the structure provide restraint for horizontal loads applied during a postulated seismic event. Seismic bracing of structural steel is provided for the transformer and the electrical bus.

A concrete door on the east end of the structure is mounted on a rail and can be slid parallel to the wall to provide access for maintenance of the CT 4 transformer. A plate embedded on the inside of the door helps provide missile protection for the doorway opening in the wall. A curb at the base of the door opening prevents oil or fire from penetrating the building during a postulated fire in the CT 4 transformer.

The Unit 3 switchgear enclosure is a reinforced concrete structure. Interior walls provide missile protection at personnel access doors. Ventilation for the structure is provided by fans on the west wall of the structure and by the door openings through the walls. The switchgear enclosure is supported by battered pipe piles filled with concrete. Angle bracing provides seismic restraint to the electrical bus.

System Intended Functions

Portions of the turbine building provide structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the turbine building is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the turbine building contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the turbine building provide structural support, and shelter and protection for non-safety related SSCs whose failure could prevent performance of a function described in 10 CFR 54.4(a)(1). Therefore, the turbine building is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the turbine building structure are relied upon for compliance with regulations for fire protection (10 CFR 50.48), SBO (10 CFR 50.63), and ATWS (10 CFR 50.62). Therefore, the reactor building is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the turbine building structure can be found in UFSAR Sections 3.2, 3.4, 3.7, and 3.8.5.

System Evaluation Boundaries

The evaluation boundary for the turbine building includes the foundation, internal structural members, external walls and roof. Also included are the turbine building cranes, doors, metal siding, and masonry block walls.

The piping penetrations, electrical penetrations, and heating and ventilation penetrations, fire barriers (fire seals, fire stops, fire wraps, coatings), cable trays and conduit, electrical panels, equipment component supports, grout, louver frames, building drains, and pipe piles are excluded from the evaluation boundaries as these structural components are addressed as bulk commodities in Section 2.4.8.

Subsequent License Renewal Boundary Drawings

The SLR boundary drawing for the turbine building is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.3-1, Turbine Building.

2.4.4 KEOWEE HYDRO STATION

System Description

The Keowee hydro station includes the breaker vault, Keowee intake structure, Keowee powerhouse, Keowee service building, Keowee penstock and power tunnels, and the Keowee spillway.

Breaker Vault

The breaker vault provides tornado wind and tornado missile protection for the electrical equipment used to route power to meet the emergency power needs of ONS. The breaker vault is located in the electrical equipment bay of the Keowee powerhouse. The breaker vault is supported by the powerhouse operating floor. The structures walls and roof are constructed of thick concrete and provide missile protection for the electrical breakers. Two openings provide access for inspection and maintenance of the breakers. Each opening is protected from missile penetration by a rolling metal door consisting of plate welded to grating.

Keowee Intake Structure

The Keowee intake structure controls flow from Lake Keowee to the Keowee hydro station turbines via the penstock and power tunnels. The Keowee intake structure is a reinforced concrete structure with eight sides. Eight piers connected to a reinforced concrete compression ring girder at the base support a concrete silo type structure at the top. The concrete silo section supports a structural steel frame which in turn provides support for gate hoisting machinery. The intake also has a trash rack that provides structural support.

Keowee Powerhouse

The Keowee powerhouse provides support and protection for equipment and components used to generate emergency electrical power for ONS. The power produced by Keowee hydro station is used to meet the emergency power needs of ONS as well as the system generation needs of Duke Energy.

The Keowee powerhouse consists of a monolithic mass concrete substructure and structural steel superstructure. The concrete substructure is supported on rock. The concrete substructure supports two vertical turbines and contains a draft tube gallery, a scroll case access gallery, and a mechanical equipment gallery.

The structural steel superstructure is supported at the operating floor level. The steel frame is covered with insulated steel exterior panels and provides protection for the generators, a 270 ton bridge crane and associated electrical and mechanical equipment. Adjacent to the erection bay is the electrical switchgear bay which provides protection for electrical switchgear and bus.

Keowee Service Building

The Keowee service building is located adjacent to the Keowee powerhouse. The main floor consists of the computer room, office and break areas. The first subfloor houses the control room and the second subfloor houses the battery room. The foundation is a thick slab on grade. The subfloor walls are thick reinforced concrete with concrete slab floors. The main floor is a steel structure with concrete block walls.

Keowee Penstock and Power Tunnels

The Keowee penstock and power tunnels convey water from the intake structure in Lake Keowee to the Keowee hydro station turbines in the Keowee powerhouse. The power tunnel is approximately 600 feet long and extends from the cylindrical concrete intake structure to two penstocks that branch from the power tunnel to each unit. The power tunnel and approximately one-half of the penstocks downstream of the power tunnel are concrete lined. The downstream part of the penstocks is steel-lined with a concrete envelope around the steel lining. An “elbow” section that provides transition between the vertical intake cylinder and the horizontal power tunnel is also steel-lined and encased in concrete. The power and penstock tunnels are in excavated rock.

Keowee Spillway

The Keowee spillway permits the controlled discharge of storm inflow from rainfall events within the Lake Keowee drainage basin. The spillway prevents overtopping of the Keowee dam, the Little River dam and dikes, and the ONS intake canal dike during periods of high rainfall on the drainage basin.

The Keowee spillway consists of a mass concrete ogee (S-shape) structure with four taintor gates constructed of plate over a structural frame supported by an anchored structural steel grid. Below the ogee section is a long tapered concrete chute section on a 10 percent grade with mass concrete side walls and concrete flip bucket. The spillway is founded on rock. Mass concrete wingwalls form an approach channel to the spillway.

System Intended Functions

Portions of the Keowee hydro station provide structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the Keowee hydro station is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the Keowee hydro station contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the Keowee hydro station provide structural support, and shelter and protection for non-safety related SSCs whose failure could prevent performance of a function described in 10 CFR 54.4(a)(1). Therefore, the Keowee hydro station is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the Keowee hydro station are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the Keowee hydro station is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the Keowee hydro station can be found in UFSAR Sections 3.2 and 3.8.5.3.2.

System Evaluation Boundaries

The evaluation boundary for the Keowee hydro station includes the foundation, internal and external structural members and roof of the Keowee powerhouse, Keowee breaker vault and Keowee service building. The evaluation boundary also includes the foundation, structural members and trash racks of the Keowee intake structure. The battery racks in the Keowee service building and cranes and hoists at the Keowee powerhouse and Keowee intake structure are within the evaluation boundary. The Keowee penstock and power tunnels along with the spillway and Keowee intake structure are water controlling structures that are considered within the evaluation boundary for the Keowee hydro station.

The Keowee hydro station also includes a transmission tower that is evaluated with electrical structures in Section 2.4.5. Cable trays and conduit, electrical panels, equipment component supports, grout, and building drains are excluded from the evaluation boundaries as these structural components are addressed as bulk commodities in Section 2.4.8.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the Keowee hydro station is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing.

Components Subject to Aging Management Review

2.4.5 ELECTRICAL RELATED STRUCTURES

System Description

The electrical related structures within the scope of SLR consist of the 100 kV structure, 230 kV relay house, and 230 kV switchyard. Each is discussed in more detail below.

100 kV Structure

The 100 kV structure is an open structural steel structure consisting of vertical columns, beams with cross bracing and one cantilevered section. The steel structure is erected on a reinforced slab on grade.

230 kV Relay House

The 230 kV relay house is a rectangular structural steel superstructure consisting of a roof system supported by columns forming a rigid frame in the direction of its least dimension and is braced with diagonal bracing in the other direction. The steel structure is erected on a slab on grade.

230 kV Switchyard Structure

The 230 kV switchyard structure includes the following: bus support bases, coupling capacitor potential device support bases, disconnect switch supports, lightning arrestor supports, wave trap support structures, power circuit breaker bases, and strain structures and bases.

The 230 kV switchyard bus support structure, wave trap support structure, lightning arrestor support structure, coupling capacitor support structures, and disconnect switch support structures make up what is termed the 230 kV switchyard low structures. These structures are all constructed of cantilevers from a concrete foundation.

Bus support bases are cylindrical concrete structures embedded in the earth. These bases support electrical buswork support steel.

Coupling capacitor potential device support bases, disconnect switch supports, lightning arrestor supports, and wave trap supports are steel support posts supported by a reinforced concrete base.

Power circuit breaker bases are reinforced concrete footings embedded in the ground.

The structural steel strain structures and bases in the 230 kV switchyard and at Keowee are an integral part of the Keowee overhead power path. The foundations are rectangular, combined footings made of reinforced concrete.

System Intended Functions

The 230 kV switchyard and 230 kV relay house provide structural and/or functional support to safety related equipment. The 230 kV relay house provides shelter/protection to safety related equipment. Therefore, portions of the electrical related structures are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the electrical related structures contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. The 230 kV switchyard and 230 kV relay house provide structural support for non-safety related SSCs whose failure could prevent a safety related SSC from accomplishing a function described in 10 CFR 54.4(a)(1). Therefore, portions of the electrical related structures are within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

The 230 kV switchyard, 230 kV relay house, and the 100 kV structure are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and SBO (10 CFR 50.63). Therefore, the electrical related structures are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the electrical related structures can be found in UFSAR Sections 3.2, 3.8.5, and 8.2.

System Evaluation Boundaries

The evaluation boundaries for the electrical related structures include the steel elements, concrete element, and miscellaneous structural elements, except as noted below, that: support or shelter the portions of the 230 kV switchyard electrical distribution systems that are either part of the Keowee overhead emergency power or the SBO offsite power recovery paths. The evaluation boundary starts at the Keowee 230 kV transmission tower and includes the intervening transmission towers that support the overhead transmission lines to the 230 kV switchyard structure, the 230 kV relay house, the structural components that provide support to in scope electrical equipment within the 230 kV switchyard structure, and the shield wire pull off structures located on the turbine building roof that support the transmission lines from the 230 kV switchyard to the ONS powerhouse; and support in-scope electrical and mechanical equipment in the 100 kV structure, including oil circuit breaker OCB-101, disconnect switches, transformer CT5, and the pot head support structure, and the transformer deluge system.

Manhole and trenches located in the vicinity of the 230 kV switchyard structure and 100 kV structure are excluded from the evaluation boundaries; these structures are addressed as yard structures in Section 2.4.7. Cable trays and conduit, electrical panels, equipment component supports, grout, louver frames, and pipe piles are also excluded from the evaluation boundaries as these structural components are addressed as bulk commodities in Section 2.4.8.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the electrical related structures is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing.

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.5-1, Electrical Related Structures.

2.4.6 EARTHEN EMBANKMENTS

System Description

The earthen embankments include the intake canal dike, Keowee River dam, the Little River dam and dikes A, B, C and D.

Intake Canal Dike

The intake canal dike is a homogeneous embankment constructed of rolled earthfill and is designed to have an adequate factor of safety under the same conditions of seismic loadings as used for the design of ONS.

The dike has zoned filter drainage blankets under the downstream slope to collect and control seepage. The upstream face is riprapped with dumped riprap and quarry run stone. The riprap layer is a minimum of two feet thick and a twelve inch layer of graded gravel is provided under the riprap for the filter. The riprap is provided on the upstream slope to accommodate all reservoir water levels. Ground cover is provided to minimize erosion.

Keowee River Dam

The Keowee River dam is a homogenous embankment constructed of rolled earthfill and the design was reviewed by an independent board of consultants and approved by the Federal Power Commission (now the Federal Energy Regulatory Commission) in accordance with the license issued by that agency. The foundation exploration, foundation and abundant treatment, slope stability and seismic analysis of the Keowee River dam are described in the UFSAR Section 2.5.6.

Seepage monitoring weirs and pipes, observation wells and piezometers are installed in the embankment to monitor the performance of the dam. A three layered graded filter is provided under the downstream third of the dam to intercept safely any seepage through the embankment and foundation. Slope protection from wind-generated waves is provided on the upstream slope of the dam. Stone riprap is provided to accommodate all reservoir levels, including maximum drawdown and maximum flood. Ground cover is provided to minimize erosion.

Little River Dam and Dikes A, B, C, and D

The Little River dam and dikes A, B, C, and D are homogeneous embankments, constructed of rolled earthfill, that impound the Little River watershed of the Keowee Reservoir. The design of the dam and dikes was reviewed by an independent board of consultants and approved by the Federal Power Commission (FERC) in accordance with the license issued by that agency. The foundation exploration, foundation and abutment treatment, slope stability and seismic analysis are described in the UFSAR Section 2.5.6.

Seepage monitoring weirs and pipes, observation wells and piezometers are installed in the embankments to monitor performance. The dam and dikes A and D have zoned filter drainage blankets under the downstream slope to collect and control seepage. Slope protection from wind-generated waves is provided on the upstream slope for the Little River dam and dikes. Stone riprap is provided to accommodate all reservoir water levels including maximum drawdown and maximum flood. Ground cover is provided to minimize erosion.

System Intended Functions

Portions of the earthen embankments provide functional support to impound Lake Keowee which provides a source of water for generation of emergency electrical power required to mitigate the consequences of design basis events. Therefore, the earthen embankments are within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(1).

UFSAR References

Additional details for the earthen embankments can be found in UFSAR Sections 3.2 and 3.8.5.

System Evaluation Boundaries

The evaluation boundary for the earthen embankments includes the intake canal dike, Keowee River dam, Little River dam and dikes, and dikes A, B, C, and D.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the earthen embankments is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing.

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.6-1, Earthen Embankments.

Table 2.4.6-1 Earthen Embankments

Structural Component	Intended Functions
Earthen Water Control Structures	Structural Support

The AMR results for these component types are indicated in Table 3.5.2-6, Containments, Structures, and Component Supports - Earthen Embankments - Aging Management Evaluation.

2.4.7 YARD STRUCTURES

2.4.7.1 Borated Water Storage Tank Superstructure

System Description

The borated water storage tank superstructure is a steel barrier enclosure of the bottom of the borated water storage tank that provides protection for piping, valves, nozzles, and instrumentation against the effects of tornado missiles and wind loads. The borated water storage tank superstructure consists of a structural steel enclosure (i.e., beams, columns, and steel plate siding and roof) on top of a new concrete foundation surrounding the original borated water storage tank base slab.

System Intended Functions

Portions of the borated water storage tank superstructure perform safety related functions by providing structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the borated water storage tank superstructure is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the borated water storage tank superstructure contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. The borated water storage tank superstructure provides structural support, and shelter and protection for non-safety related SSCs whose failure could prevent performance of a function described in 10 CFR 54.4(a)(1). Therefore, the borated water storage tank superstructure is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the borated water storage tank superstructure are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the borated water storage tank superstructure is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the borated water storage tank superstructure can be found in UFSAR Sections 3.2 and 3.2.1.1.1.

System Evaluation Boundaries

The evaluation boundary for the borated water storage tank superstructure includes the steel barrier tank enclosure, as well as the reinforced concrete foundations installed around existing borated water storage tank concrete base slabs. It includes the steel swing gate doors installed on the tank enclosure, but not the existing doors in the adjacent auxiliary building wall. The superstructure's outer sheet metal skin and underlying insulation serve no intended function and are not within the evaluation boundary. Likewise, the evaluation boundary does not include supports for lighting, receptacles, or other electrical appurtenances installed to support occupancy in the tank enclosure. It does not include the borated water storage tank foundation, which is addressed in bulk commodities in Section 2.4.8.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the borated water storage tank superstructure is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-1, Borated Water Storage Tank Superstructure.

2.4.7.2 Essential Siphon Vacuum Building

System Description

The essential siphon vacuum building houses the essential siphon vacuum pumps, tanks, local control panel, control panel for essential siphon vacuum pump alternate power feed, siphon seal water filters, motor control center ESV, 150 kVA, 75 kVA and 6 kVA transformers, 120/240 and 208 VAC power panel boards and most of the essential siphon vacuum instrumentation. The building is a pre-engineered metal building of a single story, single span, rigid frame design, supported on a reinforced concrete foundation. The roof is a zinc coated steel standing seam panel system. The panels are attached to the roof purlins using concealed clips.

System Intended Functions

Portions of the essential siphon vacuum building perform safety related functions by providing structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the essential siphon vacuum building is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the essential siphon vacuum building contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. The essential siphon vacuum building structure provides structural support, and shelter and protection for non-safety related SSCs whose failure could prevent performance of a function described in 10 CFR 54.4(a)(1). Therefore, the essential siphon vacuum building is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the essential siphon vacuum building are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the essential siphon vacuum building is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the essential siphon vacuum building can be found in UFSAR Sections 3.2, 3.8.5, and 9.2.2.2.5.

System Evaluation Boundaries

The evaluation boundary for the essential siphon vacuum building includes the concrete foundation, internal structural members, and external metal walls and roof. Equipment pads/ supports, piping supports, instrument supports, cable tray and conduit supports, and electrical enclosures are addressed as bulk commodities in Section 2.4.8.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the essential siphon vacuum building is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-2, Essential Siphon Vacuum Building.

Table 2.4.7-2 Essential Siphon Vacuum Building

Structural Component	Intended Function
Anchors	Structural Support
Bolting (structural)	Structural Support
Concrete Elements Concrete Elements (accessible) Concrete Elements (inaccessible)	Shelter, Protection Structural Support
Doors	Shelter, Protection Structural Support
Steel Elements	Shelter, Protection Structural Support
Metal Siding	Shelter, Protection Structural Support

The AMR results for these component types are indicated in Table 3.5.2-8, Containments, Structures, and Component Supports - Essential Siphon Vacuum Building - Aging Management Evaluation.

2.4.7.3 Intake Structure

System Description

The intake structure is a reinforced concrete structure located at the north end of the intake canal. The structure houses the pumps, supports the pump motors and the beginning sections of the condenser circulating water pipe. All steel surfaces not in contact with the concrete and subject to immersion are coated with metal primer. At the back of the structure is a utility trench rigidly attached to the intake structure and constructed of reinforced concrete.

System Intended Functions

Portions of the intake structure perform safety related functions by providing structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the intake structure is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the intake structure contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. The intake structure provides structural support, and shelter and protection for non-safety related SSCs whose failure could prevent performance of a function described in 10 CFR 54.4(a)(1). Therefore, the intake structure is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the intake structure are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the intake structure is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the intake structure can be found in UFSAR Sections 3.2 and 3.2.1.1.2.

System Evaluation Boundaries

The evaluation boundary for the intake structure includes the reinforced concrete structure and associated structural steel and equipment supports. It also includes the reinforced concrete utility trench rigidly attached to the intake structure. Equipment pads/supports, piping supports, instrument supports, sheet piles, cable tray and conduit supports, and electrical enclosures are addressed as bulk commodities in Section 2.4.8.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the intake structure is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-3, Intake Structure.

Table 2.4.7-3 Intake Structure

Structural Component	Intended Function
Anchors	Structural Support
Bolting (structural)	Structural Support
Concrete Elements: Concrete Elements (accessible) Concrete Elements (inaccessible)	Shelter, Protection Structural Support
Steel Elements	Shelter, Protection Structural Support

The AMR results for these component types are indicated in Table 3.5.2-9, Containments, Structures, and Component Supports - Intake Structure - Aging Management Evaluation.

2.4.7.4 Protected Service Water Building

System Description

The protected service water building houses the major electrical equipment for the protected service water system. The protected service water building is constructed of reinforced concrete structure founded on structural fill. The building consists of a transformer room, a mezzanine, a cable spreading room, and two battery rooms.

System Intended Functions

Portions of the protected service water building perform safety related functions by providing structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the protected service water building structure is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the protected service water building contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. The protected service water building provides structural support, and shelter and protection for non-safety related SSCs whose failure could prevent performance of a function described in 10 CFR 54.4(a)(1). Therefore, the protected service water building is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the protected service water building are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the protected service water building is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the protected service water building can be found in UFSAR Sections 3.2, 9.7, and 9.7.3.5.

System Evaluation Boundaries

The evaluation boundary for the protected service water building structure includes the foundation, internal structural members, external walls and roof. The following items are addressed as bulk commodities in Section 2.4.8: equipment pads/supports, piping supports, instrument supports, cable tray and conduit supports, electrical enclosures, piping penetrations, electrical penetrations, heating and ventilation penetrations, and fire barriers (fire seals, fire stops, fire wraps, coatings).

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the protected service water building is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-4, Protected Service Water Building.

Table 2.4.7-4 Protected Service Water Building

Structural Component	Intended Function
Anchors	Structural Support
Battery Racks	Structural Support
Bolting (structural)	Structural Support

Roof membrane	Shelter, Protection
Steel Elements	Flood Barrier Missile Barrier Shelter, Protection Structural Support

The AMR results for these component types are indicated in Table 3.5.2-10, Containments, Structures, and Component Supports - Protected Service Water Building - Aging Management Evaluation.

2.4.7.5 Protected Service Water Conduit Duct Banks

System Description

The protected service water conduit duct banks were constructed with the protected service water building and provide paths for electrical conductors as follows: conduit duct banks and manholes connecting the Keowee underground to the protected service water building; conduit duct banks connecting the protected service water building with the Unit 3 auxiliary building; and conduit duct banks connecting manhole 7 to the standby shutdown facility cable trench and the standby shutdown facility trench to the standby shutdown facility.

System Intended Functions

Portions of the protected service water conduit duct banks perform safety related functions by providing structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the protected service water conduit duct banks are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the protected service water conduit duct banks are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the protected service water conduit duct banks are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the protected service water conduit duct banks can be found in UFSAR Sections 3.2, 9.7, and 9.7.3.5.

System Evaluation Boundaries

The evaluation boundary for the protected service water conduit duct banks includes the three conduit duct banks providing a path for electrical conductors from the protected service water building. It includes the reinforced concrete duct banks, the covers, and associated steel structural members. It does not include the technical support building cable vault, which is addressed in Section 2.4.7.9. It does not include the elevated raceway which is addressed as a bulk commodity, nor Manhole 7, which is addressed as manholes in Section 2.4.7.12. Likewise, the following items are addressed as bulk commodities in Section 2.4.8: equipment pads/ supports, piping supports, instrument supports, cable tray and conduit supports, electrical enclosures, piping penetrations, electrical penetrations, and heating and ventilation penetrations, fire barriers (fire seals, fire stops, fire wraps, coatings), seals and water stops.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the protected service water conduit duct banks is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-5, Protected Service Water Conduit Duct Banks.

Table 2.4.7-5 Protected Service Water Conduit Duct Banks

Structural Component	Intended Function
Anchors	Structural Support
Bolting (structural)	Structural Support

Table 2.4.7-5 Protected Service Water Conduit Duct Banks

Structural Component	Intended Function
Steel Elements	Flood Barrier Missile Barrier Shelter, Protection Structural Support

The AMR results for these component types are indicated in Table 3.5.2-11, Containments, Structures, and Component Supports - Protected Service Water Conduit Duct Banks - Aging Management Evaluation.

2.4.7.6 Standby Shutdown Facility

System Description

The standby shutdown facility is designed as a standby system for use under extreme emergency conditions. The standby shutdown facility is provided as an alternate means to achieve and maintain shutdown conditions following postulated fire, sabotage, and flooding events, and is designed in accordance with criteria associated with these events. The standby shutdown facility structure is a reinforced concrete structure consisting of a diesel generator room, electrical equipment room, mechanical pump room, control room, central alarm station, and ventilation equipment room.

The standby shutdown facility structure is designed in accordance with ACI 318-71 for concrete. The structure utilizes ASTM A615-72, Grades 40 and 60 for concrete reinforcement and A36 for structural steel and plates. The standby shutdown facility foundation walls are waterproofed through the use of waterseals in the exterior construction joints to an elevation above the yard grade to prevent inflow of yard surface waters.

System Intended Functions

Portions of the standby shutdown facility perform safety related functions by providing structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the standby shutdown facility is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the standby shutdown facility structure contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. The standby shutdown facility structure provide structural support, and shelter and protection for non-safety related SSCs whose failure could prevent performance of a function described in 10 CFR 54.4(a)(1). Therefore, the standby shutdown facility structure is within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the standby shutdown facility structure are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and SBO (10 CFR 50.63). Therefore, the standby shutdown facility structure is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the standby shutdown facility structure can be found in UFSAR Sections 3.2, 3.2.1.1.1, 9.6, and 9.6.3.1.

System Evaluation Boundaries

The evaluation boundary for the standby shutdown facility includes the foundation, internal structural members, external walls and roof. Equipment pads/supports, piping supports, instrument supports, cable tray and conduit supports, and electrical enclosures are addressed as bulk commodities (Section 2.4.8) and are not included in the AMR for this structure. Piping penetrations, electrical penetrations, heating and ventilation penetrations, and fire barriers (fire seals, fire stops, fire wraps, coatings) are addressed as bulk commodities (Section 2.4.8).

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the standby shutdown facility is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-6, Standby Shutdown Facility.

Table 2.4.7-6 Standby Shutdown Facility

Structural Component	Intended Function
Anchors	Structural Support
Battery Racks	Structural Support
Bolting (structural)	Structural Support

The AMR results for these component types are indicated in Table 3.5.2-12, Containments, Structures, and Component Supports - Standby Shutdown Facility - Aging Management Evaluation.

2.4.7.7 Radwaste Facility

System Description

The ONS radwaste facility consists of two separate adjoining structures, separated by a 3 inch expansion joint, both supported by poured in place reinforced concrete mats. One structure is primarily of reinforced concrete construction with structural walls serving also as shielding for radioactive components or materials. The other structure is primarily of braced structural steel construction with floors of reinforced concrete on metal deck and conventionally formed reinforced concrete columns and floors supporting large tanks. Exterior walls are insulated metal siding on steel girts. Interior walls are gypsum wallboard on metal studs and concrete masonry.

System Intended Functions

Portions of the radwaste facility are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the radwaste facility is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the radwaste facility can be found in UFSAR Sections 3.2, 3.8.5, 11.6, and 11.6.2.1.

System Evaluation Boundaries

The evaluation boundary for the radwaste facility includes the foundation, internal structural members, external walls and roof. Equipment pads/supports, piping supports, instrument supports, cable tray and conduit supports, and electrical enclosures are addressed as bulk commodities (Section 2.4.8), and are not included in the AMR for this structure. Piping penetrations, electrical penetrations, heating and ventilation penetrations, fire barriers (fire seals, fire stops, fire wraps, coatings), and structural expansion joints are addressed as bulk commodities (Section 2.4.8).

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the radwaste facility is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-7, Radwaste Facility.

The AMR results for these component types are indicated in Table 3.5.2-13, Containments, Structures, and Component Supports - Radwaste Facility - Aging Management Evaluation.

2.4.7.8 Trenches

System Description

Trenches are provided throughout the ONS yard to allow underground routing of cables and piping. Trenches which are within the scope of SLR are the standby shutdown facility cable trench, emergency power path cable trench, the intake structure cable trench, the essential siphon vacuum system intake dike trench, the essential siphon vacuum system cable trench, the 115 kV switchyard cable trench, and the borated water storage tank pipe trench. The intended function of external concrete trenches are to provide shelter/protection for safety related equipment.

The standby shutdown facility cable trench, which carries electrical cables from the standby shutdown facility to each unit's auxiliary building, is a reinforced concrete structure. These cables are QA Condition 1 and require the seismic design and analysis of the cable trench so that the trench will safely survive the effects of earthquakes, missile loads, and truck loads. The cable trench is provided with missile proof vents so that the trench covers are not lifted by the 3 psi pressure differential. Vents are designed to protect the trench from flooding. Reinforced concrete covers are provided over the trench.

The cable trench for the emergency power path is laid out on a grid pattern which covers the entire 230 kV switchyard. It is a precast, reinforced concrete structure. The trench is drained by concrete drain tiles which run beneath it parallel to its centerline and it is covered by reinforced concrete panels. The trench is bedded in clean washed stone.

The cable trench to the intake structure is constructed of reinforced concrete. The cable trench supplying power to the condenser circulating water pump motors is qualified to withstand the maximum hypothetical earthquake seismic event.

The essential siphon vacuum system intake dike trench is constructed of reinforced concrete (bottom and walls). The covers for the trench are steel plate except at the roadway crossing. The covers at the roadway are removable reinforced concrete slabs. The essential siphon vacuum system intake dike trench routes the essential siphon vacuum piping, the siphon seal water piping, electrical heat trace cables, and electrical instrumentation cables.

The essential siphon vacuum system intake cable trench is constructed of reinforced concrete (bottom and walls). The covers for the trench are steel plate except at the traffic crossing. The covers at the crossing are removable reinforced concrete slabs. The essential siphon vacuum system cable trench routes the cables associated with the essential siphon vacuum system and siphon seal water system from the radwaste trench to the essential siphon vacuum building.

The 115 kV switchyard cable trench routes the cables from CT5 underneath the HP Office building into the auxiliary building. The cable trench is constructed of reinforced concrete and is qualified to withstand a maximum hypothetical earthquake seismic event.

The borated water storage tank pipe trench is a reinforced concrete structure. The borated water storage tank pipe trench is located between the auxiliary building and the borated water storage tank foundation. The auxiliary building foundation forms the east side trench wall.

System Intended Functions

Portions of the trenches perform safety related functions by providing structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the trenches are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the trenches contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. The trenches provide structural support, and shelter and protection for non-safety related SSCs whose failure could prevent performance of a function described in 10 CFR 54.4(a)(1). Therefore, the trenches are within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the trenches structure are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and SBO (10 CFR 50.63). Therefore, the trenches are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the trenches can be found in UFSAR Sections 3.2 and 3.8.5.

System Evaluation Boundaries

The evaluation boundary for the trenches includes all the reinforced concrete trenches, structural steel, trench covers, and cover vents. It does not include piping supports, instrument supports, or cable tray and conduit supports which are addressed as bulk commodities (Section 2.4.8).

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the trenches is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-8, Trenches.

Table 2.4.7-8 Trenches

Structural Component	Intended Function
Anchors	Structural Support
Bolting (structural)	Structural Support
Concrete Elements: Concrete Elements (accessible) Concrete Elements (inaccessible)	Flood Barrier Missile Barrier Shelter, Protection Structural Support
Steel Elements	Flood Barrier Missile Barrier Shelter, Protection Structural Support

The AMR results for these component types are indicated in Table 3.5.2-14, Containments, Structures, and Component Supports - Trenches - Aging Management Evaluation.

2.4.7.9 Technical Support Building

System Description

The technical support building contains the technical support cable vault. The technical support building cable vault is constructed of reinforced concrete. The technical support building cable vault along with other duct banks and manhole 7 connect the protected service water building to the Unit 3 auxiliary building. No other portion of the technical support building performs an intended function.

System Intended Functions

Portions of the technical support building perform safety related functions by providing structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the technical support building structure is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the technical support building are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the technical support building is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the technical support building can be found in UFSAR Sections 3.2, 3.8.5, 9.7, and 9.7.3.5.

System Evaluation Boundaries

The evaluation boundary for the technical support building is limited to the technical support building cable vault. It includes the reinforced concrete vault, internal structural members, and cable/conduit supports.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the technical support building is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-9, Technical Support Building.

Table 2.4.7-9 Technical Support Building Structure

Structural Component	Intended Function
Anchors	Structural Support
Bolting (structural)	Structural Support

Table 2.4.7-9 Technical Support Building Structure

The AMR results for these component types are indicated in Table 3.5.2-15, Containments, Structures, and Component Supports - Technical Support Building - Aging Management Evaluation.

2.4.7.10 Elevated Water Storage Tank Structure

System Description

The elevated water storage tank ensures an inventory of water for the high pressure service water system. The elevated water storage tank is a 100,000 gallon spherical atmospheric tank. The tank is designed to American Water Works Association Standard D-100, *Welded Steel Tanks for Water Storage*. The tank is supported on a cylindrical shaft and conical bell that is approximately 145 feet high. The cylindrical shaft and conical bell are ASTM A-283 Grade C plate material and A36 for structural steel. The bell is attached to the foundation by anchors which pass through an anchor chair and plate. Both the interior and exterior of the tank are coated to protect the steel from corrosion and loss of material. Materials, mixing, and placing of the concrete for the foundation were in accordance with the latest revision of ACI 318 at the time of construction.

System Intended Functions

Portions of the elevated water storage tank structure are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the elevated water storage tank structure is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the elevated water storage tank structure can be found in UFSAR Sections 3.2 and 3.8.5.

System Evaluation Boundaries

The evaluation boundaries of the elevated water storage tank include the cylindrical support shaft, anchor chair and plate assemblies. The pressure boundary portion of the elevated water storage tank is addressed as a mechanical item in Section 2.3.3.4.1, High Pressure Service Water. The tank foundation is addressed as a bulk commodity in Section 2.4.8.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the elevated water storage tank structure is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-10, Elevated Water Storage Tank Structure.

Table 2.4.7-10 Elevated Water Storage Tank Structure

Structural Component	Intended Function
Bolting (structural)	Structural Support
Steel Elements	Structural Support

The AMR results for these component types are indicated in Table 3.5.2-16, Containments, Structures, and Component Supports - Elevated Water Storage Tank Structure - Aging Management Evaluation.

2.4.7.11 Microwave House Structure

System Description

The Oconee microwave house structure is a small (16' X 10') building located approximately 100 yards northwest of the elevated water storage tank, at the base of the microwave tower superstructure and situated inside the microwave tower footings. The microwave house structure consists of aluminum sheet metal walls over a tube steel frame, supported by a concrete foundation. The roof has steel deck, covered with built up roofing. A single steel door provides access to the building.

System Intended Functions

Portions of the microwave house structure are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the microwave house structure is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the microwave house structure can be found in UFSAR Sections 2.3.3, 3.2, and 3.8.5.

System Evaluation Boundaries

The evaluation boundary for the microwave house structure includes the foundation, external walls, and roof. There are no internal walls in the building. The evaluation boundary does not include the microwave tower, tower footings, tower bolting, etc. Building insulation and heating ventilation and air conditioning are considered to perform no intended function. Equipment pads/ supports, piping supports, instrument supports, cable tray and conduit supports, and electrical enclosures are addressed as bulk commodities in Section 2.4.8.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the microwave house structure is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-11, Microwave House Structure.

Table 2.4.7-11 Microwave House Structure

Steel Elements	Shelter, Protection Structural Support

The AMR results for these component types are indicated in Table 3.5.2-17, Containments, Structures, and Component Supports - Microwave House Structure - Aging Management Evaluation.

2.4.7.12 Manholes

System Description

The yard contains manholes that perform an intended function and are in the scope of SLR. Manhole 7 is a new manhole, installed by the protected service water project, on the electrical path from the protected service water building to the Unit 3 auxiliary building. Manhole CMH-S1 is situated at the 100 kV switchyard before the cables from CT-5 go into the trench towards the auxiliary building. Manholes MCH-C3, CMH-C4, CMH-C5 and CMH-C6 are on the electrical path from the administration building to the microwave house. The cable routed through these manholes powers the air compressor for the elevated water storage tank level transmitter.

System Intended Functions

Portions of the manholes perform safety related functions by providing structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the manholes are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the manholes are relied upon for compliance with regulations for fire protection (10 CFR 50.48) and SBO (10 CFR 50.63). Therefore, the microwave house structure is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for manholes can be found in UFSAR Sections 3.2, 3.8.5, 9.7, and 9.7.3.5.

System Evaluation Boundaries

The evaluation boundary for the manholes is limited to Manhole 7, CMH-S1, CMH-C3, CMH-C4, CMH-C5 and CMH-C6. It includes the concrete manhole structure, internal structural members, and cable / conduit supports. It includes the concrete manhole structure, internal structural members, and cable/conduit supports. It does not include connected trenches / duct banks, which are addressed as separate yard structures (Section 2.4.7).

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for manholes is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-12, Manholes.

Table 2.4.7-12 Manholes

Structural Component	Intended Function
Anchors	Structural Support
Bolting (structural)	Structural Support
Concrete Elements: Concrete Elements (accessible) Concrete Elements (inaccessible)	Flood Barrier Missile Barrier Shelter, Protection Structural Support
Steel Elements	Flood Barrier Missile Barrier Shelter, Protection Structural Support

The AMR results for these component types are indicated in Table 3.5.2-18, Containments, Structures, and Component Supports - Manholes - Aging Management Evaluation.

2.4.7.13 Condenser Circulating Water Discharge Pipe

System Description

The condenser circulating water discharge pipe conveys water from the condenser to the discharge structure. The condenser circulating water pipes are fabricated from A283, Grade C steel, with A36 steel ring stiffeners located periodically along the length of pipe. The condenser circulating water discharge pipe does not perform a mechanical intended function and is evaluated as a structure.

System Intended Functions

Portions of the condenser circulating water discharge pipe contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the condenser circulating water discharge pipe provide structural support, and shelter and protection for non-safety related SSCs whose failure could prevent performance of function described in 10 CFR 54.4(a)(1). Therefore, the condenser circulating water discharge pipe is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(2).

UFSAR References

Additional details for the condenser circulating water discharge pipe can be found in UFSAR Sections 3.2.1.1.2 and 3.8.5.1.

System Evaluation Boundaries

The evaluation boundary for the condenser circulating water discharge pipe starts where the portion of piping is embedded in the turbine building basemat and includes the downstream run to the discharge structure.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the condenser circulating water discharge pipe is listed below:

- None

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-13, Condenser Circulating Water Discharge Pipe.

Table 2.4.7-13 Condenser Circulating Water Discharge Pipe

Structural Component	Intended Function
Piping Tunnel	Direct Flow Structural Support

The AMR results for these component types are indicated in Table 3.5.2-19, Containments, Structures, and Component Supports - Condenser Circulating Water Discharge Pipe - Aging Management Evaluation.

2.4.7.14 Health Physics Office Building

System Description

The health physics office building is a multi-story structure located adjacent to the Unit 3 auxiliary building with a cable trench, which contains 10 CFR 54.4(a)(1) cables, running beneath it. The health physics office building consists of a steel structure supported by reinforced concrete footers. The roof has steel deck, covered with built up roofing. The health physics office building is designed for the maximum hypothetical earthquake.

System Intended Functions

Portions of the health physics office building contains non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. Portions of the health physics office building provide structural support, and shelter and protection for non-safety related SSCs whose failure could prevent performance of function described in 10 CFR 54.4(a)(1). Therefore, the health physics office building is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(2).

UFSAR References

Additional details for the health physics office building can be found in UFSAR Sections 3.2 and 3.8.5.

System Evaluation Boundaries

The evaluation boundary for the health physics office building includes the footers, internal structural members, metal siding, and roof.

The penetrations, cable trays and conduit, electrical panels, equipment component supports, grout and building drains are addressed as bulk commodities (Section 2.4.8).

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the condenser circulating water discharge pipe is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-14, Health Physics Office Building.

Table 2.4.7-14 Health Physics Office Building

Structural Component	Intended Function
Anchor	Structural Support
Bolting (Structural)	Structural Support
Concrete Elements: Concrete Elements (accessible) Concrete Elements (inaccessible)	Structural Support
Doors	Structural Support
Metal Siding	Shelter, Protection
Roof Membrane	Shelter, Protection
Steel Elements	Shelter, Protection Structural Support

The AMR results for these component types are indicated in Table 3.5.2-20, Containments, Structures, and Component Supports - Health Physics Office Building - Aging Management Evaluation.

2.4.7.15 Administration Building

System Description

The administration building is located on the north side of the site adjacent to the security building. The administration building supports the electrical panel that provides electrical power to the air compressor for the elevated water storage tank level transmitter located in the microwave house, which serves a fire protection intended function. The administration building provides structural support for the electrical panel located on a masonry block wall, supported by a concrete foundation.

System Intended Functions

Portions of the administration building are relied upon for compliance with regulations for fire protection (10 CFR 50.48). Therefore, the administration building is within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for the administration building can be found in UFSAR Sections 3.2 and 3.8.5.

System Evaluation Boundaries

The evaluation boundary for the administration building includes the foundation and the masonry block wall.

The cable trays, electrical panels, equipment component supports and grout are addressed as bulk commodities (Section 2.4.8). Additionally, the conduit that runs from the panel in the Administration Building to the air compressor for the elevated water storage tank level transmitter runs underground and is direct buried or encased in concrete in different locations. The conduit also enters four manholes along the route. This buried conduit is addressed in bulk commodities (Section 2.4.8). The manholes are addressed in Section 2.4.7.12.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the administration building is listed below:

- SLR-C-001, Oconee Nuclear Station Structural Boundary Drawing

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.7-15, Administration Building.

Table 2.4.7-15 Administration Building

Structural Component	Intended Function
Concrete Elements: Concrete Elements (accessible) Concrete Elements (inaccessible)	Structural Support
Masonry Wall	Structural Support

The AMR results for these component types are indicated in Table 3.5.2-21, Containments, Structures, and Component Supports - Administration Building - Aging Management Evaluation.

2.4.8 BULK COMMODITIES

2.4.8.1 Component Supports

System Description

Component supports for mechanical and electrical components are an integral part of all plant systems. These supports are not uniquely identified; however, component supports exhibit similar characteristics such as design, materials of construction, environments, and aging. Therefore, component supports for mechanical and electrical components are evaluated as plant structural commodities.

The commodity evaluation applies to supports for mechanical and electrical components within the structures that are in scope for SLR.

- Pipe supports, includes ASME piping and non-ASME piping. The fuel transfer tube is classified as ASME piping, and as such its support is evaluated with ASME piping.
- Cable trays, conduit, tubetracks, instrument tubing, and associated supports
- Instrument Line Supports
- Supports for panels, cabinets and enclosures for control boards, electrical equipment and instrumentation
- Miscellaneous equipment supports

Also included in the scope of component supports are the supports for the Class 1 piping and reactor coolant system components, as stated below.

Hot and Cold Leg Piping (NPS > 14 inches)

The primary hot and cold legs are 36 inch and 28 inch, respectively, clad carbon steel pipes that are supported by the reactor vessel and steam generator. Each reactor coolant pump is supported by the cold leg piping and the weight of each reactor coolant pump motor is supported by constant load supports.

Loss of coolant accident restraints surround each hot leg: one at the 90-degree elbow that directs coolant flow to the vertical riser section, and two that envelop the vertical riser. Each cold leg contains a loss of coolant accident restraint located at the reactor coolant pump inlet. All loss of coolant accident restraints are shimmed such that a gap exists between the restraint and the piping during all modes of operation. With the approval of leak-before-break for the hot and cold leg piping, loss of coolant accident restraints are no longer necessary to prevent pipe whip following a postulated double-ended rupture of the cold leg. However, degradation of the loss of coolant accident restraints, which could cause interference between the restraint and piping, may result in unanalyzed piping stresses. Since the loss of coolant accident restraints have not been removed, and their failure could affect the integrity of the reactor coolant system piping, the loss of coolant accident restraints will be subject to AMR. Items subject to AMR are the structural members used to construct the loss of coolant accident restraints, including the exposed portion of the connection (i.e., welded or bolted) to the building structure.

Piping NPS ≤ 14 Inches

Class 1 piping less than 14 inches NPS includes the decay heat drop line, core flood decay heat injection lines, pressurizer surge line, pressurizer spray and auxiliary spray lines, high point vent makeup lines, letdown lines, vent and drain lines, instrumentation lines, and incore monitoring system piping. Pipe supports cover the entire range of structural elements which perform the function of carrying the weight of a piping system and/or providing them with structural stability. The various types of pipe supports include:

- Rigid type supports (single acting)
- Rigid type supports (double acting)
- Constant support spring hangers
- Variable support spring hangers
- Anchors
- Guides and stops
- Restraints
- Snubbers

Although snubbers are excluded from AMR by 10 CFR 54.21(a)(1)(i) because they are active, the items that mount the snubber to the pipe and to the structure are included within the scope of SLR and require AMR.

Pipe supports are generally constructed of a standard support, a structural frame, or some combination of the two. A standard support is an assembly consisting of one or more units usually referred to as a catalogue item and generally mass produced. Pipe support frames generally are constructed of A36 structural steel or A500 Grade B tube shapes. The boundary of the pipe support extends from the attachment to the pipe back to the attachment to the supporting structure.

Pressurizer

The pressurizer supports include support plate assemblies, support frame assembly, and the pressurizer loss of coolant accident restraint. The pressurizer is supported by 8 support pads spaced symmetrically around the circumference of the vessel. Lateral support is provided by means of a structural tie to the shield wall.

Reactor Vessel Supports

Supports attached to the reactor vessel that are subject to aging management review include the control rod drive service structure and the reactor vessel support skirt. The reactor vessel is supported by a cylindrical skirt. These supports are rigidly attached to the vessels and bolted to the foundation by means of an integral base plate.

Steam Generator Skirt and Upper Lateral Support

The steam generators are supported by a conical stool. These supports are rigidly attached to the vessels and bolted to the foundation by means of an integral base plate. Lateral support is provided for the steam generator at the upper tubesheet level by means of a structural tie to the secondary shield wall.

Reactor Coolant Pump Supports – Lateral and Vertical Support Assemblies

The reactor coolant pump supports include vertical and lateral support assemblies. The reactor coolant piping is self-supporting with respect to deadweight, seismic, and thermal loading. The reactor coolant pumps are partially supported by rod hangers which are designed to support the dead weight of the pump motor, with the remainder of the dead weight of the pump being supported by the piping. To reduce seismic deflection, the pumps are supported laterally at the motor by means of hydraulic suppressors connected to the secondary shield wall.

System Intended Functions

Portions of the component supports perform safety related functions by providing structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the component supports are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the component supports contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. The component supports provide structural support, and shelter and protection for non-safety related SSCs whose failure could prevent performance of a function described in 10 CFR 54.4(a)(1). Therefore, the component supports are within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the component supports are relied upon for compliance with regulations for fire protection (10 CFR 50.48), SBO (10 CFR 50.63), and ATWS (10 CFR 50.62). Therefore, the component supports are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for component supports can be found in UFSAR Sections 3.9.3, 3.9.3.4, and 3.10.

System Evaluation Boundaries

The evaluation boundary for component supports includes structural supports for all mechanical (including the fuel transfer tube) and electrical components that are within the scope of SLR. Additionally, supports that restrain components that are not within the scope of SLR but are located in buildings that contain safety related SSCs are within the evaluation boundary. The components that comprise the supports within the evaluation boundary include anchors, bolting, spring hangers, guides, stops, sliding surfaces, structural support members (aluminum elements, stainless steel elements and steel elements) and wear plates. The evaluation boundary lies between equipment or component being supported and the building-supporting structure. Conduits, cable trays and raceways are also included within the evaluation boundary for component supports. The reactor vessel support skirt and steam generator conical stool are evaluated in Section 2.3.1.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for the component supports is listed below:

- None

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.8-1, Component Supports.

The AMR results for these component types are indicated in Table 3.5.2-22, Containments, Structures, and Component Supports - Component Supports - Aging Management Evaluation.

2.4.8.2 Miscellaneous Structural Commodities

System Description

Building and structures within the scope of SLR contain miscellaneous structural commodities that are within the scope of SLR and are subject to AMR.

The following miscellaneous structural commodities have been identified as being within the scope of SLR and subject to AMR.

- Concrete Elements (Valve Pits, Yard Foundations, and Transformer Equipment Pads)
- Drains/Curbs
- Electrical Enclosures
- Fire Barrier - Penetration Seals
- Grout/Concrete for Equipment Anchorage
- Penetration Sleeves and Seals, including Louvers
- Piles, Pipe Piles, Foundation Dowels
- Seismic Gap Filler Material and Covers
- Vibrations Isolators

The concrete elements consist of the foundations for the borated water storage tank superstructure, elevated water storage tank, microwave building, transformer pads for the Keowee main step-up transformer and ONS CT1, CT2 and CT3 transformers, the Unit 3 6.9 kV switchgear and condenser circulating water valve pits (yard foundations, valve pits, and transformer equipment pads).

Drains/curbs include buildings that have either a roof drain system or gutters and downspouts for precipitation which connect to the yard drain system or which drain to the surface. Also included are curbs that are used to direct flow.

Electrical enclosures include bus duct and switchgear enclosures (including the Unit 3 6.9 kV switchgear enclosure), electrical panels and cabinets, junction, terminal, and pull boxes. The electrical panels and cabinets contain supports for electrical components located inside the enclosure.

Fire barriers are located in safety and non-safety buildings to protect equipment within the scope of SLR from fire. Cork is installed in the seismic gap between the reactor and auxiliary buildings. Cork is considered a fire barrier in the east and west penetration room (of each unit). The cork is covered with a fire- and water-resistant caulking material. The NRC has accepted this cork as a fire barrier and has exempted it from testing and rating requirements normally required for fire barriers. Armaflex is a flexible insulation material which is installed in penetrations in the floor and ceiling of east and west penetration rooms (of each unit) for pressure boundary conditions. The NRC has accepted Armaflex as a fire barrier and has exempted it from testing and rating requirements normally required for fire barriers.

Building and equipment anchorage includes grouted bolts and wedge anchors, which are located in both safety and non-safety buildings. The grout/concrete plays a significant role and contributes to anchor capacity.

Penetration sleeves are located in openings of walls, floors, roofs, or ceilings and allow components such as piping, conduits, duct banks, and tubing to be routed through the opening. Penetration seals are materials that are used to seal the penetration. Louver framing located within the walls serve a passive structural support function and are evaluated with the penetration sleeves.

Various structures are supported by piles, foundation dowels, or pipe piles. Piles and pipe piles are used under certain structures to transfer foundation loadings to greater depths below grade. The function of the piles is to support superimposed structural loads and to transfer the structural loads to soil or rock of good bearing capacity. Foundation dowels tie building foundation to bedrock.

Seismic gaps are provided between adjacent structures to allow for relative motion between the structures. Although there are different configurations, the seismic gaps are arranged to prevent material from entering the gap space since the intrusion of foreign materials may impede the relative motion of adjacent structures. In most configurations, the seismic gaps are covered by structural angles or other elements such as elastomer seals, and the seismic gaps are filled with a compressible material.

Vibration isolators are utilized to isolate sensitive equipment from mechanical vibrations. The vibration isolators ensure that dynamic loads are not transferred to the equipment.

Structure Intended Functions

Portions of the miscellaneous structural commodities perform safety related functions by providing structural support, and shelter and protection for safety related SSCs required to mitigate the consequences of design basis events. Therefore, the miscellaneous structural commodities are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(1).

Portions of the miscellaneous structural commodities contain non-safety related components whose failure could prevent satisfactory accomplishment of a 10 CFR 54.4(a)(1) function. The component supports provide structural support, and shelter and protection for non-safety related SSCs whose failure could prevent performance of a function described in 10 CFR 54.4(a)(1). Therefore, the miscellaneous structural commodities are within the scope of SLR in accordance with the criterion of 10 CFR 54.4(a)(2).

Portions of the miscellaneous structural commodities are relied upon for compliance with regulations for fire protection (10 CFR 50.48), SBO (10 CFR 50.63), and ATWS (10 CFR 50.62). Therefore, the miscellaneous structural commodities are within the scope of SLR in accordance with the criteria of 10 CFR 54.4(a)(3).

UFSAR References

Additional details for miscellaneous structural commodities can be found in UFSAR Sections 3.2 and 11.6.3.7.

System Evaluation Boundaries

The evaluation boundary for miscellaneous structural commodities includes the concrete elements (valve pits, yard foundations, and transformer pads), drain/curbs, electrical enclosures, fire barriers, grout, penetration seals, penetration sleeves, piles, seismic gap filler material and covers, and vibration isolators in the buildings and structures that are within the scope of SLR.

Fire barrier walls, floors, doors, and ceilings are evaluated with the individual structures in which they are installed. The portions of the anchors exposed to the air environment are evaluated with the building.

Subsequent License Renewal Boundary Drawing

The SLR boundary drawing for miscellaneous structural commodities is listed below:

- None

Components Subject to Aging Management Review

The component types subject to AMR are indicated in Table 2.4.8-2, Miscellaneous Structural Commodities.

Table 2.4.8-2 Miscellaneous Structural Commodities

Structural Component	Intended Function
Concrete Elements Concrete Elements (Accessible) Concrete Elements (Inaccessible)	Structural Support
Drains/Curbs	Direct Flow
Electrical Enclosure	Structural Support Shelter, Protection

Seismic Gap Filler Material	Fire Barrier Shelter, Protection
Vibration Isolator	Structural Support

The AMR results for these component types are indicated in Table 3.5.2-23, Containments, Structures, and Component Supports - Miscellaneous Structural Commodities - Aging Management Evaluation.

2.5 SCOPING AND SCREENING RESULTS: ELECTRICAL AND INSTRUMENTATION AND CONTROLS

Section 2.1.5.1 provides the screening methodology for determining which electrical components and commodity groups within the scope of 10 CFR 54.4 meet the requirements contained in 10 CFR 54.21(a)(1). The electrical commodity groups that meet those screening requirements are identified in this section. These identified electrical commodity groups consequently require an AMR.

Components which support or interface with electrical and I&C components, for example, cable trays, conduits, instrument racks panels and enclosures, are assessed as part of the component supports commodity group in Section 2.4.8.

Identification of Electrical and Instrumentation and Control Component Commodities

The first step in the screening process for electrical and I&C components is to identify electrical component commodities within the electrical, I&C, and mechanical systems based on plant design documents as well as by interfacing with the parallel mechanical and civil screening efforts. Commodity groups are used for screening the electrical and I&C components for SLR. A component commodity group is a group of components which are categorized by type or function. For example, electrical and I&C cables are grouped together and connectors are included in this group because their function is similar. Likewise, all transmitters are grouped together because their component type is similar, despite differences in the generic function of indication (level, flow, differential pressure, etc.). The same is true for motors, switchgear, and other electrical and I&C components. ONS electrical and I&C component commodity groups are listed below.

- Alarm Units
- Analyzers
- Annunciators
- Batteries
- Cable Tie Wraps
- Conductors and Connections (including splices and terminal blocks)
  - Cable Connections (metallic parts)
  - Connector Contacts for Electrical Connections Exposed to Borated Water Leakage
  - Insulation for Electrical Cables and Connections
  - Electrical and I&C Containment Penetrations (including pigtails)
  - Fuses
  - Fuse Holders (not part of active equipment)
  - Metal Enclosed Bus (metal enclosed bus, isolated-, segregated, and non-segregated phase)
  - Switchyard Bus and Connections
  - Transmission Conductors and Connections
  - Uninsulated Ground Conductors
- Chargers
- Circuit Breakers

- Communication Equipment
- Computers
- Converters
- Electric Heaters
- Electrical Controls and Panel Internal Component Assemblies
- Elements, RTDs, Sensors, Thermocouples, Transducers
- Generators, Motors
- Heat Tracing
- High Voltage Insulators
- Indicators
- Inverters
- Isolators
- Light Bulbs
- Loop Controllers
- Meters
- Power Supplies
- Radiation Monitors
- Recorders
- Regulators
- Relays
- Signal Conditioners
- Solenoid Operators
- Solid State Devices
- Surge Arresters
- Switches
- Switchgear, Load Centers, Motor Control Centers, Distribution Panels
- Transformers
- Transmitters

Application of Screening Criterion 10 CFR 54.21(a)(1)(i) to the Electrical and I&C Component Commodities

Following identification of electrical and I&C component commodity groups, the criteria of 10 CFR 54.21(a)(1)(i) were applied to identify component commodity groups that perform their functions without moving parts or without a change in configuration or properties. The following electrical commodities were determined to meet the screening criteria of 10 CFR 54.21(a)(1)(i):

- Cable Connections (Metallic Parts)
- Connector contacts for electrical connections exposed to borated water leakage
- Insulation for Electrical Cables and Connections
- Electrical and I&C Containment Penetrations (including pigtails)
- Fuse Holders (not part of active equipment)
- Metal Enclosed Bus (isolated, segregated, and non-segregated phase)
- Switchyard Bus and Connections
- Transmission Conductors and Connections
- Uninsulated Ground Conductors
- High Voltage Insulators
- Cable Tie Wraps

Elimination of Electrical and I&C Commodity Groups Without a License Renewal Intended Functions

From the above list of "passive" electrical and I&C component commodities, uninsulated ground conductors and cable tie wraps were determined to not have a SLR intended function, and thus can be eliminated from the AMR. The basis for this determination is as follows.

Uninsulated Ground Conductors

The uninsulated ground conductors commodity group is comprised of bare metallic grounding conductors and associated connectors. Uninsulated ground conductors are connected to electrical equipment enclosures as well as metal structural features such as the cable tray system and building structural steel. Uninsulated ground conductors enhance the capability of the electrical system to withstand electrical disturbances (e.g., electrical faults, lightning surges) for equipment and personnel protection. Uninsulated ground conductors are always isolated or insulated from the electrical operating circuits. As they are not part of the electrical operating circuits, uninsulated ground conductors do not perform an intended function for SLR per 10 CFR 54.4. They are not relied upon to remain functional during or following any design basis event. Therefore, uninsulated ground conductors are not within the scope of SLR and are not subject to AMR.

Cable Tie Wraps

Tie wraps are used in cable installations as cable ties. Cable ties hold groups of cables together for restraint and ease of maintenance. Cable ties are used to bundle wires and cables together to keep the wire and cable runs neat and orderly. Cable ties are used to restrain wires and cables within raceways to facilitate cable installation. There are no current license basis requirements for ONS that cable tie wraps remain functional during and following design basis events. Cable ties are not credited for maintaining cable ampacity, ensuring maintenance of cable minimum bending radius, or maintaining cables within vertical raceways at ONS. The seismic qualification of cable trays does not credit the use of cable ties. Cable tie wraps are not credited in the ONS design basis in terms of any 10 CFR 54.4 intended function. Therefore, cable tie wraps are not within the scope of SLR and therefore, are not subject to AMR.

Application of Screening Criteria 10 CFR 54.21(a)(1)(ii) to Electrical and I&C Commodity Groups

After the "passive" screening and the non-SLR intended function eliminations, the "long-lived" screening criterion of 10 CFR 54.21(a)(1)(ii) was applied to the remaining list of electrical and I&C components commodity groups. 10 CFR 54.21(a)(1)(ii) allows the exclusion of those commodities that are subject to replacement based on a qualified life or specified time period. The electrical commodities identified for exclusion by the 10 CFR 54.21(a)(1)(ii) criterion are electrical and I&C component commodities included in the EQ of electric equipment AMP (per 10 CFR 50.49). Electrical and I&C components and commodities included in the EQ Program have defined qualified lives and are replaced prior to the expiration of their qualified lives. Therefore, no electrical and I&C components and commodities within the EQ Program are subject to an

AMR in accordance with the screening criteria of 10 CFR 54.21(a)(1)(ii). See Section 4.4 for the TLAA evaluation of the EQ of electric equipment AMP.

Electrical and I&C components that are replaced based on a period of any time length may be excluded from the AMR because they do not meet the 10 CFR 54.21(a)(1)(ii) criterion. Components with lifetimes measured in operating cycles also apply to this criterion; but this 'cycles' parameter involves active components (such as breakers, switches, etc.) that are not subject to the AMR.

Some of the electrical containment penetrations are environmentally qualified per 10 CFR 50.49. These electrical penetrations are evaluated as a TLAA and are managed by the EQ program per B3.3. For the remainder of the electrical containment penetrations, the electrical continuity of their pigtails (leads) and associated connections that could potentially be exposed to an adverse localized environment is included in the evaluation for the electrical insulation material for electrical cables and connections component group under the cables and connections commodity group in Section 2.5.1. The pressure boundary and structural support intended functions of electrical penetrations are included in the evaluation for containment in Section 2.4.2.

2.5.1 ELECTRICAL AND INSTRUMENTATION AND CONTROL COMPONENT COMMODITY GROUPS

The electrical commodities subject to AMR are identified in Table 2.5.1-1, along with the associated intended functions. These electrical commodities are further described below.

2.5.1.1 Cable and Connections

This electrical commodity group includes the following electrical and I&C component groups:

- Cable Connections (Metallic Parts)
- Connector Contacts for Electrical Connections Exposed to Borated Water Leakage
- Insulation for Cable and Connections

Many insulated cables and connections are included in the EQ program and, thus, are not subject to AMR per the screening criteria of 10 CFR 54.21(a)(1)(ii). Insulated cables and connections that are not included in the EQ program meet the criterion of 10 CFR 54.21(a)(1)(ii) and are subject to an AMR. The electrical and I&C components included within these commodity groups consist of electrical conductors and termination devices that deliver voltage, current, and/or signals from sources to application devices, and are passive in nature. The electrical cable and connection subcomponents are further described below:

<u>Cable Connections (Metallic Parts)</u>

This component commodity group is comprised of metallic portions of electrical and I&C connections that are not included in the EQ program. These include compression type terminal lugs, splices, bolted connections, terminal blocks, and threaded connectors.

Connector Contacts for Electrical Connections Exposed to Borated Water Leakage

The component commodity group includes connector contacts such as pins, sockets, or other metallic connectors that are not included in the EQ program and that are exposed to borated water leakage.

Insulation for Cable and Connections

The insulation for electrical and I&C cables and connections commodity group includes insulation material, typically extruded or taped polymers, for the following component groups that are not included in the EQ program:

- Insulation for electrical cables and connections
- Insulation for electrical cables and connections used in instrumentation circuits
- Insulation for inaccessible medium-voltage cable
- Insulation for inaccessible I&C cable
- Insulation for Inaccessible low voltage power cable

These subdivisions by applications and environments are consistent with their treatment in NUREG-2191 for AMR. The above component groups are limited to the insulation for cables and connections that are passive per 10 CFR 54.21(a)(1)(i) and thus not within or part of active equipment. Cables and connections inside the enclosure of an active device (e.g., motor leads and connections, cables and connections internal to relays, chargers, switchgear, transformers, power supplies) are maintained along with the other subcomponents inside the enclosure and are not subject to an AMR.

2.5.1.2 Fuse Holders (Not Part Of Active Equipment)

As a unique type of the terminal block commodities, a fuse holder is a passive component that makes a connection between conductors and a fuse, which itself is an active circuit-controlling device. Fuse holders are typically constructed of metallic clamps that include polymer-based electrical insulation.

Insulation

The fuse holders - not part of active equipment (insulation) component group subject to an AMR includes fuse holders that are not part of active larger equipment assemblies such as motor control centers, load centers, or switchgear and are not included in the EQ program. The insulation material for these fuse holders includes the mounting block for metallic components.

Metallic Clamps

The fuse holders - not part of active equipment (metallic clamps) component group subject to an AMR includes fuse holders that are not part of active larger equipment assemblies and are not included in the EQ program. The metallic portions of these fuse holders include spring-loaded clips and bolted lugs to connect the fuse ends.

2.5.1.3 Metal Enclosed Bus

Metal enclosed bus commodity group includes current-carrying metallic bus bars that are enclosed within a protective metallic duct or housing, either on a per-phase basis (i.e. iso-phase bus) or around all three power phases collectively with or without metal barriers between phase conductors (i.e. segregated or non-segregated phase bus, respectively). Metal enclosed bus construction also includes bus insulation and insulators from structural supports. Keowee hydro station, the ONS emergency power supply, uses all three metal enclosed bus types; and the ONS units use all types except segregated phase bus. Since some ONS metal enclosed bus sections feed power circuits within the scope of SLR and are not EQ equipment and are not part of active components such as switchgear, load centers, or motor control centers, these metal enclosed bus commodities meet the 10 CFR 54.21(a)(1)(i and ii) screening criteria and are subject to the AMR. Structural supports that hold metal enclosed bus are evaluated in Section 2.4.

2.5.1.4 Switchyard Bus and Connections

The switchyard bus and connections component commodity group includes uninsulated rigid-conductor and connection portions of the overhead ONS 230 kV switchyard and 100 kV switching-station circuits that supply power from the electric transmission system to plant buses, including power circuits that are credited for recovery of offsite power following an SBO event.

The following are included in the AMR for switchyard bus and connections:

- All switchyard bus and connections in the 230 kV switchyard
- All switchyard bus and connections in the 100 kV switching station

The switchyard bus and connections are passive and not included in the EQ program; and they provide the basic intended function of electrical continuity. They meet the screening criteria of 10 CFR 54.21(a)(1)(i and ii) and are subject to AMR.

2.5.1.5 Transmission Conductors and Connections

The transmission conductors and connectors component commodity group includes uninsulated stranded-conductor and connection portions of the overhead 230 kV switchyard and 100 kV switching-station circuits that supply power from the electric transmission system to plant buses, including power circuits that are credited for recovery of offsite power following an SBO event.

The following are included in the AMR for transmission conductors:

- Transmission conductors in the 230 kV switchyard
- Transmission conductors in the Keowee 230 kV transformer yard
- Transmission conductors in the Oconee transformer yard
- Transmission conductors in the Keowee 230 kV transmission line
- Transmission conductors in the 100 kV Fant black line
- Transmission conductors in the 100 kV switching station

The transmission conductors and connectors are passive and not included in the EQ program; and they provide the basic intended function of electrical continuity. They meet the screening criteria of 10 CFR 54.21(a)(1)(i and ii) and are subject to AMR.

2.5.1.6 High Voltage Insulators

The high voltage insulators component commodity group includes rigid station post insulators and more flexible strain and suspension insulators that support and insulate overhead transmission conductors and switchyard bus. These insulators are part of the 230 kV switchyard and 100 kV switching-station circuits that supply power from the electric transmission system to plant buses, including power circuits that are credited for recovery of offsite power following an SBO event.

The following are included in the AMR for transmission conductors:

- High voltage insulators supporting bus and conductors in the 230 kV switchyard
- High voltage insulators supporting conductors in the Keowee 230 kV transformer yard
- High voltage insulators supporting 230 kV conductors in the Oconee transformer yard
- High voltage insulators supporting the Keowee 230 kV transmission line
- High voltage insulators supporting the 100 kV Fant black line
- High voltage insulators supporting bus and conductors in the 100 kV switching station

The high voltage insulators are passive and not included in the EQ program. They provide the basic intended function of electrical insulation.

Table 2.5.1-1 Electrical and Instrumentation and Controls Commodities

Electrical and Instrumentation and Controls Commodities	Intended Functions
Cable Connections (metallic parts)	Electrical Continuity
Connector Contacts for Electrical Connections Exposed to Borated Water Leakage	Electrical Continuity
Insulation for Electrical Cable and Connections	Electrical Insulation
Insulation for Electrical Cables and Connections used in Instrumentation Circuits	Electrical Insulation
Insulation for Inaccessible Medium-Voltage Power Cables	Electrical Insulation
Insulation for Inaccessible Instrument and Control Cables	Electrical Insulation

Table 2.5.1-1 Electrical and Instrumentation and Controls Commodities

Electrical and Instrumentation and Controls Commodities	Intended Functions
Insulation for Inaccessible Low-Voltage Power Cables	Electrical Insulation
Fuse Holders - Not Part of Active Equipment (insulation)	Electrical Insulation
Fuse Holders - Not Part of Active Equipment (metallic clamps)	Electrical Continuity
Metal Enclosed Bus (insulation, insulators)	Electrical Insulation
Metal Enclosed Bus (bus and connections)	Electrical Continuity
Metal Enclosed Bus (enclosure assemblies)	Shelter, Protection
Switchyard Bus and Connections	Electrical Continuity
Transmission Conductors and Connections	Electrical Continuity
High Voltage Insulators	Electrical Insulation

The AMR results for these component types are indicated in Table 3.6.2-1, Electrical, Instrumentation and Controls Commodities - Aging Management Evaluation.

2.5.2 APPLICATION OF 10 CFR 54.4(a) SCOPING CRITERIA TO ELECTRICAL COMPONENTS

The basic philosophy used in the electrical and I&C component scoping and screening process is that all plant electrical and I&C components are included in the AMR unless they are specifically scoped out per 10 CFR 54.4 or screened-out per 10 CFR 54.21(a)(1). The 10 CFR 54.4(a) scoping criteria is applied only to specific electrical and I&C components that are scoped out. This method contrasts with the approach of applying the scoping criteria to all electrical and I&C components to determine those that are scoped in. This more efficient and flexible process of selective 10 CFR 54.4 scoping is described in NUREG-2192 under its '*Key Points for Electrical Scoping*'. The section indicates that significant efficiencies can be gained by delaying such selective 10 CFR 54.4 scoping until after the larger reduction of 10 CFR 54.21(a)(1) screening as provided above in Section 2.5.

The 10 CFR 54.4(a) scoping criteria is applied to the following selected electrical components that are scoped out:

- Electrical components associated with the 525 kV switchyard which provides three transmission lines to the Duke Energy transmission grid and a connection between switchyards through a 230/525 kV autotransformer.
- Electrical components associated with the Jocassee, Calhoun, Oconee, and Dacus 230 kV transmission lines which serve to connect ONS with the remainder of the Duke Energy 230 kV transmission system.
- Electrical components associated with the Radwaste Facility that serve to process radioactive waste before shipment offsite.
- Electrical components associated with the 44 kV Oconee retail substation.
- Electrical components associated with various plant structures without a 10 CFR 54.4(a) function (i.e., structures that are not within the scope of SLR per Table 2.2-2).

The electrical components described above are not relied upon to remain functional during or following a design basis event. The electrical components are not relied upon to support any functions identified in 10 CFR 54.4(a)(1).

The electrical components described above are not relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the regulations for fire protection (10 CFR 50.48), PTS (10 CFR 50.61), EQ (10 CFR 50.49), ATWS (10 CFR 50.62), and SBO (10 CFR 50.63). The electrical components are not relied upon to support any functions identified in 10 CFR 54.4(a)(3). Note that the radwaste building is in the scope of SLR for fire protection (10 CFR 50.48) due to fire hose stations located in the structure. These fire hose stations are manually operated components with no accompanying electrical equipment required for their operation. They are addressed in Section 2.4.7.7.

3.0 AGING MANAGEMENT REVIEW RESULTS

This chapter provides the results of the AMR for those mechanical systems, structures, and electrical and I&C components identified in Section 2.2 as being subject to AMR.

Organization of this chapter is based on Tables 3.1-1 through 3.6-1 of NUREG-2192, “Standard Review Plan for Review of Subsequent License Renewal Applications for Nuclear Power Plants”.

The major sections of this chapter are:

- Aging Management of Reactor Vessel, Reactor Internals, and Reactor Coolant System (Section 3.1)
- Aging Management of Engineered Safety Features (Section 3.2)
- Aging Management of Auxiliary Systems (Section 3.3)
- Aging Management of Steam and Power Conversion System (Section 3.4)
- Aging Management of Containments, Structures, and Component Supports (Section 3.5)
- Aging Management of Electrical and Instrumentation and Controls (Section 3.6)

Descriptions of the service environments that were used in the mechanical systems, electrical, and structural AMRs to determine aging effects requiring management are included in Table 3.0-1, Oconee Nuclear Station Service Environments. The environments used in the AMRs are listed in the environment column. The third column identifies one or more of the NUREG-2191, “Generic Aging Lessons Learned for Subsequent License Renewal (GALL-SLR) Report,” (Reference 1.7-4) environments that were used when comparing the ONS AMR results to the NUREG-2191 results. The definitions of those environments correspond to the definitions in NUREG-2191, Section IX.D. Note that Table 3.0-1 includes all electrical environments except “10 CFR 50.49 Environments”. These environments are not defined in NUREG-2191, Section XI.D.

Most of the AMR results information in Section 3 is presented in the following two tables:

Table 3.x.1 - where '3' indicates the SLRA section number, 'x' indicates the subsection number from NUREG-2191, and '1' indicates that this is the first table type in Section 3. For example, in the Reactor Vessel, Internals, and Reactor Coolant System subsection, this table would be number 3.1.1, in the Engineered Safety Features subsection, this table would be 3.2.1, and so on. For ease of discussion, this table will, hereafter, be referred to in this section as “Table 1.”

Table 3.x.2-y - where '3' indicates the SLRA section number, 'x' indicates the subsection number from NUREG-2191, and '2' indicates that this is the second table type in Section 3; and 'y' indicates the table number for a specific system. For example, for the reactor vessel, within the Reactor Vessel, Internals, and Reactor Coolant System subsection, this table would be 3.1.2-1 and for the reactor vessel internals, it would be Table 3.1.2-2. For the containment spray system, within the engineered safety features subsection, this table would be 3.2.2-1. For the next system within the engineered safety features subsection, it would be Table 3.2.2-2. For ease of discussion, this table will, hereafter, be referred to in this section as Table 2.

Table Description

NUREG-2191, “Generic Aging Lessons Learned for Subsequent License Renewal (GALL-SLR) Report,” contains the generic evaluation of existing plant programs. It documents the technical basis for determining where existing programs are adequate without modification, and where existing programs should be augmented for the second extended period of operation. The evaluation results documented in NUREG-2191 indicate that many of the existing programs are adequate to manage the aging effects for particular structures or components, within the scope of license renewal, without change. NUREG-2191 also contains recommendations on specific areas for which existing programs should be enhanced for license renewal. In order to take full advantage of NUREG-2191, a comparison between the AMR results and the tables of NUREG-2191 has been performed. The results of that comparison are provided in Table 1 and Table 2.

Table 1

The purpose of Table 1 is to provide a summary comparison of how the facility aligns with the corresponding tables of NUREG-2192. The table is essentially the same as Tables 3.1-1 through 3.6-1 provided in NUREG-2192, except that the “New, Modified, Deleted, Edited Item,” “ID” and “Type” columns have been replaced by an “Item Number” column, and the “GALL-SLR Item” column has been replaced by a “Discussion” column.

The “Item Number” column provides the reviewer with a means to cross-reference from Table 2 to Table 1.

The “Discussion” column is used to provide clarifying or amplifying information. The following are examples of information that might be contained within this column:

- “Further Evaluation Recommended” information or reference to where that information is located.
- The name of a plant specific AMP being used, if applicable.
- Exceptions to the NUREG-2191 assumptions, if applicable.
- A discussion of how the line is consistent with the corresponding line item in NUREG-2191, when that may not be intuitively obvious.
- A discussion of how the item is different than the corresponding line item in NUREG-2191 when it may appear to be consistent (e.g., when there is exception taken to an AMP that is listed in NUREG-2191), if applicable.

The format of Table 1 provides the reviewer with a means of aligning a specific Table 1 row with the corresponding NUREG-2191 table row, thereby allowing for the ease of checking consistency.

Table 2

Table 2 provides the detailed results of the AMRs for those components identified in SLRA Section 2 as being subject to AMR. There is a Table 2 for each of the systems within a Chapter 3 section grouping. For example, the engineered safety features system group contains table specific to the reactor building spray system, core flood system, high pressure injection system, and low pressure injection system. Table 2 consists of the following nine columns:

- Component Type
- Intended Function
- Material
- Environment
- Aging Effect
- Aging Management Program
- NUREG-2191 Item
- NUREG-2192 Table 1
- Notes

Component Type - The first column identifies all of the component types from Section 2 of the SLRA that are subject to AMR. They are listed in alphabetical order.

Intended Function - The second column contains the SLR intended functions for the listed component types. Definitions of intended functions are contained in Table 2.1.5-1.

Material - The third column lists the particular materials of construction for the component type.

Environment - The fourth column lists the environments to which the component types are exposed. Service environments and definitions are provided in Table 3.0-1. The definitions of those environments correspond to the definitions in NUREG-2191, Section IX.D. Note that an environment is listed with a temperature only if an aging effect is dependent on temperature. For example, the internal environment for a stainless steel component would be identified as “treated water > $60^{o}C$ ($>140^{o}F$)” when cracking due to stress corrosion cracking is identified, and as “treated water” when loss of material due to pitting and crevice corrosion is identified. Therefore, in this example, the component would be assigned two separate internal environments.

Aging Effect Requiring Management - As part of the AMR process, the aging effects that are required to be managed in order to maintain the intended function of the component type are identified for the material and environment combination. These aging effects requiring management are listed in the fifth column.

Aging Management Programs - The AMPs used to manage the aging effects requiring management are listed in the sixth column. AMPs are described in Appendix B.

NUREG-2191 Item - Each combination of component type, material, environment, aging effect requiring management, and AMP that is listed in Table 2, is compared to NUREG-2191, with consideration given to the standard notes, to identify consistency. Consistency is documented by noting the appropriate NUREG-2191 item number in the seventh column of Table 2. If there is no corresponding item number in NUREG-2191, this field in column seven is marked “None.” Thus, a reviewer can readily identify the correlation between the plant-specific tables and the NUREG-2191 tables.

Table 1 Item - Each combination of component, material, environment, aging effect requiring management, and aging management program that has an identified NUREG-2191 item number must also have a Table 3.x.1 line item reference number. The corresponding line item from Table 1 is listed in the eighth column of Table 2. If there is no corresponding item in NUREG-2191, this field in column eight is marked “None.” The Table 1 Item allows correlation of the information from the two tables.

Notes - The notes provided in each Table 2 describe how the information in the table aligns with the information in NUREG-2191. Each Table 2 contains standard industry lettered notes and, if applicable, plant-specific numbered notes.

The standard industry lettered notes (e.g., A, B, C) provide standard information regarding comparison of the AMR results with the NUREG-2191 Aging Management Table line item identified in the seventh column. In addition to the standard industry lettered notes, numbered plant-specific notes provide additional clarifying information when appropriate.

Table Usage

Table 1

The reviewer evaluates each row in Table 1 by moving from left to right across the table. Since the Component, Aging Effect, Aging Management Programs and Further Evaluation Recommended information is taken directly from NUREG-2192, no further analysis of those columns is required. The information intended to help the reviewer in this table is contained within the Discussion column. Here the reviewer will be given plant-specific information necessary to determine, in summary, how the evaluations and programs align with NUREG-2191. This may be in the form of descriptive information within the Discussion column or the reviewer may be referred to other locations within the SLRA for further information. A statement of “Consistent with NUREG-2191” means that the Table 2 items that link to that Table 1 row are consistent with the component, material, environment, aging effect, and program(s) associated with the assigned NUREG-2191 row, followed by any clarifications or exceptions that may apply.

Table 2

Table 2 contains all of the AMR information for the plant, whether or not it aligns with NUREG-2191. For a given row within the table, the reviewer is able to see the intended function, material, environment, aging effect requiring management and AMP combination for a particular component type within a system. Within each system or structure, the intended functions for each component type are consolidated for table listing. In addition, if there is a correlation between the combination in Table 2 and a combination in NUREG-2191, this will be identified by a referenced item number in column seven, NUREG-2191 Item. The reviewer can refer to the item number in NUREG-2191, if desired, to verify the correlation. If the column contains “None,” no corresponding combination in NUREG-2191 was found. As the reviewer continues across the table from left to right, within a given row, the next column is labeled NUREG-2192 Table 1 Item. If there is a reference number in this column, the reviewer is able to use that reference number to locate the corresponding row in Table 1 and see how the AMP for this particular combination aligns with NUREG-2191. Table 2 provides the reviewer with a means to navigate from the components subject to AMR in SLRA Section 2 all the way through the evaluation of the programs that will be used to manage the effects of aging of those components.

Cumulative Fatigue Damage and Time Limited Aging Analysis in Table 2

A fatigue analysis is considered to be a TLAA as defined in 10 CFR 54.3 when it is within the current licensing basis and is based upon transient cycle assumptions associated with the current operating term. This includes explicit ASME Code, Section III, Class 1 and ANSI B31.7 analyses for piping and components and implicit ASME Code, Section III, Class 2 and 3 and ANSI B31.1 analyses for piping. TLAAs are required to be evaluated in accordance with 10 CFR 54.21(c)(1). Table 1 and Table 2 include an entry in the AMP column indicating “TLAA” for each line item that has a component for which a fatigue TLAA (explicit or implicit) has been identified. See SLRA Section 4.3 for details regarding the fatigue design bases, fatigue TLAAs identified, and TLAA evaluations for the SPEO.

Table 3.0-1 Oconee Nuclear Station Service Environments

ONS AMR Environment	Definition	NUREG-2191 Environment(s) Used for AMR Comparison
Adverse localized environment Adverse localized environment caused by significant moisture	An adverse localized environment is an environment limited to the immediate vicinity of a component that is hostile to the component material, thereby leading to potential aging effects. Electrical insulation used for electrical cables can be subjected to an adverse localized environment. Adverse localized environment can be due to any of the following: (1) exposure to significant moisture, or (2) heat, radiation, or moisture and are represented by specific GALL-SLR AMR items.	Adverse localized environment
Air	Any indoor or outdoor air environment where the cited aging effects could occur regardless of the particular air environment (e.g., air-indoor uncontrolled, air-outdoor). For example: (a) hardening or loss of strength of elastomeric components occurs in many different air environments depending upon environmental parameters such as temperature, ozone, ultraviolet light, and radiation; (b) loss of preload for closure bolting can occur in a variety of air environments. This term does not encompass the air environment downstream of instrument air dryers, air-dry, or the underground environment. The potential for leakage from bolted connections (e.g., flanges, packing) impacting in-scope components exists when citing the air environment.	Air

Table 3.0-1 Oconee Nuclear Station Service Environments

ONS AMR Environment	Definition	NUREG-2191 Environment(s) Used for AMR Comparison
Air - dry	Air that has been treated to reduce its dew point well below the system operating temperature and treated to control lubricant content, particulate matter, and other corrosive contaminants. Use of this term is only associated with internal air environments located downstream of the compressed air system air dryers.	Air - dry
Air - indoor controlled	An environment where the specified internal or external surface of the component or structure is exposed to a humidity-controlled (i.e., air conditioned) environment. For electrical components and structures, the controlled environment must be sufficient to show that the electrical component(s) or structure(s) are not subjected to the cited aging effect(s) (e.g., reduced insulation resistance). The potential for leakage from bolted connections (e.g., flanges, packing) impacting in-scope components exists when citing the air–indoor controlled environment.	Air - indoor controlled
Air – indoor uncontrolled	Air–indoor uncontrolled is associated with systems with temperatures higher than the dew point (i.e., condensation can occur, but only rarely; equipment surfaces are normally dry). The potential for leakage from bolted connections (e.g., flanges, packing) impacting in-scope components exists when citing the air–indoor uncontrolled environment.	Air Air – indoor uncontrolled
Air - outdoor	The outdoor environment consists of moist air, industrial pollutants (e.g., fly ash, soot), ambient temperatures and humidity, and exposure to weather events, including precipitation and wind. The outdoor air environment also potentially includes component contamination due to animal infestation including by-products or excrement containing uric acid, ammonia, phosphates, or other compounds. The outdoor air environment can also result in submergence of components (particularly when they are in vaults) due to the potential for water to accumulate or due to external or internal buildup of condensation.	Air Air - outdoor

Table 3.0-1 Oconee Nuclear Station Service Environments

ONS AMR Environment	Definition	NUREG-2191 Environment(s) Used for AMR Comparison
Air with borated water leakage	Air and untreated borated water leakage on indoor or outdoor systems with temperatures either above or below the dew point. The water from leakage is considered to be untreated, due to the potential for water contamination at the surface (germane to PWRs).	Air with borated water leakage
Closed-cycle cooling water Closed-cycle cooling water >60 °C (>140 °F)	A subset of treated water that is subject to the closed treated water systems program. Systems are closed in that the rate of recirculation is much higher than the rate of makeup water addition. Examples include the closed portions of HVAC systems and diesel generator cooling water systems. Closed-cycle cooling water above 60 °C (140 °F) exceeds the threshold for stainless steel SCC.	Closed - cycle cooling water Closed-cycle cooling water >60 °C (>140 °F)
Concrete	This environment consists of components that sit on concrete or are embedded in concrete.	Concrete
Condensation	Condensation on the surfaces of systems at temperatures below the dew point facilitates loss of material in steel caused by general, pitting, and crevice corrosion. It also facilitates cracking in those materials susceptible to stress corrosion cracking due to the potential for internal or external surface contamination. The former term “moist air” is subsumed by the usage of the term “condensation.” Moisture in the air can result in loss of material or cracking due to hygroscopic surface contaminants. Condensation can form between thermal insulation and a component when air intrusion occurs through minor gaps in the insulation and the operating temperature of the component is below the dew point of the penetrating air.	Condensation
Diesel exhaust	This environment consists of gases, fluids, and particulates present in diesel engine exhaust. This environment is also used for the auxiliary steam boiler fuel oil combustion chambers.	Diesel exhaust

Table 3.0-1 Oconee Nuclear Station Service Environments

ONS AMR Environment	Definition	NUREG-2191 Environment(s) Used for AMR Comparison
Fuel Oil	Diesel oil, No. 2 oil, or other liquid hydrocarbons used to fuel diesel engines. Fuel oil used for combustion engines may be contaminated with water, which may promote additional aging effects.	Fuel oil
Gas	Internal gas environments include inert or nonreactive gases. This generic term is used where aging effects are not expected to degrade the ability of the structure or component to perform its intended function for the subsequent period of extended operation. The term “gas” is not meant to comprehensively include all gases in the fire suppression system. The GALL-SLR Report AMP XI.M26, “Fire Protection,” is used for the periodic inspection and testing of the halon/carbon dioxide fire suppression system.	Gas
Groundwater/soil	Groundwater is subsurface water that can be detected in wells, tunnels, or drainage galleries, or that flows naturally to the earth’s surface via seeps or springs. Soil is a mixture of organic and inorganic materials produced by the weathering of rock and clay minerals or the decomposition of vegetation. Voids containing air and moisture can occupy 30–60% of the soil volume. Concrete subjected to a groundwater/soil environment can be vulnerable to an increase in porosity and permeability, cracking, loss of material (spalling, scaling), or aggressive chemical attack. Other materials with prolonged exposures to groundwater or moist soils are subject to the same aging effects as those systems and components exposed to raw water.	Groundwater/soil

Table 3.0-1 Oconee Nuclear Station Service Environments

ONS AMR Environment	Definition	NUREG-2191 Environment(s) Used for AMR Comparison
Lubricating oil Lubricating oil (waste oil)	Lubricating oils are low-to-medium viscosity hydrocarbons that can contain contaminants and/or moisture. This usage also functionally encompasses hydraulic oil (nonwater based). These oils are used for bearing, gear, and engine lubrication. Piping and piping components, whether copper, SS, or steel, when exposed to lubricating oil with some water, will have limited susceptibility to aging degradation due to general or localized corrosion. Lubricating oil (waste oil) and lubricating oil are two different environments. Lubricating oil (waste oil) is oil that has been collected as it leaks from a component (e.g., reactor coolant pumps) and as such, contains potential contaminants such as water and dirt. Lubricating oil is unlikely to contain contaminants due to the testing of the oil and corrective actions when contaminants are detected.	Lubricating oil Lubricating oil (waste oil)
Raw water	Raw water is water that has not been demineralized or treated to any significant extent. Raw water may be rough filtered to remove large particles and may contain a biocide additive for control of micro- and macro-organisms. Lake Keowee provides the source of raw water utilized at Oconee.	Raw water
Raw water (potable) Raw water >60 °C (>140 °F) (potable)	Raw water (potable) is water which has been demineralized, filtered, or otherwise treated but is not maintained by a site chemistry control program. Raw water above 60 °C (140 °F) (potable) exceeds the threshold for stainless steel SCC.	Raw water (potable)

Table 3.0-1 Oconee Nuclear Station Service Environments

ONS AMR Environment	Definition	NUREG-2191 Environment(s) Used for AMR Comparison
Reactor coolant	Reactor coolant is treated water in the reactor coolant system and connected systems at or near full operating temperature.	Reactor coolant Reactor coolant and high fluence (>1E21 n/cm^2 E>0.1 MeV), Reactor coolant and secondary feedwater/steam, System temperature up to 340^{o}C (644^{o}F)
Reactor coolant > 250 ^{o}C (>482^{o}F)	Treated water above the thermal embrittlement threshold for cast austenitic stainless steel.	Reactor coolant > 250 ^{o}C (>482^{o}F)
Reactor coolant and neutron flux	The reactor core environment that will result in a neutron fluence exceeding 10^{17} n/cm^2 (E >1 MeV) at the end of the license renewal term.	Reactor coolant and neutron flux
Secondary feedwater	PWR feedwater at or near full operating temperature, subject to the secondary water chemistry program (GALL-SLR Report AMP XI.M2). This environment is used for steam generator components only.	Secondary feedwater Secondary feedwater/steam
Soil	Soil is a mixture of inorganic materials produced by the weathering of rock and clay minerals, and organic material produced by the decomposition of vegetation. Voids containing air and moisture occupy 30–60% of the soil volume. Properties of soil that can affect degradation kinetics include moisture content, pH, ion exchange capacity, density, and hydraulic conductivity. External environments included in the soil category consist of components at the air/soil interface, buried in the soil, or exposed to groundwater in the soil.	Buried Soil
Steam	PWR steam subject to the secondary water chemistry program (GALL-SLR Report AMP XI.M2). This environment is used for steam generator components only.	Secondary feedwater/steam Steam

Table 3.0-1 Oconee Nuclear Station Service Environments

ONS AMR Environment	Definition	NUREG-2191 Environment(s) Used for AMR Comparison
Treated borated water	Borated (PWR) water is a controlled water system. The high pressure injection system maintains the proper water chemistry in the reactor coolant system while adjusting the boron concentration during operation to match long-term reactivity changes in the core.	Treated borated water
Treated borated water >60°C (>140°F)	Treated water with boric acid in PWR systems above the 60 ^{o}C (140^{o}F) stress corrosion cracking threshold for stainless steel.	Treated borated water > 60 ^{o}C (>140^{o}F)
Treated borated water >250°C (>482°F)	Treated water with boric acid above the 250 °C (482 °F) thermal embrittlement threshold for cast austenitic stainless steel.	Treated borated water > 250 ^{o}C (>482^{o}F)
Treated water	Treated water is water whose chemistry has been altered and is maintained (as evidenced by testing) in a state which differs from naturally occurring sources so as to meet a desired set of chemical specifications. Treated water generally falls into one of two categories. 1) The first category is based on demineralized water and, with the possible exception of boric acid (for PWRs only), generally contains minimal amounts of any additions. The water is generally characterized by high purity, low conductivity, and very low oxygen content. This category of treated water is generally used as PWR primary and secondary water. 2) The second category may be but need not be based on demineralized water. It contains corrosion inhibitors and also may contain biocides or other additives. This water will generally be comparatively higher in conductivity and oxygen content than the first category of treated water. This category of treated water is generally used in HVAC systems, auxiliary boilers, and diesel engine cooling systems. Closed-cycle cooling water is a subset of this category of treated water.	Treated water

Table 3.0-1 Oconee Nuclear Station Service Environments

ONS AMR Environment	Definition	NUREG-2191 Environment(s) Used for AMR Comparison
Treated water > 60 °C (>140°F)	Treated water above the 60 °C (140°F) stress corrosion cracking threshold for stainless steel.	Treated water > 60 °C (>140°F)
Underground	Underground piping and tanks are below grade, but are contained within a tunnel or vault such that they are in contact with air and are located where access for inspection is limited (e.g., special lifting equipment is required to gain access to the vault). When the underground environment is cited, the term includes exposure to air-outdoor, air-indoor uncontrolled, air, raw water, groundwater, and condensation.	Underground
Waste water Waste water >60°C (>140°F)	Radioactive, potentially radioactive or nonradioactive waters that are collected from equipment and floor drains. Waste waters may contain contaminants, including oil and boric acid, depending on location, as well as originally treated water that is not monitored by a chemistry program. Waste water above 60°C (140°F) exceeds the threshold for stainless steel stress corrosion cracking.	Waste water Waste water >60°C (>140°F)
Water-flowing	Water that is refreshed; thus, it has a greater impact on leaching and can include rainwater, raw water, groundwater, or water flowing under a foundation.	Water-flowing
Water-standing	Water that is stagnant and unrefreshed, thus possibly resulting in increased ionic strength up to saturation.	Water-standing

3.1 AGING MANAGEMENT OF REACTOR VESSEL, REACTOR INTERNALS, AND REACTOR COOLANT SYSTEM

3.1.1 INTRODUCTION

This section provides the results of the aging management review for those components identified in Section 2.3.1, Reactor Vessel, Reactor Internals, and Reactor Coolant System, as being subject to aging management review. The system, or portions of systems, which are addressed in this section are described in the indicated sections.

- Reactor Vessel (Section 2.3.1.1)
- Reactor Vessel Internals (Section 2.3.1.2)
- Reactor Coolant System (Section 2.3.1.3)
- Steam Generators (Section 2.3.1.4)

3.1.2 RESULTS

The following tables summarize the results of the aging management review for the Reactor Vessel, Reactor Internals, and Reactor Coolant System.

- Table 3.1.2-1, Reactor Vessel, Reactor Internals, and Reactor Coolant System – Reactor Vessel - Aging Management Evaluation
- Table 3.1.2-2, Reactor Vessel, Reactor Internals, and Reactor Coolant System – Reactor Vessel Internals - Aging Management Evaluation
- Table 3.1.2-3, Reactor Vessel, Reactor Internals, and Reactor Coolant System – Reactor Coolant System - Aging Management Evaluation
- Table 3.1.2-4, Reactor Vessel, Reactor Internals, and Reactor Coolant System – Steam Generators - Aging Management Evaluation

3.1.2.1 Materials, Environments, Aging Effects Requiring Management and Aging Management Programs

3.1.2.1.1 Reactor Vessel

Materials

Components in the Reactor Vessel are constructed of the following materials:

* High-Strength Steel
* Nickel Alloy
* Stainless Steel
* Steel
* Steel (with Stainless Steel Cladding)
* Steel with Nickel Alloy Cladding

Environments

Components in the Reactor Vessel are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Reactor Coolant
* Reactor Coolant and Neutron Flux

Aging Effects Requiring Management

Components in the Reactor Vessel require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage
* Loss of Fracture Toughness
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Reactor Vessel are managed by the following AMPs:

* ASME Code Class 1 Small-Bore Piping (B2.1.22)
* ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B2.1.1)
* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Cracking of Nickel Alloy Components and Loss of Material due to Boric Acid-Induced Corrosion in RCPB Components (B2.1.5)
* Neutron Fluence Monitoring (B3.2)
* One-Time Inspection (B2.1.20)
* Reactor Head Closure Stud Bolting (B2.1.3)
* Reactor Vessel Material Surveillance (B2.1.19)
* TLAA
* Water Chemistry (B2.1.2)

3.1.2.1.2 Reactor Vessel Internals

Materials

Components in the Reactor Vessel Internals are constructed of the following materials:

* Cast Austenitic Stainless Steel
* Nickel Alloy
* Stainless Steel

Environments

Components in the Reactor Vessel Internals are exposed to the following environments:

* Reactor Coolant and Neutron Flux

Aging Effects Requiring Management

Components in the Reactor Vessel Internals require aging management to address the following aging effects:

* Change in Dimension
* Cracking
* Cumulative Fatigue Damage
* Loss of Fracture Toughness
* Loss of Material
* Loss of Preload
* Reduction in Fracture Toughness

Aging Management Programs

The aging effects for components in the Reactor Vessel Internals are managed by the following AMPs:

* PWR Vessel Internals (B2.1.7)
* TLAA

* Water Chemistry (B2.1.2)

3.1.2.1.3 Reactor Coolant System

Materials

Components in the Reactor Coolant System are constructed of the following materials:

* Cast Austenitic Stainless Steel
* Copper Alloy
* Fiberglass
* Nickel Alloy
* Stainless Steel
* Steel
* Steel (with Stainless Steel Cladding)

Environments

Components in the Reactor Coolant System are exposed to the following environments:

* Air
* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Lubricating Oil
* Lubricating Oil (Waste Oil)
* Reactor Coolant
* Reactor Coolant >250°C (>482°F)
* Treated Borated Water
* Treated Borated water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Reactor Coolant System require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage

* Loss of Fracture Toughness
* Loss of Material
* Loss of Preload
* Reduced Thermal Insulation Resistance

Aging Management Programs

The aging effects for components in the Reactor Coolant System are managed by the following AMPs:

* ASME Code Class 1 Small-Bore Piping (B2.1.22)
* ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B2.1.1)
* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Cracking of Nickel Alloy Components and Loss of Material due to Boric Acid-Induced Corrosion in RCPB Components (B2.1.5)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Lubricating Oil Analysis (B2.1.25)
* One-Time Inspection (B2.1.20)
* Thermal Aging Embrittlement of Cast Austenitic Stainless Steel (CASS) (B2.1.6)
* TLAA
* Water Chemistry (B2.1.2)

3.1.2.1.4 Steam Generators

Materials

Components in the Steam Generators are constructed of the following materials:

* Nickel Alloy
* Stainless Steel
* Steel
* Steel (with Stainless Steel Cladding)
* Steel with Nickel Alloy Cladding

Environments

Components in the Steam Generators are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Reactor Coolant
* Secondary Feedwater
* Steam
* Treated Water

Aging Effects Requiring Management

Components in the Steam Generators require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage
* Loss of Material
* Loss of Preload
* Reduction of Heat Transfer
* Wall Thinning

Aging Management Programs

The aging effects for components in the Steam Generators are managed by the following AMPs:

* ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B2.1.1)
* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Flow-Accelerated Corrosion (B2.1.8)
* One-Time Inspection (B2.1.20)
* Steam Generators (B2.1.10)
* TLAA
* Water Chemistry (B2.1.2)

3.1.2.2 Further Evaluation of Aging Management as Recommended by NUREG-2192

NUREG-2192 provides the basis for identifying those programs that warrant further evaluation by the reviewer in the SLRA. For the reactor vessel, reactor internals, and reactor coolant system, those evaluations are addressed in the following sections. Italicized text is taken directly from NUREG-2192.

3.1.2.2.1 Cumulative Fatigue Damage

NUREG-2192:

Evaluations involving time-dependent fatigue or cyclical loading parameters may be time-limited aging analyses (TLAAs), as defined in 10 CFR 54.3. TLAAs are required to be evaluated in accordance with 10 CFR 54.21(c)(1). These types of TLAAs are addressed separately in Section 4.3, "Metal Fatigue," of this SRP-SLR. For plant-specific cumulative usage factor calculations that are based on stress-based input methods, the methods are to be appropriately defined and discussed in the applicable TLAAs.

Evaluation:

[3.1.1-001] - The evaluation of fatigue is a TLAA for the steel reactor vessel closure flange assembly components exposed to air-indoor uncontrolled in the reactor vessel, reactor vessel internals, and reactor coolant system, and is addressed in Section 4.3, "Metal Fatigue".

[3.1.1-002] – The evaluation of fatigue is a TLAA for nickel alloy steam generator components exposed to reactor coolant or secondary feedwater/steam in the reactor vessel, internals, and reactor coolant system, and is addressed in Section 4.3, "Metal Fatigue".

[3.1.1-003] – The evaluation of fatigue is a TLAA for stainless steel and nickel alloy reactor vessel internal components exposed to reactor coolant and neutron flux in the reactor vessel, internals, and reactor coolant system, and is addressed in Section 4.3, "Metal Fatigue".

[3.1.1-004] – The evaluation of fatigue is a TLAA for steel reactor vessel support skirt components in the reactor vessel, internals, and reactor coolant system, and is addressed in Section 4.3, "Metal Fatigue".

[3.1.1-005] – The evaluation of fatigue is a TLAA for steel, stainless steel, steel (with stainless steel or nickel alloy cladding) steam generator components, pressurizer relief tank components, piping components, and bolting in the reactor vessel, internals, and reactor coolant system, and is discussed in Section 4.3, "Metal Fatigue".

[3.1.1-006] – Not applicable - BWR only

[3.1.1-007] – Not applicable - BWR only.

[3.1.1-008] – The evaluation of fatigue is a TLAA for stainless steel, steel (with or without nickel alloy or stainless steel cladding) or nickel alloy steam generator components exposed to reactor coolant in the reactor vessel, internals, and reactor coolant system, and is addressed in Section 4.3, “Metal Fatigue”.

[3.1.1-009] – The evaluation of fatigue is a TLAA for stainless steel, steel (with or without nickel alloy or stainless steel cladding), and nickel alloy reactor coolant pressure boundary piping, piping components, and other pressure retaining components exposed to reactor coolant exposed to reactor coolant in the reactor vessel, internals, and reactor coolant system, and is addressed in Section 4.3, “Metal Fatigue”, and in Section 4.7.4, “Leak-Before-Break”.

[3.1.1-010] – The evaluation of fatigue is a TLAA for steel (with or without nickel alloy or stainless steel cladding), stainless steel, or nickel alloy reactor vessel components, nozzles, penetrations, pressure housings, safe ends, thermal sleeves, vessel shells, heads and welds exposed to reactor coolant in the reactor vessel, internals, and reactor coolant system, and is addressed in Section 4.3, “Metal Fatigue”.

[3.1.1-011] – The evaluation of fatigue is a TLAA for steel or stainless steel pump and valve closure bolting exposed to high temperatures and thermal cycles in the reactor vessel, internals, and reactor coolant system, and is addressed in Section 4.3, “Metal Fatigue”.

3.1.2.2.2 Loss of Material Due to General, Pitting, and Crevice Corrosion

NUREG-2192:

1. *Loss of material due to general, pitting, and crevice corrosion could occur in the steel PWR SG upper and lower shell and transition cone exposed to secondary feedwater and steam. The existing program relies on control of water chemistry to mitigate corrosion and inservice inspection (ISI) to detect loss of material. The extent and schedule of the existing SG inspections are designed to ensure that flaws cannot attain a depth sufficient to threaten the integrity of the welds. However, according to NRC Information Notice (IN) 90-04, “Cracking of the Upper Shell-to-Transition Cone Girth Welds in Steam Generators,” the program may not be sufficient to detect pitting and crevice corrosion if general and pitting corrosion of the shell is known to exist. Augmented inspection is recommended to manage this aging effect. Furthermore, this issue is limited to Westinghouse Model 44 and 51 Steam Generators, where a high-stress region exists at the shell to transition cone weld. Acceptance criteria are described in Branch Technical Position (BTP) RLSB-1 (Appendix A.1 of this SRP-SLR).*

2. *Loss of material due to general, pitting, and crevice corrosion could occur in the steel PWR steam generator shell assembly exposed to secondary feedwater and steam. The existing program relies on control of secondary water chemistry to mitigate corrosion. However, some applicants have replaced only the bottom part of their recirculating SGs, generating a cut in the middle of the transition cone, and, consequently, a new transition cone closure weld. It is recommended that volumetric examinations be performed in*

accordance with the requirements of ASME Code Section XI for upper shell and lower shell-to-transition cones with gross structural discontinuities for managing loss of material due to general, pitting, and crevice corrosion in the welds for Westinghouse Model 44 and 51 SGs, where a high-stress region exists at the shell-to-transition cone weld.

The new continuous circumferential weld, resulting from cutting the transition cone as discussed above, is a different situation from the SG transition cone welds containing geometric discontinuities. Control of water chemistry does not preclude loss of material due to pitting and crevice corrosion at locations of stagnant flow conditions. The new transition area weld is a field weld as opposed to having been made in a controlled manufacturing facility, and the surface conditions of the transition weld may result in flow conditions more conducive to initiation of general, pitting, and crevice corrosion than those of the upper and lower transition cone welds. Crediting of the ISI program for the new SG transition cone weld may not be an effective basis for managing loss of material in this weld, as the ISI criteria would only perform a VT-2 visual leakage examination of the weld as part of the system leakage test performed pursuant to ASME Code Section XI requirements. In addition, ASME Code Section XI does not require licensees to remove insulation when performing visual examination on nonborated treated water systems. Therefore, the effectiveness of the chemistry control program should be verified to ensure that loss of material due to general, pitting and crevice corrosion is not occurring.

For the new continuous circumferential weld, further evaluation is recommended to verify the effectiveness of the chemistry control program. A one-time inspection at susceptible locations is an acceptable method to determine whether an aging effect is not occurring or an aging effect is progressing very slowly, such that the component's intended function will be maintained during the subsequent period of extended operation. Furthermore, this issue is limited to replacement of recirculating SGs with a new transition cone closure weld.

<u>Evaluation</u>

[3.1.1-012] – Not applicable to ONS B&W steam generators. This further evaluation item applies to Westinghouse steam generators.

3.1.2.2.3 Loss of Fracture Toughness Due to Neutron Irradiation Embrittlement

<u>NUREG-2192:</u>

1. *Neutron irradiation embrittlement is a TLAA to be evaluated for the subsequent period of extended operation for all ferritic materials that have a neutron fluence greater than 10^{17} n/cm^2 (E>1 MeV) at the end of the subsequent period of extended operation. Certain aspects of neutron irradiation embrittlement are TLAAs as defined in 10 CFR 54.3. TLAAs are required to be evaluated in accordance with 10 CFR 54.21(c)(1). This TLAA is*

addressed separately in Section 4.2, "Reactor Pressure Vessel Neutron Embrittlement Analysis," of this SRP-SLR.

2. *Loss of fracture toughness due to neutron irradiation embrittlement could occur in BWR and PWR reactor vessel beltline shell nozzle, and welds exposed to reactor coolant and neutron flux. A reactor vessel material surveillance program monitors neutron irradiation embrittlement of the reactor vessel. The reactor vessel material surveillance program is either a plant-specific surveillance program or an integrated surveillance program, depending on matters such as the composition of limiting materials and the availability of surveillance capsules.*

   In accordance with 10 CFR Part 50, Appendix H, an applicant is required to submit its proposed withdrawal schedule for approval prior to implementation. Untested capsules placed in storage must be maintained for future insertion. Thus, further NRC staff evaluation is required for a subsequent license renewal (SLR). Specific recommendations for an acceptable AMP are provided in GALL-SLR Report AMP XI.M31, "Reactor Vessel Material Surveillance."

   A neutron fluence monitoring program may be used to monitor the neutron fluence levels that are used as the time-dependent inputs for the plant's reactor vessel neutron irradiation embrittlement TLAAs. These TLAAs are the subjects of the topics discussed in SRP-SLR Section 3.1.2.2.3.1 and "acceptance criteria" and "review procedure" guidance in SRP-SLR Section 4.2. For those applicants that determine it is appropriate to include a neutron fluence monitoring AMP in their SLRAs, the program is to be implemented in conjunction with the applicant's implementation of an AMP that corresponds to GALL-SLR Report AMP X1.M31, "Reactor Vessel Material Surveillance." Specific recommendations for an acceptable neutron fluence monitoring AMP are provided in GALL-SLR Report AMP X.M2, "Neutron Fluence Monitoring."

3 *Reduction in Fracture Toughness is a plant-specific TLAA for B&W reactor internals to be evaluated for the subsequent period of extended operation in accordance with the NRC staff's safety evaluation concerning "Demonstration of the Management of Aging Effects for the Reactor Vessel Internals," B&W Owners Group report number BAW-2248, which is included in BAW-2248A, March 2000. Plant-specific TLAAs are addressed in Section 4.7, "Other Plant-Specific Time-Limited Aging Analyses," of this SRP-SLR.*

<u>Evaluation</u>

[3.1.1-013] – Neutron irradiation embrittlement is a TLAA as defined in 10 CFR 54.3 and is evaluated in Section 4.2, "Reactor Vessel Neutron Embrittlement Analysis".

[3.1.1-014] – Loss of fracture toughness due to neutron irradiation embrittlement could occur in the reactor vessel beltline, shell, nozzle, and welds. The *Reactor Vessel Material Surveillance* program (B2.1.19) and the *Neutron Fluence Monitoring* program (B3.2) monitors neutron irradiation embrittlement of the reactor vessel.

[3.1.1-015] – *Reduction in Fracture Toughness* is a TLAA as defined in 10 CFR 54.3 and is evaluated in Section 4.2, “Reactor Vessel Neutron Embrittlement Analysis”.

3.1.2.2.4 Cracking Due to Stress Corrosion Cracking and Intergranular Stress Corrosion Cracking

NUREG-2192:

1 *Cracking due to stress corrosion cracking (SCC) and intergranular stress corrosion cracking (IGSCC) could occur in stainless steel (SS) and nickel alloy reactor vessel (RV) flange leak detection lines of BWR light-water reactor facilities. The plant-specific operating experience (OE) and condition of the RV flange leak detection lines are evaluated to determine if SCC or IGSCC has occurred. The aging effect of cracking in SS and nickel alloy RV flange leak detection lines is not applicable and does not require management if (a) the plant-specific OE does not reveal a history of SCC or IGSCC and (b) a one-time inspection demonstrates that the aging effect is not occurring. The applicant documents the results of the plant-specific OE review in the SLRA. GALL-SLR Report AMP X1.M32, “One-Time Inspection,” describes an acceptable program to demonstrate that cracking is not occurring. If cracking has occurred, GALL-SLR Report AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” describes an acceptable program to manage cracking in the RV flange leak detection lines.*

2. *Cracking due to SCC and IGSCC could occur in SS BWR isolation condenser components exposed to reactor coolant. The existing program relies on control of reactor water chemistry to mitigate SCC and on ASME Code Section XI ISI to detect cracking. However, the existing program should be augmented to detect cracking due to SCC and IGSCC. An augmented program is recommended to include temperature and radioactivity monitoring of the shell-side water and eddy current testing of tubes to ensure that the component’s intended function will be maintained during the subsequent period of extended operation. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

Evaluation

Not applicable - BWR only.

3.1.2.2.5 Crack Growth Due to Cyclic Loading

NUREG-2192:

Crack growth due to cyclic loading could occur in reactor pressure vessel (RPV) shell forgings clad with SS using a high-heat-input welding process. Therefore, the current licensing basis (CLB) may include flaw growth evaluations of intergranular separations (i.e., underclad cracks) that have been identified in the RPV-to-cladding welds for the vessel. The evaluations apply to

SA-508 Class 2 RPV forging components where the cladding was deposited and welded to the vessel using a high-heat-input welding process. For CLBs that include these types of evaluations, the evaluations may need to be identified as TLAAs if they are determined to conform to the six criteria for defining TLAAs in 10 CFR 54.3(a). The methodology for evaluating the underclad flaw should be consistent with the flaw evaluation procedure and criterion in the ASME Code Section XI. See SRP-SLR, Section 4.7, "Other Plant-Specific Time-Limited Aging Analyses," for generic guidance for meeting the requirements of 10 CFR 54.21(c).

Evaluation

[3.1.1-018] – Crack growth due to cyclic loading (underclad cracking) is a TLAA as defined in 10 CFR 54.3. The evaluation of crack growth due to cyclic loading as a TLAA for the reactor vessel is discussed in Section 4.7.2, "Reactor Vessel Underclad Cracking".

3.1.2.2.6 Cracking Due to Stress Corrosion Cracking

NUREG-2192:

1. *Cracking due to SCC could occur in PWR SS bottom-mounted instrument guide tubes exposed to reactor coolant. Further evaluation is recommended to ensure that these aging effects are adequately managed. A plant-specific AMP should be evaluated to ensure that this aging effect is adequately managed. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

2. *Cracking due to SCC could occur in Class 1 PWR cast austenitic stainless steel (CASS) reactor coolant system piping and piping components exposed to reactor coolant. The existing program relies on control of water chemistry to mitigate SCC; however, SCC could occur in CASS components that do not meet the NUREG-0313, "Technical Report on Material Selection and Process Guidelines for BWR Coolant Pressure Boundary Piping" guidelines with regard to ferrite and carbon content. Further evaluation is recommended of a plant-specific program for these components to ensure that this aging effect is adequately managed. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

3. *Cracking due to SCC could occur in SS or nickel alloy RV flange leak detection lines of PWR light-water reactor facilities. The plant-specific OE and condition of the RV flange leak detection lines are evaluated to determine if SCC has occurred. The aging effect of cracking in SS and nickel alloy RV flange leak detection lines is not applicable and does not require management if (a) the plant-specific OE does not reveal a history of SCC and (b) a one-time inspection demonstrates that the aging effect is not occurring. The applicant documents the results of the plant-specific OE review in the SLRA. GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that cracking is not occurring. If cracking has ocurred, GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," describes an acceptable program to manage cracking in RV flange leak detection lines.*

Evaluation

[3.1.1-019] – Not applicable. ONS Units 1, 2, and 3 utilize B&W reactors. The associated NUREG-2191 aging items are not used.

[3.1.1-020] – Cracking due to stress corrosion cracking could occur in Class 1 PWR cast austenitic stainless steel reactor coolant system piping and piping components exposed to reactor coolant. ONS applicable components are valve bodies and reactor coolant pump suction and discharge nozzles. Mitigation and monitoring of cracking of valve bodies and reactor coolant pump suction and discharge nozzles are managed by the *Water Chemistry* (B2.1.2) program and the *ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD* (B2.1.1) program, respectively. The *Water Chemistry* (B2.1.2) program provides controls to minimize the presence of contaminants that promote stress corrosion cracking. The *ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD* (B2.1.1) program provides for periodic testing and inspections to detect cracking.

[3.1.1-139] – Cracking due to stress corrosion cracking could occur in stainless steel or nickel alloy reactor vessel flange leak detection lines of PWR light-water reactor facilities. A review of ONS OE identified that a subset of these lines was susceptible to inner diameter initiated cracking in a localized vertical region of NSSS vendor supplied piping where contaminants could concentrate. Based on the results of metallurgical investigation, plant modifications were implemented between 2004 and 2008 on all three units to cut and cap the affected lines above the area of concern. This design change alleviated the potential for cracking associated with this OE. No evidence of cracking or leakage has been identified in the remaining segments of capped piping or in the unaffected reactor vessel leakage detection lines. The *One-Time Inspection* (B2.1.20) program will be used to verify that cracking is not occurring in the remaining reactor vessel leakage detection piping (including capped piping segments) or in comparable locations in the reactor coolant system aligned to this standard review plan item.

3.1.2.2.7 Cracking Due to Cyclic Loading

NUREG-2192:

Cracking due to cyclic loading could occur in steel and SS BWR isolation condenser components exposed to reactor coolant. The existing program relies on ASME Code Section XI ISI. However, the existing program should be augmented to detect cracking due to cyclic loading. An augmented program is recommended to include temperature and radioactivity monitoring of the shell-side water and eddy current testing of tubes to ensure that the component's intended function will be maintained during the subsequent period of extended operation. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).

Evaluation

Not applicable - BWR only.

3.1.2.2.8 Loss of Material Due to Erosion

NUREG-2192:

Loss of material due to erosion could occur in steel steam generator feedwater impingement plates and supports exposed to secondary feedwater. Further evaluation is recommended of a plant-specific AMP to ensure that this aging effect is adequately managed. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).

Evaluation

[3.1.1-022] - Not applicable to ONS once through steam generators. The ONS steam generators do not have feedwater impingement plates and associated supports.

3.1.2.2.9 Aging Management of Pressurized Water Reactor Vessel Internals (Applicable to Subsequent License Renewal Periods Only)

NUREG-2192:

Electric Power Research Institute (EPRI) Topical Report (TR)-1022863, "Materials Reliability Program: Pressurized Water Reactor Internals Inspection and Evaluation Guidelines (MRP-227-A)" (Agencywide Documents Access and Management System (ADAMS) Accession Nos. ML12017A191 through ML12017A197 and ML12017A199), provided the industry's initial set of aging management inspection and evaluation (I&E) recommendations for the reactor vessel internal (RVI) components that are included in the design of a PWR facility. Since the issuance of MRP-227-A on January 9, 2012, EPRI updated its I&E guidelines for the PWR RVI components in Topical Report No. 3002017168, "Materials Reliability Program: Pressurized Water Reactor Internals Inspection and Evaluation Guidelines (MRP-227, Revision 1-A)" (ADAMS Accession No. ML20175A112). MRP-227, Revision 1-A, incorporated the industry's bases for resolving operating experience and industry lessons learned resulting from component-specific inspections performed since the issuance of MRP-227-A in January 2012. The staff found the guidelines in MRP-227, Revision 1-A, acceptable, as documented in a staff-issued safety evaluation dated April 25, 2019 (ADAMS Accession No. ML19081A001) and approved the topical report for use as documented in the staff's letters to the EPRI Materials Reliability Program (MRP) dated February 19, 2020 and July 7, 2020 (ADAMS Accession Nos. ML20006D152 and ML20175A149).

In MRP-227, Revision 1-A, the EPRI MRP identified that the following aging mechanisms may be applicable to the design of the RVI components in these types of facilities: (a) stress corrosion cracking (SCC), (b) irradiation-assisted stress corrosion cracking (IASCC), (c) fatigue, (d) wear, (e) neutron irradiation embrittlement, (f) thermal aging embrittlement, (g) void swelling and irradiation growth or component distortion, and (h) thermal or irradiation-enhanced stress relaxation or irradiation enhanced creep.

The EPRI MRP's functionality analysis and failure modes, effects, and criticality analysis bases for grouping Westinghouse-designed, B&W-designed and Combustion Engineering (CE)-designed RVI components into the applicable inspection categories (as evaluated in MRP-227, Revision 1-A) were based on an assessment of aging effects and relevant time-dependent aging parameters through a cumulative 60-year licensing period (i.e., 40 years for the initial operating license period plus an additional 20 years during the initial period of extended operation). The EPRI MRP's assessment in MRP-227, Revision 1-A, did not evaluate whether operation of Westinghouse-designed, B&W-designed and CE-designed reactors during an SLR operating period (60 to 80 years) would have an impact on the existing susceptibility rankings and inspection categorizations for the RVI components in these designs, as defined in MRP-227, Revision 1-A or the applicable MRP background documents (e.g., MRP-191, Revision 1, for Westinghouse-designed or CE-designed RVI components or MRP-189, Revision 2, for B&W-designed components).

As described in GALL-SLR Report AMP XI.M16A, the applicant may use the MRP-227, Revision 1-A based AMP as an initial reference basis for developing and defining the AMP that will be applied to the RVI components for the subsequent period of extended operation. However, to use this alternative basis, GALL-SLR Report AMP XI.M16A recommends that the MRP-227, Revision 1-A based AMP be enhanced to include a gap analysis of the components that are within the scope of the AMP. The gap analysis is a basis for identifying and justifying changes to the MRP-227, Revision 1-A based program that are necessary to provide reasonable assurance that the effects of age-related degradation will be managed during the subsequent period of extended operation. The criteria for the gap analysis are described in GALL-SLR Report AMP XI.M16A. If a gap analysis is needed to establish the appropriate aging management criteria for the RVI components, the applicant has the option of including the gap analysis in the SLRA or making the gap analysis and any supporting gap analysis documents available in the in-office audit portal for the SLRA review.

Subsequent license renewal (SLR) applicants for units of a PWR design will no longer need to include separate SLRA Appendix C section responses in resolution of the A/LAIs previously issued on MRP-227-A because the A/LAIs were resolved and closed by the staff in the April 25, 2019, safety evaluation for MRP-227, Revision 1-A. The sole A/LAI issued by the staff in the safety evaluation dated April 25, 2019, relates to an applicant's methods and timing of inspections that will be applied to the baffle-to-former bolts or core shroud bolts in the plant design. Since an applicant's resolution of this A/LAI can be appropriately addressed in the "Operating Experience" program element discussion for the AMP and in the applicant's basis document for the AMP, a separate SLRA Appendix C response for the A/LAI is unnecessary.

Alternatively, the PWR SLRA may define a plant-specific AMP for the RVI components to demonstrate that the RVI components will be managed in accordance with the requirements of 10 CFR 54.21(a)(3) during the proposed subsequent period of extended operation. Components to be inspected, parameters monitored, monitoring methods, inspection sample size, frequencies, expansion criteria, and acceptance criteria are justified in the SLRA. If the AMP is a plant-specific program, the NRC staff will assess the adequacy of the plant-specific AMP against the criteria for the 10 AMP program elements that are defined in Section A.1.2.3 of SRP-SLR Appendix A.1.

Evaluation

[3.1.1-051a] [3.1.1-051b] [3.1.1-055a] [3.1.1-058a] [3.1.1-058b] [3.1.1-118] [3.1.1-119] – Electric Power Research Institute (EPRI) Topical Report (TR)-1022863, "Materials Reliability Program: Pressurized Water Reactor Internals Inspection and Evaluation Guidelines (MRP-227-A)" provides the industry's aging management recommendations for the reactor vessel internal components that are included in the design of a PWR facility. The methodology in MRP-227-A was approved by the NRC in a safety evaluation dated December 16, 2011, which includes those plant specific applicant/licensee action items that a licensee or applicant applying the MRP-227-A report would need to address and resolve and apply to its licensing basis. MRP-227 Revision 1 has since been developed, and was approved by the NRC in a safety evaluation dated April 25, 2019 as MRP-227-1A.

ONS is in the process of transitioning its *PWR Vessel Internals* (B2.1.7) program from MRP-227-A to MRP-227-1A. The approved MRP-227-1A guidelines are based on an analysis of the reactor vessel internals that considers the operating conditions up to a 60 year operating period. To address an 80 year operating period, the guidelines have been supplemented with a gap analysis that identifies enhancements to the *PWR Vessel Internals* (B2.1.7) program. The MRP-227-1A gap analysis for PWR vessel internals aging management is incorporated into the *PWR Vessel Internals* program description in Appendix B of the LRA. This gap analysis provides a basis for identifying and justifying changes to the MRP-227-1A based program that are necessary to provide reasonable assurance that the effects of age related degradation will be managed during the SPEO.

The *PWR Vessel Internals* (B2.1.7) program manages the applicable aging effects for the reactor vessel internal components and the *Water Chemistry* (B2.1.2) program monitors and controls water environments consistent with industry guidelines to ensure that the reactor coolant water environment is favorable to mitigate SCC in reactor vessel internal components.

3.1.2.2.10 Loss of Material Due to Wear

NUREG-2192:

1. *Industry OE indicates that loss of material due to wear can occur in PWR control rod drive (CRD) head penetration nozzles made of nickel alloy due to the interactions between the nozzle and the thermal sleeve centering pads of the nozzle. The CRD head penetration nozzles are also called control rod drive mechanism (CRDM) nozzles or CRDM head adapter tubes. The applicant should perform a further evaluation to confirm the adequacy of a plant-specific AMP or analysis (with any necessary inspections) for management of the aging effect. The applicant may use the acceptance criteria, which are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR), to demonstrate the adequacy of a plant-specific AMP. Alternatively, the applicant may perform an analysis with any necessary inspections to confirm that loss of material due to wear does not affect the intended function(s) of these CRD head penetration nozzles, consistent with the current licensing basis (CLB).*

2. *Industry OE indicates that loss of material due to wear can occur in the SS thermal sleeves of PWR CRD head penetration nozzles due to the interactions between the nozzle and the thermal sleeve (e.g., where the thermal sleeve exits from the head penetration nozzle inside the reactor vessel). Therefore, the applicant should perform a further evaluation to confirm the adequacy of a plant-specific AMP for management of the aging effect. The applicant may use the acceptance criteria, which are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR), to demonstrate the adequacy of a plant-specific AMP.*

Evaluation

[3.1.1-116] [3.1.1-117] - Not applicable to ONS. B&W reactors have a different configuration that utilize a leadscrew support tube, leadscrew support nut, and leadscrew support nut lock washer.

3.1.2.2.11 Cracking Due to Primary Water Stress Corrosion Cracking

NUREG-2192:

1. *Foreign OE in steam generators with a design similar to that of Westinghouse steam generators (particularly Model 51) has identified cracks due to primary water stress corrosion cracking (PWSCC) in steam generator (SG) divider plate assemblies fabricated of Alloy 600 and/or the associated Alloy 600 weld materials, even with proper primary water chemistry. Cracks have been detected in the stub runner with depths typically about 0.08 inches (EPRI 3002002850).*

   All but one of these instances of cracking has been detected in divider plate assemblies that are approximately 1.3 inches in thickness. For the cracks in the 1.3-inch thick divider plate assemblies, the cracks tend to be parallel to the divider-plate-to-stub-runner weld (i.e., run horizontally in parallel to the lower surface of the tubesheet). For the one instance of cracking in a divider plate assembly with a thickness greater than 1.3 inches, the cracking occurred in a divider plate assembly with a thickness of approximately 2.4 inches near manufacturing marks on the upper end of the stub runner used for locating tubesheet holes. These flaws were estimated to be approximately 0.08-inch deep.

   Although these instances indicate that the water chemistry program may not be sufficient to manage cracking due to PWSCC in SG divider plate assemblies, analyses by the industry indicate that PWSCC in the divider plate assembly does not pose a structural integrity concern for other steam generator components (e.g., tubesheet and tube-to tubesheet welds) and does not adversely affect other safety analyses (e.g., analyses supporting tube plugging and repairs, tube repair criteria, and design basis accidents). In addition, the industry analyses indicate that flaws in the divider plate assembly will not adversely affect the heat transfer function (as a result of bypass flow) during normal forced flow operation, during natural circulation conditions (assessed in the analyses of various design basis accidents), or in the event of a loss-of-coolant accident (LOCA).

Furthermore, additional industry analyses indicate that PWSCC in the divider plate assembly is unlikely to adversely impact adjacent items, such as the tubesheet cladding, tube-to-tubesheet welds, and channel head. Therefore,

- *For units with divider plate assemblies fabricated of Alloy 690 and Alloy 690 type weld materials, a plant-specific AMP is not necessary.*
- *For units with divider plate assemblies fabricated of Alloy 600 or Alloy 600 type weld materials, if the analyses performed by the industry (EPRI 3002002850) are applicable and bounding for the unit, a plant-specific AMP is not necessary.*
- *For units with divider plate assemblies fabricated of Alloy 600 or Alloy 600 type weld materials, if the industry analyses (EPRI 3002002850) are not bounding for the applicant's unit, a plant-specific AMP is necessary or a rationale is necessary for why such a program is not needed. A plant-specific AMP (one beyond the primary water chemistry and the steam generator programs) may include a one-time inspection that is capable of detecting cracking to verify the effectiveness of the water chemistry and steam generator programs and the absence of PWSCC in the divider plate assemblies.*

The existing programs rely on control of reactor water chemistry to mitigate cracking due to PWSCC and general visual inspections of the channel head interior surfaces (included as part of the steam generator program). The GALL-SLR Report recommends further evaluation for a plant-specific AMP to confirm the effectiveness of the primary water chemistry and steam generator programs as described in this section. Acceptance criteria for a plant-specific AMP are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR). In place of a plant-specific AMP, the applicant may provide a rationale to justify why a plant-specific AMP is not necessary.

2. *Cracking due to PWSCC could occur in SG nickel alloy tube-to-tubesheet welds exposed to reactor coolant. The acceptance criteria for this review are:*

- *For units with Alloy 600 SG tubes for which an alternate repair criterion such as C*, F*, H*, or W* has been permanently approved for both the hot- and cold-leg side of the steam generator, the weld is no longer part of the reactor coolant pressure boundary and a plant-specific AMP is not necessary;*
- *For units with Alloy 600 steam generator tubes, if there is no permanently approved alternate repair criteria such as C*, F*, H*, or W*, or permanent approval applies to only either the hot- or cold-leg side of the steam generator, a plant-specific AMP is necessary;*
- *For units with thermally treated Alloy 690 SG tubes and with tubesheet cladding using Alloy 690 type material, a plant-specific AMP is not necessary;*
- *For units with thermally treated Alloy 690 SG tubes and with tubesheet cladding using Alloy 600 type material, a plant-specific AMP is necessary unless the applicant confirms that the industry's analyses for tube-to-tubesheet weld cracking (e.g., chromium content for the tube-to-tubesheet welds is approximately 22 percent and the tubesheet primary face is in compression as discussed in EPRI 3002002850) are applicable and bounding for the unit, and the applicant will perform general visual inspections of the tubesheet region looking for evidence of cracking (e.g., rust stains*

on the tubesheet cladding) as part of the steam generator program. In lieu of a plant-specific AMP, the applicant may provide a rationale for why a plant-specific AMP is not necessary.

The existing programs rely on control of reactor water chemistry to mitigate cracking due to PWSCC and visual inspections of the steam generator head interior surfaces. Along with the primary water chemistry and steam generator programs, a plant-specific AMP should be evaluated to confirm the effectiveness of the primary water chemistry and steam generator programs in certain circumstances. A plant-specific AMP may include a one-time inspection that is capable of detecting cracking to confirm the absence of PWSCC in the tube-to-tubesheet welds. Acceptance criteria for a plant-specific AMP are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR). In place of a plant-specific AMP, the applicant may provide a rationale to justify why a plant-specific AMP is not necessary.

Evaluation

[3.1.1-025] – Cracking of divider plates is not applicable to the ONS once through steam generators.

Oconee Unit 1, 2 and 3 replacement once through steam generators do not have Alloy 600-equivalent materials in the tubes or tubesheet cladding, including in tube-to-tubesheet weld repairs. The Oconee Units 1, 2 and 3 replacement steam generators have tubesheet clad with I-52 (Alloy 690) material and, as a result, has a chromium content >22%. The tubes are Alloy 690 with a minimum of 28.5% chromium specified. Therefore, primary water stress corrosion cracking is not a concern due to the high chromium content of both the tube and cladding, and there is no risk of cracking initiating in the tube-to-tubesheet welds.

3.1.2.2.12 Cracking Due to Irradiation-Assisted Stress Corrosion Cracking

NUREG-2192:

GALL-SLR Report AMP XI.M9, "BWR Vessel Internals," manages aging degradation of nickel alloy and SS, including associated welds, which are used in BWR vessel internal components. When exposed to the BWR vessel environment, these materials can experience cracking due to IASCC. The existing Boiling Water Reactor Vessel and Internals Project (BWRVIP) examination guidelines are mainly based on aging evaluation of BWR vessel internals for operation up to 60 years. However, increases in neutron fluence during the SLR term may need to be assessed for supplemental inspections of BWR vessel internals to adequately manage cracking due to IASCC. Therefore, the applicant should perform an evaluation to determine whether supplemental inspections are necessary in addition to those recommended in the existing BWRVIP examination guidelines. If the applicant determines that supplemental inspections are not necessary, the applicant should provide adequate technical justification for the determination. If supplemental inspections are determined necessary for BWR vessel internals, the applicant identifies the components to be inspected and performs supplemental inspections to adequately *manage IASCC. In addition, the applicant should confirm the adequacy of any necessary supplemental inspections and enhancements to the BWR Vessel Internals Program.*

Evaluation

Not applicable - BWR only.

3.1.2.2.13 Loss of Fracture Toughness Due to Neutron Irradiation or Thermal Aging Embrittlement

NUREG-2192:

GALL-SLR Report AMP XI.M9 manages aging degradation of nickel alloy and SS, including associated welds, which are used in BWR vessel internal components. When exposed to the BWR vessel environment, these materials can experience loss of fracture toughness due to neutron irradiation embrittlement. In addition, CASS, precipitation-hardened (PH) martensitic SS (e.g., 15-5 and 17-4 PH steel) and martensitic SS (e.g., 403, 410, 431 steel) can experience loss of fracture toughness due to neutron irradiation or thermal aging embrittlement.

The existing BWRVIP examination guidelines are mainly based on aging evaluation of BWR vessel internals for operation up to 60 years. Increases in neutron fluence and thermal embrittlement during the SLR term may need to be assessed for supplemental inspections of BWR vessel internals to adequately manage loss of fracture toughness due to neutron irradiation or thermal aging embrittlement. Therefore, the applicant should perform an evaluation to determine whether supplemental inspections are necessary in addition to those recommended in the existing BWRVIP examination guidelines. If the applicant determines that supplemental inspections are not necessary, the applicant should provide adequate technical justification for the determination. If supplemental inspections are determined necessary for BWR vessel internals, the applicant should identify the components to be inspected and perform supplemental inspections to adequately manage loss of fracture toughness. In addition, the applicant should confirm the adequacy of any necessary supplemental inspections and enhancements to the BWR Vessel Internals Program.

Evaluation

Not applicable - BWR only.

3.1.2.2.14 Loss of Preload Due to Thermal or Irradiation-Enhanced Stress Relaxation

NUREG-2192:

GALL-SLR Report AMP XI.M9 manages loss of preload due to thermal or irradiation-enhanced stress relaxation in BWR core plate rim holddown bolts. The issue is applicable to BWR designed light water reactors that employ rim holddown bolts as the means for protecting the reactor's core plate from the consequences of lateral movement. The potential for such movement, if left *unmanaged, could impact the ability of the reactor to be brought to a safe shutdown condition during an anticipated transient occurrence or during a postulated design-basis accident or seismic event. This issue is not applicable to BWR reactor designs that use wedges as the means of precluding lateral movement of the core plate because the wedges are fixed in place and are not subject to this type of aging effect and mechanism combination.*

GALL-SLR Report AMP XI.M9 indicates that the inspections in the BWRVIP topical report, "BWR Vessel and Internals Project, BWR Core Plate Inspection and Flaw Evaluation Guidelines (BWRVIP-25)," are used to manage loss of preload due to thermal or irradiation-enhanced stress relaxation in BWR designs with core plate rim holddown bolts. However, in previous license renewal applications (LRAs), some applicants have identified that the inspection bases for managing loss of preload in BWRVIP-25 may not be capable of gaining access to the rim holddown bolts or are not sufficient to detect loss of preload on the components. For applicants that have identified this issue in their past LRAs, the applicants either committed to modifying the plant design to install wedges in the core plate designs or to submit an inspection plan, with a supporting core plate rim holddown bolt preload analysis for NRC approval at least 2 years prior to entering into the initial period of extended operation for the facility.

If an existing NRC-approved analysis for the bolts exists in the CLB and conforms to the definition of a TLAA, the applicant should identify the analysis as a TLAA for the SLRA and demonstrate how the analysis is acceptable in accordance with either 10 CFR 54.21(c)(1)(i), (ii), or (iii). Otherwise, if a new analysis will be performed to support an updated augmented inspection basis for the bolts for the subsequent period of extended operation, the NRC staff recommends that a license renewal commitment be placed in the FSAR Supplement for the applicant to submit both the inspection plan and the supporting loss of preload analysis to the NRC staff for approval at least 2 years prior to entering into the subsequent period of extended operation for the facility. If loss of preload in the bolts is managed with an AMP that correlates to GALL-SLR Report AMP XI.M9, the inspection basis in the applicable BWRVIP report is reviewed for continued validity, or else augmented as appropriate.

<u>Evaluation</u>

Not applicable - BWR only.

3.1.2.2.15 Loss of Material Due to General, Crevice or Pitting Corrosion and Cracking Due to Stress Corrosion Cracking

<u>NUREG-2192:</u>

Loss of material due to general (steel only), crevice, or pitting corrosion and cracking due to SCC (SS only) can occur in steel and SS piping and piping components exposed to concrete. Concrete provides a high alkalinity environment that can mitigate the effects of loss of material for steel piping, thereby significantly reducing the corrosion rate. However, if water intrudes through the concrete, the pH can be reduced and ions that promote loss of material such as chlorides, which can penetrate the protective oxide layer created in the high alkalinity environment, can reach the surface of the metal. Carbonation can reduce the pH within concrete.

The rate of carbonation is reduced by using concrete with a low water-to-cement ratio and low permeability. Concrete with low permeability also reduces the potential for the penetration of water. Adequate air entrainment improves the ability of the concrete to resist freezing and thawing cycles and therefore reduces the potential for cracking and intrusion of water. Cracking due to SCC, as well as pitting and crevice corrosion can occur due to halides present in the water that penetrates to the surface of the metal.

If the following conditions are met, loss of material is not considered to be an applicable aging effect for steel: (a) attributes of the concrete are consistent with American Concrete Institute (ACI) 318 or ACI 349 (low water-to-cement ratio, low permeability, and adequate air entrainment) as cited in NUREG–1557; (b) plant-specific OE indicates no degradation of the concrete that could lead to penetration of water to the metal surface; and (c) the piping is not potentially exposed to groundwater. For SS components loss of material and cracking due to SCC are not considered to be applicable aging effects as long as the piping is not potentially exposed to groundwater. Where these conditions are not met, loss of material due to general (steel only), crevice or pitting corrosion and cracking due to SCC (SS only) are identified as applicable aging effects. GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," describes an acceptable program to manage these aging effects.

Evaluation

[3.1.1-105], [3.1.1-115] – There are no stainless steel piping or piping components exposed to concrete in the ONS Reactor Coolant System.

3.1.2.2.16 Loss of Material Due to Pitting and Crevice Corrosion in Stainless Steel and Nickel Alloys

NUREG-2192:

Loss of material due to pitting and crevice corrosion could occur in indoor or outdoor SS and nickel alloy piping, piping components, and tanks exposed to any air, condensation, or underground environment when the component is: (a) uninsulated; (b) insulated; (c) in the vicinity of insulated components; or (d) in the vicinity of potentially transportable halogens. Loss of material due to pitting and crevice corrosion can occur on SS and nickel alloys in environments containing sufficient halides (e.g., chlorides) in the presence of moisture.

Insulated SS and nickel alloy components exposed to air, condensation, or underground environments are susceptible to loss of material due to pitting or crevice corrosion if the insulation contains certain contaminants. Leakage of fluids through mechanical connections such as bolted flanges and valve packing can result in contaminants leaching onto the component surface or the surfaces of other components below the component. For outdoor insulated SS and nickel alloy components, rain and changing weather conditions can result in moisture intrusion into the insulation.

Plant-specific OE and the condition of SS and nickel alloy components are evaluated to determine if prolonged exposure to the plant-specific environments has resulted in pitting or crevice corrosion. Loss of material due to pitting and crevice corrosion is not an aging effect requiring management for SS and nickel alloy components if (a) plant-specific OE does not reveal a history of loss of material due to pitting or crevice corrosion; and (b) a one-time inspection demonstrates that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the subsequent period of extended operation. The applicant documents the results of the plant-specific OE review in the SLRA.

In the environment of air-indoor controlled, pitting and crevice corrosion is only expected to occur as the result of a source of moisture and halides. Inspections focus on the most susceptible locations.

The GALL-SLR Report recommends further evaluation of SS and nickel alloy piping and piping components exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of loss of material due to pitting and crevice corrosion. GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that loss of material due to pitting and crevice corrosion is not occurring at a rate that will affect the intended function of the components. If loss of material due to pitting or crevice corrosion has occurred and is sufficient to potentially affect the intended function of an SSC, GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," describes an acceptable program to manage loss of material due to pitting or crevice corrosion. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in AMP XI.M32.

The applicant may establish that loss of material due to pitting and crevice corrosion is not an aging effect requiring management by demonstrating that a barrier coating isolates the component from aggressive environments. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating.

Evaluation

Plant-specific OE associated with stainless steel and nickel alloy piping, piping components in the reactor vessel, internals, and reactor coolant system has been evaluated to determine if prolonged exposure to air-indoor uncontrolled or condensation has resulted in loss of material due to pitting or crevice corrosion. Loss of material has not been identified as an aging effect at ONS for the stainless steel and nickel alloy components in these environments, or as a result of transportable halogens, indicating that these environments do not contain sufficient halides (e.g., chlorides) in the presence of moisture to result in loss of material.

[3.1.1-136] – The *One-Time Inspection* (B2.1.20) program will be implemented to demonstrate that the aging effect of loss of material is not occurring in stainless steel and nickel alloy piping, piping components exposed to air or condensation in the reactor vessel, internals, and reactor coolant system.

3.1.2.2.17 Quality Assurance for Aging Management of Non-Safety Related Components

NUREG-2192:

Acceptance criteria are described in BTP IQMB-1 (Appendix A.2 of this SRP-SLR). Evaluation

Quality Assurance provisions applicable to SLR are discussed in Appendix B1.3, Quality Assurance Program and Administrative Controls.

3.1.2.2.18 Ongoing Review of Operating Experience

NUREG-2192:

Acceptance criteria are described in Appendix A.4, "Operating Experience for Aging Management Programs."

Evaluation

The operating experience process and acceptance criteria are described in Appendix B1.4, Operating Experience.

Results Tables: Reactor Vessel, Internals, and Reactor Coolant System

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-001	Steel reactor vessel closure flange assembly components exposed to air-indoor uncontrolled	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 Metal Fatigue	Yes (SRP-SLR Section 3.1.2.2.1)	Consistent with NUREG-2191. Cumulative fatigue damage of steel reactor vessel closure flange assembly components exposed to air-indoor uncontrolled is a TLAA. See further evaluation in Section 3.1.2.2.1.
3.1.1-002	Nickel alloy tubes and sleeves exposed to reactor coolant, secondary feedwater/steam	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 Metal Fatigue	Yes (SRP-SLR Section 3.1.2.2.1)	Consistent with NUREG-2191. Cumulative fatigue damage of nickel alloy components exposed to reactor coolant or secondary feedwater/steam is a TLAA. See further evaluation in Section 3.1.2.2.1.
3.1.1-003	Stainless steel, nickel alloy reactor vessel internal components exposed to reactor coolant, neutron flux	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 Metal Fatigue	Yes (SRP-SLR Section 3.1.2.2.1)	Consistent with NUREG-2191. Cumulative fatigue damage of stainless steel reactor vessel internal components exposed to reactor coolant and neutron flux is a TLAA. See further evaluation in Section 3.1.2.2.1.
3.1.1-004	Steel pressure vessel support skirt and attachment welds	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 Metal Fatigue	Yes (SRP-SLR Section 3.1.2.2.1)	Consistent with NUREG-2191. Cumulative fatigue damage of steel reactor vessel support skirt components exposed to air-indoor uncontrolled is a TLAA. See further evaluation in Section 3.1.2.2.1.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-005	Steel, stainless steel, steel (with stainless steel or nickel alloy cladding) steam generator components, pressurizer relief tank components, piping components, bolting	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 Metal Fatigue	Yes (SRP-SLR Section 3.1.2.2.1)	Consistent with NUREG-2191. Cumulative fatigue damage of steel or stainless steel components is a TLAA. See further evaluation in Section 3.1.2.2.1.
3.1.1-006	Stainless steel, steel (with or without nickel alloy or stainless steel cladding), nickel alloy reactor coolant pressure boundary components: piping, piping components; other pressure retaining components exposed to reactor coolant	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 Metal Fatigue	Yes (SRP-SLR Section 3.1.2.2.1)	Not applicable - BWR only
3.1.1-007	Stainless steel, steel (with or without nickel alloy or stainless steel cladding), nickel alloy reactor vessel components: nozzles; penetrations; safe ends; thermal sleeves; vessel shells, heads and welds exposed to reactor coolant	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 Metal Fatigue	Yes (SRP-SLR Section 3.1.2.2.1)	Not applicable - BWR only

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-008	Stainless steel, steel (with or without nickel alloy or stainless steel cladding), nickel alloy steam generator components exposed to reactor coolant	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 Metal Fatigue	Yes (SRP-SLR Section 3.1.2.2.1)	Consistent with NUREG-2191. Cumulative fatigue damage of stainless steel, steel (with nickel alloy or stainless steel cladding) or nickel alloy steam generator components exposed to reactor coolant is a TLAA. See further evaluation in Section 3.1.2.2.1.
3.1.1-009	Stainless steel, steel (with or without nickel alloy or stainless steel cladding), nickel alloy reactor coolant pressure boundary piping, piping components; other pressure retaining components exposed to reactor coolant	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 Metal Fatigue	Yes (SRP-SLR Section 3.1.2.2.1)	Consistent with NUREG-2191. Cumulative fatigue damage of stainless steel or steel (with stainless steel cladding) reactor coolant pressure boundary components exposed to reactor coolant is a TLAA. See further evaluation in Section 3.1.2.2.1.
3.1.1-010	Steel (with or without nickel alloy or stainless steel cladding), stainless steel, or nickel alloy reactor vessel components: nozzles; penetrations; pressure housings; safe ends; thermal sleeves; vessel shells, heads and welds exposed to reactor coolant	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 Metal Fatigue	Yes (SRP-SLR Section 3.1.2.2.1)	Consistent with NUREG-2191. Cumulative fatigue damage of steel (with stainless steel cladding), stainless steel or nickel alloy reactor vessel components exposed to reactor coolant is a TLAA. See further evaluation in Section 3.1.2.2.1.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-011	Steel or stainless steel pump and valve closure bolting exposed to high temperatures and thermal cycles	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 Metal Fatigue	Yes (SRP-SLR Section 3.1.2.2.1)	Consistent with NUREG-2191. Cumulative fatigue damage of steel or stainless steel pump and valve closure bolting exposed to high temperatures and thermal cycles is a TLAA. See further evaluation in Section 3.1.2.2.1.
3.1.1-012	Steel steam generator components: upper and lower shells, transition cone; new transition cone closure weld exposed to secondary feedwater or steam	Loss of material due to general, pitting, crevice corrosion	AMP XI.M1, “ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD,” and AMP XI.M2, “Water Chemistry”	Yes (SRP-SLR Sections 3.1.2.2.2.1 and 3.1.2.2.2.2)	Not applicable to ONS Steam Generators. The associated NUREG-2191 aging items are not used.
3.1.1-013	Steel (with or without stainless steel or nickel alloy cladding) reactor vessel beltline shell, nozzle, and weld components exposed to reactor coolant and neutron flux	Loss of fracture toughness due to neutron irradiation embrittlement	TLAA, SRP-SLR Section 4.2 Reactor Pressure Vessel Neutron Embrittlement	Yes (SRP-SLR Section 3.1.2.2.3.1)	Consistent with NUREG-2191. Loss of fracture toughness of steel (with stainless steel cladding) reactor vessel components exposed to reactor coolant and neutron flux is a TLAA. See further evaluation in Section 3.1.2.2.3.1.
3.1.1-014	Steel (with or without cladding) reactor vessel beltline shell, nozzle, and weld components; exposed to reactor coolant and neutron flux	Loss of fracture toughness due to neutron irradiation embrittlement	AMP XI.M31, “Reactor Vessel Material Surveillance,” and X.M2, “Neutron Fluence Monitoring”	Yes (SRP-SLR Section 3.1.2.2.3.2)	Consistent with NUREG-2191 with exceptions. See further evaluation in Section 3.1.2.2.3.2. Exceptions apply to the NUREG-2191 recommendations for the *Reactor Vessel Material Surveillance* (B2.1.19) program implementation.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-015	Stainless steel Babcock & Wilcox (including CASS, martensitic SS, and PH SS) and nickel alloy reactor vessel internal components exposed to reactor coolant and neutron flux	Reduction in fracture toughness due to neutron irradiation	TLAA, SRP-SLR Section 4.7 Other Plant-Specific TLAAs	Yes (SRP-SLR Section 3.1.2.2.3.3)	Consistent with NUREG-2191. Reduction in fracture toughness due to neutron irradiation is a TLAA. See further evaluation in Section 3.1.2.2.3.
3.1.1-016	Stainless steel or nickel alloy reactor vessel top head enclosure flange leakage detection line exposed to air-indoor uncontrolled, reactor coolant leakage	Cracking due to SCC, IGSCC	AMP XI.M32, "One-Time Inspection," or AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	Yes (SRP-SLR Section 3.1.2.2.4.1)	Not applicable - BWR only.
3.1.1-017	Stainless steel isolation condenser components exposed to reactor coolant	Cracking due to SCC, IGSCC	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD," and AMP XI.M2, "Water Chemistry"	Yes (SRP-SLR Section 3.1.2.2.4.2)	Not Applicable - BWR only
3.1.1-018	Reactor vessel shell fabricated of SA508-Cl 2 forgings clad with stainless steel using a high-heat-input welding process exposed to reactor coolant	Crack growth due to cyclic loading	TLAA, SRP-SLR Section 4.7 Other Plant-Specific TLAAs	Yes (SRP-SLR Section 3.1.2.2.5)	Consistent with NUREG-2191. Crack growth due to cyclic loading (underclad cracking) is a TLAA. See further evaluation in Section 3.1.2.2.5.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-019	Stainless steel reactor vessel bottom-mounted instrument guide tubes (external to reactor vessel) exposed to reactor coolant	Cracking due to stress corrosion cracking	Plant-specific aging management program	Yes (SRP-SLR Section 3.1.2.2.6.1)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock and Wilcox reactors. The associated NUREG-2191 aging items are not used.
3.1.1-020	Cast austenitic stainless steel Class 1 piping, piping components exposed to reactor coolant	Cracking due to stress corrosion cracking	AMP XI.M2, “Water Chemistry” and plant-specific aging management program	Yes (SRP-SLR Section 3.1.2.2.6.2)	Consistent with NUREG-2191. Cracking of cast austenitic stainless steel Class 1 piping, piping components exposed to reactor coolant is managed by the *ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD* (B2.1.1) program and the *Water Chemistry* (B2.1.2) program. See further evaluation in Section 3.1.2.2.6.2.
3.1.1-021	Steel and stainless steel isolation condenser components exposed to reactor coolant	Cracking due to cyclic loading	AMP XI.M1, “ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD”	Yes (SRP-SLR Section 3.1.2.2.7)	Not applicable - BWR only.
3.1.1-022	Steel steam generator feedwater impingement plate and support exposed to secondary feedwater	Loss of material due to erosion	Plant-specific aging management program	Yes (SRP-SLR Section 3.1.2.2.8)	Not applicable to ONS steam generators. The associated NUREG-2191 aging items are not used.
3.1.1-025	Steel (with nickel alloy cladding) or nickel alloy steam generator primary side components: divider plate and tube-to-tube sheet welds exposed to reactor coolant	Cracking due to primary water stress corrosion cracking	AMP XI.M2, “Water Chemistry”, and AMP XI.M19, “Steam Generators.” In addition, a plant-specific program is to be evaluated.	Yes (SRP-SLR Sections 3.1.2.2.11.1 and 3.1.2.2.11.2)	Consistent with NUREG-2191. See further evaluation in Section 3.1.2.2.11.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-028	Westinghouse-specific "Existing Programs" components: Stainless steel, nickel alloy, and X-750 control rod guide tube support pins (split pins) exposed to reactor coolant and neutron flux.	Loss of material due to wear; cracking due to stress corrosion cracking, IASCC, fatigue	AMP XI.M16A, "PWR Vessel Internals," and AMP XI.M2, "Water Chemistry" (for stress corrosion cracking mechanisms only)	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock and Wilcox reactors. The associated NUREG-2191 aging items are not used.
3.1.1-029	Nickel alloy core shroud and core plate access hole cover (welded covers) exposed to reactor coolant	Cracking due to stress corrosion cracking, IGSCC, IASCC	AMP XI.M9, "BWR Vessel Internals," and AMP XI.M2, "Water Chemistry"	Yes (SRP-SLR Section 3.1.2.2.12)	Not applicable - BWR only
3.1.1-030	Stainless steel, nickel alloy penetration: drain line exposed to reactor coolant	Cracking due to stress corrosion cracking, IGSCC, cyclic loading	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD," and AMP XI.M2, "Water Chemistry" (stress corrosion cracking, IGSCC mechanisms only)	No	Not applicable - BWR only
3.1.1-031	Steel and stainless steel isolation condenser components exposed to reactor coolant	Loss of material due to general (steel only), pitting, crevice corrosion, wear	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD," and AMP XI.M2, "Water Chemistry"	No	Not applicable - BWR only

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-033	Stainless steel, steel with stainless steel cladding Class 1 reactor coolant pressure boundary components exposed to reactor coolant	Cracking due to stress corrosion cracking	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD," and AMP XI.M2, "Water Chemistry"	No	Consistent with NUREG-2191.
3.1.1-034	Stainless steel, steel with stainless steel cladding pressurizer relief tank (tank shell and heads, flanges, nozzles) exposed to treated borated water >60°C (>140°F)	Cracking due to stress corrosion cracking	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD," and AMP XI.M2, "Water Chemistry"	No	Not applicable. The tank performing this function at ONS is called the quench tank, and is evaluated as part of the Coolant Storage System. The associated NUREG-2191 aging items are not used.
3.1.1-035	Stainless steel, steel with stainless steel cladding reactor coolant system cold leg, hot leg, surge line, and spray line piping and fittings exposed to reactor coolant	Cracking due to cyclic loading	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD"	No	Consistent with NUREG-2191.
3.1.1-036	Steel, stainless steel pressurizer integral support exposed to any environment	Cracking due to cyclic loading	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD"	No	Consistent with NUREG-2191.
3.1.1-037	Steel reactor vessel flange	Loss of material due to wear	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD"	No	Consistent with NUREG-2191.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-038	Cast austenitic stainless steel Class 1 valve bodies and bonnets exposed to reactor coolant >250 °C (>482 °F)	Loss of fracture toughness due to thermal aging embrittlement	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD"	No	Consistent with NUREG-2191.
3.1.1-039	Stainless steel, steel (with or without nickel alloy or stainless steel cladding), nickel alloy Class 1 piping, fittings and branch connections < NPS 4 exposed to reactor coolant	Cracking due to stress corrosion cracking (for stainless steel or nickel alloy surfaces exposed to reactor coolant only), IGSCC (for stainless steel or nickel alloy surfaces exposed to reactor coolant only), or thermal, mechanical, or vibratory loading	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD," AMP XI.M2, "Water Chemistry," and XI.M35, "ASME Code Class 1 Small-Bore Piping"	No	Consistent with NUREG-2191.
3.1.1-040	Steel with stainless steel or nickel alloy cladding; or stainless steel pressurizer components exposed to reactor coolant	Cracking due to cyclic loading	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD"	No	Consistent with NUREG-2191.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-040a	Nickel alloy core support pads; core guide lugs exposed to reactor coolant	Cracking due to primary water stress corrosion cracking	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD," and AMP XI.M2, "Water Chemistry"	No	Consistent with NUREG-2191.
3.1.1-041	Nickel alloy core shroud and core plate access hole cover (mechanical covers) exposed to reactor coolant	Cracking due to stress corrosion cracking, IGSCC, IASCC	AMP XI.M9, "BWR Vessel Internals," and AMP XI.M2, "Water Chemistry"	Yes (SRP-SLR Section 3.1.2.2.12)	Not applicable - BWR only.
3.1.1-042	Steel with stainless steel or nickel alloy cladding; stainless steel primary side components; steam generator upper and lower heads, and tube sheet welds; pressurizer components exposed to reactor coolant	Cracking due to stress corrosion cracking, primary water stress corrosion cracking	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD," and AMP XI.M2, "Water Chemistry"	No	Consistent with NUREG-2191.
3.1.1-043	Stainless steel and nickel alloy reactor vessel internals exposed to reactor coolant	Loss of material due to pitting, crevice corrosion	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD," and AMP XI.M2, "Water Chemistry"	No	Not applicable - BWR only.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-044	Steel steam generator secondary manway and handhole cover seating surfaces exposed to treated water, steam	Loss of material due to erosion	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD"	No	Consistent with NUREG-2191.
3.1.1-045	Nickel alloy, steel with nickel alloy cladding reactor coolant pressure boundary components exposed to reactor coolant	Cracking due to primary water stress corrosion cracking	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC and IWD," and AMP XI.M2, "Water Chemistry," and, for nickel-alloy, AMP XI.M11B, "Cracking of Nickel-Alloy Components and Loss of Material Due to Boric Acid-induced Corrosion in RCPB Components (PWRs Only)"	No	Consistent with NUREG-2191.
3.1.1-046	Stainless steel, nickel alloy control rod drive head penetration pressure housings, reactor vessel nozzles, nozzle safe ends and welds exposed to reactor coolant	Cracking due to stress corrosion cracking, primary water stress corrosion cracking	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC and IWD," and AMP XI.M2, "Water Chemistry," and, for nickel-alloy, AMP XI.M11B, "Cracking of Nickel-Alloy Components and Loss of Material Due to Boric Acid-induced corrosion in RCPB Components (PWRs Only)"	No	Consistent with NUREG-2191.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-047	Stainless steel, nickel alloy control rod drive head penetration pressure housing exposed to reactor coolant	Cracking due to stress corrosion cracking, primary water stress corrosion cracking	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC and IWD," and AMP XI.M2, "Water Chemistry"	No	Consistent with NUREG-2191.
3.1.1-048	Steel external surfaces: reactor vessel top head, reactor vessel bottom head, reactor coolant pressure boundary piping or components adjacent to dissimilar metal (Alloy 82/182) welds exposed to air with borated water leakage	Loss of material due to boric acid corrosion	AMP XI.M10, "Boric Acid Corrosion," and AMP XI.M11B, "Cracking of Nickel-Alloy Components and Loss of Material Due to Boric Acid- Induced Corrosion in RCPB Components (PWRs Only)"	No	Consistent with NUREG-2191.
3.1.1-049	Steel reactor vessel, piping, piping components in the reactor coolant pressure boundary of PWRs, and applicable exterior attachments, or steel steam generators in PWRs: external surfaces or closure bolting exposed to air with borated water leakage	Loss of material due to boric acid corrosion	AMP XI.M10, "Boric Acid Corrosion"	No	Consistent with NUREG-2191.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-050	Cast austenitic stainless steel Class 1 piping, piping components (including pump casings and control rod drive pressure housings) exposed to reactor coolant >250 °F (>482 °C)	Loss of fracture toughness due to thermal aging embrittlement	AMP XI.M12, “Thermal Aging Embrittlement of Cast Austenitic Stainless Steel (CASS)”	No	Consistent with NUREG-2191.
3.1.1-051a	Stainless steel, nickel alloy Babcock & Wilcox reactor internal Primary components exposed to reactor coolant, neutron flux	Cracking due to stress corrosion cracking, IASCC, fatigue	AMP XI.M16A, “PWR Vessel Internals,” and AMP XI.M2, “Water Chemistry” (for stress corrosion cracking mechanisms only)	Yes (SRP-SLR Section 3.1.2.2.9)	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *PWR Vessel Internals* (B2.1.7) program implementation.
3.1.1-051b	Stainless steel, nickel alloy Babcock & Wilcox reactor internal Expansion components exposed to reactor coolant, neutron flux	Cracking due to stress corrosion cracking, IASCC, fatigue, overload	AMP XI.M16A, “PWR Vessel Internals,” and AMP XI.M2, “Water Chemistry” (for stress corrosion cracking mechanisms only)	Yes (SRP-SLR Section 3.1.2.2.9)	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *PWR Vessel Internals* (B2.1.7) program implementation.
3.1.1-052a	Stainless steel, nickel alloy Combustion Engineering reactor internal Primary components exposed to reactor coolant, neutron flux	Cracking due to stress corrosion cracking, IASCC, fatigue	AMP XI.M16A, “PWR Vessel Internals,” and AMP XI.M2, “Water Chemistry” (for stress corrosion cracking mechanisms only)	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-052b	Stainless steel, nickel alloy Combustion Engineering reactor internal Expansion components exposed to reactor coolant, neutron flux	Cracking due to stress corrosion cracking, IASCC, fatigue	AMP XI.M16A, “PWR Vessel Internals,” and AMP XI.M2, “Water Chemistry” (for stress corrosion cracking mechanisms only)	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.
3.1.1-052c	Stainless steel, nickel alloy Combustion Engineering reactor internal Existing Programs components exposed to reactor coolant, neutron flux	Cracking due to stress corrosion cracking, IASCC, fatigue	AMP XI.M16A, “PWR Vessel Internals,” and AMP XI.M2, “Water Chemistry” (for stress corrosion cracking mechanisms only)	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.
3.1.1-053a	Stainless steel, nickel alloy Westinghouse reactor internal Primary components exposed to reactor coolant, neutron flux	Cracking due to stress corrosion cracking, IASCC, fatigue	AMP XI.M16A, “PWR Vessel Internals,” and AMP XI.M2, “Water Chemistry” (for stress corrosion cracking mechanisms only)	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.
3.1.1-053b	Stainless steel Westinghouse reactor internal Expansion components exposed to reactor coolant and neutron flux	Cracking due to stress corrosion cracking, IASCC, fatigue	AMP XI.M16A, “PWR Vessel Internals,” and AMP XI.M2, “Water Chemistry” (for stress corrosion cracking mechanisms only)	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.
3.1.1-053c	Stainless steel, nickel alloy Westinghouse reactor internal Existing Programs components exposed to reactor coolant, neutron flux	Cracking due to stress corrosion cracking, IASCC, fatigue	AMP XI.M16A, “PWR Vessel Internals,” and AMP XI.M2, “Water Chemistry” (for stress corrosion cracking mechanisms only)	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-054	Stainless steel Westinghouse-design bottom mounted instrument system flux thimble tubes (with or without chrome plating) exposed to reactor coolant and neutron flux	Loss of material due to wear	AMP XI.M37, “Flux Thimble Tube Inspection”	No	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.
3.1.1-055a	Stainless steel, nickel alloy Babcock and Wilcox reactor internal No Additional Measures components exposed to reactor coolant, neutron flux	No additional aging management for reactor internal No Additional Measures components unless required by ASME Section XI, Examination Category B-N-3 or relevant operating experience exists	AMP XI.M16A, “PWR Vessel Internals”	Yes (SRP-SLR Section 3.1.2.2.9)	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *PWR Vessel Internals* (B2.1.7) program implementation.
3.1.1-055b	Stainless steel, nickel alloy Combustion Engineering reactor internal No Additional Measures components exposed to reactor coolant, neutron flux	No additional aging management for reactor internal No Additional Measures components unless required by ASME Section XI, Examination Category B-N-3 or relevant operating experience exists	AMP XI.M16A, “PWR Vessel Internals”	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-055c	Stainless steel, nickel alloy Westinghouse reactor internal No Additional Measures components exposed to reactor coolant, neutron flux	No additional aging management for reactor internal No Additional Measures components unless required by ASME Section XI, Examination Category B-N-3 or relevant operating experience exists	AMP XI.M16A, "PWR Vessel Internals"	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.
3.1.1-056a	Stainless steel (SS, including CASS, PH SS or martensitic SS) or nickel alloy Combustion Engineering reactor internal Primary components exposed to reactor coolant and neutron flux	Loss of fracture toughness due to neutron irradiation embrittlement and for CASS, martensitic SS, and PH SS due to thermal aging embrittlement; changes in dimensions due to void swelling, distortion; loss of preload due to thermal and irradiation-enhanced stress relaxation, creep; loss of material due to wear	AMP XI.M16A, "PWR Vessel Internals"	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-056b	Stainless steel (SS, including CASS, PH SS or martensitic SS) Combustion Engineering Expansion reactor internal components exposed to reactor coolant and neutron flux	Loss of fracture toughness due to neutron irradiation embrittlement and for CASS, martensitic SS, and PH SS due to thermal aging embrittlement; changes in dimensions due to void swelling, distortion; loss of preload due to thermal and irradiation-enhanced stress relaxation, creep; loss of material due to wear	AMP XI.M16A, “PWR Vessel Internals”	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-056c	Stainless steel (SS, including CASS, PH SS or martensitic SS) or nickel alloy Combustion Engineering reactor internal Existing Programs components exposed to reactor coolant and neutron flux	Loss of fracture toughness due to neutron irradiation embrittlement and for CASS, martensitic SS, and PH SS due to thermal aging embrittlement; changes in dimensions due to void swelling, distortion; loss of preload due to thermal and irradiation-enhanced stress relaxation, creep; loss of material due to wear	AMP XI.M16A, “PWR Vessel Internals”	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-058a	Stainless steel (SS, including CASS, PH SS or martensitic SS), nickel alloy Babcock & Wilcox reactor internal "Primary" components exposed to reactor coolant and neutron flux	Loss of fracture toughness due to neutron irradiation embrittlement and for CASS, martensitic SS, and PH SS due to thermal aging embrittlement; or changes in dimensions due to void swelling or distortion; or loss of preload due to wear; or loss of material due to wear	AMP XI.M16A, "PWR Vessel Internals"	Yes (SRP-SLR Section 3.1.2.2.9)	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *PWR Vessel Internals* (B2.1.7) program implementation.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-058b	Stainless steel (SS, including CASS, PH SS or martensitic SS), nickel alloy Babcock & Wilcox reactor internal Expansion components exposed to reactor coolant and neutron flux	Loss of fracture toughness due to neutron irradiation embrittlement and for CASS, martensitic SS, and PH SS due to thermal aging embrittlement; or changes in dimensions due to void swelling, or distortion; or loss of preload due to thermal and irradiation-enhanced stress relaxation, or creep; or loss of material due to wear	AMP XI.M16A, "PWR Vessel Internals"	Yes (SRP-SLR Section 3.1.2.2.9)	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *PWR Vessel Internals* (B2.1.7) program implementation.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-059a	Stainless steel (SS, including CASS, PH SS or martensitic SS) or nickel alloy Westinghouse reactor internal Primary components exposed to reactor coolant and neutron flux	Loss of fracture toughness due to neutron irradiation embrittlement and for CASS, martensitic SS, and PH SS due to thermal aging embrittlement; changes in dimensions due to void swelling, distortion; loss of preload due to thermal and irradiation-enhanced stress relaxation, creep; loss of material due to wear	AMP XI.M16A, “PWR Vessel Internals”	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-059b	Stainless steel (SS, including CASS, PH SS or martensitic SS) Westinghouse reactor internal Expansion components exposed to reactor coolant and neutron flux	Loss of fracture toughness due to neutron irradiation embrittlement and for CASS, martensitic SS, and PH SS due to thermal aging embrittlement; changes in dimensions due to void swelling, distortion; loss of preload due to thermal and irradiation-enhanced stress relaxation, creep; loss of material due to wear	AMP XI.M16A, “PWR Vessel Internals”	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-059c	Stainless steel (SS, including CASS, PH SS or martensitic SS), nickel alloy, or stellite Westinghouse reactor internal "Existing Programs" components exposed to reactor coolant and neutron flux	Loss of fracture toughness due to neutron irradiation embrittlement and for CASS, martensitic SS, and PH SS due to thermal aging embrittlement; changes in dimensions due to void swelling, distortion; loss of preload due to thermal and irradiation-enhanced stress relaxation, creep; loss of material due to wear	AMP XI.M16A, "PWR Vessel Internals"	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. ONS Units 1, 2 and 3 utilize Babcock & Wilcox reactors. The associated NUREG-2191 aging items are not used.
3.1.1-060	Steel piping, piping components exposed to reactor coolant	Wall thinning due to flow-accelerated corrosion	AMP XI.M17, "Flow-Accelerated Corrosion"	No	Not applicable - BWR only
3.1.1-061	Steel steam generator steam nozzle and safe end, feedwater nozzle and safe end. AFW nozzles and safe ends exposed to secondary feedwater/steam	Wall thinning due to flow-accelerated corrosion	AMP XI.M17, "Flow-Accelerated Corrosion"	No	Consistent with NUREG-2191.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-062	High-strength steel, stainless steel closure bolting; stainless steel control rod drive head penetration flange bolting exposed to air-indoor uncontrolled	Cracking due to stress corrosion cracking	AMP XI.M18, "Bolting Integrity"	No	Consistent with NUREG-2191.
3.1.1-063	Steel or stainless steel closure bolting exposed to air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion, wear	AMP XI.M18, "Bolting Integrity"	No	Not applicable - BWR only.
3.1.1-064	Steel or stainless steel closure bolting exposed to air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion, wear	AMP XI.M18, "Bolting Integrity"	No	Consistent with NUREG-2191.
3.1.1-065	Stainless steel control rod drive head penetration flange bolting exposed to air - indoor uncontrolled	Loss of material due to wear	AMP XI.M18, "Bolting Integrity"	No	Not applicable. ONS has no stainless steel control rod drive head penetration flange bolting exposed to air-indoor uncontrolled in the Reactor Vessel, Internals, and Reactor Coolant System. The associated NUREG-2191 aging items are not used.
3.1.1-066	Steel, stainless steel closure bolting; stainless steel control rod drive head penetration flange bolting exposed to air-indoor uncontrolled	Loss of preload due to thermal effects, gasket creep, self-loosening	AMP XI.M18, "Bolting Integrity"	No	Consistent with NUREG-2191.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-067	Steel or stainless steel closure bolting exposed to air - indoor uncontrolled (external)	Loss of preload due to thermal effects, gasket creep, self-loosening	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191.
3.1.1-068	Nickel alloy steam generator tubes exposed to secondary feedwater or steam	Changes in dimension (denting) due to corrosion of carbon steel tube support plate.	AMP XI.M19, “Steam Generators,” and AMP XI.M2, “Water Chemistry”	No	Not applicable. ONS has stainless steel tube support plates that do no promote formation of corrosion products that cause denting.
3.1.1-069	Nickel alloy steam generator tubes and sleeves exposed to secondary feedwater or steam	Cracking due to outer diameter stress corrosion cracking, intergranular attack	AMP XI.M19, “Steam Generators,” and AMP XI.M2, “Water Chemistry”	No	Consistent with NUREG-2191.
3.1.1-070	Nickel alloy steam generator tubes, repair sleeves, and tube plugs exposed to reactor coolant	Cracking due to primary water stress corrosion cracking	AMP XI.M19, “Steam Generators,” and AMP XI.M2, “Water Chemistry”	No	Consistent with NUREG-2191.
3.1.1-071	Steel, chrome plated steel, stainless steel, nickel alloy steam generator U-bend supports including antivibration bars exposed to secondary feedwater or steam	Cracking due to stress corrosion cracking or other mechanism(s); loss of material due general (steel only), pitting, crevice corrosion	AMP XI.M19, “Steam Generators,” and AMP XI.M2, “Water Chemistry”	No	Not applicable to ONS steam generators. The associated NUREG-2191 aging items are not used.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-072	Steel steam generator tube support plate, tube bundle wrapper, supports and mounting hardware exposed to secondary feedwater or steam	Loss of material due to general, pitting, crevice corrosion, erosion, ligament cracking due to corrosion	AMP XI.M19, "Steam Generators," and AMP XI.M2, "Water Chemistry" (corrosion based aging effects and mechanisms only)	No	Consistent with NUREG-2191.
3.1.1-073	Nickel alloy steam generator tubes and sleeves exposed to phosphate chemistry in secondary feedwater or steam	Loss of material due to wastage, pitting corrosion	AMP XI.M19, "Steam Generators," and AMP XI.M2, "Water Chemistry"	No	Not applicable to ONS steam generators. The associated NUREG-2191 aging items are not used.
3.1.1-074	Steel steam generator upper assembly and separators including feedwater inlet ring and support exposed to secondary feedwater or steam	Wall thinning due to flow-accelerated corrosion	AMP XI.M19, "Steam Generators," and AMP XI.M2, "Water Chemistry"	No	Not applicable to ONS steam generators. The associated NUREG-2191 aging items are not used.
3.1.1-075	Steel steam generator tube support lattice bars exposed to secondary feedwater or steam	Wall thinning due to flow-accelerated corrosion, general corrosion	AMP XI.M19, "Steam Generators," and AMP XI.M2, "Water Chemistry"	No	Not applicable to ONS steam generators. The associated NUREG-2191 aging items are not used.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-076	Steel, chrome plated steel, stainless steel, nickel alloy steam generator U-bend supports including anti-vibration bars exposed to secondary feedwater or steam	Loss of material due to wear, fretting	AMP XI.M19, “Steam Generators”	No	Not applicable to ONS steam generators. The associated NUREG-2191 aging items are not used.
3.1.1-077	Nickel alloy steam generator tubes and sleeves exposed to secondary feedwater or steam	Loss of material due to wear, fretting	AMP XI.M19, “Steam Generators”	No	Consistent with NUREG-2191.
3.1.1-078	Nickel alloy steam generator components such as, secondary side nozzles (vent, drain, and instrumentation) exposed to secondary feedwater or steam	Cracking due to SCC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection,” or AMP XI.M1, “ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD”	No	Consistent with NUREG-2191.
3.1.1-079	Stainless steel; steel with nickel alloy or stainless steel cladding; and nickel alloy reactor coolant pressure boundary components exposed to reactor coolant	Loss of material due to pitting, crevice corrosion	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable - BWR only.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-080	Stainless steel or steel with stainless steel cladding pressurizer relief tank: tank shell and heads, flanges, nozzles (none-ASME Section XI components) exposed to treated borated water >60°C (>140°F)	Cracking due to stress corrosion cracking	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Not applicable. The ONS tank performing this function is called the quench tank, and is addressed with the Condensate Storage System. The associated NUREG-2191 aging items are not used.
3.1.1-081	Stainless steel pressurizer spray head exposed to reactor coolant	Cracking due to stress corrosion cracking	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191.
3.1.1-082	Nickel alloy pressurizer spray head exposed to reactor coolant	Cracking due to stress corrosion cracking, primary water stress corrosion cracking	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Not applicable. The ONS pressurizer spray head is not constructed of nickel alloy. See item 3.1.1-081. The associated NUREG-2191 aging items are not used.
3.1.1-083	Steel steam generator shell assembly exposed to secondary feedwater or steam	Loss of material due to general, pitting, crevice corrosion	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191.
3.1.1-084	Steel top head enclosure (without cladding): top head, top head nozzles (vent, top head spray, RCIC, spare) exposed to reactor coolant	Loss of material due to general, pitting, crevice corrosion	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Not applicable - BWR only.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-085	Stainless steel, nickel alloy, and steel with nickel alloy or stainless steel cladding reactor vessel flanges, nozzles, penetrations, safe ends, vessel shells, heads and welds exposed to reactor coolant	Loss of material due to pitting, crevice corrosion	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable - BWR only.
3.1.1-086	Stainless steel steam generator primary side divider plate exposed to reactor coolant	Cracking due to SCC	AMP XI.M2, “Water Chemistry”	No	Not applicable to once through steam generators. The associated NUREG-2191 aging items are not used.
3.1.1-087	Stainless steel, nickel alloy PWR reactor internal components exposed to reactor coolant, neutron flux	Loss of material due to pitting, crevice corrosion	AMP XI.M2, “Water Chemistry”	No	Consistent with NUREG-2191.
3.1.1-088	Stainless steel; steel with nickel alloy or stainless steel cladding; and nickel alloy reactor coolant pressure boundary components exposed to reactor coolant	Loss of material due to pitting, crevice corrosion	AMP XI.M2, “Water Chemistry”	No	Consistent with NUREG-2191.
3.1.1-089	Steel piping, piping components exposed to closed-cycle cooling water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M21A, “Closed Treated Water Systems”	No	Not applicable. ONS has no stainless steel piping or piping components exposed to closed-cycle cooling water in the Reactor Vessel, Internals, and Reactor Coolant System. The associated NUREG-2191 aging items are not used.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-090	Copper alloy piping, piping components exposed to closed-cycle cooling water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M21A, "Closed Treated Water Systems"	No	Not applicable. ONS has no copper alloy piping or piping components exposed to closed-cycle cooling water in the Reactor Vessel, Internals, and Reactor Coolant System. The associated NUREG-2191 aging items are not used.
3.1.1-091	Steel (including high-strength steel) reactor vessel closure flange assembly components (including flanges, nut, studs, and washers) exposed to air-indoor uncontrolled	Cracking due to SCC; loss of material due to general, pitting, crevice corrosion, wear	AMP XI.M3, "Reactor Head Closure Stud Bolting"	No	Not applicable - BWR only.
3.1.1-092	Steel (including high-strength steel) reactor vessel closure flange assembly components (including flanges, nut, studs, and washers) exposed to air-indoor uncontrolled	Cracking due to SCC, IGSCC; loss of material due to general, pitting, crevice corrosion, wear	AMP XI.M3, "Reactor Head Closure Stud Bolting"	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Reactor Head Closure Stud Bolting* (B2.1.3) program implementation.
3.1.1-093	Copper alloy >15% Zn or >8% Al piping, piping components exposed to closed-cycle cooling water, treated water	Loss of material due to selective leaching	AMP XI.M33, "Selective Leaching"	No	Not applicable. ONS has no copper alloy >15% Zn or >8% Al piping or piping components exposed to closed-cycle cooling water or treated water in the Reactor Vessel, Internals, and Reactor Coolant System. The associated NUREG-2191 aging items are not used.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-094	Stainless steel and nickel alloy vessel shell attachment welds exposed to reactor coolant	Cracking due to stress corrosion cracking, IGSCC, cyclic loading	AMP XI.M4, "BWR Vessel ID Attachment Welds," and AMP XI.M2, "Water Chemistry" (stress corrosion cracking, IGSCC mechanisms only)	No	Not applicable - BWR only.
3.1.1-095	Steel (with or without stainless steel or nickel alloy cladding) feedwater nozzles exposed to reactor coolant	Cracking due to cyclic loading	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD"	No	Not applicable - BWR only.
3.1.1-096	Steel (with or without stainless steel cladding) control rod drive return line nozzles and their nozzle-to-vessel welds exposed to reactor coolant in BWR-3, BWR-4, BWR-5, and BWR-6 designs	Cracking due to stress corrosion cracking, IGSCC, cyclic loading	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD"	No	Not applicable - BWR only.
3.1.1-097	Stainless steel and nickel alloy piping, piping components greater than or equal to 4 NPS; nozzle safe ends and associated welds; control rod drive return line nozzle cap and associated cap-to-nozzle weld or cap-to-safe end weld in BWR-3, BWR 4, BWR 5, and BWR-6 designs	Cracking due to stress corrosion cracking, IGSCC	AMP XI.M7, "BWR Stress Corrosion Cracking," and AMP XI.M2, "Water Chemistry"	No	Not applicable - BWR only.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-098	Stainless steel, nickel alloy penetrations: instrumentation and standby liquid control exposed to reactor coolant	Cracking due to stress corrosion cracking, IGSCC, cyclic loading	AMP XI.M8, "BWR Penetrations," and AMP XI.M2, "Water Chemistry" (stress corrosion cracking, IGSCC mechanisms only)	No	Not applicable - BWR only.
3.1.1-099	Stainless steel (including cast austenitic stainless steel; PH martensitic stainless steel; martensitic stainless steel); nickel alloy (including X-750 alloy) reactor internal components exposed to reactor coolant and neutron flux	Loss of fracture toughness due to thermal aging, neutron irradiation embrittlement	AMP XI.M9, "BWR Vessel Internals"	Yes (SRP-SLR Section 3.1.2.2.13)	Not applicable - BWR only.
3.1.1-100	Stainless steel reactor vessel internals components (jet pump wedge surface) exposed to reactor coolant	Loss of material due to wear	AMP XI.M9, "BWR Vessel Internals"	Yes (SRP-SLR Section 3.1.2.2.13)	Not applicable - BWR only.
3.1.1-101	Stainless steel steam dryers exposed to reactor coolant	Cracking due to flow induced vibration, stress corrosion cracking, IGSCC; loss of material due to wear	AMP XI.M9, "BWR Vessel Internals"	No	Not applicable - BWR only

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-102	Stainless steel fuel supports and control rod drive assemblies control rod drive housing exposed to reactor coolant	Cracking due to stress corrosion cracking, IGSCC	AMP XI.M9, “BWR Vessel Internals,” and AMP XI.M2, “Water Chemistry”	No	Not applicable - BWR only
3.1.1-103	Stainless steel, nickel alloy reactor internal components exposed to reactor coolant and neutron flux	Cracking due to stress corrosion cracking, IGSCC, IASCC	AMP XI.M9, “BWR Vessel Internals,” and AMP XI.M2, “Water Chemistry”	Yes (SRP-SLR Section 3.1.2.2.12)	Not applicable - BWR only.
3.1.1-104	Nickel alloy reactor vessel internal components exposed to reactor coolant and neutron flux	Cracking due to IGSCC	AMP XI.M9, “BWR Vessel Internals,” and AMP XI.M2, “Water Chemistry”	No	Not applicable - BWR only
3.1.1-105	Steel piping, piping components exposed to concrete	None	None	Yes (SRP-SLR Section 3.1.2.2.15)	Not applicable. ONS has no stainless steel piping, piping components exposed to concrete in the Reactor Vessel, Internals, and Reactor Coolant System. The associated NUREG-2191 aging items are not used.
3.1.1-106	Nickel alloy piping, piping components exposed to air with borated water leakage	None	None	No	Consistent with NUREG-2191.
3.1.1-107	Stainless steel piping, piping components exposed to gas, air with borated water leakage	None	None	No	Consistent with NUREG-2191.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-110	Metallic piping, piping components exposed to reactor coolant	Wall thinning due to erosion	AMP XI.M17, "Flow Accelerated Corrosion"	No	Not applicable - BWR only.
3.1.1-111	Nickel alloy steam generator tubes exposed to secondary feedwater or steam	Reduction of heat transfer due to fouling	AMP XI.M2, "Water Chemistry," and AMP XI.M19, "Steam Generators"	No	Consistent with NUREG-2191.
3.1.1-113	Steel reactor vessel external attachments exposed to indoor, uncontrolled air	Loss of material due to general, pitting, crevice corrosion, wear	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD"	No	Not applicable - BWR only.
3.1.1-114	Reactor coolant system components defined as ASME Section XI Code Class components (ASME Code Class 1 reactor coolant pressure boundary components, reactor vessel interior attachments, or core support structure components, or ASME Class 2 or 3 components - including ASME defined appurtenances, component supports, and associated pressure boundary welds, or components subject to plant-specific equivalent classifications for these ASME code classes)	Cracking due to stress corrosion cracking, IGSCC, PWSCC, IASCC (stress corrosion cracking stainless steel, nickel alloy components only), fatigue or cyclic loading; loss of material due to general corrosion (steel only), pitting corrosion, crevice corrosion, or wear	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD," and AMP XI.M2, "Water Chemistry" (water chemistry-related or corrosion-related aging effect mechanisms only)	No	Not applicable. Cracking and loss of material of reactor coolant system components defined as ASME Section XI Code Class components (ASME Code Class 1 reactor coolant pressure boundary components or core support structure components, or ASME Class 2 or 3 components - including ASME defined appurtenances, component supports, and associated pressure boundary welds, or components subject to plant-specific equivalent classifications for these ASME code classes) is addressed in rows 3.1.1-020, 3.1.1-033, 3.3.1-037, 3.1.1-039, 3.1.1-042, 3.1.1-088, and 3.1.1-116. The associated NUREG-2191 aging items are not used.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-115	Stainless steel piping, piping components exposed to concrete	None	None	Yes (SRP-SLR Section 3.1.2.2.15)	Not applicable. ONS has no stainless steel piping, piping components exposed to concrete in the Reactor Vessel, Internals, and Reactor Coolant System. The associated NUREG-2191 aging items are not used.
3.1.1-116	Nickel alloy control rod drive penetration nozzles exposed to reactor coolant	Loss of material due to wear	Plant-specific aging management program	Yes (SRP-SLR Section 3.1.2.2.10.1)	Not applicable. B&W reactors have a different configuration that utilize a leadscrew support tube, leadscrew support nut, leadscrew support nut lock washer. The associated NUREG-2191 aging items are not used.
3.1.1-117	Stainless steel, nickel alloy control rod drive penetration nozzle thermal sleeves exposed to reactor coolant	Loss of material due to wear	Plant-specific aging management program	Yes (SRP-SLR Section 3.1.2.2.10.2)	Not applicable. B&W reactors have a different configuration that utilize a leadscrew support tube, leadscrew support nut, leadscrew support nut lock washer. The associated NUREG-2191 aging items are not used.
3.1.1-118	Stainless steel, nickel alloy PWR reactor vessel internal components exposed to reactor coolant, neutron flux	Cracking due to stress corrosion cracking, IASCC, cyclic loading, fatigue	Plant-specific aging management program or AMP XI.M16A, “PWR Vessel Internals,” and AMP XI.M2, “Water Chemistry” (SCC and IASCC only), with adjusted site-specific or component-specific aging management basis for a given component	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. Cracking of stainless steel and nickel alloy PWR reactor vessel internal components exposed to reactor coolant and neutron flux is addressed by items 3.1.1-051a and 3.1.1-051b. The associated NUREG-2191 aging items are not used. See further evaluation in Section 3.1.2.2.9.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-119	Stainless steel, nickel alloy, stellite PWR reactor vessel internal components or LRA/ SLRA specified reactor vessel internal component exposed to reactor coolant, neutron flux	Loss of fracture toughness due to neutron irradiation embrittlement or thermal aging embrittlement; changes in dimensions due to void swelling or distortion; loss of preload due to thermal and irradiation-enhanced stress relaxation or creep; loss of material due to wear	Plant-specific aging management program or AMP XI.M16A, "PWR Vessel Internals," with adjusted site-specific or component-specific aging management basis for a given component	Yes (SRP-SLR Section 3.1.2.2.9)	Not applicable. Loss of fracture toughness, changes in dimensions, loss of preload, and loss of material of stainless steel and nickel alloy PWR reactor vessel internal components exposed to reactor coolant and neutron flux are addressed by items 3.1.1-058a and 3.1.1-058b. The associated NUREG-2191 aging items are not used. See further evaluation in Section 3.1.2.2.9.
3.1.1-120	Stainless steel core plate rim holddown bolts exposed to reactor coolant and neutron flux	Loss of preload due to thermal or irradiation-enhanced stress relaxation	AMP XI.M9, "BWR Vessel Internals," and TLAA SRP-SLR 4.7 Other Plant-Specific TLAAs [if an analysis is performed as part of the aging management basis and conforms to the definition of a TLAA in 10 CFR 54.3(a)]	Yes (SRP-SLR Section 3.1.2.2.14)	Not applicable - BWR only.
3.1.1-121	Stainless steel jet pump assembly holddown beam bolts exposed to reactor coolant and neutron flux	Loss of preload due to thermal or irradiation-enhanced stress relaxation	AMP XI.M9, "BWR Vessel Internals"	No	Not applicable - BWR only.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-124	Steel piping, piping components exposed to air-indoor uncontrolled, air-outdoor, condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191.
3.1.1-125	Nickel alloy steam generator tubes at support plate locations exposed to secondary feedwater or steam	Cracking due to flow-induced vibration, high-cycle fatigue	AMP XI.M19, “Steam Generators”	No	Consistent with NUREG-2191.
3.1.1-127	Steel (with stainless steel or nickel alloy cladding) steam generator heads and tubesheets exposed to reactor coolant	Loss of material due to boric acid corrosion	AMP XI.M2, “Water Chemistry,” and AMP XI.M19, “Steam Generators”	No	Consistent with NUREG-2191.
3.1.1-128	Stainless steel, nickel alloy nozzles safe ends and welds: high pressure core spray; low pressure core spray; recirculating water, low pressure coolant injection or RHR injection mode exposed to reactor coolant	Cracking due to stress corrosion cracking, IGSCC	AMP XI.M7, “BWR Stress Corrosion Cracking,” and AMP XI.M2, “Water Chemistry”	No	Not applicable - BWR only.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-129	Steel and stainless steel piping, piping components exposed to reactor coolant: welded connections between the re-routed control rod drive return line and the inlet piping system that delivers return line flow to the reactor pressure vessel exposed to reactor coolant	Cracking due to cyclic loading	AMP XI.M1, “ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD”	No	Not applicable - BWR only.
3.1.1-133	Steel components exposed to treated water	Long-term loss of material due to general corrosion	AMP XI.M32, “One-Time Inspection”	No	Not applicable - BWR only.
3.1.1-134	Non-metallic thermal insulation exposed to air, condensation	Reduced thermal insulation resistance due to moisture intrusion	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191.

Table 3.1.1 Summary of Aging Management Programs for Reactor Vessel, Internals, and Reactor Coolant System Evaluated in Chapter IV of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.1.1-136	Stainless steel, nickel alloy piping, piping components exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.1.2.2.16)	Consistent with NUREG-2191. Loss of material of stainless steel and nickel alloy components exposed to air is managed by the *One-Time Inspection* (B2.1.20) program. See further evaluation in Section 3.1.2.2.16.
3.1.1-137	Copper alloy piping, piping components exposed to air, condensation, gas	None	None	No	Not applicable. ONS has no in-scope copper alloy piping, piping components exposed to air, condensation, gas in the Reactor Vessel, Internals, and Reactor Coolant System. The associated NUREG-2191 aging items are not used.
3.1.1-139	Stainless steel, nickel alloy reactor vessel top head enclosure flange leakage detection line exposed to air-indoor uncontrolled, reactor coolant leakage	Cracking due to stress corrosion cracking	AMP XI.M32, "One-Time Inspection," or AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	Yes (SRP-SLR Section 3.1.2.2.6.3)	Consistent with NUREG-2191 for the remaining leakage detection line, with exceptions. The vessel flange leak detection lines have been cut and capped on all three units. Cracking of the remaining stainless steel reactor vessel top head enclosure flange leakage detection line exposed to air-indoor uncontrolled is managed by the *One-Time Inspection* (B2.1.20) program. See further evaluation in Section 3.1.2.2.6.3.

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes

Plant Specific Notes:

1. The RPV support skirt is the critical location of the RPV support assembly and is not susceptible to irradiation embrittlement based on the NDT evaluation reported. The RPV support intended function will be maintained consistent with the CLB during the SPEO when considering damage due to irradiation.

Plant Specific Notes:

1. The only component items that were Expansion for 60 years and were changed to Primary for 80 years due to the increase in the severity of the age-related degradation mechanism are the core barrel cylinder (including the center circumferential weld) for IE and the lower grid rib section for IE.
2. The aging effect of loss of material due to wear is not applicable to this component.

						IV.C2.R-09	3.1.1- 033	A
				Cumulative Fatigue Damage	TLAA	IV.C2.R-223	3.1.1- 009	A
				Loss of Fracture Toughness	Thermal Aging Embrittlement of Cast Austenitic Stainless Steel (CASS) (B2.1.6)	IV.C2.R-52	3.1.1- 050	A, 3
				Loss of Material	Water Chemistry (B2.1.2)	IV.C2.RP-23	3.1.1- 088	A

Plant Specific Notes:

1. This component is associated with the Control Rod Drive Venting System. See drawings OSLRD-100A-1.5, -2.5, and -3.5.
2. This line item is associated with components containing lubricating oil wastage.
3. The operating temperature of the RCP covers, or stuffing boxes, is <482F, therefore it is not subject to thermal aging embrittlement.

Plant Specific Notes:

1. None.

Tables 3.1.2-1 through 3.1.2-4 Industry Standard Notes:

A. Consistent with NUREG-2191 item for component, material, environment, and aging effect. AMP is consistent with NUREG-2191 AMP.

B. Consistent with NUREG-2191 item for component, material, environment, and aging effect. AMP takes some exceptions to NUREG-2191 AMP.

C. Component is different, but consistent with NUREG-2191 item for material, environment, and aging effect. AMP is consistent with NUREG-2191 AMP.

D. Component is different, but consistent with NUREG-2191 item for material, environment, and aging effect. AMP takes some exceptions to the NUREG-2191 AMP.

E. Consistent with NUREG-2191 item for material, environment, and aging effect, but a different AMP is credited or NUREG-2191 identifies a plant-specific AMP.

F. Material not in NUREG-2191 for this component.

G. Environment not in NUREG-2191 for this component and material.

H. Aging effect not in NUREG-2191 for this component, material and environment combination.

I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.

J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

3.2 AGING MANAGEMENT OF ENGINEERED SAFETY FEATURES

3.2.1 INTRODUCTION

This section provides the results of the aging management review for those components identified in Section 2.3.2, Engineered Safety Features, as being subject to aging management review. The systems, or portions of systems, which are addressed in this section are described in the indicated sections.

- Reactor Building Spray (Section 2.3.2.1)
- Core Flood System (Section 2.3.2.2)
- High Pressure Injection System (Section 2.3.2.3)
- Low Pressure Injection System (Section 2.3.2.4)

3.2.2 RESULTS

The following tables summarize the results of the aging management review for Engineered Safety Features Systems.

- Table 3.2.2-1, Engineered Safety Features – Reactor Building Spray System - Aging Management Evaluation
- Table 3.2.2-2, Engineered Safety Features - Core Flood System - Aging Management Evaluation
- Table 3.2.2-3, Engineered Safety Features – High Pressure Injection System - Aging Management Evaluation
- Table 3.2.2-4, Engineered Safety Features – Low Pressure Injection System - Aging Management Evaluation

3.2.2.1 Materials, Environments, Aging Effects Requiring Management and Aging Management Programs

3.2.2.1.1 Reactor Building Spray System

Materials

Components in the Reactor Building Spray System are constructed of the following materials:

* Fiberglass
* Glass
* Stainless Steel
* Steel

Environments

Components in the Reactor Building Spray System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Treated Borated Water
* Treated Borated water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Reactor Building Spray System require aging management to address the following aging effects:

* Cracking
* Loss of Material
* Loss of Preload
* Reduced Thermal Insulation Resistance

Aging Management Programs

The aging effects for components in the Reactor Building Spray System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* One-Time Inspection (B2.1.20)
* Water Chemistry (B2.1.2)

3.2.2.1.2 Core Flood System

Materials

Components in the Core Flood System are constructed of the following materials:

* Stainless Steel
* Steel
* Steel (with Stainless Steel Cladding)

Environments

Components in the Core Flood System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Gas
* Treated Borated Water
* Treated Borated water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Core Flood System require aging management to address the following aging effects:

* Cracking
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Core Flood System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)

* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* One-Time Inspection (B2.1.20)
* Water Chemistry (B2.1.2)

3.2.2.1.3 High Pressure Injection System

Materials

Components in the High Pressure Injection System are constructed of the following materials:

* Cast Austenitic Stainless Steel
* Fiberglass
* Glass
* Stainless Steel
* Steel

Environments

Components in the High Pressure Injection System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Closed-Cycle Cooling Water
* Gas
* Treated Borated Water
* Treated Borated Water >250°C (>482°F)
* Treated Borated water >60°C (>140°F)

Aging Effects Requiring Management

Components in the High Pressure Injection System require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage
* Loss of Fracture Toughness
* Loss of Material

* Loss of Preload
* Reduced Thermal Insulation Resistance
* Wall Thinning

Aging Management Programs

The aging effects for components in the High Pressure Injection System are managed by the following AMPs:

* ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B2.1.1)
* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Flow-Accelerated Corrosion (B2.1.8)
* One-Time Inspection (B2.1.20)
* TLAA
* Water Chemistry (B2.1.2)

3.2.2.1.4 Low Pressure Injection System

Materials

Components in the Low Pressure Injection System are constructed of the following materials:

* Cast Austenitic Stainless Steel
* Fiberglass
* Glass
* Stainless Steel
* Steel
* Steel with Internal Coating/Lining

Environments

Components in the Low Pressure Injection System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Concrete
* Raw Water
* Treated Borated Water
* Treated Borated Water >250°C (>482°F)
* Treated Borated water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Low Pressure Injection System require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage
* Flow Blockage

* Long-Term Loss of Material
* Loss of Coating or Lining Integrity
* Loss of Fracture Toughness
* Loss of Material
* Loss of Preload
* Reduced Thermal Insulation Resistance
* Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Low Pressure Injection System are managed by the following AMPs:

* ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B2.1.1)
* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B2.1.27)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)
* Outdoor and Large Atmospheric Metallic Storage Tanks (B2.1.17)
* TLAA
* Water Chemistry (B2.1.2)

3.2.2.2 Further Evaluation of Aging Management as Recommended by NUREG-2192

NUREG-2192 provides the basis for identifying those programs that warrant further evaluation by the reviewer in the SLRA. For the engineered safety features, those evaluations are addressed in the following sections. Italicized text is taken directly from NUREG-2192.

3.2.2.2.1 Cumulative Fatigue Damage

NUREG-2192:

Evaluations involving time-dependent fatigue or cyclical loading parameters may be time-limited aging analyses (TLAAs), as defined in 10 CFR 54.3. TLAAs are required to be evaluated in accordance with 10 CFR 54.21(c)(1). This TLAA is addressed separately in Section 4.3, "Metal Fatigue," or Section 4.7, "Other Plant-Specific Time-Limited Aging Analyses," of this SRP-SLR. For plant-specific cumulative usage factor calculations that are based on stress-based input methods, the methods are to be appropriately defined and discussed in the applicable TLAAs.

Evaluation:

[3.2.1-001]: Fatigue of Engineered Safety Features components is a TLAA, as defined in 10 CFR 54.3. The evaluation of this TLAA is addressed in SLRA Section 4.3.3, "Non-Class 1 Piping Fatigue Analyses".

3.2.2.2.2 Loss of Material Due to Pitting and Crevice Corrosion in Stainless Steel and Nickel Alloys

NUREG-2192:

Loss of material due to pitting and crevice corrosion could occur in indoor or outdoor stainless steel (SS) and nickel alloy piping, piping components, and tanks exposed to any air, condensation, or underground environment when the component is: (a) uninsulated; (b) insulated; (c) in the vicinity of insulated components; or (d) in the vicinity of potentially transportable halogens. Loss of material due to pitting and crevice corrosion can occur on SS and nickel alloys in environments containing sufficient halides (e.g., chlorides) in the presence of moisture.

Insulated SS and nickel alloy components exposed to air, condensation, or underground environments are susceptible to loss of material due to pitting or crevice corrosion if the insulation contains certain contaminants. Leakage of fluids through mechanical connections such as bolted flanges and valve packing can result in contaminants leaching onto the component surface or the surfaces of other components below the component. For outdoor insulated SS and nickel alloy components, rain and changing weather conditions can result in moisture intrusion into the insulation.

Plant-specific operating experience (OE) and the condition of SS and nickel alloy components are evaluated to determine if prolonged exposure to the plant-specific environments has resulted in pitting or crevice corrosion. Loss of material due to pitting and crevice corrosion is not an aging effect requiring management for SS and nickel alloy components if (a) plant-specific OE does not reveal a history of loss of material due to pitting or crevice corrosion, and (b) a one-time inspection demonstrates that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the subsequent period of extended operation. The applicant documents the results of the plant-specific OE review in the SLRA.

In the environment of air-indoor controlled, pitting and crevice corrosion is only expected to occur as the result of a source of moisture and halides. Inspections focus on the most susceptible locations.

The GALL-SLR Report recommends further evaluation of SS and nickel alloy piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of loss of material due to pitting and crevice corrosion. The GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that loss of material due to pitting and crevice corrosion is not occurring at a rate that affects the intended function of the components. If loss of material due to pitting or crevice corrosion has occurred and is sufficient to potentially affect the intended function of systems, structures, and components (SSCs), the following AMPs describe acceptable programs to manage loss of material due to pitting or crevice corrosion: (a) the GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," for tanks; (b) the GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," for external surfaces of piping and piping components; (c) the GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," for underground piping, piping components and tanks; and (d) the GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, a one-time inspection would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in AMP XI.M32.

The applicant may establish that loss of material due to pitting and crevice corrosion is not an aging effect requiring management by demonstrating that a barrier coating isolates the component from aggressive environments. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating.

Evaluation:

A review of ONS OE confirmed that pitting and crevice corrosion has not occurred on external surfaces of stainless steel piping, piping components, and tanks exposed to air or condensation environments in the ONS engineered safety features systems.

[3.2.1-004]: The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion of stainless steel components exposed to air-indoor uncontrolled (external) is not occurring.

[3.2.1-048]: The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion of stainless steel components exposed to air-indoor uncontrolled (internal) is not occurring.

[3.2.1-099]: The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion of stainless steel tanks exposed to air-indoor uncontrolled environments is not occurring.

[3.2.1-106]: Not applicable. ONS has no stainless steel or nickel alloy tanks in the Engineered Safety Features systems within the scope of the *Outdoor and Large Atmospheric Metallic Storage Tanks* (B2.1.17) program.

[3.2.1-107]: The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion is not occurring in insulated stainless steel piping and piping components exposed to air-indoor uncontrolled environments.

[3.2.1-112]: Not applicable. ONS has no underground stainless steel or nickel alloy components in the scope of subsequent license renewal in Engineered Safety Features systems.

3.2.2.2.3 Loss of Material Due to General Corrosion and Flow Blockage Due to Fouling

NUREG-2192:

Loss of material due to general corrosion (as applicable) and flow blockage due to fouling for all materials can occur in the spray nozzles and flow orifices in the drywell and suppression chamber spray system exposed to air-indoor uncontrolled. This aging effect and mechanism will apply since the carbon steel piping upstream of the spray nozzles and flow orifices is occasionally wetted, even though the majority of the time this system is in standby. The wetting and drying of these components can accelerate corrosion in the system and lead to flow blockage from an accumulation of corrosion products. Aging effects sufficient to result in a loss of intended function are not anticipated if: (a) the applicant identifies those portions of the system that are normally dry but subject to periodic wetting; (b) plant-specific procedures exist to drain the normally dry portions that have been wetted during normal plant operation or inadvertently; (c) the plant-specific configuration of the drains and piping allow sufficient draining to empty the normally dry pipe; (d) plant-specific OE has not revealed loss of material or flow blockage due to *fouling; and (e) a one-time inspection is conducted to verify that loss of material or flow blockage due to fouling has not occurred. The GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to conduct the one-time inspections. The GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," describes an acceptable program to manage loss of material due to general corrosion and flow blockage due to fouling when the above conditions are not met.*

Evaluation:

Not applicable – BWR only.

3.2.2.2.4 Cracking Due to Stress Corrosion Cracking in Stainless Steel Alloys

NUREG-2192:

Cracking due to stress corrosion cracking (SCC) could occur in indoor or outdoor SS piping, piping components, and tanks exposed to any air, condensation, or underground environment when the component is: (a) uninsulated; (b) insulated; (c) in the vicinity of insulated components, or (d) in the vicinity of potentially transportable halogens. Cracking can occur in environments containing sufficient halides (e.g., chlorides) in the presence of moisture.

Insulated SS components exposed to indoor air, outdoor air, condensation, or underground environments are susceptible to SCC if the insulation contains certain contaminants. Leakage of fluids through bolted connections (e.g., flanges, valve packing) can result in contaminants present in the insulation leaching onto the component surface or the surfaces of other components below the component. For outdoor insulated SS components, rain and changing weather conditions can result in moisture intrusion into the insulation.

Plant-specific OE and the condition of SS components are evaluated to determine if prolonged exposure to the plant-specific environments has resulted in SCC. SCC in SS components is not an aging effect requiring management if (a) plant-specific OE does not reveal a history of SCC and (b) a one-time inspection demonstrates that the aging effect is not occurring.

In the environment of air-indoor controlled, SCC is only expected to occur as the result of a source of moisture and halides. Inspections focus on the most susceptible locations. The applicant documents the results of the plant-specific OE review in the SLRA.

The GALL-SLR Report recommends further evaluation of SS piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of SCC. The GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that SCC is not occurring. If SCC is applicable, the following AMPs describe acceptable programs to manage loss of material due to SCC: (a) the GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," for tanks; (b) the GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," for external surfaces of piping and piping components; (c) the

GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," for underground piping, piping components and tanks; and (d) the GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in AMP XI.M32.

The applicant may establish that SCC is not an aging effect requiring management for all components, by demonstrating that a barrier coating isolates the component from aggressive environments. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. The GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating.

Evaluation:

A review of ONS OE confirmed that stress corrosion cracking has not occurred on external surfaces of stainless steel piping, piping components, and tanks exposed to air or condensation environments in the ONS engineered safety features systems or in reactor vessel, internals, and reactor coolant system components aligned to this section.

[3.2.1-007]: A one-time inspection will be performed to confirm that cracking due to stress corrosion cracking is not occurring on stainless steel piping, piping components, and tanks exposed to any air-indoor uncontrolled (external).

[3.2.1-080]: Not applicable. ONS has no underground stainless steel components in scope of SLR in the engineered safety features systems.

[3.2.1-103]: Not applicable. ONS has no stainless steel tanks in the engineered safety features systems within the scope of the *Outdoor and Large Atmospheric Metallic Storage Tanks* (B2.1.17) program.

[3.2.1-108]: A one-time inspection will be performed to demonstrate that cracking due to stress corrosion cracking is not occurring in insulated stainless steel piping and piping components exposed to air-indoor uncontrolled environments.

3.2.2.2.5 Quality Assurance for Aging Management of Non-Safety Related Components

NUREG-2192:

Acceptance criteria are described in Branch Technical Position (BTP) IQMB-1 (Appendix A.2 of this SRP-SLR).

Evaluation:

Quality Assurance provisions applicable to SLR are discussed in Appendix B1.3, Quality Assurance Program and Administrative Controls.

3.2.2.2.6 Ongoing Review of Operating Experience

NUREG-2192:

Acceptance criteria are described in Appendix A.4, "Operating Experience for Aging Management Programs."

Evaluation:

The process for the ongoing review of OE is described in Appendix B1.4, Operating Experience.

3.2.2.2.7 Loss of Material Due to Recurring Internal Corrosion

NUREG-2192:

Recurring internal corrosion can result in the need to augment AMPs beyond the recommendations in the GALL-SLR Report. During the search of plant-specific OE conducted during the SLRA development, recurring internal corrosion can be identified by the number of occurrences of aging effects and the extent of degradation at each localized corrosion site. This further evaluation item is applicable if the search of plant-specific OE reveals repetitive occurrences. The criteria for recurrence is (a) a 10-year search of plant-specific OE reveals the aging effect has occurred in three or more refueling outage cycles; or (b) a 5-year search of plant-specific OE reveals the aging effect has occurred in two or more refueling outage cycles and resulted in the component either not meeting plant-specific acceptance criteria or experiencing a reduction in wall thickness greater than 50 percent (regardless of the minimum wall thickness).

The GALL-SLR Report recommends that the GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," be evaluated for inclusion of augmented requirements to ensure the adequate management of any recurring aging effect(s). Alternatively, a plant-specific AMP may be proposed. Potential augmented requirements include: alternative examination methods (e.g., volumetric versus external visual), augmented inspections (e.g., a greater number of locations, additional locations based on risk insights based on susceptibility to aging effect and consequences of failure, a greater frequency of inspections), and additional trending parameters and decision points where increased inspections would be implemented.

The applicant states: (a) why the program's examination methods will be sufficient to detect the recurring aging effect before affecting the ability of a component to perform its intended function, (b) the basis for the adequacy of augmented or lack of augmented inspections, (c) what *parameters will be trended as well as the decision points where increased inspections would be implemented (e.g., the extent of degradation at individual corrosion sites, the rate of degradation change), (d) how inspections of components that are not easily accessed (i.e., buried, underground) will be conducted, and (e) how leaks in any involved buried or underground components will be identified.*

Plant-specific OE examples should be evaluated to determine if the chosen AMP should be augmented even if the thresholds for significance of aging effect or frequency of occurrence of aging effect have not been exceeded. For example, during a 10-year search of plant-specific OE, two instances of a 360 degree 30 percent wall loss occurred at copper alloy to steel joints. Neither the significance of the aging effect nor the frequency of occurrence of aging effect threshold has been exceeded. Nevertheless, the OE should be evaluated to determine if the AMP that is proposed to manage the aging effect is sufficient (e.g., method of inspection, frequency of inspection, number of inspections) to provide reasonable assurance that the current licensing basis (CLB) intended functions of the component will be met throughout the subsequent period of extended operation. While recurring internal corrosion is not as likely in other environments as raw water and waste water (e.g., treated water), the aging effect should be addressed in a similar manner.

Evaluation:

[3.2.1-066]: Not applicable. A review of OE confirms that loss of material due to recurring internal corrosion is not an aging effect that requires management for the engineered safety features systems.

3.2.2.2.8 Cracking Due to Stress Corrosion Cracking in Aluminum Alloys

NUREG-2192:

SCC is a form of environmentally assisted cracking which is known to occur in high and moderate strength aluminum alloys. The three conditions necessary for SCC to occur in a component are a sustained tensile stress, aggressive environment, and material with a susceptible microstructure. Cracking due to SCC can be mitigated by eliminating one of the three necessary conditions. For the purposes of subsequent license renewal (SLR), acceptance criteria for this further evaluation are being provided for demonstrating that the specific material is not susceptible to SCC or an aggressive environment is not present. Cracking due to SCC is an aging effect requiring management unless it is demonstrated by the applicant that one of the two necessary conditions discussed below is absent.

Susceptible Material: If the material is not susceptible to SCC, then cracking is not an aging effect requiring management. The microstructure of an aluminum alloy, of which alloy composition is only one factor, is what determines if the alloy is susceptible to SCC. Therefore, determining susceptibility based on alloy composition alone is not adequate to conclude whether a particular material is susceptible to SCC. The temper, condition, and product form of the alloy is considered when assessing if a material is susceptible to SCC. Aluminum alloys that are susceptible to SCC include:

- *2xxx series alloys in the F, W, Ox, T3x, T4x, or T6x temper*
- *5xxx series alloys with a magnesium content of 3.5 weight percent or greater*
- *6xxx series alloys in the F temper*
- *7xxx series alloys in the F, T5x, or T6x temper*
- *2xx.x and 7xx.x series alloys*
- *3xx.x series alloys that contain copper*
- *5xx.x series alloys with a magnesium content of greater than 8 weight percent*

The material is evaluated to verify that it is not susceptible to SCC and that the basis used to make the determination is technically substantiated. Tempers have been specifically developed to improve the SCC resistance for some aluminum alloys. Aluminum alloy and temper combination which are not susceptible to SCC when used in piping, piping component, and tank applications include 1xxx series, 3xxx series, 6061-T6x, and 5454-x. If it is determined that a material is not susceptible to SCC, the SLRA provides the components/locations where it is used, alloy composition, temper or condition, product form, and for tempers not addressed above, the basis used to determine the alloy is not susceptible and technical information substantiating the basis.

<u>Aggressive Environment</u>: If the environment to which an aluminum alloy is exposed is not aggressive, such as dry gas or treated water, then cracking due to SCC will not occur and it is not an aging effect requiring management. Aggressive environments that are known to result in cracking due to SCC of susceptible aluminum alloys are aqueous solutions, air, condensation, and underground locations that contain halides (e.g., chloride). Halide concentrations should be considered high enough to facilitate SCC of aluminum alloys in uncontrolled or untreated aqueous solutions and air, such as raw water, waste water, condensation, underground locations, and outdoor air, unless demonstrated otherwise.

Halides could be present on the surface of the aluminum material if the component is encapsulated in a material such as insulation or concrete. In a controlled or uncontrolled indoor air, condensation, or underground environment, sufficient halide concentrations to cause SCC could be present due to secondary sources such as leakage from nearby components (e.g., leakage from insulated flanged connections or valve packing). If an aluminum component is exposed to a halide-free indoor air environment, not encapsulated in materials containing halides, and the exposure to secondary sources of moisture or halides is precluded, cracking due to SCC is not expected to occur. The plant-specific configuration can be used to demonstrate that exposure to halides will not occur. If it is determined that SCC will not occur because the environment is not aggressive, the SLRA provides the components and locations exposed to the environment, a description of the environment, basis used to determine the environment is not aggressive, and technical information substantiating the basis. The GALL-SLR Report AMP XI.M32, "One-Time Inspection," and a review of plant-specific OE describe an acceptable means to confirm the absence of moisture or halides within the proximity of the aluminum component.

If the environment potentially contains halides, the GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," describes an acceptable program to manage cracking due to SCC of aluminum tanks. The GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," describes an acceptable program to manage cracking *due to SCC of aluminum piping and piping components. The GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," describes an acceptable program to manage cracking due to SCC of aluminum piping and tanks, which are buried or underground. The GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components" describes an acceptable program to manage cracking due to SCC of aluminum components that are not included in other AMPs.*

An alternative strategy to demonstrating that an aggressive environment is not present is to isolate the aluminum alloy from the environment using a barrier to prevent SCC. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. The GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating for internal or external coatings.

Evaluation:

[3.2.1-100]: Not applicable. There are no aluminum or aluminum alloy piping, piping components, or tanks exposed to air or condensation (internal) raw water, or waste water in the engineered safety features systems at ONS.

[3.2.1-101]: Not applicable. There are no aluminum or aluminum alloy piping, piping components, or tanks exposed to air or condensation (external) in the engineered safety features systems at ONS.

[3.2.1-102]: Not applicable. There are no aluminum or aluminum alloy tanks exposed to air, condensation, soil, concrete, raw water, or waste water in the engineered safety features systems at ONS.

[3.2.1-109]: Not applicable. There are no insulated aluminum or aluminum alloy piping, piping components, or tanks exposed to air or condensation in the engineered safety features systems at ONS.

[3.2.1-110]: Not applicable. There are no underground aluminum or aluminum alloy piping, piping components, or tanks in the engineered safety features systems at ONS.

3.2.2.2.9 Loss of Material Due to General, Crevice or Pitting Corrosion and Cracking Due to Stress Corrosion Cracking

NUREG-2192:

Loss of material due to general (steel only), crevice, or pitting corrosion and cracking due to SCC (stainless steel only) can occur in steel and stainless steel piping and piping components exposed to concrete. Concrete provides a high alkalinity environment that can mitigate the effects of loss of material for steel piping, thereby significantly reducing the corrosion rate.

However, if water intrudes through the concrete, the pH can be reduced and ions that promote loss of material such as chlorides, which can penetrate the protective oxide layer created in the high alkalinity environment, can reach the surface of the metal. Carbonation can reduce the pH within concrete. The rate of carbonation is reduced by using concrete with a low water-to-cement ratio and low permeability. Concrete with low permeability also reduces the potential for the penetration of water. Adequate air entrainment improves the ability of the concrete to resist freezing and thawing cycles and therefore reduces the potential for cracking and intrusion of water. Cracking due to SCC, as well as pitting and crevice corrosion can occur due to halides present in the water that penetrates to the surface of the metal.

If the following conditions are met, loss of material is not considered to be an applicable aging effect for steel: (a) attributes of the concrete are consistent with American Concrete Institute (ACI) 318 or ACI 349 (low water-to-cement ratio, low permeability, and adequate air entrainment) as cited in NUREG–1557; (b) plant-specific OE indicates no degradation of the concrete that could lead to penetration of water to the metal surface; and (c) the piping is not potentially exposed to groundwater. For SS components loss of material and cracking due to SCC are not considered to be applicable aging effects as long as the piping is not potentially exposed to groundwater. Where these conditions are not met, loss of material due to general (steel only), crevice or pitting corrosion and cracking due to SCC (SS only) are identified as applicable aging effects. The GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," describes an acceptable program to manage these aging effects.

<u>Evaluation</u>

[3.2.1-055]: Not applicable. There are no steel piping or piping components exposed to concrete in the engineered safety features system at ONS.

[3.2.1-091]: Not applicable. There are no in-scope stainless steel piping or piping components exposed to concrete in the engineered safety features system at ONS.

3.2.2.2.10 Loss of Material Due to Pitting and Crevice Corrosion in Aluminum Alloys

<u>NUREG-2192:</u>

Loss of material due to pitting and crevice corrosion could occur in aluminum piping, piping components, and tanks exposed to an air, condensation, underground, raw water, or waste water environment for a sufficient duration of time. Environments that can result in pitting and/or crevice corrosion of aluminum alloys are those that contain halides (e.g., chloride) in the presence of moisture. The moisture level and halide concentration in atmospheric and uncontrolled air are greatly dependent on geographical location and site-specific conditions. Moisture level and halide concentration should be considered high enough to facilitate pitting and/or crevice corrosion of aluminum alloys in atmospheric and uncontrolled air, unless demonstrated otherwise. The periodic introduction of moisture or halides into an environment from secondary sources should also be considered. Leakage of fluids from mechanical connections (e.g., insulated bolted flanges and valve packing); onto a component in indoor controlled air is an example of a secondary source that should be considered. Halide *concentrations should be considered high enough to facilitate loss of material of aluminum alloys in untreated aqueous solutions, unless demonstrated otherwise. Plant-specific OE and the condition of aluminum alloy components are evaluated to determine if prolonged exposure to the plant-specific air, condensation, underground, or water environments has resulted in pitting or crevice corrosion. Loss of material due to pitting and crevice corrosion is not an aging effect requiring management for aluminum alloys if (a) plant-specific OE does not reveal a history of loss of material due to pitting or crevice corrosion and (b) a one-time inspection demonstrates that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components. The applicant documents the results of the plant-specific OE review in the SLRA.*

In the environment of air-indoor controlled, pitting and crevice corrosion is only expected to occur as the result of a source of moisture and halides. Alloy susceptibility may be considered when reviewing OE and interpreting inspection results. Inspections focus on the most susceptible alloys and locations.

The GALL-SLR Report recommends the further evaluation of aluminum piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of loss of material due to pitting and crevice corrosion. GALL-SLR Report AMP XI.M32, “One-Time Inspection,” describes an acceptable program to demonstrate that the aging effect of loss of material due to pitting and crevice corrosion is not occurring at a rate that will affect the intended function of the components. If loss of material due to pitting or crevice corrosion has occurred and is sufficient to potentially affect the intended function of an SSC, the following AMPs describe acceptable programs to manage loss of material due to pitting and crevice corrosion: (i) the GALL-SLR Report AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” for tanks; (ii) the GALL-SLR Report AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” for external surfaces of piping and piping components; (iii) the GALL-SLR Report AMP XI.M41, “Buried and Underground Piping and Tanks,” for underground piping, piping components and tanks; and (iv) the GALL-SLR Report AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components” for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the “detection of aging effects” program element in AMP XI.M32.

An alternative strategy to demonstrating that an aggressive environment is not present is to isolate the aluminum alloy from the environment using a barrier to prevent loss of material due to pitting and crevice corrosion. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. The GALL-SLR Report AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks,” or equivalent program, describes an acceptable program to manage the integrity of a barrier coating.

Evaluation:

[3.2.1-042]: Not applicable. There are no aluminum or aluminum alloy piping, piping components, or tanks exposed to air or condensation (external) in the engineered safety features systems at ONS.

[3.2.1-056]: Not applicable. There are no aluminum or aluminum alloy piping, piping components, or tanks exposed to air or condensation (internal) in the engineered safety features systems at ONS.

[3.2.1-105]: Not applicable. There are no aluminum or aluminum alloy tanks exposed to air or condensation in the engineered safety features systems at ONS.

[3.2.1-111]: Not applicable. There are no underground aluminum or aluminum alloy piping, piping components, or tanks in the engineered safety features systems at ONS.

[3.2.1-119]: Not applicable. There are no insulated aluminum or aluminum alloy piping, piping components, or tanks exposed to air or condensation in the engineered safety features systems at ONS.

[3.2.1-121]: Not applicable. There are no aluminum or aluminum alloy piping, piping components, or tanks exposed to raw water or waste water in the engineered safety features systems at ONS.

Results Tables: Engineered Safety Features Systems

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-001	Stainless steel, steel piping, piping components exposed to any environment	Cumulative fatigue damage due to fatigue	TLAA, SRP-SLR Section 4.3 "Metal Fatigue"	Yes (SRP-SLR Section 3.2.2.2.1)	Consistent with NUREG-2191. Cumulative fatigue damage of stainless steel piping, piping components is a TLAA. The evaluation of this TLAA is addressed in Section 4.3. See further evaluation in Section 3.2.2.2.1.
3.2.1-004	Stainless steel, nickel alloy piping, piping components exposed to air, condensation (external)	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.2)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that loss of material is not occurring in stainless steel components exposed to air-indoor uncontrolled (external) environments. See further evaluation in Section 3.2.2.2.2.
3.2.1-005	Stainless steel orifice (miniflow recirculation when centrifugal HPSI pumps are used for normal charging) exposed to treated borated water	Loss of material due to erosion	AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-006	Metallic drywell and suppression chamber spray system (internal surfaces): flow orifice; spray nozzles exposed to air – indoor uncontrolled, condensation	Loss of material due to general, pitting, crevice corrosion; flow blockage due to fouling	AMP XI.M32, "One-Time Inspection," or AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	Yes (SRP-SLR Section 3.2.2.2.3)	Not applicable - BWR only
3.2.1-007	Stainless steel piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M32, "One Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.4)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that cracking is not occurring in stainless steel components exposed to air environments. In addition to Engineered Safety Features systems, components in Reactor Vessel, Internals, and Reactor Coolant System are aligned to this item. See further evaluation in Section 3.2.2.2.4.
3.2.1-008	Copper alloy (>15% Zn) piping, piping components exposed to air with borated water leakage	Loss of material due to boric acid corrosion	AMP XI.M10, "Boric Acid Corrosion"	No	Not applicable. ONS has no copper alloy (>15% Zn) piping or piping components exposed to air with borated water leakage in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-009	Steel external surfaces exposed to air with borated water leakage	Loss of material due to boric acid corrosion	AMP XI.M10, "Boric Acid Corrosion"	No	Consistent with NUREG-2191.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-010	Cast austenitic stainless steel piping, piping components exposed to treated borated water >250°C (>482°F), treated water >250°C (>482°F)	Loss of fracture toughness due to thermal aging embrittlement	AMP XI.M12, "Thermal Aging Embrittlement of Cast Austenitic Stainless Steel (CASS)"	No	Consistent with NUREG-2191 except that a different program is used. The *ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD* (B2.1.1) will be used to manage loss of fracture toughness due to thermal aging embrittlement of valve bodies.
3.2.1-011	Steel piping, piping components exposed to steam, treated water	Wall thinning due to flow-accelerated corrosion	AMP XI.M17, "Flow-Accelerated Corrosion"	No	Not applicable. ONS has no steel piping or piping components exposed to steam or treated water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-012	High-strength steel closure bolting exposed to air, soil, underground	Cracking due to SCC; cyclic loading	AMP XI.M18, "Bolting Integrity"	No	Not applicable. ONS has no high-strength steel closure bolting exposed to air, soil, or underground in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-014	Stainless steel, steel, nickel alloy closure bolting exposed to air- indoor uncontrolled, air-outdoor, condensation	Loss of material due to general (steel only), pitting, crevice corrosion	AMP XI.M18, "Bolting Integrity"	No	Consistent with NUREG-2191.
3.2.1-015	Metallic closure bolting exposed to any environment, soil underground	Loss of preload due to thermal effects, gasket creep, self-loosening	AMP XI.M18, "Bolting Integrity"	No	Consistent with NUREG-2191.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-016	Steel piping, piping components exposed to treated water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable. ONS has no steel piping or piping components exposed to treated water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-017	Aluminum piping, piping components exposed to treated water, treated borated water	Loss of material due to pitting, crevice corrosion	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable. ONS has no aluminum piping or piping components exposed to treated water or treated borated water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-019	Stainless steel heat exchanger tubes exposed to treated water, treated borated water	Reduction of heat transfer due to fouling	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191.
3.2.1-020	Stainless steel, steel (with stainless steel or nickel alloy cladding) piping, piping components, tanks exposed to treated borated water >60°C (>140°F)	Cracking due to SCC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. In addition to Engineered Safety Features systems, components in Reactor Vessel, Internals, and Reactor Coolant System are aligned to this item.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-022	Nickel alloy, stainless steel heat exchanger components, piping, piping components, tanks exposed to treated water, treated borated water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191. In addition to Engineered Safety Features systems, components in Reactor Vessel, Internals, and Reactor Coolant System are aligned to this item.
3.2.1-023	Steel heat exchanger components, piping, piping components exposed to raw water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, "Open-Cycle Cooling Water System"	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Open-Cycle Cooling Water System* (B2.1.11) program implementation.
3.2.1-024	Stainless steel piping, piping components exposed to raw water	Loss of material due to pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, "Open-Cycle Cooling Water System"	No	Not applicable. ONS has no stainless steel piping or piping components exposed to raw water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-025	Stainless steel heat exchanger components exposed to raw water	Loss of material due to pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, "Open-Cycle Cooling Water System"	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Open-Cycle Cooling Water System* (B2.1.11) program implementation.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-027	Stainless steel, steel heat exchanger tubes exposed to raw water	Reduction of heat transfer due to fouling	AMP XI.M20, "Open-Cycle Cooling Water System"	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Open-Cycle Cooling Water System* (B2.1.11) program implementation.
3.2.1-028	Stainless steel piping, piping components exposed to closed-cycle cooling water >60°C (>140°F)	Cracking due to SCC	AMP XI.M21A, "Closed Treated Water Systems"	No	Not applicable. ONS has no stainless steel piping or piping components exposed to closed-cycle cooling water >60°C (>140°F) in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-029	Steel piping, piping components exposed to closed-cycle cooling water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M21A, "Closed Treated Water Systems"	No	Not applicable. ONS has no steel piping or piping components exposed to closed-cycle cooling water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-030	Steel heat exchanger components exposed to closed-cycle cooling water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M21A, "Closed Treated Water Systems"	No	Consistent with NUREG-2191.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-031	Stainless steel heat exchanger components, piping, piping components exposed to closed-cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M21A, "Closed Treated Water Systems"	No	Not applicable. ONS has no stainless steel heat exchanger components, piping, or piping components exposed to closed-cycle cooling water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-032	Copper alloy heat exchanger components, piping, piping components exposed to closed- cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M21A, "Closed Treated Water Systems"	No	Not applicable. ONS has no copper alloy heat exchanger components, piping, or piping components exposed to closed-cycle cooling water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-033	Copper alloy, stainless steel heat exchanger tubes exposed to closed- cycle cooling water	Reduction of heat transfer due to fouling	AMP XI.M21A, "Closed Treated Water Systems"	No	Not applicable. ONS has no copper alloy or stainless steel heat exchanger tubes exposed to closed-cycle cooling water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-034	Copper alloy (>15% Zn or >8% Al) piping, piping components, heat exchanger components exposed to closed-cycle cooling water, treated water	Loss of material due to selective leaching	AMP XI.M33, "Selective Leaching"	No	Not applicable. ONS has no copper alloy (>15% Zn or >8% Al) piping, piping components, or heat exchanger components exposed to closed-cycle cooling water or treated water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-035	Gray cast iron motor cooler exposed to closed-cycle cooling water, treated water	Loss of material due to selective leaching	AMP XI.M33, "Selective Leaching"	No	Not applicable. ONS has no gray cast iron motor cooler exposed to closed-cycle cooling water or treated water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-036	Gray cast iron, ductile iron piping, piping components exposed to closed-cycle cooling water, treated water	Loss of material due to selective leaching	AMP XI.M33, "Selective Leaching"	No	Not applicable. ONS has no gray cast iron or ductile iron piping or piping components exposed to closed-cycle cooling water or treated water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-037	Gray cast iron, ductile iron piping, piping components exposed to soil	Loss of material due to selective leaching	AMP XI.M33, “Selective Leaching”	No	Not applicable. ONS has no gray cast iron or ductile iron piping or piping components exposed to soil in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-038	Elastomer piping, piping components, seals exposed to air, condensation	Hardening or loss of strength due to elastomer degradation	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Not applicable. ONS has no elastomer piping, piping components, or seals exposed to air or condensation in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-040	Steel external surfaces exposed to air – indoor uncontrolled, air – outdoor, condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191. In addition to Engineered Safety Features systems, components in Reactor Vessel, Internals, and Reactor Coolant System are aligned to this item.
3.2.1-042	Aluminum piping, piping components, tanks exposed to air, condensation (external)	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes (SRP-SLR Section 3.2.2.2.10)	Not applicable. ONS has no aluminum or aluminum alloy piping, piping components, or tanks exposed to air or condensation (external) in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-043	Elastomer piping, piping components, seals exposed to air, condensation	Hardening or loss of strength due to elastomer degradation	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not applicable. ONS has no elastomer piping, piping components, or seals exposed to air or condensation in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-044	Steel piping, piping components, ducting, ducting components exposed to air – indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not applicable. ONS has no steel piping, piping components, ducting, or ducting components exposed to air – indoor uncontrolled in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-045	Steel encapsulation components exposed to air – indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not applicable. ONS has no steel encapsulation components exposed to air – indoor uncontrolled in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-046	Steel piping, piping components exposed to condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not applicable. ONS has no steel piping or piping components exposed to condensation in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-047	Steel encapsulation components exposed to air with borated water leakage	Loss of material due to general, pitting, crevice, boric acid corrosion	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not applicable. ONS has no steel encapsulation components exposed to air with borated water leakage in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-048	Stainless steel, nickel alloy piping, piping components, tanks exposed to air, condensation (internal)	Loss of material due to pitting, crevice corrosion	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," AMP XI.M32, "One-Time Inspection," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.2)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that loss of material is not occurring in stainless steel components exposed to air-indoor uncontrolled (internal) environments. See further evaluation in Section 3.2.2.2.2.
3.2.1-049	Steel piping, piping components exposed to lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M39, "Lubricating Oil Analysis," and AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191. ONS has no copper alloy or stainless steel piping or piping components exposed to lubricating oil in the scope of subsequent license renewal in Engineered Safety Features systems. Components in Reactor Vessel, Internals, and Reactor Coolant System are aligned to this item.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-050	Copper alloy, stainless steel piping, piping components exposed to lubricating oil	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M39, "Lubricating Oil Analysis," and AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191. ONS has no copper alloy or stainless or steel piping or piping components exposed to lubricating oil in the scope of subsequent license renewal in Engineered Safety Features systems. Components in Reactor Vessel, Internals, and Reactor Coolant System are aligned to this item.
3.2.1-051	Steel, copper alloy, stainless steel heat exchanger tubes exposed to lubricating oil	Reduction of heat transfer due to fouling	AMP XI.M39, "Lubricating Oil Analysis," and AMP XI.M32, "One-Time Inspection"	No	Not applicable. ONS has no steel, copper alloy, or stainless steel heat exchanger tubes exposed to lubricating oil in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-052	Steel piping, piping components exposed to soil, concrete, underground	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, "Buried and Underground Piping and Tanks"	No	Not applicable. ONS has no steel piping or piping components exposed to soil, concrete, or underground in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-053	Stainless steel, nickel alloy piping, piping components, tanks, exposed to soil, concrete	Loss of material due to pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not applicable. ONS has no stainless steel or nickel alloy piping, piping components, or tanks exposed to soil or concrete in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-054	Stainless steel, nickel alloy piping, piping components greater than or equal to 4 NPS exposed to treated water >93°C (>200°F)	Cracking due to SCC, IGSCC	AMP XI.M7, “BWR Stress Corrosion Cracking,” and AMP XI.M2, “Water Chemistry”	No	Not applicable - BWR only
3.2.1-055	Steel piping, piping components exposed to concrete	None	None	Yes (SRP-SLR Section 3.2.2.2.9)	Not applicable. ONS has no steel piping or piping components exposed to concrete in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-056	Aluminum piping, piping components, tanks exposed to air, condensation (internal)	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP-XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.10)	Not applicable. ONS has no aluminum or aluminum alloy piping, piping components, or tanks exposed to air or condensation (internal) in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-057	Copper alloy piping, piping components exposed to air, condensation, gas	None	None	No	Not applicable. ONS has no copper alloy piping, or piping components exposed to air, condensation, gas in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-058	Copper alloy, copper alloy (>8% Al) piping, piping components exposed to air with borated water leakage	None	None	No	Consistent with NUREG-2191. ONS has no in-scope copper alloy piping, piping components exposed to air, condensation, or gas in the scope of subsequent license renewal in Engineered Safety Features systems. Components in Reactor Vessel, Internals, and Reactor Coolant System are aligned to this item.
3.2.1-059	Galvanized steel ducting, ducting components, piping, piping components exposed to air – indoor controlled	None	None	No	Not applicable. ONS has no galvanized steel ducting, ducting components, piping, or piping components exposed to air – indoor controlled in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-060	Glass piping elements exposed to air, underground, lubricating oil, raw water, treated water, treated borated water, air with borated water leakage, condensation, gas, closed-cycle cooling water	None	None	No	Consistent with NUREG-2191.
3.2.1-062	Nickel alloy piping, piping components exposed to air with borated water leakage	None	None	No	Not applicable. ONS has no nickel alloy piping or piping components exposed to air with borated water leakage in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-063	Stainless steel piping, piping components exposed to air with borated water leakage, gas	None	None	No	Consistent with NUREG-2191.
3.2.1-064	Steel piping, piping components exposed to air – indoor controlled, gas	None	None	No	Not applicable. ONS has no steel piping, piping components exposed to air – indoor controlled or gas in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-065	Metallic piping, piping components exposed to treated water, treated borated water	Wall thinning due to erosion	AMP XI.M17, “Flow-Accelerated Corrosion”	No	Consistent with NUREG-2191.
3.2.1-066	Metallic piping, piping components, tanks exposed to raw water, waste water	Loss of material due to recurring internal corrosion	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	Yes (SRP-SLR Section 3.2.2.2.7)	Not applicable. The associated NUREG-2191 aging items are not used.
3.2.1-067	Stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete	Cracking due to SCC	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not applicable. ONS has no stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil or concrete in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-068	Steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete, air, condensation	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Consistent with NUREG-2191.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-069	Insulated steel piping, piping components, tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components” or AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not applicable. ONS has no insulated steel piping or piping components in the scope of subsequent license renewal in Engineered Safety Features systems. Insulated steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) maintain an air gap between the insulation and tank exterior such that the insulation is not in contact with the tank. The associated NUREG-2191 aging items are not used.
3.2.1-070	Steel, stainless steel, aluminum tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to treated water, treated borated water	Loss of material due to general (steel only), pitting, crevice corrosion, MIC (steel, stainless steel only)	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not applicable. ONS has no steel, stainless steel, or aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to treated water or treated borated water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-071	Insulated copper alloy (>15% Zn or >8% Al) piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components”	No	Not applicable. ONS has no insulated copper alloy (>15% Zn or >8% Al) piping, piping components, or tanks exposed to air or condensation in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-072	Any material piping, piping components, heat exchangers, tanks with internal coatings/linings exposed to closed-cycle cooling water, raw water, treated water, treated borated water, lubricating oil, condensation	Loss of coating or lining integrity due to blistering, cracking, flaking, peeling, delamination, rusting, or physical damage; loss of material or cracking for cementitious coatings/linings	AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks* (B2.1.27) program implementation.
3.2.1-073	Any material piping, piping components, heat exchangers, tanks with internal coatings/linings exposed to closed-cycle cooling water, raw water, treated water, treated borated water, lubricating oil, condensation	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks* (B2.1.27) program implementation.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-074	Gray cast iron, ductile iron piping, piping components with internal coatings/linings exposed to closed- cycle cooling water, raw water, treated water, treated borated water, waste water	Loss of material due to selective leaching	AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	No	Not applicable. ONS has no gray cast iron or ductile iron piping or piping components with internal coatings/ linings exposed to closed-cycle cooling water, raw water, treated water, treated borated water, or waste water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-076	Stainless steel, steel, nickel alloy, copper alloy closure bolting exposed to treated water, treated borated water, raw water, waste water, lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC (steel, copper alloy in raw water, waste water only)	AMP XI.M18, "Bolting Integrity"	No	Not applicable. ONS has no stainless steel, steel, nickel alloy, or copper alloy closure bolting exposed to treated water, treated borated water, raw water, waste water, or lubricating oil in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-078	Stainless steel, steel, aluminum piping, piping components, tanks exposed to soil, concrete	Cracking due to SCC (steel in carbonate/ bicarbonate environment only)	AMP XI.M41, "Buried and Underground Piping and Tanks"	No	Not applicable. ONS has no stainless steel, steel, aluminum piping, piping components, tanks exposed to soil or concrete environment, or steel exposed to a carbonate/bicarbonate environment, in the scope of subsequent license renewal in Engineered Safety Features systems. Aging effects applicable to the Borated Water Storage Tank exposed to concrete are addressed in Item 3.2.1-068. The associated NUREG-2191 aging items are not used.
3.2.1-079	Stainless steel closure bolting exposed to air, soil, concrete, underground	Cracking due to SCC	AMP XI.M18, "Bolting Integrity"	No	Consistent with NUREG-2191.
3.2.1-080	Stainless steel underground piping, piping components, tanks	Cracking due to SCC	AMP XI.M32, "One Time Inspection," AMP XI.M41, "Buried and Underground Piping and Tanks," or AMP XI.M42, "Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.4)	Not applicable. ONS has no stainless steel underground piping, piping components, or tanks in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-081	Stainless steel, steel, aluminum, copper alloy, titanium heat exchanger tubes exposed to air, condensation	Reduction of heat transfer due to fouling	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Not applicable. ONS has no stainless steel, steel, aluminum, copper alloy, or titanium heat exchanger tubes exposed to air or condensation in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-087	Non-metallic thermal insulation exposed to air, condensation	Reduced thermal insulation resistance due to moisture intrusion	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Consistent with NUREG-2191.
3.2.1-090	Steel components exposed to treated water, treated borated water, raw water	Long-term loss of material due to general corrosion	AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191. In addition to Engineered Safety Features systems, components in Auxiliary Systems are aligned to this item.
3.2.1-091	Stainless steel piping, piping components exposed to concrete	None	None	Yes (SRP-SLR Section 3.2.2.2.9)	Not applicable. ONS has no in-scope stainless steel piping or piping components exposed to concrete in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-096	Steel, stainless steel piping, piping components exposed to raw water (for components not covered by NRC GL 89-13)	Loss of material due to general (steel only), pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not applicable. ONS has no steel or stainless steel piping or piping components exposed to raw water (for components not covered by NRC GL 89-13) in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-098	Copper alloy (>15% Zn or >8% Al) piping, piping components exposed to soil	Loss of material due to selective leaching	AMP XI.M33, "Selective Leaching"	No	Not applicable. ONS has no copper alloy (>15% Zn or >8% Al) piping or piping components exposed to soil in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-099	Stainless steel, nickel alloy tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.2)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be used to confirm that loss of material is not occurring in stainless steel tanks exposed to air-indoor uncontrolled environments. See further evaluation in Section 3.2.2.2.2.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-100	Aluminum piping, piping components, tanks exposed to air, condensation (internal), raw water, waste water	Cracking due to SCC	AMP XI.M32, “One Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes (SRP-SLR Section 3.2.2.2.8)	Not applicable. ONS has no in-scope aluminum or aluminum alloy piping, piping components, or tanks exposed to air or condensation (internal) raw water, or waste water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-101	Aluminum piping, piping components, tanks exposed to air, condensation (external)	Cracking due to SCC	AMP XI.M32, "One Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.8)	Not applicable. ONS has no aluminum or aluminum alloy piping, piping components, or tanks exposed to air or condensation (external) in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-102	Aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation, soil, concrete, raw water, waste water	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.8)	Not applicable. ONS has no aluminum or aluminum alloy tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation, soil, concrete, raw water, waste water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-103	Stainless steel tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to air, condensation	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.4)	Not applicable. ONS has no stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-104	Aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not applicable. ONS has no aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil or concrete in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-105	Aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.10)	Not applicable. ONS has no aluminum or aluminum alloy tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-106	Stainless steel, nickel alloy tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.2)	Not applicable. ONS has no stainless steel or nickel alloy tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-107	Insulated stainless steel, nickel alloy piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.2)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to demonstrate that loss of material is not occurring in insulated stainless steel or nickel alloy piping and piping components exposed to air-indoor uncontrolled environments. See further evaluation in Section 3.2.2.2.2.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-108	Insulated stainless steel piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes (SRP-SLR Section 3.2.2.2.4)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to demonstrate that cracking is not occurring in insulated stainless steel piping and piping components exposed to air-indoor uncontrolled environments. See further evaluation in Section 3.2.2.2.4.
3.2.1-109	Insulated aluminum piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes (SRP-SLR Section 3.2.2.2.8)	Not applicable. ONS has no insulated aluminum or aluminum alloy piping, piping components, or tanks exposed to air or condensation in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-110	Aluminum underground piping, piping components, tanks	Cracking due to SCC	AMP XI.M32, “One-Time Inspection,” AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.8)	Not applicable. ONS has no underground aluminum or aluminum alloy piping, piping components, or tanks in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-111	Aluminum underground piping, piping components, tanks	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M41, "Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.10)	Not applicable. ONS has no underground aluminum or aluminum alloy piping, piping components, or tanks in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-112	Stainless steel, nickel alloy underground piping, piping components, tanks	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.2)	Not applicable. ONS has no underground stainless steel or nickel alloy piping, piping, or tanks components in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-114	Stainless steel, nickel alloy piping, piping components exposed to treated water >60°C (>140°F)	Cracking due to SCC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable. ONS has no stainless steel or nickel alloy piping or piping components exposed to treated water >60°C (>140°F) in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-115	Titanium heat exchanger tubes exposed to treated water	Cracking due to SCC, reduction of heat transfer due to fouling	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable. ONS has no titanium heat exchanger tubes exposed to treated water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-116	Titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to treated water	None	None	No	Not applicable. ONS has no titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, or piping components exposed to treated water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-117	Titanium heat exchanger tubes exposed to closed-cycle cooling water	Cracking due to SCC, reduction of heat transfer due to fouling	AMP XI.M21A, "Closed Treated Water Systems”	No	Not applicable. ONS has no titanium heat exchanger tubes exposed to closed-cycle cooling water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-118	Titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to closed-cycle cooling water	None	None	No	Not applicable. ONS has no titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to closed-cycle cooling water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-119	Insulated aluminum piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.10)	Not applicable. ONS has no insulated aluminum or aluminum alloy piping, piping components, or tanks exposed to air or condensation in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-120	Aluminum piping, piping components, tanks exposed to soil, concrete	Loss of material due to pitting, crevice corrosion	AMP XI.M41, "Buried and Underground Piping and Tanks"	No	Not applicable. ONS has no aluminum piping, piping components, or tanks exposed to soil or concrete in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-121	Aluminum piping, piping components, tanks exposed to raw water, waste water	Loss of material due to pitting, crevice corrosion	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," AMP XI.M32, "One-Time Inspection," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.2.2.2.10)	Not applicable. ONS has no aluminum or aluminum alloy piping, piping components, or tanks exposed to raw water or waste water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-122	Elastomer piping, piping components, seals exposed to air	Loss of material due to wear	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Not applicable. ONS has no elastomer piping, piping components, or seals exposed to air in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-123	Elastomer piping, piping components, seals exposed to air	Loss of material due to wear	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not applicable. ONS has no elastomer piping, piping components, or seals exposed to air in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-124	Aluminum piping, piping components, tanks exposed to air with borated water leakage	None	None	No	Not applicable. ONS has no aluminum piping, piping components, or tanks exposed to air with borated water leakage in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-125	Steel closure bolting exposed to soil, concrete, underground	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not applicable. ONS has no steel closure bolting exposed to soil, concrete, or underground in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-126	Titanium, super austenitic piping, piping components, tanks, closure bolting exposed to soil, concrete, underground	Loss of material due to pitting, crevice corrosion, MIC (except for titanium; soil environment only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not applicable. ONS has no titanium, super austenitic piping, piping components, tanks, or closure bolting exposed to soil, concrete, or underground in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-127	Copper alloy piping, piping components exposed to concrete	None	None	No	Not applicable. ONS has no copper alloy piping, piping components exposed to concrete in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-128	Copper alloy piping, piping components exposed to soil, underground	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not applicable. ONS has no copper alloy piping, piping components exposed to soil, underground in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-129	Stainless steel tanks exposed to soil, concrete	Loss of material due to pitting, crevice corrosion, MIC (soil only)	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not applicable. ONS has no stainless steel tanks exposed to soil or concrete in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-130	Steel heat exchanger components exposed to lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable. ONS has no steel heat exchanger components exposed to lubricating oil in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-131	Aluminum piping, piping components exposed to raw water	Flow blockage due to fouling	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not applicable. ONS has no aluminum piping or piping components exposed to raw water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-132	Titanium (ASTM Grades 3, 4, or 5) heat exchanger tubes exposed to raw water	Cracking due to SCC	AMP XI.M20, "Open-Cycle Cooling Water System”	No	Not applicable. ONS has no titanium (ASTM Grades 3, 4, or 5) heat exchanger tubes exposed to raw water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.
3.2.1-133	Titanium piping, piping components, heat exchanger components exposed to raw water	Cracking due to SCC, flow blockage due to fouling	AMP XI.M20, "Open-Cycle Cooling Water System”	No	Not applicable. ONS has no titanium piping, piping components, or heat exchanger components exposed to raw water in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Table 3.2.1 Summary of Aging Management Programs for Engineered Safety Features Evaluated in Chapter V of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.2.1-134	Polymeric piping, piping components, ducting, ducting components, seals exposed to air, condensation, raw water, raw water (potable), treated water, waste water, underground, concrete, soil	Hardening or loss of strength due to polymeric degradation; loss of material due to peeling, delamination, wear; cracking or blistering due to exposure to ultraviolet light, ozone, radiation, or chemical attack; flow blockage due to fouling	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not applicable. ONS has no polymeric piping, piping components, ducting, ducting components, or seals exposed to air, condensation, raw water, raw water (potable), treated water, waste water, underground, concrete, or soil in the scope of subsequent license renewal in Engineered Safety Features systems. The associated NUREG-2191 aging items are not used.

Plant Specific Notes:

1. Loss of material due to erosion is an aging effect requiring management for HPI miniflow recirculation orifices only.
2. In accordance with NUREG-2191 Chapter XI.M12 and NRC Letter dated 5/19/2000 (ML003717179), valve bodies are adequately covered by existing inspection requirements in Section XI of the ASME Code.
3. The terminology “Piping and Piping Components” represents pipes, pipe fittings (reducers, elbows, tees, etc), and in-line piping components (e.g. valves, traps, strainers, orifices, flow elements, etc.) and is used to identify components with the system that are susceptible to wall thinning (due to erosion or flow accelerated corrosion) or cumulative fatigue damage. Component susceptibility to these aging effects is determined by susceptibility analyses, operating experience, or system design.

Plant Specific Notes:

1. The terminology “Piping and Piping Components” represents pipes, pipe fittings (reducers, elbows, tees, etc), and in-line piping components (e.g. valves, traps, strainers, orifices, flow elements, etc.) and is used to identify components with the system that are susceptible to wall thinning (due to erosion or flow accelerated corrosion) or cumulative fatigue damage. Component susceptibility to these aging effects is determined by susceptibility analyses, operating experience, or system design.
2. In accordance with NUREG-2191 Chapter XI.M12 and NRC Letter dated 5/19/2000 (ML003717179), valve bodies are adequately covered by existing inspection requirements in Section XI of the ASME Code.

Tables 3.2.2-1 through 3.2.2-4 Industry Standard Notes:

A. Consistent with NUREG-2191 item for component, material, environment, and aging effect. AMP is consistent with NUREG-2191 AMP.

B. Consistent with NUREG-2191 item for component, material, environment, and aging effect. AMP takes some exceptions to NUREG-2191 AMP.

C. Component is different, but consistent with NUREG-2191 item for material, environment, and aging effect. AMP is consistent with NUREG-2191 AMP.

D. Component is different, but consistent with NUREG-2191 item for material, environment, and aging effect. AMP takes some exceptions to the NUREG-2191 AMP.

E. Consistent with NUREG-2191 item for material, environment, and aging effect, but a different AMP is credited or NUREG-2191 identifies a plant-specific AMP.

F. Material not in NUREG-2191 for this component.

G. Environment not in NUREG-2191 for this component and material.

H. Aging effect not in NUREG-2191 for this component, material and environment combination.

I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.

J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

3.3 AGING MANAGEMENT OF AUXILIARY SYSTEMS

3.3.1 INTRODUCTION

This section provides the results of the aging management review for those components identified in Section 2.3.3, Auxiliary Systems, as being subject to aging management review. The systems, or portions of systems, which are addressed in this section are described in the indicated sections:

- Air Gas Related Systems (Section 2.3.3.1)
- Ancillary Related Systems (Section 2.3.3.2)
- Closed Cycle Water Related Systems (Section 2.3.3.3)
- Fire Protection Related Systems (Section 2.3.3.4)
- Heating Ventilation and Air Conditioning Related Systems (Section 2.3.3.5)
- Lube Oil Related Systems (Section 2.3.3.6)
- Miscellaneous Related Systems (Section 2.3.3.7)
- Miscellaneous Oil Related Systems (Section 2.3.3.8)
- Raw Water Related Systems (Section 2.3.3.9)
- Standby Shutdown Facility Diesel Generator Related Systems (Section 2.3.3.10)
- Waste Disposal Related Systems (Section 2.3.3.11)

3.3.2 RESULTS

The following tables summarize the results of the aging management review for Auxiliary Systems:

3.3.2.1 Materials, Environments, Aging Effects Requiring Management and Aging Management Programs

3.3.2.1.1 Auxiliary Instrument Air System

Materials

Components in the Auxiliary Instrument Air System are constructed of the following materials:

* Galvanized Steel
* Stainless Steel
* Steel

Environments

Components in the Auxiliary Instrument Air System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Waste Water

Aging Effects Requiring Management

Components in the Auxiliary Instrument Air System require aging management to address the following aging effects:

* Cracking
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Auxiliary Instrument Air System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)

* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)

3.3.2.1.2 Breathing Air System

Materials

Components in the Breathing Air System are constructed of the following materials:

* Stainless Steel
* Steel

Environments

Components in the Breathing Air System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Condensation
* Waste Water

Aging Effects Requiring Management

Components in the Breathing Air System require aging management to address the following aging effects:

* Cracking
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Breathing Air System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)

* One-Time Inspection (B2.1.20)

3.3.2.1.3 Hydrogen System

Materials

Components in the Hydrogen System are constructed of the following materials:

* Copper Alloy
* Glass
* Stainless Steel
* Steel

Environments

Components in the Hydrogen System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Treated Water
* Waste Water

Aging Effects Requiring Management

Components in the Hydrogen System require aging management to address the following aging effects:

* Cracking
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Hydrogen System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)

* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Water Chemistry (B2.1.2)

3.3.2.1.4 Instrument Air System

Materials

Components in the Instrument Air System are constructed of the following materials:

* Copper Alloy
* Copper Alloy (>15% Zn)
* Elastomer
* Galvanized Steel
* Glass
* Stainless Steel
* Steel

Environments

Components in the Instrument Air System are exposed to the following environments:

* Air – Dry
* Air – Indoor Uncontrolled
* Air – Outdoor
* Air with Borated Water Leakage
* Condensation
* Raw Water
* Soil
* Waste Water

Aging Effects Requiring Management

Components in the Instrument Air System require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage

* Flow Blockage
* Hardening or Loss of Strength
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Instrument Air System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Buried and Underground Piping and Tanks (B2.1.26)
* Compressed Air Monitoring (B2.1.14)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Fire Water System (B2.1.16)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* TLAA

3.3.2.1.5 Keowee Air Breaker System

Materials

Components in the Keowee Air Breaker System are constructed of the following materials:

* Copper Alloy
* Stainless Steel
* Steel

Environments

Components in the Keowee Air Breaker System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Condensation
* Waste Water

Aging Effects Requiring Management

Components in the Keowee Air Breaker System require aging management to address the following aging effects:

* Cracking
* Flow Blockage
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Keowee Air Breaker System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)

* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)

3.3.2.1.6 Keowee Depressing Air System

Materials

Components in the Keowee Depressing Air System are constructed of the following materials:

* Galvanized Steel
* Stainless Steel
* Steel

Environments

Components in the Keowee Depressing Air System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Waste Water

Aging Effects Requiring Management

Components in the Keowee Depressing Air System require aging management to address the following aging effects:

* Cracking
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Keowee Depressing Air System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)

* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)

3.3.2.1.7 Keowee Governor Air System

Materials

Components in the Keowee Governor Air System are constructed of the following materials:

- Stainless Steel
- Steel

Environments

Components in the Keowee Governor Air System are exposed to the following environments:

- Air – Indoor Uncontrolled
- Condensation
- Raw Water
- Waste Water

Aging Effects Requiring Management

Components in the Keowee Governor Air System require aging management to address the following aging effects:

- Cracking
- Flow Blockage
- Long-Term Loss of Material
- Loss of Material
- Loss of Preload

Aging Management Programs

The aging effects for components in the Keowee Governor Air System are managed by the following AMPs:

- Bolting Integrity (B2.1.9)
- External Surfaces Monitoring of Mechanical Components (B2.1.23)

* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)

3.3.2.1.8 Keowee Station Air System

Materials

Components in the Keowee Station Air System are constructed of the following materials:

* Stainless Steel
* Steel

Environments

Components in the Keowee Station Air System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Raw Water
* Waste Water

Aging Effects Requiring Management

Components in the Keowee Station Air System require aging management to address the following aging effects:

* Cracking
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Keowee Station Air System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)

* Open-Cycle Cooling Water System (B2.1.11)

3.3.2.1.9 Nitrogen Purge and Blanket System

Materials

Components in the Nitrogen Purge and Blanket System are constructed of the following materials:

* Copper Alloy
* Copper Alloy (>15% Zn)
* Elastomer
* Stainless Steel
* Steel

Environments

Components in the Nitrogen Purge and Blanket System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Gas

Aging Effects Requiring Management

Components in the Nitrogen Purge and Blanket System require aging management to address the following aging effects:

* Cracking
* Hardening or Loss of Strength
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Nitrogen Purge and Blanket System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)

3.3.2.1.10 Service Air System

Materials

Components in the Service Air System are constructed of the following materials:

* Aluminum
* Copper Alloy
* Galvanized Steel
* Glass
* Stainless Steel
* Steel

Environments

Components in the Service Air System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air – Outdoor
* Condensation
* Soil
* Waste Water

Aging Effects Requiring Management

Components in the Service Air System require aging management to address the following aging effects:

* Cracking
* Flow Blockage
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload
* Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Service Air System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Buried and Underground Piping and Tanks (B2.1.26)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)

3.3.2.1.11 Standby Shutdown Facility Fire Protection System

Materials

Components in the Standby Shutdown Facility Fire Protection System are constructed of the following materials:

* Copper Alloy
* Copper Alloy (>15% Zn)
* Galvanized Steel
* Stainless Steel
* Steel

Environments

Components in the Standby Shutdown Facility Fire Protection System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Condensation
* Gas

Aging Effects Requiring Management

Components in the Standby Shutdown Facility Fire Protection System require aging management to address the following aging effects:

* Cracking
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Standby Shutdown Facility Fire Protection System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)

* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Fire Protection (B2.1.15)
* One-Time Inspection (B2.1.20)

3.3.2.1.12 Chemical Addition System

Materials

Components in the Chemical Addition System are constructed of the following materials:

* Aluminum
* Elastomer
* Glass
* Gray Cast Iron
* Polymeric
* Stainless Steel
* Steel

Environments

Components in the Chemical Addition System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Closed-Cycle Cooling Water
* Gas
* Treated Borated Water
* Treated Borated water >60°C (>140°F)
* Treated Water
* Treated Water >60°C (>140°F)
* Waste Water
* Waste Water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Chemical Addition System require aging management to address the following aging effects:

* Cracking
* Cracking or Blistering
* Cumulative Fatigue Damage
* Hardening or Loss of Strength
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Chemical Addition System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Selective Leaching (B2.1.21)
* TLAA
* Water Chemistry (B2.1.2)

3.3.2.1.13 Coolant Storage System

Materials

Components in the Coolant Storage System are constructed of the following materials:

* Aluminum
* Glass
* Stainless Steel
* Steel

Environments

Components in the Coolant Storage System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Closed-Cycle Cooling Water
* Gas
* Treated Borated Water
* Treated Borated water >60°C (>140°F)
* Treated Water
* Treated Water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Coolant Storage System require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Coolant Storage System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* One-Time Inspection (B2.1.20)
* TLAA
* Water Chemistry (B2.1.2)

3.3.2.1.14 Coolant Treatment System

Materials

Components in the Coolant Treatment System are constructed of the following materials:

* Stainless Steel
* Steel

Environments

Components in the Coolant Treatment System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Gas
* Treated Water
* Treated Water >60°C (>140°F)
* Waste Water
* Waste Water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Coolant Treatment System require aging management to address the following aging effects:

* Cracking
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Coolant Treatment System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)

* Boric Acid Corrosion (B2.1.4)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Water Chemistry (B2.1.2)

3.3.2.1.15 Demineralized Water System

Materials

Components in the Demineralized Water System are constructed of the following materials:

* Aluminum
* Copper Alloy (>15% Zn)
* PVC
* Stainless Steel
* Steel

Environments

Components in the Demineralized Water System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Treated Water
* Treated Water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Demineralized Water System require aging management to address the following aging effects:

* Cracking
* Cracking or Blistering
* Hardening or Loss of Strength
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Demineralized Water System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Selective Leaching (B2.1.21)
* Water Chemistry (B2.1.2)

3.3.2.1.16 Essential Siphon Vacuum System

Materials

Components in the Essential Siphon Vacuum System are constructed of the following materials:

- Gray Cast Iron
- Stainless Steel
- Steel

Environments

Components in the Essential Siphon Vacuum System are exposed to the following environments:

- Air
- Air – Indoor Uncontrolled
- Raw Water
- Soil
- Underground

Aging Effects Requiring Management

Components in the Essential Siphon Vacuum System require aging management to address the following aging effects:

- Cracking
- Loss of Material
- Loss of Preload

Aging Management Programs

The aging effects for components in the Essential Siphon Vacuum System are managed by the following AMPs:

- Bolting Integrity (B2.1.9)

* Buried and Underground Piping and Tanks (B2.1.26)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)

3.3.2.1.17 Spent Fuel Cooling System

Materials

Components in the Spent Fuel Cooling System are constructed of the following materials:

* Elastomer
* Glass
* Polymeric
* Stainless Steel
* Steel

Environments

Components in the Spent Fuel Cooling System are exposed to the following environments:

* Air
* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Closed-Cycle Cooling Water
* Closed-Cycle Cooling Water >60°C (>140°F)
* Treated Borated Water
* Treated Borated water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Spent Fuel Cooling System require aging management to address the following aging effects:

* Cracking
* Cracking or Blistering
* Hardening or Loss of Strength
* Loss of Material
* Loss of Preload

* Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Spent Fuel Cooling System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Water Chemistry (B2.1.2)

3.3.2.1.18 Alternate Chilled Water System

Materials

Components in the Alternate Chilled Water System are constructed of the following materials:

* Aluminum
* Copper Alloy
* Copper Alloy (>15% Zn)
* Ductile Iron
* Elastomer
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Alternate Chilled Water System are exposed to the following environments:

* Air
* Air – Indoor Uncontrolled
* Air – Outdoor
* Air with Borated Water Leakage
* Closed-Cycle Cooling Water
* Gas
* Raw Water (Potable)

Aging Effects Requiring Management

Components in the Alternate Chilled Water System require aging management to address the following aging effects:

* Cracking

* Hardening or Loss of Strength
* Loss of Material
* Loss of Preload
* Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Alternate Chilled Water System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Selective Leaching (B2.1.21)

3.3.2.1.19 Component Cooling Water System

Materials

Components in the Component Cooling Water System are constructed of the following materials:

* Glass
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Component Cooling Water System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Closed-Cycle Cooling Water
* Closed-Cycle Cooling Water >60°C (>140°F)
* Raw Water

Aging Effects Requiring Management

Components in the Component Cooling Water System require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Component Cooling Water System are managed by the following AMPs:

- Bolting Integrity (B2.1.9)
- Boric Acid Corrosion (B2.1.4)
- Closed Treated Water System (B2.1.12)
- External Surfaces Monitoring of Mechanical Components (B2.1.23)
- One-Time Inspection (B2.1.20)
- Open-Cycle Cooling Water System (B2.1.11)
- Selective Leaching (B2.1.21)
- TLAA

3.3.2.1.20 Chilled Water (Non-Vital Loads) System

Materials

Components in the Chilled Water (Non-Vital Loads) System are constructed of the following materials:

* Copper Alloy
* Copper Alloy (>15% Zn)
* Glass
* Stainless Steel
* Steel

Environments

Components in the Chilled Water (Non-Vital Loads) System are exposed to the following environments:

* Air with Borated Water Leakage
* Closed-Cycle Cooling Water
* Condensation
* Gas
* Raw Water

Aging Effects Requiring Management

Components in the Chilled Water (Non-Vital Loads) System require aging management to address the following aging effects:

* Cracking
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Chilled Water (Non-Vital Loads) System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)

3.3.2.1.21 Recirculating Cooling Water System

Materials

Components in the Recirculating Cooling Water System are constructed of the following materials:

* Copper Alloy (>15% Zn)
* Glass
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Recirculating Cooling Water System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Closed-Cycle Cooling Water
* Closed-Cycle Cooling Water >60°C (>140°F)
* Gas
* Raw Water

Aging Effects Requiring Management

Components in the Recirculating Cooling Water System require aging management to address the following aging effects:

* Cracking
* Flow Blockage
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

* Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Recirculating Cooling Water System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)
* Selective Leaching (B2.1.21)

3.3.2.1.22 Sample Cooling Water System

Materials

Components in the Sample Cooling Water System are constructed of the following materials:

* Copper Alloy
* Copper Alloy (>15% Zn)
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Sample Cooling Water System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Closed-Cycle Cooling Water
* Gas
* Raw Water (Potable)

Aging Effects Requiring Management

Components in the Sample Cooling Water System require aging management to address the following aging effects:

* Cracking
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Sample Cooling Water System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Selective Leaching (B2.1.21)

3.3.2.1.23 Chilled Water (Vital Loads) System

Materials

Components in the Chilled Water (Vital Loads) System are constructed of the following materials:

* Aluminum
* Copper Alloy
* Glass
* Gray Cast Iron
* Polymeric
* Stainless Steel
* Steel

Environments

Components in the Chilled Water (Vital Loads) System are exposed to the following environments:

* Air – Outdoor
* Air with Borated Water Leakage
* Closed-Cycle Cooling Water
* Condensation
* Gas
* Raw Water

Aging Effects Requiring Management

Components in the Chilled Water (Vital Loads) System require aging management to address the following aging effects:

* Cracking
* Cracking or Blistering
* Flow Blockage

* Hardening or Loss of Strength
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload
* Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Chilled Water (Vital Loads) System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)
* Selective Leaching (B2.1.21)

3.3.2.1.24 High Pressure Service Water System

Materials

Components in the High Pressure Service Water System are constructed of the following materials:

* Aluminum
* Copper Alloy
* Copper Alloy (>15% Zn)
* Ductile Iron
* Ductile Iron (w. Cement Lining)
* Elastomer
* Galvanized Steel
* Gray Cast Iron
* Stainless Steel
* Steel
* Steel with Internal Coating/Lining

Environments

Components in the High Pressure Service Water System are exposed to the following environments:

* Air – Outdoor
* Air with Borated Water Leakage
* Condensation
* Raw Water
* Soil
* Underground

Aging Effects Requiring Management

Components in the High Pressure Service Water System require aging management to address the following aging effects:

* Cracking
* Flow Blockage
* Hardening or Loss of Strength
* Long-Term Loss of Material
* Loss of Coating or Lining Integrity
* Loss of Material
* Loss of Preload
* Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the High Pressure Service Water System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Buried and Underground Piping and Tanks (B2.1.26)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Fire Water System (B2.1.16)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B2.1.27)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)
* Selective Leaching (B2.1.21)

3.3.2.1.25 Keowee Service Water System

Materials

Components in the Keowee Service Water System are constructed of the following materials:

* Copper Alloy
* Galvanized Steel
* Gray Cast Iron
* Polymeric
* PVC
* Stainless Steel
* Steel

Environments

Components in the Keowee Service Water System are exposed to the following environments:

* Condensation
* Raw Water

Aging Effects Requiring Management

Components in the Keowee Service Water System require aging management to address the following aging effects:

* Cracking
* Cracking or Blistering
* Cracking, Blistering
* Hardening or Loss of Strength
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Keowee Service Water System are managed by the following AMPs:

- Bolting Integrity (B2.1.9)
- External Surfaces Monitoring of Mechanical Components (B2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
- One-Time Inspection (B2.1.20)
- Open-Cycle Cooling Water System (B2.1.11)
- Selective Leaching (B2.1.21)

3.3.2.1.26 Keowee Fire Detection/Protection System

Materials

Components in the Keowee Fire Detection/Protection System are constructed of the following materials:

* Copper Alloy
* Copper Alloy (>15% Zn)
* Ductile Iron
* Ductile Iron (w. Cement Lining)
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Keowee Fire Detection/Protection System are exposed to the following environments:

* Air – Outdoor
* Condensation
* Raw Water
* Soil

Aging Effects Requiring Management

Components in the Keowee Fire Detection/Protection System require aging management to address the following aging effects:

* Cracking
* Flow Blockage
* Long-Term Loss of Material
* Loss of Coating or Lining Integrity
* Loss of Material

* Loss of Preload

Aging Management Programs

The aging effects for components in the Keowee Fire Detection/Protection System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Buried and Underground Piping and Tanks (B2.1.26)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Fire Water System (B2.1.16)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B2.1.27)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)
* Selective Leaching (B2.1.21)

3.3.2.1.27 Reactor Building Cooling and Ventilation Systems

Materials

Components in the Reactor Building Cooling and Ventilation Systems are constructed of the following materials:

* Copper Alloy
* Galvanized Steel
* Stainless Steel
* Steel

Environments

Components in the Reactor Building Cooling and Ventilation Systems are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Condensation
* Raw Water
* Waste Water

Aging Effects Requiring Management

Components in the Reactor Building Cooling and Ventilation Systems require aging management to address the following aging effects:

* Cracking
* Flow Blockage
* Loss of Material
* Loss of Preload
* Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Reactor Building Cooling and Ventilation Systems are managed by the following AMPs:

* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)

3.3.2.1.28 Reactor Building Purge System

Materials

Components in the Reactor Building Purge System are constructed of the following materials:

* Copper Alloy
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Reactor Building Purge System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Treated Water
* Waste Water
* Waste Water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Reactor Building Purge System require aging management to address the following aging effects:

* Cracking
* Flow Blockage
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Reactor Building Purge System are managed by the following AMPs:

* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Selective Leaching (B2.1.21)
* Water Chemistry (B2.1.2)

3.3.2.1.29 Ventilation Systems

Materials

Components in the Ventilation Systems are constructed of the following materials:

* Aluminum
* Copper Alloy
* Elastomer
* Galvanized Steel
* Galvanized Steel with Internal Coating/Lining
* Gray Cast Iron
* Polymeric
* PVC
* Stainless Steel
* Steel

Environments

Components in the Ventilation Systems are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air – Outdoor
* Air with Borated Water Leakage
* Closed-Cycle Cooling Water
* Condensation
* Gas
* Raw Water
* Treated Water
* Waste Water

Aging Effects Requiring Management

Components in the Ventilation Systems require aging management to address the following aging effects:

* Cracking
* Cracking or Blistering
* Flow Blockage
* Hardening or Loss of Strength
* Long-Term Loss of Material
* Loss of Coating or Lining Integrity
* Loss of Material
* Loss of Preload
* Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Ventilation Systems are managed by the following AMPs:

* Boric Acid Corrosion (B2.1.4)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Fire Protection (B2.1.15)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)
* Selective Leaching (B2.1.21)
* Water Chemistry (B2.1.2)

3.3.2.1.30 Lube Oil System

Materials

Components in the Lube Oil System are constructed of the following materials:

* Copper Alloy
* Copper Alloy (>15% Zn)
* Elastomer
* Glass
* Gray Cast Iron
* Stainless Steel
* Steel
* Steel with Internal Coating/Lining

Environments

Components in the Lube Oil System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Closed-Cycle Cooling Water
* Lubricating Oil
* Raw Water
* Waste Water
* Waste Water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Lube Oil System require aging management to address the following aging effects:

* Cracking
* Flow Blockage
* Hardening or Loss of Strength

* Long-Term Loss of Material
* Loss of Coating or Lining Integrity
* Loss of Material
* Loss of Preload
* Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Lube Oil System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B2.1.27)
* Lubricating Oil Analysis (B2.1.25)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)
* Selective Leaching (B2.1.21)

3.3.2.1.31 Keowee Turbine Guide Bearing Oil System

Materials

Components in the Keowee Turbine Guide Bearing Oil System are constructed of the following materials:

- Copper Alloy (>15% Zn)
- Stainless Steel
- Steel

Environments

Components in the Keowee Turbine Guide Bearing Oil System are exposed to the following environments:

- Air – Indoor Uncontrolled
- Lubricating Oil
- Raw Water

Aging Effects Requiring Management

Components in the Keowee Turbine Guide Bearing Oil System require aging management to address the following aging effects:

- Cracking
- Flow Blockage
- Loss of Material
- Loss of Preload
- Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Keowee Turbine Guide Bearing Oil System are managed by the following AMPs:

- Bolting Integrity (B2.1.9)

* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Lubricating Oil Analysis (B2.1.25)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)

3.3.2.1.32 Keowee Lube Oil System

Materials

Components in the Keowee Lube Oil System are constructed of the following materials:

* Copper Alloy (>15% Zn)
* Glass
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Keowee Lube Oil System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Lubricating Oil
* Waste Water

Aging Effects Requiring Management

Components in the Keowee Lube Oil System require aging management to address the following aging effects:

* Cracking
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Keowee Lube Oil System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)

* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* Lubricating Oil Analysis (B2.1.25)
* One-Time Inspection (B2.1.20)
* Selective Leaching (B2.1.21)

3.3.2.1.33 Filtered Water System

Materials

Components in the Filtered Water System are constructed of the following materials:

* Aluminum
* Stainless Steel
* Steel

Environments

Components in the Filtered Water System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Raw Water (Potable)

Aging Effects Requiring Management

Components in the Filtered Water System require aging management to address the following aging effects:

* Cracking
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Filtered Water System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)

3.3.2.1.34 Keowee Main Turbine System

Materials

Components in the Keowee Main Turbine System are constructed of the following materials:

* Stainless Steel
* Steel

Environments

Components in the Keowee Main Turbine System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air – Outdoor
* Concrete
* Raw Water

Aging Effects Requiring Management

Components in the Keowee Main Turbine System require aging management to address the following aging effects:

* Cracking
* Flow Blockage
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Keowee Main Turbine System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)

* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)

3.3.2.1.35 Leak Rate Test System

Materials

Components in the Leak Rate Test System are constructed of the following materials:

* Copper Alloy
* Galvanized Steel
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Leak Rate Test System are exposed to the following environments:

* Air
* Air – Indoor Uncontrolled
* Air – Outdoor
* Air with Borated Water Leakage

Aging Effects Requiring Management

Components in the Leak Rate Test System require aging management to address the following aging effects:

* Cracking
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Leak Rate Test System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)

* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)

3.3.2.1.36 Plant Drinking Water System

Materials

Components in the Plant Drinking Water System are constructed of the following materials:

* Copper Alloy
* Galvanized Steel
* Glass
* Polymeric
* PVC
* Stainless Steel
* Steel
* Steel with Internal Coating/Lining

Environments

Components in the Plant Drinking Water System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Raw Water
* Raw Water (Potable)
* Raw Water >60°C (>140°F) (Potable)

Aging Effects Requiring Management

Components in the Plant Drinking Water System require aging management to address the following aging effects:

* Cracking
* Cracking or Blistering
* Hardening or Loss of Strength
* Long-Term Loss of Material

* Loss of Coating or Lining Integrity
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Plant Drinking Water System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)

3.3.2.1.37 Radiation Monitoring System

Materials

Components in the Radiation Monitoring System are constructed of the following materials:

* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Radiation Monitoring System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Raw Water
* Treated Water
* Treated Water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Radiation Monitoring System require aging management to address the following aging effects:

* Cracking
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Radiation Monitoring System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)

* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)
* Selective Leaching (B2.1.21)
* Water Chemistry (B2.1.2)

3.3.2.1.38 Stator Coolant System

Materials

Components in the Stator Coolant System are constructed of the following materials:

* Copper Alloy
* Stainless Steel
* Steel

Environments

Components in the Stator Coolant System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Treated Water
* Treated Water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Stator Coolant System require aging management to address the following aging effects:

* Cracking
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Stator Coolant System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* One-Time Inspection (B2.1.20)

* Water Chemistry (B2.1.2)

3.3.2.1.39 Station Sewage Disposal System

Materials

Components in the Station Sewage Disposal System are constructed of the following materials:

* Galvanized Steel
* Gray Cast Iron
* Polymeric
* PVC
* Stainless Steel
* Steel

Environments

Components in the Station Sewage Disposal System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Waste Water
* Waste Water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Station Sewage Disposal System require aging management to address the following aging effects:

* Cracking
* Cracking or Blistering
* Hardening or Loss of Strength
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Station Sewage Disposal System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Selective Leaching (B2.1.21)

3.3.2.1.40 Keowee Turbine Sump Pump System

Materials

Components in the Keowee Turbine Sump Pump System are constructed of the following materials:

* Copper Alloy
* Copper Alloy (>15% Zn)
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Keowee Turbine Sump Pump System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air – Outdoor
* Concrete
* Waste Water

Aging Effects Requiring Management

Components in the Keowee Turbine Sump Pump System require aging management to address the following aging effects:

* Cracking
* Flow Blockage
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Keowee Turbine Sump Pump System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Selective Leaching (B2.1.21)

3.3.2.1.41 Vacuum System

Materials

Components in the Vacuum System are constructed of the following materials:

* Copper Alloy
* Ductile Iron
* Glass
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Vacuum System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Condensation
* Raw Water
* Treated Water
* Treated Water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Vacuum System require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Vacuum System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)
* Selective Leaching (B2.1.21)
* TLAA
* Water Chemistry (B2.1.2)

3.3.2.1.42 Electro-Hydraulic Control System

Materials

Components in the Electro-Hydraulic Control System are constructed of the following materials:

* Aluminum
* Ductile Iron
* Elastomer
* Glass
* Stainless Steel
* Steel

Environments

Components in the Electro-Hydraulic Control System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Closed-Cycle Cooling Water
* Gas
* Lubricating Oil

Aging Effects Requiring Management

Components in the Electro-Hydraulic Control System require aging management to address the following aging effects:

* Cracking
* Hardening or Loss of Strength
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Electro-Hydraulic Control System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* Lubricating Oil Analysis (B2.1.25)
* One-Time Inspection (B2.1.20)

3.3.2.1.43 Fuel Oil System

Materials

Components in the Fuel Oil System are constructed of the following materials:

* Polymeric
* Stainless Steel
* Steel

Environments

Components in the Fuel Oil System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Fuel Oil
* Lubricating Oil (Waste Oil)

Aging Effects Requiring Management

Components in the Fuel Oil System require aging management to address the following aging effects:

* Cracking
* Cracking or Blistering
* Hardening or Loss of Strength
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Fuel Oil System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)

* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)

3.3.2.1.44 Keowee Generator High Pressure Oil System

Materials

Components in the Keowee Generator High Pressure Oil System are constructed of the following materials:

* Copper Alloy
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Keowee Generator High Pressure Oil System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Lubricating Oil

Aging Effects Requiring Management

Components in the Keowee Generator High Pressure Oil System require aging management to address the following aging effects:

* Cracking
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Keowee Generator High Pressure Oil System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Lubricating Oil Analysis (B2.1.25)

* One-Time Inspection (B2.1.20)

3.3.2.1.45 Keowee Governor Oil System

Materials

Components in the Keowee Governor Oil System are constructed of the following materials:

* Glass
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Keowee Governor Oil System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Lubricating Oil

Aging Effects Requiring Management

Components in the Keowee Governor Oil System require aging management to address the following aging effects:

* Cracking
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Keowee Governor Oil System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Lubricating Oil Analysis (B2.1.25)
* One-Time Inspection (B2.1.20)

3.3.2.1.46 Refueling System

Materials

Components in the Refueling System are constructed of the following materials:

* Copper Alloy
* Copper Alloy (>15% Zn)
* Elastomer
* Glass
* Stainless Steel
* Steel

Environments

Components in the Refueling System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Treated Water

Aging Effects Requiring Management

Components in the Refueling System require aging management to address the following aging effects:

* Cracking
* Hardening or Loss of Strength
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Refueling System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Selective Leaching (B2.1.21)
* Water Chemistry (B2.1.2)

3.3.2.1.47 Hydrogen Seal Oil System

Materials

Components in the Hydrogen Seal Oil System are constructed of the following materials:

* Copper Alloy
* Ductile Iron
* Glass
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Hydrogen Seal Oil System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Lubricating Oil

Aging Effects Requiring Management

Components in the Hydrogen Seal Oil System require aging management to address the following aging effects:

* Cracking
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Hydrogen Seal Oil System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)

* Lubricating Oil Analysis (B2.1.25)
* One-Time Inspection (B2.1.20)

3.3.2.1.48 Condenser Circulating Water System

Materials

Components in the Condenser Circulating Water System are constructed of the following materials:

* Copper Alloy
* Ductile Iron
* Elastomer
* Gray Cast Iron
* Stainless Steel
* Steel
* Steel with Internal Coating/Lining

Environments

Components in the Condenser Circulating Water System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air – Outdoor
* Air with Borated Water Leakage
* Concrete
* Condensation
* Gas
* Raw Water
* Soil
* Underground
* Waste Water

Aging Effects Requiring Management

Components in the Condenser Circulating Water System require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage
* Flow Blockage
* Hardening or Loss of Strength
* Long-Term Loss of Material
* Loss of Coating or Lining Integrity
* Loss of Material
* Loss of Preload
* Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Condenser Circulating Water System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Buried and Underground Piping and Tanks (B2.1.26)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B2.1.27)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)
* Selective Leaching (B2.1.21)
* TLAA

3.3.2.1.49 Low Pressure Service Water System

Materials

Components in the Low Pressure Service Water System are constructed of the following materials:

- Aluminum
- Copper Alloy
- Copper Alloy (>15% Zn)
- Ductile Iron
- Elastomer
- Glass
- Gray Cast Iron
- Stainless Steel
- Steel
- Steel with Internal Coating/Lining

Environments

Components in the Low Pressure Service Water System are exposed to the following environments:

- Air
- Air – Dry
- Air – Indoor Uncontrolled
- Air – Outdoor
- Air with Borated Water Leakage
- Concrete
- Condensation
- Raw Water

Aging Effects Requiring Management

Components in the Low Pressure Service Water System require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage
* Flow Blockage
* Hardening or Loss of Strength
* Long-Term Loss of Material
* Loss of Coating or Lining Integrity
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Low Pressure Service Water System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Compressed Air Monitoring (B2.1.14)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B2.1.27)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)
* Selective Leaching (B2.1.21)
* TLAA

3.3.2.1.50 Protected Service Water System

Materials

Components in the Protected Service Water System are constructed of the following materials:

* Ductile Iron
* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Protected Service Water System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Concrete
* Raw Water
* Waste Water

Aging Effects Requiring Management

Components in the Protected Service Water System require aging management to address the following aging effects:

* Cracking
* Flow Blockage
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Protected Service Water System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)
* Selective Leaching (B2.1.21)

3.3.2.1.51 Siphon Seal Water System

Materials

Components in the Siphon Seal Water System are constructed of the following materials:

* Stainless Steel
* Steel

Environments

Components in the Siphon Seal Water System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air – Outdoor
* Condensation
* Raw Water
* Soil
* Underground

Aging Effects Requiring Management

Components in the Siphon Seal Water System require aging management to address the following aging effects:

* Cracking
* Flow Blockage
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Siphon Seal Water System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)

* Buried and Underground Piping and Tanks (B2.1.26)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)

3.3.2.1.52 Keowee Turbine Generator Cooling Water System

Materials

Components in the Keowee Turbine Generator Cooling Water System are constructed of the following materials:

- Copper Alloy
- Copper Alloy (>15% Zn)
- Copper Alloy (>8% Al)
- Gray Cast Iron
- Stainless Steel
- Steel

Environments

Components in the Keowee Turbine Generator Cooling Water System are exposed to the following environments:

- Air – Indoor Uncontrolled
- Concrete
- Raw Water

Aging Effects Requiring Management

Components in the Keowee Turbine Generator Cooling Water System require aging management to address the following aging effects:

- Cracking
- Flow Blockage
- Long-Term Loss of Material
- Loss of Material
- Loss of Preload
- Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Keowee Turbine Generator Cooling Water System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)
* Selective Leaching (B2.1.21)

3.3.2.1.53 Standby Shutdown Facility Air Intake and Exhaust System

Materials

Components in the Standby Shutdown Facility Air Intake and Exhaust System are constructed of the following materials:

* Calcium Silicate
* Elastomer
* Stainless Steel
* Steel

Environments

Components in the Standby Shutdown Facility Air Intake and Exhaust System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air – Outdoor
* Diesel Exhaust

Aging Effects Requiring Management

Components in the Standby Shutdown Facility Air Intake and Exhaust System require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage
* Hardening or Loss of Strength
* Loss of Material
* Loss of Preload
* Reduced Thermal Insulation Resistance

Aging Management Programs

The aging effects for components in the Standby Shutdown Facility Air Intake and Exhaust System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* TLAA

3.3.2.1.54 Standby Shutdown Facility Diesel Jacket Water Cooling System

Materials

Components in the Standby Shutdown Facility Diesel Jacket Water Cooling System are constructed of the following materials:

* Copper Alloy (>15% Zn)
* Glass
* Stainless Steel
* Steel

Environments

Components in the Standby Shutdown Facility Diesel Jacket Water Cooling System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Closed-Cycle Cooling Water
* Closed-Cycle Cooling Water >60°C (>140°F)
* Raw Water

Aging Effects Requiring Management

Components in the Standby Shutdown Facility Diesel Jacket Water Cooling System require aging management to address the following aging effects:

* Cracking
* Flow Blockage
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload
* Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Standby Shutdown Facility Diesel Jacket Water Cooling System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* One-Time Inspection (B2.1.20)
* Open-Cycle Cooling Water System (B2.1.11)

3.3.2.1.55 Standby Shutdown Facility Diesel Lube Oil System

Materials

Components in the Standby Shutdown Facility Diesel Lube Oil System are constructed of the following materials:

* Aluminum
* Copper Alloy (>15% Zn)
* Glass
* Stainless Steel
* Steel

Environments

Components in the Standby Shutdown Facility Diesel Lube Oil System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Closed-Cycle Cooling Water
* Lubricating Oil

Aging Effects Requiring Management

Components in the Standby Shutdown Facility Diesel Lube Oil System require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage
* Loss of Material
* Loss of Preload
* Reduction of Heat Transfer

Aging Management Programs

The aging effects for components in the Standby Shutdown Facility Diesel Lube Oil System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Lubricating Oil Analysis (B2.1.25)
* One-Time Inspection (B2.1.20)
* TLAA

3.3.2.1.56 Standby Shutdown Facility Fuel Oil System

Materials

Components in the Standby Shutdown Facility Fuel Oil System are constructed of the following materials:

* Gray Cast Iron
* Stainless Steel
* Steel

Environments

Components in the Standby Shutdown Facility Fuel Oil System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air – Outdoor
* Concrete
* Fuel Oil
* Soil
* Underground

Aging Effects Requiring Management

Components in the Standby Shutdown Facility Fuel Oil System require aging management to address the following aging effects:

* Cracking
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Standby Shutdown Facility Fuel Oil System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Buried and Underground Piping and Tanks (B2.1.26)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Fuel Oil Chemistry (B2.1.18)
* One-Time Inspection (B2.1.20)

3.3.2.1.57 Standby Shutdown Facility Starting Air System

Materials

Components in the Standby Shutdown Facility Starting Air System are constructed of the following materials:

* Copper Alloy
* Copper Alloy (>15% Zn)
* Ductile Iron
* Elastomer
* Stainless Steel
* Steel
* Zinc

Environments

Components in the Standby Shutdown Facility Starting Air System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Condensation

Aging Effects Requiring Management

Components in the Standby Shutdown Facility Starting Air System require aging management to address the following aging effects:

* Cracking
* Hardening or Loss of Strength
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Standby Shutdown Facility Starting Air System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)

3.3.2.1.58 Gaseous Waste Disposal System

Materials

Components in the Gaseous Waste Disposal System are constructed of the following materials:

* Glass
* Nickel Alloy
* Stainless Steel
* Steel

Environments

Components in the Gaseous Waste Disposal System are exposed to the following environments:

* Air
* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Closed-Cycle Cooling Water
* Gas
* Treated Water
* Treated Water >60°C (>140°F)
* Waste Water

Aging Effects Requiring Management

Components in the Gaseous Waste Disposal System require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage
* Long-Term Loss of Material
* Loss of Material

* Loss of Preload

Aging Management Programs

The aging effects for components in the Gaseous Waste Disposal System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* Closed Treated Water System (B2.1.12)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* TLAA
* Water Chemistry (B2.1.2)

3.3.2.1.59 Liquid Waste Disposal System

Materials

Components in the Liquid Waste Disposal System are constructed of the following materials:

* Copper Alloy
* Glass
* Stainless Steel
* Steel
* Steel (with Stainless Steel Cladding)

Environments

Components in the Liquid Waste Disposal System are exposed to the following environments:

* Air – Indoor Uncontrolled
* Air with Borated Water Leakage
* Concrete
* Waste Water
* Waste Water >60°C (>140°F)

Aging Effects Requiring Management

Components in the Liquid Waste Disposal System require aging management to address the following aging effects:

* Cracking
* Cumulative Fatigue Damage
* Flow Blockage
* Long-Term Loss of Material
* Loss of Material
* Loss of Preload

Aging Management Programs

The aging effects for components in the Liquid Waste Disposal System are managed by the following AMPs:

* Bolting Integrity (B2.1.9)
* Boric Acid Corrosion (B2.1.4)
* External Surfaces Monitoring of Mechanical Components (B2.1.23)
* Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)
* One-Time Inspection (B2.1.20)
* TLAA

3.3.2.2 Further Evaluation of Aging Management as Recommended by NUREG-2192

NUREG-2192 provides the basis for identifying those programs that warrant further evaluation by the reviewer in the SLRA. For the auxiliary systems, those evaluations are addressed in the following sections. Italicized text is taken directly from NUREG-2192.

3.3.2.2.1 Cumulative Fatigue Damage

NUREG-2192:

Evaluations involving time-dependent fatigue or cyclical loading parameters may be time-limited aging analyses (TLAAs), as defined in 10 CFR 54.3. TLAAs are required to be evaluated in accordance with 10 CFR 54.21(c)(1). This TLAA is addressed separately in Section 4.3, “Metal Fatigue,” or Section 4.7, “Other Plant-Specific Time-Limited Aging Analyses,” of this SRP-SLR. For plant-specific cumulative usage factor calculations that are based on stress-based input methods, the methods are to be appropriately defined and discussed in the applicable TLAAs.

Evaluation:

[3.3.1-001] - Load cycles of NUREG-0612 plant cranes is a TLAA as defined in 10 CFR 54.3. The evaluation of the TLAA is addressed in Section 4.7.5, Crane Load Cycle Limit.

[3.3.1-002] - Fatigue of auxiliary systems components is a TLAA as defined in 10 CFR 54.3. The evaluation of the TLAA is address in Section 4.3.3, Non-Class 1 Piping Fatigue Analyses.

3.3.2.2.2 Cracking Due to Stress Corrosion Cracking and Cyclic Loading

Cracking due to stress corrosion cracking (SCC) and cyclic loading could occur in stainless steel (SS) PWR nonregenerative heat exchanger tubing exposed to treated borated water greater than 60 ^{o}C (Celsius) [140 ^{o}F (Fahrenheit)] in the chemical and volume control system. The existing AMP for monitoring and control of primary water chemistry in PWRs (GALL-SLR Report AMP X1.M2, “Water Chemistry”) manages the aging effects of cracking due to SCC. However, control of water chemistry does not preclude cracking due to SCC and cyclic loading. Therefore, the effectiveness of the water chemistry control program should be verified to ensure that cracking is not occurring. If a search of plant-specific operating experience (OE) does not reveal that cracking has occurred in nonregenerative heat exchanger tubing, this aging effect can be considered to be adequately managed by GALL-SLR Report AMP XI.M2. However, if cracking has occurred in nonregenerative heat exchanger tubing, the GALL-SLR Report recommends that AMP XI.M21A, “Closed Treated Water Systems,” be evaluated for inclusion of augmented requirements to conduct temperature and radioactivity monitoring of the shell side water, and where component configuration permits, periodic eddy current testing of tubes.

Evaluation:

[3.3.1-003] [3.3.1-003a] – Not applicable. The ONS high pressure injection system letdown coolers and seal return coolers function as nonregenerative heat exchangers. The tubes on these heat exchangers perform no intended function and are not in the scope of SLR. Therefore, cracking due to stress corrosion cracking and cyclic loading of stainless steel PWR nonregenerative heat exchanger tubing exposed to treated borated water greater than 60 °C (Celsius) [140 °F (Fahrenheit)] is not an aging effect requiring management for ONS.

3.3.2.2.3 Cracking Due to Stress Corrosion Cracking in Stainless Steel Alloys

NUREG-2192:

Cracking due to SCC could occur in indoor or outdoor SS piping, piping components, and tanks exposed to any air, condensation, or underground environment when the component is: (a) uninsulated, (b) insulated, (c) in the vicinity of insulated components, or (d) in the vicinity of potentially transportable halogens. Cracking can occur in environments containing sufficient halides (e.g., chlorides) in the presence of moisture.

Insulated SS components exposed to indoor air, outdoor air, condensation, or underground environments are susceptible to SCC if the insulation contains certain contaminants. Leakage of fluids through bolted connections (e.g., flanges, valve packing) can result in contaminants present in the insulation leaching onto the component surface or the surfaces of other components below the component. For outdoor insulated SS components, rain and changing weather conditions can result in moisture intrusion into the insulation.

Plant-specific OE and the condition of SS components are evaluated to determine if prolonged exposure to the plant-specific environments has resulted in SCC. SCC in SS components is not an aging effect requiring management if (a) plant-specific OE does not reveal a history of SCC and (b) a one-time inspection demonstrates that the aging effect is not occurring.

In the environment of air-indoor controlled, SCC is only expected to occur as the result of a source of moisture and halides. Inspections focus on the most susceptible locations. The applicant documents the results of the plant-specific OE review in the license renewal application (LRA).

The GALL-SLR Report recommends further evaluation of SS piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of SCC. The GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that SCC is not occurring. If SCC is applicable, the following AMPs describe acceptable programs to manage loss of material due to SCC: (a) GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," for tanks; (b) GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," for external surfaces of piping and piping components; (c) GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," for underground piping, piping components and tanks; and (d) GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces *in Miscellaneous Piping and Ducting Components," for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in GALL-SLR Report AMP XI.M32.*

The applicant may establish that SCC is not an aging effect requiring management for all components, by demonstrating that a barrier coating isolates the component from aggressive environments. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. The GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating.

Evaluation:

A review of ONS operating experience confirmed that cracking due to stress corrosion cracking has not been identified in stainless steel piping, piping components, and tanks exposed to air, condensation, or underground environment in ONS auxiliary systems.

[3.3.1-004] - The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that cracking due to stress corrosion cracking is not occurring on stainless steel piping, piping components, and tanks exposed to air or condensation environments.

[3.3.1-094a] - The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that cracking due to stress corrosion cracking is not occurring on stainless steel ducting or ducting components exposed to air or condensation environments.

[3.3.1-146] - The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that cracking due to stress corrosion cracking is not occurring on stainless steel piping or piping components exposed to an underground environment.

[3.3.1-205] - The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that cracking due to stress corrosion cracking is not occurring on insulated stainless steel piping, piping components, and tanks exposed to air or condensation environments.

[3.3.1-231] - ONS has no stainless steel tanks within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks" in the scope of SLR in auxiliary systems.

3.3.2.2.4 Loss of Material Due to Pitting and Crevice Corrosion in Stainless Steel and Nickel Alloys

NUREG-2192:

Loss of material due to pitting and crevice corrosion could occur in indoor or outdoor SS and nickel alloy piping, piping components, and tanks exposed to any air, condensation, or underground environment when the component is: (a) uninsulated; (b) insulated; (c) in the vicinity of insulated components; or (d) in the vicinity of potentially transportable halogens. Loss of material due to pitting and crevice corrosion can occur on SS and nickel alloys in environments containing sufficient halides (e.g., chlorides) in the presence of moisture.

Insulated SS and nickel alloy components exposed to air, condensation, or underground environments are susceptible to loss of material due to pitting or crevice corrosion if the insulation contains certain contaminants. Leakage of fluids through mechanical connections such as bolted flanges and valve packing can result in contaminants leaching onto the component surface or the surfaces of other components below the component. For outdoor insulated SS and nickel alloy components, rain and changing weather conditions can result in moisture intrusion into the insulation.

Plant-specific OE and the condition of SS and nickel alloy components are evaluated to determine if prolonged exposure to the plant-specific environments has resulted in pitting or crevice corrosion. Loss of material due to pitting and crevice corrosion is not an aging effect requiring management for SS and nickel alloy components if (a) plant-specific OE does not reveal a history of loss of material due to pitting or crevice corrosion; and (b) a one-time inspection demonstrates that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the subsequent period of extended operation. The applicant documents the results of the plant-specific OE review in the SLRA.

In the environment of air-indoor controlled, pitting and crevice corrosion is only expected to occur as the result of a source of moisture and halides. Inspections focus on the most susceptible locations.

The GALL-SLR Report recommends further evaluation of SS and nickel alloy piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of loss of material due to pitting and crevice corrosion. GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that loss of material due to pitting and crevice corrosion is not occurring at a rate that affects the intended function of the components. If loss of material due to pitting or crevice corrosion has occurred and is sufficient to potentially affect the intended function of an SSC, the following AMPs describe acceptable programs to manage loss of material due to pitting or crevice corrosion: (a) GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," for tanks; (b) GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," for external surfaces of piping and piping components; (c) GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," for underground piping, piping components and tanks; and (d) GALL-SLR Report AMP

XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in GALL-SLR Report AMP XI.M32.

The applicant may establish that loss of material due to pitting and crevice corrosion is not an aging effect requiring management by demonstrating that a barrier coating isolates the component from aggressive environments. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating.

Evaluation:

A review of ONS operating experience confirmed that pitting and crevice corrosion has not occurred on surfaces of stainless steel or nickel alloy piping, piping components, and tanks exposed to air, condensation, or underground environments in ONS auxiliary systems.

[3.3.1-006] – The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion of stainless steel and nickel alloy piping and piping components exposed to air or condensation environments is not occurring.

[3.3.1-094] – The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion of stainless steel ducting and ducting components exposed to air or condensation environments is not occurring.

[3.3.1-222] – The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion of stainless steel tanks exposed to air or condensation environments is not occurring.

[3.3.1-228] – Not applicable. ONS has no stainless steel or nickel alloy tanks within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks" in the scope of SLR in auxiliary systems.

[3.3.1-232] – The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion of insulated stainless steel piping and piping components exposed to air or condensation environments is not occurring.

[3.3.1-241] – The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion of stainless steel heat exchanger components exposed to air or condensation environments is not occurring.

[3.3.1-246] – The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion of stainless steel piping and piping components exposed to an underground environment is not occurring.

3.3.2.2.5 Quality Assurance for Aging Management of Non-Safety Related Components

NUREG-2192:

Acceptance criteria are described in Branch Technical Position (BTP) IQMB-1 (Appendix A.2 of this SRP-SLR).

Evaluation:

Quality Assurance provisions applicable to SLR are discussed in Appendix B1.3, Quality Assurance Program and Administrative Controls.

3.3.2.2.6 Ongoing Review of Operating Experience

NUREG-2192:

Acceptance criteria are described in Appendix A.4, "Operating Experience for Aging Management Programs."

Evaluation:

The OE process and acceptance criteria are described in Appendix B1.4, Operating Experience.

3.3.2.2.7 Loss of Material Due to Recurring Internal Corrosion

NUREG-2192:

Recurring internal corrosion can result in the need to augment AMPs beyond the recommendations in the GALL-SLR Report. During the search of plant-specific OE conducted during the SLRA development, recurring internal corrosion can be identified by the number of occurrences of aging effects and the extent of degradation at each localized corrosion site. This further evaluation item is applicable if the search of plant specific OE reveals repetitive occurrences. The criteria for recurrence is (a) a 10 year search of plant specific OE reveals the aging effect has occurred in three or more refueling outage cycles; or (b) a 5 year search of plant specific OE reveals the aging effect has occurred in two or more refueling outage cycles and resulted in the component either not meeting plant specific acceptance criteria or experiencing a reduction in wall thickness greater than 50 percent (regardless of the minimum wall thickness).

The GALL-SLR Report recommends that GALL-SLR Report AMP XI.M20, "Open-Cycle Cooling Water System," GALL-SLR Report AMP XI.M27, "Fire Water System," or GALL-SLR Report

AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," be evaluated for inclusion of augmented requirements to ensure the adequate management of any recurring aging effect(s). Alternatively, a plant-specific AMP may be proposed. Potential augmented requirements include: alternative examination methods (e.g., volumetric versus external visual), augmented inspections (e.g., a greater number of locations, additional locations based on risk insights based on susceptibility to aging effect and consequences of failure, a greater frequency of inspections), and additional trending parameters and decision points where increased inspections would be implemented.

The applicant states: (a) why the program's examination methods will be sufficient to detect the recurring aging effect before affecting the ability of a component to perform its intended function, (b) the basis for the adequacy of augmented or lack of augmented inspections, (c) what parameters will be trended as well as the decision points where increased inspections would be implemented (e.g., the extent of degradation at individual corrosion sites, the rate of degradation change), (d) how inspections of components that are not easily accessed (i.e., buried, underground) will be conducted, and (e) how leaks in any involved buried or underground components will be identified.

Plant-specific OE examples should be evaluated to determine if the chosen AMP should be augmented even if the thresholds for significance of aging effect or frequency of occurrence of aging effect have not been exceeded. For example, during a 10-year search of plant-specific OE, two instances of 360 degree 30 percent wall loss occurred at copper alloy to steel joints. Neither the significance of the aging effect nor the frequency of occurrence of aging effect threshold has been exceeded. Nevertheless, the OE should be evaluated to determine if the AMP that is proposed to manage the aging effect is sufficient (e.g., method of inspection, frequency of inspection, number of inspections) to provide reasonable assurance that the current licensing basis (CLB) intended functions of the component will be met throughout the subsequent period of extended operation. While recurring internal corrosion is not as likely in other environments as raw water and waste water (e.g., treated water), the aging effect should be addressed in a similar manner.

Evaluation:

[3.3.1-127] - The review of plant specific OE has identified recurring internal corrosion in carbon steel piping and piping components exposed to raw water from Lake Keowee. Carbon steel piping and piping components in the condenser circulating water system, high pressure service water system, Keowee fire protection/detection system, Keowee main turbine system, Keowee service water system, Keowee turbine generator cooling water system, low pressure service water system, protected service water system, and vacuum system are exposed to raw water from Lake Keowee and considered susceptible to recurring internal corrosion.

As described below ONS will implement the *Open-Cycle Cooling Water System* (B2.1.11) program to manage recurring internal corrosion. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B corrective action program. *The Open-Cycle Cooling Water System* (B2.1.11) program is described in Appendix B.

a. The program utilizes volumetric (e.g., UT) examination methods for the detection of aging effects. The program will also rely on periodic internal visual inspections of the normally inaccessible (i.e., buried) condenser circulating water system piping. These conventional NDE methods quantitatively evaluate components to verify fitness for service and have been proven effective for the detection of aging effects prior to loss of intended function.

b. The program includes methodology for choosing piping inspection locations and the performance of volumetric inspections for various degradation mechanisms including recurring internal corrosion. The existing program does not require a specified number or location of volumetric examinations of raw water system piping. Instead, the number and prioritization of inspection locations is based on piping corrosion susceptibility (based on material, piping size, piping configuration, flow velocity, and past inspection data) and the consequences of pipe leaks or other integrity issues (e.g., piping design function). The size of the inspection scope and criteria used when selecting inspection locations may include: inspections required for extent of condition, re-inspection locations based on remaining service life calculations, new inspection locations based on Industry/Duke Energy fleet OE, and follow-up inspections of locations where repairs have been performed. The selection of inspection locations based on susceptibility to aging effects and consequences of failure is an acceptable approach to address recurring internal corrosion as required by this Further Evaluation. The *Open-Cycle Cooling Water System* (B2.1.11) program will be enhanced to require a minimum of 20 inspections for recurring internal corrosion every 24 months to ensure that a sufficient number of inspections are performed to adequately monitor the condition of carbon steel piping exposed to raw water from Lake Keowee at ONS. Inspections will be performed in both open-cycle cooling water systems and water-based fire suppression systems in representative sample locations with conditions that are characteristic of the conditions found throughout raw water filled systems at ONS. Since the material of construction and service environment are equivalent between the open-cycle cooling water systems and the water-based fire suppression systems, managing recurring internal corrosion of these systems as a single population is appropriate. Inspection results will be extrapolated to similar locations throughout all the raw water systems within the scope of SLR and used to assess the general condition of piping exposed to raw water, including carbon steel components exposed to raw water that are not easily accessed (i.e., buried). This characteristic-based approach recognizes the commonality among the component materials of construction and the environment to which they are exposed.

c. The program includes trending of corrosion data and the decision point where increased inspections would be implemented.

- The program includes guidance for the determination of the expected remaining service life based on the corrosion rate experienced by the inspected piping segment. To ensure conservatism, a safety factor of 1.5 - 2.0 is applied to the corrosion rate when calculating expected remaining service life. If the corrosion rate is based on a single set of data for the piping segment, then a safety factor of 2.0 is used to establish remaining service life. If there are multiple datasets for the piping, then a safety factor of 1.5 can be used.

- If the cause of the aging effect is not mitigated for all components constructed of the same material and exposed to the same environment, additional inspections are conducted if one of the inspections does not meet acceptance criteria. When the code (e.g., ASME Code Case N-513-3) requires extent of condition or scope expansion, the requirements of the code are followed. For extent of condition inspections that are not driven by code requirements, the *Open-Cycle Cooling Water System* (B2.1.11) program will be enhanced to provide for expanding inspection scope. The program will require no fewer than five additional inspections for each inspection that did not meet acceptance criteria, or 20 percent of each applicable material, environment, and aging effect combination, whichever is less.

d. The only carbon steel components exposed to raw water that are not easily accessed (i.e., buried) is internally uncoated buried steel piping providing the supply and return flow paths to the radwaste equipment cooling system from the condenser circulating water system intake piping. The radwaste equipment cooling system does not perform any SLR intended functions and the supply and return lines are only in scope as part of the pressure boundary of the large diameter condenser circulating water system piping. The *Open-Cycle Cooling Water System* (B2.1.11) program will be enhanced to perform internal visual inspections of the visible portions of the radwaste equipment cooling system supply and return piping every six years in conjunction with the performance of the condenser circulating water system intake piping internal coating inspections. The direct visual inspections of this piping supplemented by the volumetric inspection data for the aboveground piping, which provides information regarding the general condition of similar piping exposed to the same service conditions, provide reasonable assurance that age-related degradation will be detected and corrected prior to loss of intended function.

e. ONS is incapable of detecting leaks in buried raw water piping during normal operation because installed instrumentation is not sensitive enough to detect leakage. However, the periodic internal visual inspections of the buried piping segments susceptible to recurring internal corrosion will provide opportunities to detect direct evidence of internal degradation and through wall leakage as well as indirect evidence of through wall leakage including the presence of backfill material or gravel within the pipe. Additionally, internal corrosion effects are similar for both buried and accessible piping. The *Open-Cycle Cooling Water System* (B2.1.11) program extrapolates the results of inspections to similar locations throughout all the raw water systems within the scope of SLR and to assess the general condition of piping exposed to raw water including both buried and accessible piping.

3.3.2.2.8 Cracking Due to Stress Corrosion Cracking in Aluminum Alloys

<u>NUREG-2192</u>

SCC is a form of environmentally assisted cracking which is known to occur in high and moderate strength aluminum alloys. The three conditions necessary for SCC to occur in a component are a sustained tensile stress, aggressive environment, and material with a susceptible microstructure. Cracking due to SCC can be mitigated by eliminating one of the three necessary conditions. For the purposes of SLR, acceptance criteria for this further evaluation is being provided for demonstrating that the specific material is not susceptible to SCC or an aggressive environment is not present. Cracking due to SCC is an aging effect requiring management unless it is demonstrated by the applicant that one of the two necessary conditions discussed below is absent.

Susceptible Material: If the material is not susceptible to SCC then cracking is not an aging effect requiring management. The microstructure of an aluminum alloy, of which alloy composition is only one factor, is what determines if the alloy is susceptible to SCC. Therefore, determining susceptibility based on alloy composition alone is not adequate to conclude whether a particular material is susceptible to SCC. The temper, condition, and product form of the alloy is considered when assessing if a material is susceptible to SCC. Aluminum alloys that are susceptible to SCC include:

- *2xxx series alloys in the F, W, Ox, T3x, T4x, or T6x temper*
- *5xxx series alloys with a magnesium content of 3.5 weight percent or greater*
- *6xxx series alloys in the F temper*
- *7xxx series alloys in the F, T5x, or T6x temper*
- *2xx.x and 7xx.x series alloys*
- *3xx.x series alloys that contain copper*
- *5xx.x series alloys with a magnesium content of greater than 8 weight percent*

The material is evaluated to verify that it is not susceptible to SCC and that the basis used to make the determination is technically substantiated. Tempers have been specifically developed to improve the SCC resistance for some aluminum alloys. Aluminum alloy and temper combination which are not susceptible to SCC when used in piping, piping component, and tank applications include 1xxx series, 3xxx series, 6061-T6x, and 5454-x. If it is determined that a material is not susceptible to SCC, the SLRA provides the components/locations where it is used, alloy composition, temper or condition, product form, and for tempers not addressed above, the basis used to determine the alloy is not susceptible and technical information substantiating the basis.

Aggressive Environment: If the environment to which an aluminum alloy is exposed is not aggressive, such as dry gas or treated water, then cracking due to SCC will not occur and it is not an aging effect requiring management. Aggressive environments that are known to result in cracking due to SCC of susceptible aluminum alloys are aqueous solutions, air, condensation, and underground locations that contain halides (e.g., chloride). Halide concentrations should be considered high enough to facilitate SCC of aluminum alloys in uncontrolled or untreated *aqueous solutions and air, such as raw water, waste water, condensation, underground locations, and outdoor air, unless demonstrated otherwise.*

Halides could be present on the surface of the aluminum material if the component is encapsulated in a material such as insulation or concrete. In a controlled or uncontrolled indoor air, condensation, or underground environment, sufficient halide concentrations to cause SCC could be present due to secondary sources such as leakage from nearby components (e.g., leakage from insulated flanged connections or valve packing). If an aluminum component is exposed to a halide-free indoor air environment, not encapsulated in materials containing halides, and the exposure to secondary sources of moisture or halides is precluded, cracking due to SCC is not expected to occur. The plant-specific configuration can be used to demonstrate that exposure to halides will not occur. If it is determined that SCC will not occur because the environment is not aggressive, the SLRA provides the components and locations exposed to the environment, a description of the environment, basis used to determine the environment is not aggressive, and technical information substantiating the basis. The GALL-SLR Report AMP XI.M32, "One-Time Inspection," and a review of plant-specific OE describe an acceptable means to confirm the absence of moisture or halides within the proximity of the aluminum component.

If the environment potentially contains halides, GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," describes an acceptable program to manage cracking due to SCC of aluminum tanks. GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," describes an acceptable program to manage cracking due to SCC of aluminum piping and piping components. GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," describes an acceptable program to manage cracking due to SCC of aluminum piping and tanks which are buried or underground. GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components" describes an acceptable program to manage cracking due to SCC of aluminum components that are not included in other AMPs.

An alternative strategy to demonstrating that an aggressive environment is not present is to isolate the aluminum alloy from the environment using a barrier to prevent SCC. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating for internal or external coatings.

Evaluation:

[3.3.1-186] - ONS has no aluminum or aluminum alloy tanks within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks" in the scope of SLR in auxiliary systems.

[3.3.1-189] - This item is aligned to the following SSCs:

- Aluminum piping in the filtered water system: The ONS piping specification identifies this piping and fittings is constructed of 6061-T6 Alloy, which is not considered susceptible to stress corrosion cracking. This piping is exposed to a highly filtered lake water internal environment and an air-indoor uncontrolled external environment. Since the material is not susceptible to stress corrosion cracking, no AMP is required to manage stress corrosion cracking.
- Aluminum connectors on stored fire hose in the alternate chilled water and low pressure service water systems: These connectors are constructed of unknown aluminum alloy series, and therefore are assumed to be susceptible to stress corrosion cracking. These connectors are stored in a halide free air-indoor uncontrolled environment inside a storage trailer, and are not encapsulated in materials containing halides or exposed to secondary sources of moisture or halides.
- Filter bodies in the service air system are constructed of an unknown aluminum alloy series, and therefore are assumed to be susceptible to stress corrosion cracking. These components are exposed to a halide free air-indoor uncontrolled external environment in the turbine building, and a non-aggressive air-outdoor external environment in the yard. These filter bodies are not encapsulated in materials containing halides or exposed to secondary sources of moisture or halides. The internal environment for these components is a non-aggressive condensation environment.
- Filter bodies in the electro-hydraulic control system are constructed of an unknown aluminum alloy series, and therefore are assumed to be susceptible to stress corrosion cracking. These components are exposed to a halide free air-indoor uncontrolled environment external in the turbine building, and are not encapsulated in materials containing halides or exposed to secondary sources of moisture or halides. The internal environment is purified oil, which is not an environment that would promote stress corrosion cracking.
- A lubricating oil strainer housing in the standby shutdown facility diesel generator lube oil system is constructed of an unknown aluminum alloy series, and therefore are assumed to be susceptible to stress corrosion cracking. This housing is exposed to a halide free air-indoor uncontrolled environment external in the standby shutdown facility structure, and is not encapsulated in materials containing halides or exposed to secondary sources of moisture or halides. The internal environment is purified oil, which is not an environment that would promote stress corrosion cracking.

Aggressive external environments may exist where there are concentrations of airborne particles such as near industrial facilities that discharge soot, or near the sea coast where salt spray is prevalent. ONS is located in a mountainous area with moderate rainfall where airborne particle concentrations are comparatively low. While small amounts of halides may be present in outside air from environmental sources, the operating experience at ONS indicates that the concentration is not sufficient to contribute to aging that causes a loss of function for aluminum components, and that cracking due to stress corrosion cracking has not occurred on surfaces of aluminum alloys exposed to air and condensation environments in auxiliary systems. For those components constructed of a susceptible material, the *One-Time Inspection* program (B2.1.20) will be implemented to confirm that cracking due to stress corrosion cracking is not occurring on aluminum piping or piping components exposed to air or condensation environments.

[3.3.1-192] - ONS has no aluminum underground piping, piping components, or tanks in the scope of SLR in auxiliary systems.

[3.3.1-233] - The boric acid mixing tanks in the chemical addition system, and the concentrated boric acid tanks in the coolant storage system are constructed of 5052 alloy, and considered to be potentially susceptible to stress corrosion cracking. These tanks are exposed to a halide free air-indoor uncontrolled external environment in the auxiliary building, and a treated borated water internal environment. Both the boric acid mixing tanks and the concentrated boric acid tanks are insulated, and are heat traced such that condensation is not a concern. An OE review does not reflect that external surfaces of these tanks have been exposed to secondary sources of halides. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that cracking due to stress corrosion cracking is not occurring on surfaces of aluminum tanks exposed to an air-indoor uncontrolled environment.

[3.3.1-254] – Aluminum cooling coil fins installed in alternate chilled water system, chilled water (vital loads) system, high pressure service water, and ventilation systems air handing units are exposed to a halide free indoor uncontrolled environment with potential condensation in the auxiliary building, and a non-aggressive outdoor air external environment with potential condensation in the yard. These fins are not encapsulated in materials containing halides or exposed to secondary sources of moisture or halides. The specific series of the aluminum alloy is unknown, and they are assumed to be made of a material that is susceptible to stress corrosion cracking.

Aggressive external environments may exist where there are concentrations of airborne particles such as near industrial facilities that discharge soot, or near the sea coast where salt spray is prevalent. ONS is located in a mountainous area with moderate rainfall where airborne particle concentrations are comparatively low. While small amounts of halides may be present in outside air from environmental sources, the OE at ONS indicates that the concentration is not sufficient to contribute to aging that causes a loss of function for aluminum components, and that cracking due to stress corrosion cracking has not occurred on surfaces of aluminum alloys exposed to air environments in auxiliary systems. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that cracking due to stress corrosion cracking is not occurring on aluminum heat exchanger components exposed to air or condensation environments.

3.3.2.2.9 Loss of Material Due to General, Crevice or Pitting Corrosion and Cracking Due to Stress Corrosion Cracking

<u>NUREG-2192:</u>

Loss of material due to general (steel only), crevice, or pitting corrosion, and cracking due to SCC (SS only) can occur in steel and SS piping and piping components exposed to concrete. Concrete provides a high alkalinity environment that can mitigate the effects of loss of material for steel piping, thereby significantly reducing the corrosion rate. However, if water intrudes *through the concrete, the pH can be reduced and ions that promote loss of material such as chlorides, which can penetrate the protective oxide layer created in the high alkalinity environment, can reach the surface of the metal. Carbonation can reduce the pH within concrete. The rate of carbonation is reduced by using concrete with a low water-to-cement ratio and low permeability. Concrete with low permeability also reduces the potential for the penetration of water. Adequate air entrainment improves the ability of the concrete to resist freezing and thawing cycles and therefore reduces the potential for cracking and intrusion of water. Cracking due to SCC, as well as pitting and crevice corrosion can occur due to halides present in the water that penetrates to the surface of the metal.*

If the following conditions are met, loss of material is not considered to be an applicable aging effect for steel: (a) attributes of the concrete are consistent with American Concrete Institute (ACI) 318 or ACI 349 (low water-to-cement ratio, low permeability, and adequate air entrainment) as cited in NUREG–1557; (b) plant-specific OE indicates no degradation of the concrete that could lead to penetration of water to the metal surface; and (c) the piping is not potentially exposed to groundwater. For SS components, loss of material and cracking due to SCC are not considered to be applicable aging effects as long as the piping is not potentially exposed to groundwater. Where these conditions are not met, loss of material due to general (steel only), crevice, or pitting corrosion, and cracking due to SCC (SS only) are identified as applicable aging effects. GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," describes an acceptable program to manage these aging effects.

Evaluation:

Loss of material due to general (steel only), crevice, or pitting corrosion, and cracking due to stress corrosion cracking (stainless steel only) can occur in steel and stainless steel components exposed to concrete.

[3.3.1-112] – Loss of material of steel piping components or structural steel with an external environment of concrete that do not exit the concrete into soil is not an applicable aging effect requiring management. Steel components that do not exit the concrete into soil are not potentially exposed to groundwater. Structural steel embedded in reinforced concrete within building walls are not potentially exposed to groundwater. The concrete in areas containing these components conforms to ACI 349 or ACI 318. Review of ONS operating experience did not identify degradation of concrete around embedded components that could lead to penetration of water.

Loss of material can occur for steel piping components with an external environment of concrete that are potentially exposed to groundwater. Embedded piping that exits concrete into soil is potentially exposed to groundwater. Loss of material for steel components with an external environment of concrete that exit the concrete into soil is managed by the *Buried and Underground Piping and Tanks* (B2.1.26) program, as identified in Item [3.3.1-109].

[3.3.1-202] – Loss of material and cracking of stainless steel components exposed to concrete is not an aging effect for components that are not potentially exposed to groundwater. Stainless steel piping components exposed to concrete within interior concrete structures are not potentially exposed to groundwater. The stainless steel fuel pool liner and structural elements associated with the fuel pool and the stainless steel auxiliary building sumps that are exposed to concrete are also not potentially exposed to groundwater.

Loss of material and cracking could occur for stainless steel piping components with an external environment of concrete that are potentially exposed to groundwater. Embedded piping that exits concrete into soil is potentially exposed to groundwater. ONS has no in scope embedded stainless steel piping that exits concrete directly into the soil. Loss of material and cracking for stainless steel components with an external environment of soil is managed by the *Buried and Underground Piping and Tanks* (B2.1.26) program, as identified in Item [3.3.1-107] and [3.3.1-144].

3.3.2.2.10 Loss of Material Due to Pitting and Crevice Corrosion in Aluminum Alloys

NUREG-2192:

Loss of material due to pitting and crevice corrosion could occur in aluminum piping, piping components, and tanks exposed to an air, condensation, underground, raw water, or waste water environment for a sufficient duration of time. Environments that can result in pitting and/or crevice corrosion of aluminum alloys are those that contain halides (e.g., chloride) in the presence of moisture. The moisture level and halide concentration in atmospheric and uncontrolled air are greatly dependent on geographical location and site-specific conditions. Moisture level and halide concentration should be considered high enough to facilitate pitting and/or crevice corrosion of aluminum alloys in atmospheric and uncontrolled air, unless demonstrated otherwise. The periodic introduction of moisture or halides into an environment from secondary sources should also be considered. Leakage of fluids from mechanical connections (e.g., insulated bolted flanges and valve packing); onto a component in indoor controlled air is an example of a secondary source that should be considered. Halide concentrations should be considered high enough to facilitate loss of material of aluminum alloys in untreated aqueous solutions, unless demonstrated otherwise. Plant-specific OE and the condition of aluminum alloy components are evaluated to determine if prolonged exposure to the plant-specific air, condensation, underground, or water environments has resulted in pitting or crevice corrosion. Loss of material due to pitting and crevice corrosion is not an aging effect requiring management for aluminum alloys if (a) plant-specific OE does not reveal a history of loss of material due to pitting or crevice corrosion and (b) a one-time inspection demonstrates that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components. The applicant documents the results of the plant-specific OE review in the SLRA.

In the environment of air-indoor controlled, pitting and crevice corrosion is only expected to occur as the result of a source of moisture and halides. Alloy susceptibility may be considered when reviewing OE and interpreting inspection results. Inspections focus on the most susceptible alloys and locations.

The GALL-SLR Report recommends the further evaluation of aluminum piping, piping components, and tanks exposed to an air, condensation, or underground environment to *determine whether an AMP is needed to manage the aging effect of loss of material due to pitting and crevice corrosion. GALL-SLR Report AMP XI.M32, “One-Time Inspection,” describes an acceptable program to demonstrate that the aging effect of loss of material due to pitting and crevice corrosion is not occurring at a rate that will affect the intended function of the components. If loss of material due to pitting or crevice corrosion has occurred and is sufficient to potentially affect the intended function of an SSC, the following AMPs describe acceptable programs to manage loss of material due to pitting and crevice corrosion: (i) GALL-SLR Report AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” for tanks; (ii) GALL-SLR Report AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” for external surfaces of piping and piping components; (iii) GALL-SLR Report AMP XI.M41, “Buried and Underground Piping and Tanks,” for underground piping, piping components and tanks; and (iv) GALL-SLR Report AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components” for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the “detection of aging effects” program element in GALL-SLR Report AMP XI.M32.*

An alternative strategy to demonstrating that an aggressive environment is not present is to isolate the aluminum alloy from the environment using a barrier to prevent loss of material due to pitting and crevice corrosion. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. The GALL-SLR Report AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks,” or equivalent program, describes an acceptable program to manage the integrity of a barrier coating.

Evaluation:

Aggressive external environments may exist where there are concentrations of airborne particles such as near industrial facilities that discharge soot, or near the sea coast where salt spray is prevalent. ONS is located in a mountainous area with moderate rainfall where airborne particle concentrations are comparatively low. A review of ONS OE reflects that loss of material due to pitting and crevice corrosion has not been identified in aluminum piping, piping components, and tanks exposed to air, condensation, or raw water environments in ONS auxiliary systems.

[3.3.1-223] - Not applicable. ONS has no aluminum underground piping, piping components, or tanks in the scope of SLR in auxiliary systems.

[3.3.1-227] - Not applicable. ONS has no aluminum tanks within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks” in the scope of SLR in auxiliary systems.

[3.3.1-234] - The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion of aluminum piping and piping components exposed to air or condensation environments is not occurring.

[3.3.1-240] - Not applicable. ONS has no aluminum heat exchanger components exposed to waste water in the scope of SLR in auxiliary systems

[3.3.1-242] - The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion of aluminum heat exchanger components exposed to air or condensation environments is not occurring.

[3.3.1-245] - The boric acid mixing tanks in the chemical addition system and the concentrated boric acid tanks in the coolant storage system are aligned to this item. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion of insulated aluminum tanks exposed to air or condensation environments is not occurring.

[3.3.1-247] - Aluminum piping and fittings in the filtered water system are aligned to this item. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that pitting and crevice corrosion of aluminum piping and piping components exposed to a raw water environment is not occurring.

Results Tables: Auxiliary Systems

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-001	Steel cranes: bridges, structural members, structural components exposed to any environment	Cumulative fatigue damage due to failure	TLAA, SRP-SLR Section 4.7 "Other Plant-Specific TLAAs"	Yes (SRP-SLR Section 3.3.2.2.1)	Consistent with NUREG-2191. Cumulative fatigue damage of steel crane components is a TLAA. The evaluation of this TLAA is addressed in Section 4.7.5. Civil / Structural components are aligned to this item. See further evaluation in Section 3.3.2.2.1.
3.3.1-002	Stainless steel, steel heat exchanger components and tubes, piping, piping components exposed to any environment	Cumulative fatigue damage due to failure	TLAA, SRP-SLR Section 4.3 "Metal Fatigue"	Yes (SRP-SLR Section 3.3.2.2.1)	Consistent with NUREG-2191. Cumulative fatigue damage of stainless steel or steel components is a TLAA. The evaluation of this TLAA is addressed in Section 4.3. In addition to auxiliary systems, components in steam and power conversion systems are aligned to this item. See further evaluation in Section 3.3.2.2.1.
3.3.1-003	Stainless steel heat exchanger tubing, non-regenerative exposed to treated borated water >60°C (>140°F)	Cracking due to stress corrosion cracking; cyclic loading	AMP XI.M2, "Water Chemistry"	Yes (SRP-SLR Section 3.3.2.2.2)	Not applicable. ONS has no stainless steel PWR nonregenerative heat exchanger tubing exposed to treated borated water greater than 60 °C (140 °F) in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used. See further evaluation in Section 3.3.2.2.2.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-003a	Stainless steel heat exchanger tubing, non-regenerative exposed to treated borated water >60°C (>140°F)	Cracking due to stress corrosion cracking; cyclic loading	AMP XI.M2, "Water Chemistry" and AMP XI.M21A, "Closed Treated Water Systems"	Yes (SRP-SLR Section 3.3.2.2.2)	Not applicable. ONS has no stainless steel PWR nonregenerative heat exchanger tubing exposed to treated borated water greater than 60 °C (140 °F) in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used. See further evaluation in Section 3.3.2.2.2.
3.3.1-004	Stainless steel piping, piping components, tanks exposed to air, condensation	Cracking due to stress corrosion cracking	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.3)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.3.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-006	Stainless steel, nickel alloy piping, piping components exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.4)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.4.
3.3.1-007	Stainless steel high pressure pump, casing exposed to treated borated water	Cracking due to cyclic loading	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD"	No	Consistent with NUREG-2191. Components in Engineered Safety Features systems are aligned to this item.
3.3.1-008	Stainless steel heat exchanger components and tubes exposed to treated borated water >60°C (>140°F)	Cracking due to cyclic loading	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD"	No	Consistent with NUREG-2191. Components in Engineered Safety Features systems are aligned to this item.
3.3.1-009	Steel, copper alloy (>15% Zn) external surfaces, piping, piping components exposed to air with borated water leakage	Loss of material due to boric acid corrosion	AMP XI.M10, "Boric Acid Corrosion"	No	Consistent with NUREG-2191.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-010	High-strength steel closure bolting exposed to air, soil, underground	Cracking due to stress corrosion cracking; cyclic loading	AMP XI.M18, “Bolting Integrity”	No	Not applicable. ONS has no in-scope high-strength steel closure bolting exposed to air, soil, or underground environments in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-012	Steel; stainless steel, nickel alloy closure bolting exposed to air - indoor uncontrolled, air - outdoor, condensation	Loss of material due to general (steel only), pitting, crevice corrosion	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191.
3.3.1-015	Metallic closure bolting exposed to any environment, soil, underground	Loss of preload due to thermal effects, gasket creep, self-loosening	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191.
3.3.1-016	Stainless steel piping, piping components outboard the second containment isolation valves with a diameter ≥4 inches nominal pipe size exposed to treated water >93°C (>200°F)	Cracking due to stress corrosion cracking, IGSCC	AMP XI.M2, “Water Chemistry,” and AMP XI.M25, “BWR Reactor Water Cleanup System”	No	Not applicable - BWR only.
3.3.1-017	Stainless steel heat exchanger tubes exposed to treated water, treated borated water	Reduction of heat transfer due to fouling	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. Spent Fuel Cooling heat exchanger plates (plate and frame heat exchanger) are also aligned to this item.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-018	Stainless steel high pressure pump casing, piping, piping components, tanks exposed to treated borated water >60°C (>140°F), sodium pentaborate solution >60°C (>140°F)	Cracking due to stress corrosion cracking	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable. The associated NUREG-2191 aging items are not used.
3.3.1-019	Stainless steel regenerative heat exchanger components exposed to treated water >60°C (>140°F)	Cracking due to stress corrosion cracking	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable - BWR only.
3.3.1-020	Stainless steel, steel with stainless steel cladding heat exchanger components exposed to treated borated water >60°C (>140°F), treated water >60°C (>140°F)	Cracking due to stress corrosion cracking	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191.
3.3.1-021	Steel piping, piping components exposed to treated water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable - BWR only.
3.3.1-022	Copper alloy piping, piping components exposed to treated water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable - BWR only.
3.3.1-025	Aluminum piping, piping components exposed to treated water, treated borated water	Loss of material due to pitting, crevice corrosion	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-026	Steel (with stainless steel cladding) piping, piping components exposed to treated water	Loss of material due to general (only after cladding degradation), pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable - BWR only.
3.3.1-027	Stainless steel heat exchanger tubes exposed to treated water	Reduction of heat transfer due to fouling	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable - BWR only.
3.3.1-028	Stainless steel piping, piping components, tanks exposed to treated borated water >60°C (>140°F)	Cracking due to stress corrosion cracking	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. In addition to piping and piping components, bolting in the spent fuel cooling system is also aligned to this item.
3.3.1-030	Concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitous piping, piping components exposed to raw water.	Cracking due to chemical reaction, weathering, settlement, or corrosion of reinforcement (reinforced concrete only); loss of material due to delamination, exfoliation, spalling, popout, scaling, or cavitation; flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Not applicable. ONS has no in-scope concrete, concrete cylinder piping, reinforced concrete, asbestos cement, or cementitious piping, piping components exposed to raw water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-030a	Fiberglass, HDPE piping, piping components exposed to raw water	Cracking, blistering, loss of material due to exposure to ultraviolet light, ozone, radiation, temperature, or moisture; flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Not applicable. Aging effects associated with HDPE piping exposed to raw water in ONS auxiliary systems are managed by the *Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components* (B2.1.24) program. The associated NUREG-2191 aging items are not used.
3.3.1-034	Nickel alloy, copper alloy piping, piping components exposed to raw water	Loss of material due to general (copper alloy only), pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Open-Cycle Cooling Water System* (B2.1.11) program implementation.
3.3.1-037	Steel piping, piping components exposed to raw water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Open-Cycle Cooling Water System* (B2.1.11) program implementation.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-038	Copper alloy, steel heat exchanger components exposed to raw water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, "Open-Cycle Cooling Water System"	No	Consistent with NUREG-2191 with exceptions. In addition to auxiliary systems, components in Steam and Power Conversion systems are aligned to this item. Exceptions apply to the NUREG-2191 recommendations for the *Open-Cycle Cooling Water System* (B2.1.11) program implementation.
3.3.1-040	Stainless steel piping, piping components exposed to raw water	Loss of material due to pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, "Open-Cycle Cooling Water System"	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Open-Cycle Cooling Water System* (B2.1.11) program implementation.
3.3.1-042	Copper alloy, titanium, stainless steel heat exchanger tubes exposed to raw water, raw water (potable), treated water	Cracking due to stress corrosion cracking (titanium only), reduction of heat transfer due to fouling	AMP XI.M20, "Open-Cycle Cooling Water System" or AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191 with exceptions. Recirculating Cooling Water heat exchanger plates (plate and frame heat exchanger) are also aligned to this item. Exceptions apply to the NUREG-2191 recommendations for the *Open-Cycle Cooling Water System* (B2.1.11) program implementation.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-043	Stainless steel piping, piping components exposed to closed cycle cooling water >60°C (>140°F)	Cracking due to stress corrosion cracking	AMP XI.M21A, "Closed Treated Water Systems"	No	Consistent with NUREG-2191.
3.3.1-044	Stainless steel; steel wtih stainless steel cladding heat exchanger components exposed to closed cycle cooling water >60°C (>140°F)	Cracking due to stress corrosion cracking	AMP XI.M21A, "Closed Treated Water Systems"	No	Consistent with NUREG-2191.
3.3.1-045	Steel piping, piping components, tanks exposed to closed cycle cooling water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M21A, "Closed Treated Water Systems"	No	Consistent with NUREG-2191.
3.3.1-046	Steel, copper alloy heat exchanger components, piping, piping components exposed to closed cycle cooling water	Loss of material due to general (steel only), pitting, crevice corrosion, MIC	AMP XI.M21A, "Closed Treated Water Systems"	No	Consistent with NUREG-2191.
3.3.1-047	Stainless steel; steel with stainless steel cladding heat exchanger components exposed to closed cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M21A, "Closed Treated Water Systems"	No	Not applicable. BWR only
3.3.1-048	Aluminum piping, piping components exposed to closed cycle cooling water	Loss of material due to pitting, crevice corrosion	AMP XI.M21A, "Closed Treated Water Systems"	No	Not applicable. ONS has no in-scope aluminum piping, piping components exposed to closed-cycle cooling water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-049	Stainless steel piping, piping components exposed to closed cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M21A, "Closed Treated Water Systems"	No	Consistent with NUREG-2191.
3.3.1-050	Stainless steel, copper alloy, steel heat exchanger tubes exposed to closed cycle cooling water	Reduction of heat transfer due to fouling	AMP XI.M21A, "Closed Treated Water Systems"	No	Consistent with NUREG-2191. Recirculating Cooling Water System and Spent Fuel Cooling System heat exchanger plates (plate and frame heat exchanger) are also aligned to this item.
3.3.1-051	Boraflex spent fuel storage racks: neutron absorbing sheets (PWR), spent fuel storage racks: neutron absorbing sheets (BWR) exposed to treated borated water, treated water	Reduction of neutron absorbing capacity due to boraflex degradation	AMP XI.M22, "Boraflex Monitoring"	No	Not applicable. Boraflex is not credited in ONS spent fuel storage criticality evaluations with an intended function for neutron attenuation. The associated NUREG-2191 aging items are not used.
3.3.1-052	Steel cranes: rails, bridges, structural members, structural components exposed to air	Loss of material due to general corrosion, wear, deformation, cracking	AMP XI.M23, "Inspection of Overhead Heavy Load and Light Load (Related to Refueling) Handling Systems"	No	Consistent with NUREG-2191. Civil/ Structural components are aligned to this item.
3.3.1-055	Steel piping, piping components, tanks exposed to condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191.
3.3.1-057	Elastomer fire barrier penetration seals exposed to air, condensation	Hardening, loss of strength, shrinkage due to elastomer degradation	AMP XI.M26, "Fire Protection"	No	Consistent with NUREG-2191. Civil/ Structural components are aligned to this item.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-058	Steel halon/carbon dioxide fire suppression system piping, piping components exposed to air - indoor uncontrolled, air - outdoor, condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M26, "Fire Protection"	No	Consistent with NUREG-2191.
3.3.1-059	Steel fire rated doors exposed to air	Loss of material due to wear	AMP XI.M26, "Fire Protection"	No	Consistent with NUREG-2191. Civil/ Structural components are aligned to this item.
3.3.1-060	Reinforced concrete structural fire barriers: walls, ceilings and floors exposed to air	Cracking due to chemical reaction, weathering, settlement, or corrosion of reinforcement; loss of material due to delamination, exfoliation, spalling, popout, or scaling	AMP XI.M26, "Fire Protection" and AMP XI.S6, "Structures Monitoring"	No	Consistent with NUREG-2191. Civil/ Structural components are aligned to this item.
3.3.1-063	Steel fire hydrants exposed to air - outdoor, raw water, raw water (potable), treated water	Loss of material due to general, pitting, crevice corrosion; flow blockage due to fouling (raw water, raw water (potable) only)	AMP XI.M27, "Fire Water System"	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Fire Water System* (B2.1.16) program implementation.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-064	Steel, copper alloy piping, piping components exposed to raw water, treated water, raw water (potable)	Loss of material due to general (steel; copper alloy in raw water and raw water (potable) only), pitting, crevice corrosion, MIC; flow blockage due to fouling (raw water; raw water (potable) for steel only)	AMP XI.M27, "Fire Water System"	No	Consistent with NUREG-2191 with exceptions. Cement lined piping is managed by the *Fire Water System* (B2.1.16) program only for flow blockage. Degradation of the cement lining is managed by *Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks* (B2.1.27) program. Exceptions apply to the NUREG-2191 recommendations for the *Fire Water System* (B2.1.16) program implementation.
3.3.1-065	Aluminum piping, piping components exposed to raw water, treated water, raw water (potable)	Loss of material due to pitting, crevice corrosion; flow blockage due to fouling (raw water only)	AMP XI.M27, "Fire Water System"	No	Not applicable. ONS has no in-scope aluminum piping, piping components exposed to raw water, treated water, or raw water (potable) in fire water service. The associated NUREG-2191 aging items are not used.
3.3.1-066	Stainless steel piping, piping components exposed to raw water, treated water, raw water (potable)	Loss of material due to pitting, crevice corrosion, MIC; flow blockage due to fouling (raw water only)	AMP XI.M27, "Fire Water System"	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Fire Water System* (B2.1.16) program implementation.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-069	Copper alloy piping, piping components exposed to fuel oil	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M30, "Fuel Oil Chemistry," and AMP XI.M32, "One-Time Inspection," or AMP XI.M30, "Fuel Oil Chemistry"	No	Not applicable. ONS has no in-scope copper alloy piping, piping components exposed to fuel oil in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-070	Steel piping, piping components, tanks exposed to fuel oil	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M30, "Fuel Oil Chemistry," and AMP XI.M32, "One-Time Inspection," or AMP XI.M30, "Fuel Oil Chemistry"	No	Consistent with NUREG-2191, except that a different program is applied to some components. Loss of material in fuel oil system components that supply fuel oil to the auxiliary boilers is managed by the *Inspection of Internal Surfaces of Miscellaneous Piping and Ducting Components* (B2.1.24) program.
3.3.1-071	Stainless steel, aluminum, nickel alloy piping, piping components exposed to fuel oil	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M30, "Fuel Oil Chemistry," and AMP XI.M32, "One-Time Inspection," or AMP XI.M30, "Fuel Oil Chemistry"	No	Consistent with NUREG-2191, except that a different program is applied to some components. Loss of material in fuel oil system components that supply fuel oil to the auxiliary boilers is managed by the *Inspection of Internal Surfaces of Miscellaneous Piping and Ducting Components* (B2.1.24) program.
3.3.1-072	Gray cast iron, ductile iron, copper alloy (>15% Zn or >8% Al) piping, piping components, heat exchanger components exposed to treated water, closed cycle cooling water, soil, raw water, raw water (potable), waste water	Loss of material due to selective leaching	AMP XI.M33, "Selective Leaching"	No	Consistent with NUREG-2191. in addition to auxiliary systems, components in Steam and Power Conversion systems are aligned to this item.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-073	Concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to air – outdoor	Cracking due to chemical reaction, weathering, or corrosion of reinforcement (reinforced concrete only); loss of material due to delamination, exfoliation, spalling, popout, or scaling	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Not applicable. ONS has no concrete, concrete cylinder piping, reinforced concrete, asbestos cement, or cementitious piping, piping components exposed to air - outdoor in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-076	Elastomer piping, piping components, ducting, ducting components, seals exposed to air, condensation	Hardening or loss of strength due to elastomer degradation	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191.
3.3.1-078	Steel external surfaces exposed to air - indoor uncontrolled, air - outdoor, condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191.
3.3.1-080	Steel heat exchanger components, piping, piping components exposed to air - indoor uncontrolled, air - outdoor	Loss of material due to general, pitting, crevice corrosion	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191.
3.3.1-082	Elastomer, fiberglass piping, piping components, ducting, ducting components, seals exposed to air	Loss of material due to wear	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-083	Stainless steel diesel engine exhaust piping, piping components exposed to diesel exhaust	Cracking due to stress corrosion cracking	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191.
3.3.1-085	Elastomer piping, piping components, seals exposed to air, condensation, closed cycle cooling water, treated borated water, treated water, raw water, raw water (potable), waste water, gas, fuel oil, lubricating oil	Hardening or loss of strength due to elastomer degradation; flow blockage due to fouling (raw water, waste water only)	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191.
3.3.1-088	Steel; stainless steel piping, piping components, diesel engine exhaust exposed to raw water (potable), diesel exhaust	Loss of material due to general (steel only), pitting, crevice corrosion, flow blockage due to fouling (steel only for raw water (potable) environment)	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191. in addition to auxiliary systems, components in Steam and Power Conversion systems are aligned to this item.
3.3.1-089	Steel piping, piping components exposed to condensation (internal)	Loss of material due to general, pitting, crevice corrosion	AMP XI.M27, "Fire Water System"	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Fire Water System* (B2.1.16) program implementation.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-090	Steel ducting, ducting components (internal surfaces) exposed to condensation	Loss of material due to general, pitting, crevice corrosion, MIC (for drip pans and drain lines only)	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191.
3.3.1-091	Steel piping, piping components, heat exchanger components, tanks exposed to waste water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191. in addition to auxiliary systems, components in Steam and Power Conversion systems are aligned to this item.
3.3.1-093	Copper alloy piping, piping components exposed to raw water (potable)	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191.
3.3.1-094	Stainless steel ducting, ducting components exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," or AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	Yes (SRP-SLR Section 3.3.2.2.4)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.4.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-094a	Stainless steel ducting, ducting components exposed to air, condensation	Cracking due to stress corrosion cracking	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," or AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	Yes (SRP-SLR Section 3.3.2.2.3)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.3.
3.3.1-095	Copper alloy, stainless steel, nickel alloy piping, piping components, heat exchanger components, tanks exposed to waste water	Loss of material due to general (copper alloy only), pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191. in addition to auxiliary systems, components in Steam and Power Conversion systems are aligned to this item.
3.3.1-096	Elastomer piping, piping components, seals exposed to air, raw water, raw water (potable), treated water, waste water	Loss of material due to wear; flow blockage due to fouling (raw water, waste water only)	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191.
3.3.1-096a	Steel, aluminum, copper alloy, stainless steel, titanium heat exchanger tubes internal to components exposed to air, condensation (external)	Reduction of heat transfer due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191.
3.3.1-096b	Steel heat exchanger components exposed to condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Consistent with NUREG-2191.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-097	Steel piping, piping components exposed to lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191.
3.3.1-098	Steel heat exchanger components exposed to lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191.
3.3.1-099	Copper alloy, aluminum piping, piping components exposed to lubricating oil	Loss of material due to pitting, crevice corrosion, MIC (copper alloy only)	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191.
3.3.1-100	Stainless steel piping, piping components exposed to lubricating oil	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. In addition to auxiliary systems, components in reactor vessel, internals, and reactor coolant system are aligned to this item.
3.3.1-101	Aluminum heat exchanger tubes exposed to lubricating oil	Reduction of heat transfer due to fouling	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable. ONS has no aluminum heat exchanger tubes exposed to lubricating oil in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-102	Boral®; boron steel, and other materials (excluding Boraflex) spent fuel storage racks: neutron absorbing sheets (PWR), spent fuel storage racks: neutron absorbing sheets (BWR) exposed to treated borated water, treated water	Reduction of neutron absorbing capacity; change in dimensions and loss of material due to effects of spent fuel pool environment	AMP XI.M40, "Monitoring of Neutron Absorbing Materials Other than Boraflex"	No	Not applicable. ONS has no Boral®; boron steel, and other materials (excluding Boraflex) spent fuel storage racks: neutron-absorbing sheets exposed to treated borated water or treated water. The associated NUREG-2191 aging items are not used.
3.3.1-103	Concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to soil, concrete	Cracking due to chemical reaction, weathering, or corrosion of reinforcement (reinforced concrete only); loss of material due to delamination, exfoliation, spalling, popout, or scaling	AMP XI.M41, "Buried and Underground Piping and Tanks"	No	Not applicable. ONS has no concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to soil, concrete in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-104	HDPE, fiberglass piping, piping components exposed to soil, concrete	Cracking, blistering, loss of material due to exposure to ultraviolet light, ozone, radiation, temperature, or moisture	AMP XI.M41, "Buried and Underground Piping and Tanks"	No	Not applicable. ONS has no HDPE, fiberglass piping, piping components exposed to soil, concrete in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-107	Stainless steel, nickel alloy piping, piping components exposed to soil, concrete	Loss of material due to pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, "Buried and Underground Piping and Tanks"	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Buried and Underground Piping and Tanks* (B2.1.26) program implementation.
3.3.1-108	Titanium, super austenitic, copper alloy, stainless steel, nickel alloy piping, piping components, tanks, closure bolting exposed to soil, concrete, underground	Loss of material due to general (copper alloy only), pitting, crevice corrosion, MIC (super austenitic, copper alloy, stainless steel, nickel alloy; soil environment only)	AMP XI.M41, "Buried and Underground Piping and Tanks"	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Buried and Underground Piping and Tanks* (B2.1.26) program implementation.
3.3.1-109	Steel piping, piping components, closure bolting exposed to soil, concrete, underground	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, "Buried and Underground Piping and Tanks"	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Buried and Underground Piping and Tanks* (B2.1.26) program implementation.
3.3.1-110	Stainless steel, nickel alloy piping, piping components greater than or equal to 4 NPS exposed to treated water >93°C (>200°F)	Cracking due to stress corrosion cracking, IGSCC	AMP XI.M7, "BWR Stress Corrosion Cracking," and AMP XI.M2, "Water Chemistry"	No	Not applicable. BWR only

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-111	Steel structural steel exposed to air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	AMP XI.S6, “Structures Monitoring”	No	Not applicable. Structural steel is treated as a Civil / Structural commodity and addressed in Section 3.5. The associated NUREG-2191 aging items are not used.
3.3.1-112	Steel piping, piping components exposed to concrete	None	None	Yes (SRP-SLR Section 3.3.2.2.9)	Consistent with NUREG-2191. In addition to auxiliary systems, Civil / Structural components (Keowee Hydro Station penstock, power tunnels, spillway intake: steel elements) are aligned to this item. See further evaluation in Section 3.3.2.2.9.
3.3.1-113	Aluminum piping, piping components exposed to gas	None	None	No	Consistent with NUREG-2191.
3.3.1-114	Copper alloy piping, piping components exposed to air, condensation, gas	None	None	No	Consistent with NUREG-2191. In addition to auxiliary systems, components from Reactor Vessel, Internals, and Reactor Coolant System are aligned to this item.
3.3.1-115	Copper alloy, copper alloy (>8% Al) piping, piping components exposed to air with borated water leakage	None	None	No	Consistent with NUREG-2191.
3.3.1-116	Galvanized steel piping, piping components exposed to air - indoor uncontrolled	None	None	No	Consistent with NUREG-2191. in addition to auxiliary systems, components in Steam and Power Conversion systems are aligned to this item.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-117	Glass piping elements exposed to air, lubricating oil, closed-cycle cooling water, fuel oil, raw water, treated water, treated borated water, air with borated water leakage, condensation, gas underground	None	None	No	Consistent with NUREG-2191.
3.3.1-119	Nickel alloy, PVC, glass piping, piping components exposed to air with borated water leakage, air - indoor uncontrolled, condensation, waste water, raw water (potable)	None	None	No	Consistent with NUREG-2191. In addition to auxiliary systems, Civil / Structural components (PVC conduit) are aligned to this item.
3.3.1-120	Stainless steel piping, piping components exposed to air with borated water leakage, gas	None	None	No	Consistent with NUREG-2191.
3.3.1-121	Steel piping, piping components exposed to air - indoor controlled, gas	None	None	No	Consistent with NUREG-2191.
3.3.1-122	Titanium heat exchanger components, piping, piping components exposed to air - indoor uncontrolled, air - outdoor	None	None	No	Not applicable. ONS has no titanium heat exchanger components, piping, piping components exposed to air – indoor uncontrolled, air – outdoor in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-123	Titanium heat exchanger components other than tubes, piping and piping components exposed to raw water	Cracking due to stress corrosion cracking, flow blockage due to fouling	AMP XI.M20, "Open-Cycle Cooling Water System," or AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not applicable. ONS has no titanium heat exchanger components other than tubes, piping and piping components exposed to raw water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-124	Stainless steel, steel (with stainless steel or nickel alloy cladding) spent fuel storage racks (BWR), spent fuel storage racks (PWR), piping, piping components exposed to treated water >60°C (>140°F), treated borated water >60°C (>140°F)	Cracking due to stress corrosion cracking	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191. Spent fuel storage racks are Civil / Structural commodities, and are aligned to this item. Cracking due to SCC of piping, piping components exposed to treated borated water >60°C (>140°F) is addressed in Item 3.3.1-028.
3.3.1-125	Stainless steel, steel (with stainless steel cladding), nickel alloy spent fuel storage racks (BWR), spent fuel storage racks (PWR), piping, piping components exposed to treated water, treated borated water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191. in addition to auxiliary systems, civil / structural components (spent fuel storage racks) are aligned to this item.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-126	Metallic piping, piping components exposed to treated water, treated borated water, raw water	Wall thinning due to erosion	AMP XI.M17, "Flow-Accelerated Corrosion"	No	Not applicable. Wall thinning due to erosion has not been identified as an applicable aging effect in ONS metallic piping, piping components exposed to treated water, treated borated water, or raw water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-127	Metallic piping, piping components, tanks exposed to raw water, raw water (potable), treated water, waste water	Loss of material due to recurring internal corrosion	AMP XI.M20, "Open-Cycle Cooling Water System," AMP XI.M27, "Fire Water System," or AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	Yes (SRP-SLR Section 3.3.2.2.7)	Consistent with NUREG-2191 with exceptions. Recurring internal corrosion in steel piping, piping components exposed to raw water is addressed in the *Open-Cycle Cooling Water System* (B2.1.11) program. See further evaluation in Section 3.3.2.2.7 Exceptions apply to the NUREG-2191 recommendations for the *Open-Cycle Cooling Water System* (B2.1.11) program implementation.
3.3.1-128	Steel tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to soil, concrete, air, condensation, raw water	Loss of material due to general, pitting, crevice corrosion, MIC (soil, raw water only)	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks"	No	Not applicable. ONS has no steel tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to soil, concrete, air, condensation, raw water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-130	Metallic sprinklers exposed to air, condensation, raw water, raw water (potable), treated water	Loss of material due to general (where applicable), pitting, crevice corrosion, MIC (except for aluminum, and in raw water, raw water (potable), treated water only); flow blockage due to fouling	AMP XI.M27, “Fire Water System”	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Fire Water System* (B2.1.16) program implementation.
3.3.1-131	Steel, stainless steel, copper alloy, aluminum piping, piping components exposed to air, condensation	Flow blockage due to fouling	AMP XI.M27, “Fire Water System”	No	Not applicable. The associated NUREG-2191 aging items are not used.
3.3.1-132	Insulated steel, copper alloy (>15% Zn or >8% Al), piping, piping components, tanks, tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to air, condensation	Loss of material due to general, pitting, crevice corrosion (steel only); cracking due to SCC (copper alloy (>15% Zn or >8% Al) only)	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components" or AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Consistent with NUREG-2191.
3.3.1-133	HDPE underground piping, piping components	Cracking, blistering	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not applicable. ONS has no HDPE underground piping, piping components in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-134	Steel, stainless steel, copper alloy piping, piping components, and heat exchanger components exposed to raw water (for components not covered by NRC GL 89-13)	Loss of material due to general (steel, copper alloy only), pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191.
3.3.1-135	Steel, stainless steel pump casings exposed to waste water environment	Loss of material due to general (steel only), pitting, crevice corrosion, MIC	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Not applicable. ONS has no steel or stainless steel pump casings with a waste water external environment in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-136	Steel fire water storage tanks exposed to air, condensation, soil, concrete, raw water, raw water (potable), treated water	Loss of material due to general, pitting, crevice corrosion, MIC (raw water, raw water (potable), treated water, soil only)	AMP XI.M27, "Fire Water System"	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Fire Water System* (B2.1.16) program implementation.
3.3.1-137	Steel, stainless steel, aluminum tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to treated water, raw water, waste water	Loss of material due to general (steel only), pitting, crevice corrosion, MIC (steel, stainless steel only)	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks"	No	Not applicable. ONS has no steel, stainless steel, aluminum tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to treated water, raw water, waste water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-138	Any material piping, piping components, heat exchangers, tanks with internal coatings/linings exposed to closed-cycle cooling water, raw water, raw water (potable), treated water, treated borated water, fuel oil, lubricating oil, waste water, air-dry, air, condensation	Loss of coating or lining integrity due to blistering, cracking, flaking, peeling, delamination, rusting, or physical damage; loss of material or cracking for cementitious coatings/linings	AMP XI. M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	No	Consistent with NUREG-2191 with exceptions, and a different program is credited for some components. Aging effects for the Elevated Water Storage Tank are managed by the *Fire Water System* (B2.1.16) program. Aging effects for components in the Plant Drinking Water System, Ventilation System and Lube Oil System are managed by the *Inspection of Internal Surfaces of Miscellaneous Piping and Ducting Components* (B2.1.24) program. Components in the Lube Oil System aligned to this item are also managed by the *Open-Cycle Cooling Water System* (B2.1.11) program Exceptions apply to the NUREG-2191 recommendations for the *Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks* (B2.1.27) program implementation.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-139	Any material piping, piping components, heat exchangers, tanks with internal coatings/linings exposed to closed-cycle cooling water, raw water, raw water (potable), treated water, treated borated water, fuel oil, lubricating oil, waste water. air-dry, air, condensation	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI. M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	No	Consistent with NUREG-2191 with exceptions, and a different program is credited for some components. Aging effects for the Elevated Water Storage Tank are managed by the *Fire Water System* (B2.1.16) program. Aging effects for components in the Plant Drinking Water and Ventilation Systems are managed by the *Inspection of Internal Surfaces of Miscellaneous Piping and Ducting Components* (B2.1.24) program. Exceptions apply to the NUREG-2191 recommendations for the *Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks* (B2.1.27) program implementation.
3.3.1-140	Gray cast iron, ductile iron piping components with internal coatings/linings exposed to closed-cycle cooling water, raw water, raw water (potable), treated water, waste water	Loss of material due to selective leaching	AMP XI. M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks* (B2.1.27) program implementation.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-142	Stainless steel, steel, nickel alloy, copper alloy closure bolting exposed to fuel oil, lubricating oil, treated water, treated borated water, raw water, waste water	Loss of material due to general (steel; copper alloy in raw water, waste water only), pitting, crevice corrosion, MIC (raw water and waste water environments only)	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191.
3.3.1-144	Stainless steel, steel, aluminum piping, piping components, tanks exposed to soil, concrete	Cracking due to stress corrosion cracking (steel in carbonate/ bicarbonate environment only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Consistent with NUREG-2191 with exceptions. Exceptions apply to the NUREG-2191 recommendations for the *Buried and Underground Piping and Tanks* (B2.1.26) program implementation.
3.3.1-145	Stainless steel closure bolting exposed to air, soil, concrete, underground, waste water	Cracking due to stress corrosion cracking	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191.
3.3.1-146	Stainless steel underground piping, piping components, tanks	Cracking due to stress corrosion cracking	AMP XI.M32, "One-Time Inspection," AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes (SRP-SLR Section 3.3.2.2.3)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.3.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-147	Nickel alloy, nickel alloy cladding piping, piping components exposed to closed-cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	AMP XIM21A, “Closed Treated Water Systems”	No	Not applicable. ONS has no nickel alloy, nickel alloy cladding piping, piping components exposed to closed-cycle cooling water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-149	Fiberglass piping, piping components, ducting, ducting components exposed to air – outdoor	Cracking, blistering, loss of material due to exposure to ultraviolet light, ozone, radiation, temperature, or moisture	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components"	No	Not applicable. ONS has no fiberglass piping, piping components, ducting, ducting components exposed to air – outdoor in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-150	Fiberglass piping, piping components, ducting, ducting components exposed to air	Cracking, blistering, loss of material due to exposure to ultraviolet light, ozone, radiation, temperature, or moisture	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components"	No	Not applicable. ONS has no fiberglass piping, piping components, ducting, ducting components exposed to air in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-151	Stainless steel, steel, aluminum, copper alloy, titanium heat exchanger tubes exposed to air, condensation	Reduction of heat transfer due to fouling	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components"	No	Consistent with NUREG-2191.
3.3.1-155	Stainless steel piping, piping components, and tanks exposed to waste water >60°C (>140°F)	Cracking due to stress corrosion cracking	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-157	Steel piping, piping components, heat exchanger components exposed to air-outdoor	Loss of material due to general, pitting, crevice corrosion	AMP XI.M27, “Fire Water System,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191 with exceptions. Loss of material in High Pressure Service Water piping is managed by the *Fire Water System* (B2.1.16) program. The remaining components aligned to this item credit the *Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components* (B2.1.24) program. Exceptions apply to the NUREG-2191 recommendations for the *Fire Water System* (B2.1.16) program implementation.
3.3.1-158	Nickel alloy piping, piping components heat exchanger components (for components not covered by NRC GL 89-13) exposed to raw water	Loss of material due to pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not applicable. ONS has no nickel alloy piping, piping components, or heat exchanger components exposed to raw water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-159	Fiberglass piping, piping components, ducting, ducting components exposed to air	Loss of material due to wear	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not applicable. ONS has no fiberglass piping, piping components, ducting, ducting components exposed to air in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-160	Copper alloy (>15% Zn or >8% Al) piping, piping components, heat exchanger components exposed to closed-cycle cooling water, raw water, waste water	Cracking due to stress corrosion cracking	AMP XI.M20, "Open-Cycle Cooling Water System," AMP XI.M21A, "Closed Treated Water Systems," or AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191 with exceptions. In addition to auxiliary systems, components in steam and power conversion systems are aligned to this item. Exceptions apply to the NUREG-2191 recommendations for the *Open-Cycle Cooling Water System* (B2.1.11) program implementation.
3.3.1-161	Copper alloy heat exchanger tubes exposed to condensation	Reduction of heat transfer due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191.
3.3.1-166	Copper alloy piping, piping components exposed to concrete	None	None	No	Consistent with NUREG-2191.
3.3.1-167	Zinc piping components exposed to air-indoor controlled, air – indoor uncontrolled	None	None	No	Consistent with NUREG-2191.
3.3.1-169	Steel, copper alloy piping, piping components exposed to steam	Loss of material due to general (steel only), pitting, crevice corrosion	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Not applicable. Aging effects for steel and copper alloy piping, piping components exposed to steam in ONS auxiliary systems were aligned to items in Steam and Power Conversion system with a treated water environment. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-170	Stainless steel piping, piping components exposed to steam	Loss of material due to pitting, crevice corrosion	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Not applicable. Loss of material for stainless steel components exposed to steam is evaluated in 3.3.1-125. The associated NUREG-2191 aging items are not used.
3.3.1-172	PVC piping, piping components exposed to air-outdoor	Reduction in impact strength due to photolysis	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Not applicable. Aging effects for polymeric piping in air - outdoor in auxiliary systems is addressed by SRP Item 3.3.1-263. The associated NUREG-2191 aging items are not used.
3.3.1-175	Fiberglass piping, piping components, tanks exposed to raw water (for components not covered by NRC GL 89-13), raw water (potable), treated water, waste water	Cracking, blistering, loss of material due to exposure to ultraviolet light, ozone, radiation, temperature, or moisture; flow blockage due to fouling (raw water, waste water only)	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not applicable. ONS has no fiberglass piping, piping components, tanks exposed to raw water (for components not covered by NRC GL 89-13), raw water (potable), treated water, or waste water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-176	Fiberglass piping, piping components, tanks exposed to raw water environment (for components not covered by NRC GL 89-13), raw water (potable), treated water, waste water	Loss of material due to wear; flow blockage due to fouling (raw water, waste water only)	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not applicable. ONS has no fiberglass piping, piping components or tanks exposed to raw water environment (for components not covered by NRC GL 89-13), raw water (potable), treated water, or waste water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-177	Fiberglass piping, piping components exposed to soil	Loss of material due to wear	AMP XI.M41, "Buried and Underground Piping and Tanks"	No	Not applicable. ONS has no fiberglass piping or piping components exposed to soil in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-178	Fiberglass piping and piping components exposed to concrete	None	None	No	Not applicable. ONS has no fiberglass piping and piping components exposed to concrete in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-179	Masonry walls: structural fire barriers exposed to air	Cracking due to restraint shrinkage, creep, aggressive environment; loss of material (spalling, scaling) and cracking due to freeze-thaw	AMP XI.M26, "Fire Protection," and AMP XI.S5, "Masonry Walls"	No	Consistent with NUREG-2191. Civil/ Structural components are aligned to this item. Masonry walls addressed by this item are interior walls. Loss of material (spalling, scaling) and cracking due to freeze-thaw do not apply.
3.3.1-181	Titanium piping, piping components exposed to condensation	None	None	No	Not applicable. ONS has no titanium piping, piping components exposed to condensation in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-182	Non-metallic thermal insulation exposed to air, condensation	Reduced thermal insulation resistance due to moisture intrusion	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Consistent with NUREG-2191.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-184	PVC piping, piping components, tanks exposed to concrete	None	None	No	Consistent with NUREG-2191. This item is aligned to a Civil / Structural commodity for PVC conduit
3.3.1-185	Aluminum fire water storage tanks exposed to air, condensation, soil, concrete, raw water, raw water (potable), treated water	Cracking due to stress corrosion cracking	AMP XI.M27, “Fire Water System”	No	Not applicable. ONS has no aluminum fire water storage tanks in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-186	Aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation, soil, concrete, raw water, waste water	Cracking due to stress corrosion cracking	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes (SRP-SLR Section 3.3.2.2.8)	Not applicable. ONS has no aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-189	Aluminum piping, piping components, tanks exposed to air, condensation, raw water, raw water (potable), waste water	Cracking due to stress corrosion cracking	AMP XI.M32, "One-Time Inspection," AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes (SRP-SLR Section 3.3.2.2.8)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.8.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-192	Aluminum underground piping, piping components, tanks	Cracking due to stress corrosion cracking	AMP XI.M32, "One-Time Inspection," AMP XI.M41, "Buried and Underground Piping and Tanks,' AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.8)	Not applicable. ONS has no in-scope aluminum underground piping, piping components, tanks in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-193	Steel components exposed to treated water, raw water, raw water (potable), waste water	Long-term loss of material due to general corrosion	AMP XI.M32, "One-Time Inspection,"	No	Consistent with NUREG-2191. in addition to auxiliary systems, components in steam and power conversion systems are aligned to this item.
3.3.1-194	PVC piping, piping components, and tanks exposed to soil	Loss of material due to wear	AMP XI.M41, "Buried and Underground Piping and Tanks"	No	Not applicable. ONS has no PVC piping, piping components, and tanks exposed to soil in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-195	Concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to raw water, treated water, raw water (potable)	Cracking due to chemical reaction, weathering, settlement, or corrosion of reinforcement (reinforced concrete only); loss of material due to delamination, exfoliation, spalling, popout, scaling, or cavitation; flow blockage due to fouling (raw water only)	AMP XI.M27, “Fire Water System”	No	Not applicable. ONS has no concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to raw water, treated water, raw water (potable) in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-196	HDPE piping, piping components exposed to raw water, treated water, raw water (potable)	Cracking, blistering; flow blockage due to fouling (raw water only)	AMP XI.M27, “Fire Water System”	No	Not applicable. ONS has no HDPE piping, piping components in fire water service in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-197	Metallic fire water system piping, piping components, heat exchanger, heat exchanger components (any material) with only a leakage boundary (spatial) or structural integrity (attached) intended function exposed to any external environment except soil, concrete	Loss of material due to general (steel, copper alloy only), pitting, crevice corrosion	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-198	Metallic fire water system piping, piping components, heat exchanger, heat exchanger components (any material) with only a leakage boundary (spatial) or structural integrity (attached) intended function	Loss of material due to general (steel, copper alloy only), pitting, crevice corrosion, MIC (all metallic materials except aluminum; in liquid environments only)	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not applicable. The associated NUREG-2191 aging items are not used.
3.3.1-199	Cranes: steel structural bolting exposed to air	Loss of preload due to self-loosening; loss of material due to general corrosion; cracking	AMP XI.M23, “Inspection of Overhead Heavy Load and Light Load (Related to Refueling) Handling Systems”	No	Consistent with NUREG-2191. Civil/Structural components are aligned to this item.
3.3.1-202	Stainless steel piping, piping components exposed to concrete	None	None	Yes (SRP-SLR Section 3.3.2.2.9)	Consistent with NUREG-2191. Civil / Structural components (Spent Fuel Pool Liner and Auxiliary Building Sumps) are also aligned to this item. See further evaluation in Section 3.3.2.2.9.
3.3.1-203	Stainless steel; steel with stainless steel cladding, nickel alloy piping, piping components, heat exchanger components, tanks exposed to treated water, sodium pentaborate solution	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection"	No	Not applicable. BWR only

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-205	Insulated stainless steel piping, piping components, tanks exposed to air, condensation	Cracking due to stress corrosion cracking	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," or AMP XI.M42, "Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.3)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring on insulated surfaces, or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.3.
3.3.1-207	Stainless steel, copper alloy, titanium heat exchanger tubes exposed to raw water (for components not covered by NRC GL 89-13)	Cracking due to stress corrosion cracking (titanium only), reduction of heat transfer due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-208	Concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to raw water (for components not covered by NRC GL 89-13)	Cracking due to chemical reaction, weathering, settlement, or corrosion of reinforcement (reinforced concrete only); loss of material due to delamination, exfoliation, spalling, popout, scaling, or cavitation; flow blockage due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not applicable. ONS has no concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-210	HDPR piping, piping components exposed to raw water (for components not covered by NRC GL 89-13)	Cracking, blistering; flow blockage due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191.
3.3.1-214	Copper alloy (>15% Zn or >8% Al) piping, piping components exposed to soil	Loss of material due to selective leaching	AMP XI.M33, "Selective Leaching"	No	Not applicable. ONS has no copper alloy (>15% Zn or >8% Al) piping, piping components exposed to soil in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-215	Aluminum fire water storage tanks exposed to air, condensation, soil, concrete, raw water, raw water (potable), treated water	Loss of material due to pitting, crevice corrosion	AMP XI.M27, “Fire Water System”	No	Not applicable. ONS has no aluminum fire water storage tanks exposed to air, condensation, soil, concrete, raw water, raw water (potable), treated water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-216	Stainless steel fire water storage tanks exposed to air, condensation, soil, concrete	Cracking due to stress corrosion cracking	AMP XI.M27, “Fire Water System”	No	Not applicable. ONS has no stainless steel fire water storage tanks exposed to air, condensation, soil, concrete in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-218	Stainless steel fire water storage tanks exposed to air, condensation, soil, concrete, raw water, raw water (potable), treated water	Loss of material due to pitting, crevice corrosion, MIC (water and soil environment only)	AMP XI.M27, “Fire Water System”	No	Not applicable. ONS has no stainless steel fire water storage tanks in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-219	Stainless steel piping, piping components exposed to steam	Cracking due to stress corrosion cracking	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not applicable. Cracking due to SCC for stainless steel piping, piping components exposed to steam in ONS auxiliary systems was aligned to SRP Item 3.3.1-028 for a Treated Borated water >60°C (>140°F) environment. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-222	Stainless steel, nickel alloy tanks exposed to air, condensation (internal/ external)	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.4)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.4.
3.3.1-223	Aluminum underground piping, piping components, tanks	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M41, "Buried and Underground Piping and Tanks," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.10)	Not applicable. ONS has no aluminum underground piping, piping components, tanks in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-226	Aluminum tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to soil, concrete	Loss of material due to pitting, crevice corrosion	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks"	No	Not applicable. ONS has no aluminum tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to soil, concrete in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-227	Aluminum tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," AMP XI.M32, "One-Time Inspection," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.10)	Not applicable. ONS has no aluminum tanks within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks" in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-228	Stainless steel, nickel alloy tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," AMP XI.M32, "One-Time Inspection," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.4)	Not applicable. ONS has no stainless steel or nickel alloy tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-229	Stainless steel tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to soil, concrete	Loss of material due to pitting, crevice corrosion, MIC (soil only)	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks"	No	Not applicable. ONS has no stainless steel tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to soil, concrete in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-230	Stainless steel tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to soil, concrete	Cracking due to stress corrosion cracking	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks"	No	Not applicable. ONS has no stainless steel tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to soil, concrete in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-231	Stainless steel tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to air, condensation	Cracking due to stress corrosion cracking	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," AMP XI.M32, "One-Time Inspection," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.3)	Not applicable. ONS has no stainless steel tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-232	Insulated stainless steel, nickel alloy piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," or AMP XI.M42, "Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.4)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring on insulated surfaces, or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.4.
3.3.1-233	Insulated aluminum piping, piping components, tanks exposed to air, condensation	Cracking due to stress corrosion cracking	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," or AMP XI.M42, "Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.8)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring on insulated surfaces, or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.8.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-234	Aluminum piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.10)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.10.
3.3.1-235	Metallic piping, piping components exposed to air-dry (internal)	Loss of material due to general (steel only), pitting, crevice corrosion	AMP XI.M24, "Compressed Air Monitoring"	No	Consistent with NUREG-2191.
3.3.1-236	Titanium heat exchanger tubes exposed to treated water	Cracking due to stress corrosion cracking, reduction of heat transfer due to fouling	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Not applicable. ONS has no titanium heat exchanger tubes exposed to treated water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-237	Titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to treated water	None	None	No	Not applicable. ONS has no titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to treated water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-238	Titanium heat exchanger tubes exposed to closed-cycle cooling water	Cracking due to stress corrosion cracking, reduction of heat transfer due to fouling	AMP XI.M21A, "Closed Treated Water System"	No	Not applicable. ONS has no titanium heat exchanger tubes exposed to closed-cycle cooling water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-239	Titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to closed-cycle cooling water	None	None	No	Not applicable. ONS has no titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to closed-cycle cooling water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-240	Aluminum heat exchanger components exposed to waste water	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.10)	Not applicable. ONS has no aluminum heat exchanger components exposed to waste water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-241	Stainless steel, nickel alloy heat exchanger components exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.4)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the SPEO. in addition to auxiliary systems, components in steam and power conversion systems are aligned to this item. See further evaluation in Section 3.3.2.2.4.
3.3.1-242	Aluminum heat exchanger components exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.10)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.10.
3.3.1-244	Stainless steel, nickel alloy piping, piping components exposed to treated water >60°C (>140°F)	Cracking due to stress corrosion cracking	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Not applicable. BWR only

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-245	Insulated aluminum piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes (SRP-SLR Section 3.3.2.2.10)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring on insulated surfaces, or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.10.
3.3.1-246	Stainless steel, nickel alloy underground piping, piping components, tanks	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes (SRP-SLR Section 3.3.2.2.4)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.4.
3.3.1-247	Aluminum piping, piping components, tanks exposed to raw water, waste water	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes (SRP-SLR Section 3.3.2.2.10)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.10.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-248	Aluminum piping, piping components, tanks exposed to air with borated water leakage	None	None	No	Consistent with NUREG-2191.
3.3.1-249	Steel heat exchanger tubes internal to components exposed to air-outdoor, air-indoor uncontrolled, condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191.
3.3.1-250	Steel reactor coolant pump oil collection system tanks, piping, piping components exposed to lubricating oil (waste oil)	Loss of material due to general, pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191, except that a different program is used for components in the Fuel Oil System. This item is aligned to portions of the Fuel Oil System potentially containing waste oil, contaminated oil, and solvents. Therefore, a periodic inspection program is used in lieu of a one time inspection. The *Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components* (B2.1.24) will be used to manage loss of material of steel tanks, piping, piping components exposed to lubricating oil (waste oil) in the Fuel Oil System. In addition to auxiliary systems, components in reactor vessel, internals, and reactor coolant system are aligned to this item.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-252	Aluminum piping, piping components exposed to soil, concrete	Loss of material due to pitting, crevice corrosion	AMP XI.M41, "Buried and Underground Piping and Tanks"	No	Not applicable. ONS has no aluminum piping, piping components exposed to soil, concrete in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-253	PVC piping, piping components exposed to raw water, raw water (potable), treated water, waste water	Loss of material due to wear; flow blockage due to fouling (raw water only)	AMP XI.M20, "Open-Cycle Cooling Water System," AMP XI.M27, "Fire Water System," or AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191. The *Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components* (B2.1.24) program is used to manage components aligned to this item.
3.3.1-254	Aluminum heat exchanger components exposed to air, condensation	Cracking due to stress corrosion cracking	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes (SRP-SLR Section 3.3.2.2.8)	Consistent with NUREG-2191. The *One-Time Inspection* program (B2.1.20) will be implemented to confirm that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the SPEO. See further evaluation in Section 3.3.2.2.8.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-255	Any material fire damper assemblies exposed to air	Loss of material due to general, pitting, crevice corrosion; cracking due to stress corrosion cracking; hardening, loss of strength, shrinkage due to elastomer degradation	AMP XI.M26, “Fire Protection”	No	Consistent with NUREG-2191.
3.3.1-257	Steel, stainless steel, copper alloy heat exchanger tubes exposed to lubricating oil	Reduction of heat transfer due to fouling	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191.
3.3.1-258	Metallic, elastomer, fiberglass, HDPE piping, piping components exposed to waste water	Flow blockage due to fouling	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not applicable. This component and aging effect are addressed in lines rolling up to SRP 3.3.1-091 and 3.3.1-095. The associated NUREG-2191 aging items are not used.
3.3.1-259	Aluminum piping, piping components exposed to raw water	Flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System,” or AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not applicable. Flow blockage due to fouling is not an aging effect requiring management in aluminum piping, piping components exposed to raw water in ONS auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-260	Metallic HVAC closure bolting exposed to air, condensation	Loss of material due to general (where applicable), pitting, crevice corrosion; cracking due to SCC, loss of preload	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-261	Titanium (ASTM Grades 3, 4, or 5) heat exchanger tubes exposed to closed-cycle cooling water, raw water	Cracking due to SCC	AMP XI.M20, “Open-Cycle Cooling Water System,” or AMP XI.M21A, “Cosed Treated Water Systems”	No	Not applicable. ONS has no titanium (ASTM Grades 3, 4, or 5) heat exchanger tubes exposed to closed-cycle cooling water or raw water environments in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-262	Titanium piping, piping components, heat exchanger components exposed to closed-cycle cooling water, treated water	Cracking due to SCC	AMP XI.M20, “Open-Cycle Cooling Water System,” or AMP XI.M21A, “Closed Treated Water Systems,” or AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not applicable. ONS has no titanium piping, piping components, heat exchanger components exposed to closed-cycle cooling water, treated water in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-263	Polymeric piping, piping components, ducting, ducting components, seals exposed to air, condensation, raw water, raw water (potable), treated water, waste water, underground, concrete, soil	Hardening or loss of strength due to polymeric degradation; loss of material due to peeling, delamination, wear; cracking or blistering due to exposure to ultraviolet light, ozone, radiation, or chemical attack; flow blockage due to fouling	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-265	Steel heat exchanger tubes exposed to fuel oil	Reduction of heat transfer due to fouling	AMP XI.M30, “Fuel Oil Chemistry”, and AMP XI.M32, “One-Time Inspection”	No	Not applicable. ONS has no steel heat exchanger radiator tubes exposed to fuel oil in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-266	Steel heat exchanger tubes exposed to fuel oil	Reduction of heat transfer due to fouling	AMP XI.M30, “Fuel Oil Chemistry"	No	Not applicable. ONS has no steel heat exchanger radiator tubes exposed to fuel oil in the scope of SLR in auxiliary systems. The associated NUREG-2191 aging items are not used.
3.3.1-267	Subliming compound fireproofing/fire barriers (Thermo-lag®, Darmatt™, 3M™ Interam™, and other similar materials) exposed to air	Loss of material due to abrasion, flaking, vibration; cracking/ delamination due to chemical reaction, settlement; change in material properties due to gamma irradiation exposure; separation	AMP XI.M26, “Fire Protection”	No	Not applicable. Fire barrier materials are addressed in SRP Item 3.3.1-269. The associated NUREG-2191 aging items are not used.

Table 3.3.1 Summary of Aging Management Programs for Auxiliary Systems Evaluated in Chapter VII of the GALL-SLR Report

Item Number	Component	Aging Effect/ Mechanism	Aging Management Program	Further Evaluation Recommended	Discussion
3.3.1-268	Cementitious coating fireproofing/fire barriers (Pyrocrete, BIO™ K-10 Mortar, Cafecote, and other similar materials) exposed to air	Loss of material due to abrasion, exfoliation, elevated temperature, flaking, spalling; cracking/ delamination due to chemical reaction, elevated temperature, settlement, vibration; change in material properties due to elevated temperature, gamma irradiation exposure; separation	AMP XI.M26, "Fire Protection"	No	Not applicable. Fire barrier materials are addressed in SRP Item 3.3.1-269. The associated NUREG-2191 aging items are not used.
3.3.1-269	Silicate fireproofing/fire barriers (Marinite®, Kaowool™, Cerafiber®, Cera® blanket, or other similar materials) exposed to air	Loss of material due to abrasion, flaking; cracking/ delamination due to settlement; change in material properties due to gamma irradiation exposure; separation	AMP XI.M26, "Fire Protection"	No	Consistent with NUREG-2191. Civil/ Structural components are aligned to this item.

Results Table: Auxiliary Systems AMR Results

			Condensation (Internal)	Loss of Material	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)	VII.D.A-26	3.3.1- 055	A

Plant Specific Notes:

1. Bubbler piping for fire water storage tank level indication has instrument air internal and raw water external within the tank. Flow blockage is not a concern for the internal air environment.
2. Cracking of copper alloy (>15% Zn) in indoor air could result from ammonia-based compounds conveyed to external surfaces from bolted joint leakage through insulation. However, cracking of internal surfaces is not expected as these surfaces are not exposed to contamination from external leakage sources.
3. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.
4. The terminology “Piping and Piping Components” represents pipes, pipe fittings (reducers, elbows, tees, etc), and in-line piping components (e.g. valves, traps, strainers, orifices, flow elements, etc.) and is used to identify components with the system that are susceptible to wall thinning (due to erosion or flow accelerated corrosion) or cumulative fatigue damage. Component susceptibility to these aging effects is determined by susceptibility analyses, operating experience, or system design.

				Loss of Material	One-Time Inspection (B2.1.20)	VII.D.AP-221a	3.3.1- 006	A

Plant Specific Notes:

1. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.

Table 3.3.2-6 Auxiliary Systems - Keowee Depressing Air System - Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes
Bolting	Structural Integrity	Stainless Steel	Air – Indoor Uncontrolled (External)	Cracking	Bolting Integrity (B2.1.9)	VII.I.A-426	3.3.1- 145	A
				Loss of Material	Bolting Integrity (B2.1.9)	VII.I.A-03	3.3.1- 012	A
				Loss of Preload	Bolting Integrity (B2.1.9)	VII.I.AP-124	3.3.1- 015	A
		Steel	Air – Indoor Uncontrolled (External)	Loss of Material	Bolting Integrity (B2.1.9)	VII.I.A-03	3.3.1- 012	A
				Loss of Preload	Bolting Integrity (B2.1.9)	VII.I.AP-124	3.3.1- 015	A
Piping	Structural Integrity	Galvanized Steel	Air – Indoor Uncontrolled (External)	None	None	VII.J.AP-13	3.3.1- 116	A
			Waste Water (Internal)	Long-Term Loss of Material	One-Time Inspection (B2.1.20)	VII.E5.A-785	3.3.1- 193	A
				Loss of Material	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)	VII.E5.AP-281	3.3.1- 091	A, 1
Valve Body	Structural Integrity	Steel	Air – Indoor Uncontrolled (External)	Loss of Material	External Surfaces Monitoring of Mechanical Components (B2.1.23)	VII.I.A-77	3.3.1- 078	A
			Waste Water (Internal)	Long-Term Loss of Material	One-Time Inspection (B2.1.20)	VII.E5.A-785	3.3.1- 193	A

			Gas (Internal)	None	None	VII.J.AP-22	3.3.1- 120	A

Table 3.3.2-11 Auxiliary Systems - Standby Shutdown Facility Fire Protection System - Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes
Valve Body	Pressure Boundary	Steel	Air – Indoor Uncontrolled (External)	Loss of Material	Fire Protection (B2.1.15)	VII.G.AP-150	3.3.1- 058	A
			Gas (Internal)	None	None	VII.J.AP-6	3.3.1- 121	A

Plant Specific Notes:

1. Cracking of copper alloy (>15% Zn) in indoor air could result from ammonia-based compounds conveyed to external surfaces from bolted joint leakage through insulation. However, cracking of internal surfaces is not expected as these surfaces are not exposed to contamination from external leakage sources.

Plant Specific Notes:

1. GALL-SLR item VII.C1.A-797b includes treated water environment. The treated borated water is considered equivalent to treated water for polymeric components.
2. Material of construction is 5052 Aluminum which is not susceptible to stress corrosion cracking per NUREG 2192 Section 3.3.2.2.8.
3. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.
4. Subject component is exposed to air with borated water leakage. No additional aging effects are identified for exposure of polymeric materials to borated water leakage.
5. The treated borated water environment is considered a match to the treated water environment for steel. General, crevice, and pitting corrosion occurs for steels in both treated water and treated borated water environments. Control of oxygen and contaminants in both environments mitigates crevice and pitting corrosion. General corrosion rates in a treated borated water environment are higher than in a treated water environment and is managed as long-term loss of material due to general corrosion.
6. The terminology “Piping and Piping Components” represents pipes, pipe fittings (reducers, elbows, tees, etc), and in-line piping components (e.g. valves, traps, strainers, orifices, flow elements, etc.) and is used to identify components with the system that are susceptible to wall thinning (due to erosion or flow accelerated corrosion) or cumulative fatigue damage. Component susceptibility to these aging effects is determined by susceptibility analyses, operating experience, or system design.

Table 3.3.2-13 Auxiliary Systems - Coolant Storage System - Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes

Plant Specific Notes:

1. Material of construction is 5052 Aluminum which is not susceptible to stress corrosion cracking per NUREG 2192 Section 3.3.2.2.8.
2. The treated borated water environment is considered a match to the treated water environment for steel. General, crevice, and pitting corrosion occurs for steels in both treated water and treated borated water environments. Control of oxygen and contaminants in both environments mitigates crevice and pitting corrosion. General corrosion rates in a treated borated water environment are higher than in a treated water environment and is managed as long-term loss of material due to general corrosion.
3. The terminology “Piping and Piping Components” represents pipes, pipe fittings (reducers, elbows, tees, etc), and in-line piping components (e.g. valves, traps, strainers, orifices, flow elements, etc.) and is used to identify components with the system that are susceptible to wall thinning (due to erosion or flow accelerated corrosion) or cumulative fatigue damage. Component susceptibility to these aging effects is determined by susceptibility analyses, operating experience, or system design.

Plant Specific Notes:

1. DW piping is Aluminum 6061-T6, which is not susceptible to SCC
2. NUREG-2191 identifies no aging effects for PVC in a raw (potable) environment. The treated water environment is demineralized water that contains no additives. This environment is considered a match to raw (potable) for the subject material-environment-aging effect combination.
3. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.

			Underground (External)	Cracking	One-Time Inspection (B2.1.20)	VII.I.A-714a	3.3.1- 146	A
				Loss of Material	One-Time Inspection (B2.1.20)	VII.I.A-775a	3.3.1- 246	A

Plant Specific Notes:

1. The ESV vacuum tank level gauge is a magnetic float type indicator with no glass element.
2. Flow blockage is not a concern in the ESV system as the raw water environment is only present in drain piping which is not part of the main flow path.

			Treated Borated Water (Internal)	Loss of Material	One-Time Inspection (B2.1.20)	VII.A2.AP-79	3.3.1- 125	A
					Water Chemistry (B2.1.2)	VII.A2.AP-79	3.3.1- 125	A
			Treated Borated water >60°C (>140°F) (Internal)	Cracking	One-Time Inspection (B2.1.20)	VII.E1.AP-82	3.3.1- 028	A
					Water Chemistry (B2.1.2)	VII.E1.AP-82	3.3.1- 028	A

Plant Specific Notes:

1. GALL-SLR item VII.C1.A-797b includes treated water environment. The treated borated water is considered equivalent to treated water for polymeric components.
2. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.

Valve Body	Pressure Boundary	Steel	Air with Borated Water Leakage (External)	Loss of Material	Boric Acid Corrosion (B2.1.4)	VII.I.A-79	3.3.1- 009	A
			Closed-Cycle Cooling Water (Internal)	Loss of Material	Closed Treated Water System (B2.1.12)	VII.C2.AP-202	3.3.1- 045	A

Plant Specific Notes:

1. Cracking of copper alloy (>15% Zn) in indoor air could result from ammonia-based compounds conveyed to external surfaces from bolted joint leakage through insulation. However, cracking of internal surfaces is not expected as these surfaces are not exposed to contamination from external leakage sources.
2. External surface of tank bladder is located inside of the tank. Therefore, the inspection is performed inside of the tank.
3. Hose is stored in a cabinet or trailer and protected from system leakage. Inspection of the external surface is representative of the internal surface.

Table 3.3.2-19 Auxiliary Systems - Component Cooling Water System - Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes

Plant Specific Notes:

1. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.
2. The terminology "Piping and Piping Components" represents pipes, pipe fittings (reducers, elbows, tees, etc), and in-line piping components (e.g. valves, traps, strainers, orifices, flow elements, etc.) and is used to identify components with the system that are susceptible to wall thinning (due to erosion or flow accelerated corrosion) or cumulative fatigue damage. Component susceptibility to these aging effects is determined by susceptibility analyses, operating experience, or system design.

			Condensation (External)	Loss of Material	External Surfaces Monitoring of Mechanical Components (B2.1.23)	VII.I.A-405a	3.3.1- 132	A

Plant Specific Notes:

1. Material of construction is inhibited Brass which is not susceptible to selective leaching.
2. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes

Plant Specific Notes:

1. The heat exchanger plate performs the same function as a heat exchanger tube. Therefore, the component type is equivalent.
2. Material of construction is inhibited Brass which is not susceptible to selective leaching.

Table 3.3.2-23 Auxiliary Systems - Chilled Water (Vital Loads) System - Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes

Plant Specific Notes:

1. The temporary chiller tubes and tubesheet are periodically exposed to closed-cycle cooling water and raw water depending on the chiller service. Therefore, the Inspection of Internal Surfaces AMP is used rather than the Open-Cycle Cooling Water AMP.
2. The temporary chiller tubes and tubesheet are exposed to raw water only when used for Reactor Building cooling during outages. Otherwise, the environment is closed-cycle cooling water when in WC service or nitrogen gas when stored. Therefore, long-term loss of material due to exposure to raw water is not an aging effect requiring management.
3. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.

Plant Specific Notes:

1. MTOT cooler heads have a localized coating type repair that will be managed with the Open Cycle Cooling Water program.
2. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.
3. In accordance with industry best practice, the internal coating of this tank is not maintained. Therefore, loss of material of the tank base metal will be managed by the Lubricating Oil Analysis program

Table 3.3.2-32 Auxiliary Systems - Keowee Lube Oil System - Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes
Valve Body	Structural Integrity	Copper Alloy (>15% Zn)	Air – Indoor Uncontrolled (External)	Cracking	External Surfaces Monitoring of Mechanical Components (B2.1.23)	VII.I.A-405a	3.3.1- 132	A
			Lubricating Oil (Internal)	Loss of Material	Lubricating Oil Analysis (B2.1.25)	VII.C1.AP-133	3.3.1- 099	A
					One-Time Inspection (B2.1.20)	VII.C1.AP-133	3.3.1- 099	A
			Waste Water (Internal)	Cracking	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)	VII.E5.A-473c	3.3.1- 160	A
				Loss of Material	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)	VII.E5.AP-272	3.3.1- 095	A, 1
					Selective Leaching (B2.1.21)	VII.E5.A-547	3.3.1- 072	A
		Steel	Air – Indoor Uncontrolled (External)	Loss of Material	External Surfaces Monitoring of Mechanical Components (B2.1.23)	VII.I.A-77	3.3.1- 078	A
			Lubricating Oil (Internal)	Loss of Material	Lubricating Oil Analysis (B2.1.25)	VII.C1.AP-127	3.3.1- 097	A
					One-Time Inspection (B2.1.20)	VII.C1.AP-127	3.3.1- 097	A

Table 3.3.2-32 Auxiliary Systems - Keowee Lube Oil System - Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes
Valve Body	Structural Integrity	Steel	Waste Water (Internal)	Long-Term Loss of Material	One-Time Inspection (B2.1.20)	VII.E5.A-785	3.3.1- 193	A
				Loss of Material	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)	VII.E5.AP-281	3.3.1- 091	A, 1

Plant Specific Notes:

1. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.

Table 3.3.2-41 Auxiliary Systems - Vacuum System - Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes

Plant Specific Notes:

1. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.
2. The terminology "Piping and Piping Components" represents pipes, pipe fittings (reducers, elbows, tees, etc), and in-line piping components (e.g. valves, traps, strainers, orifices, flow elements, etc.) and is used to identify components with the system that are susceptible to wall thinning (due to erosion or flow accelerated corrosion) or cumulative fatigue damage. Component susceptibility to these aging effects is determined by susceptibility analyses, operating experience, or system design.

Valve Body	Structural Integrity	Steel	Fuel Oil (Internal)	Loss of Material	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)	VII.G.AP-234	3.3.1- 070	E,4
			Lubricating Oil (Waste Oil) (Internal)	Loss of Material	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B2.1.24)	VII.G.AP-117	3.3.1- 250	E,1

Plant Specific Notes:

1. This portion of the system potentially contains waste oil, contaminated oil, and solvents; therefore, a periodic inspection program is used in lieu of a one time inspection for conservatism.
2. Lubricating Oil (Waste Oil) is not an environment identified by NUREG-2191 for a stainless steel sight glass or a stainless steel pulsation dampener.
3. Piping constructed of PDVF (Polymeric) is used with a fuel oil internal environment. Per EPRI Tools section C.2.1.6, polymerics have no aging effects in this environment. The polymeric/fuel oil environment does not exists in GALL.
4. The fuel oil supply to the auxiliary boiler is not routinely analyzed for water or corrosion product contamination, therefore this component is managed by the Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components Program instead of the Fuel Oil Chemistry Program.

Table 3.3.2-48 Auxiliary Systems - Condenser Circulating Water System - Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes

Plant Specific Notes:

1. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.
2. The submersible pump is normally stored in the standby shutdown facility. The pump is exposed to raw water only during brief periods of time when the pump is flow tested. The normal environment is air indoor uncontrolled.
3. The terminology “Piping and Piping Components” represents pipes, pipe fittings (reducers, elbows, tees, etc), and in-line piping components (e.g. valves, traps, strainers, orifices, flow elements, etc.) and is used to identify components with the system that are susceptible to wall thinning (due to erosion or flow accelerated corrosion) or cumulative fatigue damage. Component susceptibility to these aging effects is determined by susceptibility analyses, operating experience, or system design.

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes
Valve Body	Structural Integrity	Steel	Raw Water (Internal)	Long-Term Loss of Material	One-Time Inspection (B2.1.20)	VII.C1.A-532	3.3.1- 193	A
				Loss of Material	Open-Cycle Cooling Water System (B2.1.11)	VII.C1.AP-194	3.3.1- 037	B,1

Plant Specific Notes:

1. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.
2. The terminology "Piping and Piping Components" represents pipes, pipe fittings (reducers, elbows, tees, etc), and in-line piping components (e.g. valves, traps, strainers, orifices, flow elements, etc.) and is used to identify components with the system that are susceptible to wall thinning (due to erosion or flow accelerated corrosion) or cumulative fatigue damage. Component susceptibility to these aging effects is determined by susceptibility analyses, operating experience, or system design.
3. Stored equipment used for alternate Reactor Building Cooling is located in a hose trailer and in the yard. Those components stored within the hose trailer are evaluated with an air-indoor uncontrolled environment while those stored in the yard are evaluated with an air-outdoor environment.

Table 3.3.2-50 Auxiliary Systems - Protected Service Water System - Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes

Plant Specific Notes:

1. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.
2. The portable pump is normally stored in a warehouse. The pump is exposed to raw water only during brief periods of time when the pump is flow tested. The normal environment is air indoor uncontrolled.
3. Stored equipment in the PSW System, which is normally located in a warehouse, is evaluated with an air-indoor uncontrolled environment.

			Condensation (External)	Cracking	One-Time Inspection (B2.1.20)	VII.I.A-734b	3.3.1- 205	A
				Loss of Material	One-Time Inspection (B2.1.20)	VII.I.A-761b	3.3.1- 232	A
			Raw Water (Internal)	Loss of Material, Flow Blockage	Open-Cycle Cooling Water System (B2.1.11)	VII.C1.A-54	3.3.1- 040	B
			Underground (External)	Cracking	One-Time Inspection (B2.1.20)	VII.I.A-714a	3.3.1- 146	A
				Loss of Material	One-Time Inspection (B2.1.20)	VII.I.A-775a	3.3.1- 246	A
	Structural Integrity	Stainless Steel	Condensation (External)	Cracking	One-Time Inspection (B2.1.20)	VII.I.A-734b	3.3.1- 205	A

Table 3.3.2-51 Auxiliary Systems - Siphon Seal Water System - Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes
Valve Body	Structural Integrity	Stainless Steel	Condensation (External)	Loss of Material	One-Time Inspection (B2.1.20)	VII.I.A-761b	3.3.1- 232	A
			Raw Water (Internal)	Loss of Material	Open-Cycle Cooling Water System (B2.1.11)	VII.C1.A-54	3.3.1- 040	B,1

Plant Specific Notes:

1. Flow blockage due to fouling is not a concern for components that perform a structural integrity function.

Table 3.3.2-52 Auxiliary Systems - Keowee Turbine Generator Cooling Water System - Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1	Notes
Bolting	Pressure Boundary	Stainless Steel	Air – Indoor Uncontrolled (External)	Cracking	Bolting Integrity (B2.1.9)	VII.I.A-426	3.3.1- 145	A
				Loss of Material	Bolting Integrity (B2.1.9)	VII.I.A-03	3.3.1- 012	A
				Loss of Preload	Bolting Integrity (B2.1.9)	VII.I.AP-124	3.3.1- 015	A
		Steel	Air – Indoor Uncontrolled (External)	Loss of Material	Bolting Integrity (B2.1.9)	VII.I.A-03	3.3.1- 012	A
				Loss of Preload	Bolting Integrity (B2.1.9)	VII.I.AP-124	3.3.1- 015	A
	Structural Integrity	Stainless Steel	Air – Indoor Uncontrolled (External)	Cracking	Bolting Integrity (B2.1.9)	VII.I.A-426	3.3.1- 145	A
				Loss of Material	Bolting Integrity (B2.1.9)	VII.I.A-03	3.3.1- 012	A
				Loss of Preload	Bolting Integrity (B2.1.9)	VII.I.AP-124	3.3.1- 015	A
		Steel	Air – Indoor Uncontrolled (External)	Loss of Material	Bolting Integrity (B2.1.9)	VII.I.A-03	3.3.1- 012	A
