Browns Ferry Nuclear Plant, Units 1, 2, and 3
Renewed Facility Operating License Nos. DPR-33, DPR-52, and DPR-68
NRC Docket Nos. 50-259, 50-260, and 50-296

Subject: **Browns Ferry Nuclear Plant, Units 1, 2, and 3 – Application for Subsequent Renewed Operating Licenses**

Pursuant to Title 10 of the *Code of Federal Regulations*, Part 50, "Domestic Licensing of Production and Utilization Facilities," Part 51, "Environmental Protection Regulations for Domestic Licensing and Related Regulatory Functions," and Part 54, "Requirements for Renewal of Operating Licenses for Nuclear Power Plants," the Tennessee Valley Authority (TVA) applies for the renewal of the Browns Ferry Nuclear Plant (BFN), Units 1, 2, and 3, Renewed Facility Operating Licenses, Nos. DPR-33, DPR-52, and DPR-68, respectively. The first Renewed Facility Operating Licenses for BFN Units 1, 2, and 3 were issued on May 4, 2006, and will expire at midnight on December 20, 2033, June 28, 2034, and July 2, 2036, respectively.

TVA seeks to extend the operating term of the BFN units by 20 years beyond the current renewal license expiration dates.

The enclosed Subsequent License Renewal Application (SLRA) contains the information required by 10 CFR Parts 54 and 51 and meets the submittal timeliness requirements of 10 CFR 54.17(c) and 10 CFR 2.109(b). This submittal provides appropriate administrative, technical, and environmental information sufficient to support Nuclear Regulatory Commission (NRC) findings required by 10 CFR 54.29.

Enclosure 1 of this letter provides BFN SLRA Sections 1 through 4 and Appendices A through D. Enclosure 2 of this letter provides BFN SLRA Appendix E, Applicant's Environmental Report-Operating License Renewal Stage. Enclosure 3 of this letter provides the proprietary version of BFN SLRA Section 4, Time-Limited Aging Analyses. Electric Power Research Institute (EPRI) and General Electric Hitachi (GEH) separately consider portions of the information provided in Enclosure 3 of this letter to be proprietary and, therefore, exempt from public disclosure pursuant to 10 CFR 2.390, "Public Inspections, Exemptions, Requests for Withholding." Affidavits for withholding information, executed by EPRI and GEH, are provided in Enclosure 4, respectively. A non-proprietary version of BFN SLRA Section 4 is provided in Enclosure 1. Therefore, on behalf of EPRI and GEH, TVA requests that Enclosure 3 of this letter be withheld from public disclosure in accordance with the EPRI and GEH affidavits and the provisions of 10 CFR 2.390.

As part of this application, TVA also requests NRC approval to implement BWRVIP-321 Revision 1-A, "Boiling Water Reactor Vessel and Internals Project, Plan for Extension of the BWR Integrated Surveillance (ISP) Through the Second License Renewal (SLR)," as required by NRC Safety Evaluation included in BWRVIP-321 Revision 1-A and per 10 CFR Part 50, Appendix H, Paragraph III.B.3. The commitment to implement BWRVIP-321 Revision 1-A upon obtaining NRC approval is provided as an enhancement of the Reactor Vessel Material Surveillance Program as shown in SLRA Table A.5, Commitment Number 19.1, and B.2.1.19.

As required by 10 CFR 54.21(b), current licensing basis changes which have a material effect on the content of this application will be submitted at least annually while the application is under NRC review and at least three months prior to the scheduled completion of the NRC review.

Appendix A, Table A.5, "Subsequent License Renewal Commitment List," of the enclosed BFN SLRA provides a list of commitments made in this application. This list will be updated as required throughout the SLRA review process.

Should you have any questions regarding this submittal, please contact Peter J. Donahue, Director, Subsequent License Renewal, at pjdonahue@tva.gov.

I declare under penalty of perjury that the foregoing is true and correct. Executed on the 19th day of January 2024.

Respectfully,

Kimly D. Hulvey

1.0 ADMINISTRATIVE INFORMATION

1.1 GENERAL INFORMATION

1.1.1 Name of Applicant

The Tennessee Valley Authority (TVA) is the SLR Applicant. The Browns Ferry Nuclear Plant (BFN) Site is owned by the United States of America and managed by TVA, a corporate agency of the United States of America created by an act of Congress. TVA manages and operates the BFN units installed on the BFN Site.

1.1.2 Address of Applicant

Tennessee Valley Authority
400 West Summit Hill Drive
Knoxville, TN 37902
865-632-2101

1.1.3 Description of Business or Occupation of Applicant

TVA, a corporate agency and instrumentality of the United States, was created in 1933 by the United States Congress by virtue of the Tennessee Valley Authority Act of 1933, as amended, 16 U.S.C. §§ 831-831ee (as amended). TVA was created to, among other things, improve navigation on the Tennessee River, reduce the damage from destructive flood waters within the Tennessee River system and downstream on the lower Ohio and Mississippi Rivers, further the economic development of TVA's service area in the southeastern United States, and sell the electricity generated at the facilities TVA operates.

TVA supplies power in most of Tennessee, northern Alabama, northeastern Mississippi, and southwestern Kentucky and in portions of northern Georgia, western North Carolina, and southwestern Virginia to a population of over 10 million people.

The current BFN Units 1, 2 and 3 renewed facility operating licenses will expire as follows:

- At midnight on December 20, 2033 for BFN Unit 1 (Renewed Facility Operating License No. DPR-33).
- At midnight on June 28, 2034 for BFN Unit 2 (Renewed Facility Operating License No. DPR-52).
- At midnight on July 2, 2036 for BFN Unit 3 (Renewed Facility Operating License No. DPR-68).

TVA will continue as the licensed operator on the subsequently renewed facility operating licenses.

1.1.4 Description of Organization and Management of Applicant

TVA is administered by a eight-member Board of Directors (Board) appointed by the President of the United States with the advice and consent of the U.S. Senate. All Board members are United States citizens. TVA Board members serve five-year terms, and at least one member's term ends each year. The TVA Board, among other things, establishes broad goals, objectives, and policies for TVA; develops long-range plans to guide TVA in achieving these goals, objectives, and policies;

approves annual budgets; and establishes a compensation plan for employees. Board members select the Chair of the Board.

The business address for the TVA Board is:

Tennessee Valley Authority Board of Directors
400 West Summit Hill Drive, WT7
Knoxville, TN 37902

As of the date of this application, the names of the board members are as follows:

- Beth Geer
- Beth Harwell
- Bobby Klein
- Michelle Moore
- Brian Noland
- Bill Renick
- Joe Ritch (Chair)
- Wade White

The TVA Act gives the TVA Board sole responsibility for establishing the rates TVA charges for power. These rates are not subject to review or approval by any state or Federal regulatory body.

The President and Chief Executive Officer is a United States citizen, who is selected by the Board of Directors and is the senior executive responsible for TVA's day-to-day operations. The names, titles, and addresses of the principal executives and officers of TVA, all of whom are United States citizens, are as follows:

Jeffrey J. Lyash	President and Chief Executive Officer	Tennessee Valley Authority 400 West Summit Hill Drive Knoxville, TN 37902
Donald A. Moal	Executive Vice President and Chief Operating Officer	Tennessee Valley Authority 400 West Summit Hill Drive Knoxville, TN 37902
Timothy S. Rausch	Executive Vice President and Chief Nuclear Officer	Tennessee Valley Authority 1101 Market Street Chattanooga, TN 37402
David Fountain	Executive Vice President and General Counsel	Tennessee Valley Authority 400 West Summit Hill Drive Knoxville, TN 37902

John M. Thomas	Executive Vice President and Chief Financial and Strategy Officer	Tennessee Valley Authority 1101 Market Street Chattanooga, TN 37402
Jeanette Mills	Executive Vice President and Chief External Relations Officer	Tennessee Valley Authority 400 West Summit Hill Drive Knoxville, TN 37902

1.1.5 Class of License, Use of the Facility, and Period of Time for Which the License is Sought

TVA requests a subsequent renewal of the Class 104b operating licenses for BFN Units 1, 2 and 3, for a period of 20 years beyond the expiration of the current licenses to allow continued use of the facilities for the commercial generation of electricity. BFN Unit 1 license (DPR-33) expires at midnight on December 20, 2033. BFN Unit 2 license (DPR-52) expires at midnight on June 28, 2034. BFN Unit 3 license (DPR- 68) expires at midnight on July 2, 2036.

In this application, TVA also requests the renewal of specific licenses under 10 CFR Parts 30, 40, and 70 that are subsumed in or combined with the current operating licenses.

1.1.6 Earliest and Latest Dates for Alterations, if Proposed

The BFN Subsequent License Renewal Application (SLRA) does not require new construction or modifications beyond normal maintenance. TVA has no plans for refurbishment or replacement activities, outside of normal maintenance, at BFN associated with SLRA.

1.1.7 Restricted Data

With regard to the requirements of 10 CFR 54.17(f), this application does not contain any “Restricted Data,” as that term is defined in the Atomic Energy Act of 1954, as amended, or other defense information, and it is not expected that any such information will be part of the licensed activities.

In accordance with the requirements of 10 CFR 54.17(g), the applicant will not permit any individual to have access to, or any facility to possess restricted data or classified national security information until the individual and/or facility has been approved for such access under the provisions of 10 CFR Parts 25 and/or 95.

1.1.8 Regulatory Agencies

As required by its founding charter, the Tennessee Valley Authority Act of 1933, TVA sets rates for electric power which will produce revenues sufficient to provide funds for operation, maintenance, and administration of its power system. No other regulatory agencies have jurisdiction over TVA's rates and services.

1.1.9 Local News Publications

News publications in circulation near BFN that are considered appropriate to give reasonable notice of the application are as follows:

The News Courier
410 West Green Street
Athens, AL 35612

The Decatur Daily
201 1st Ave SE
Decatur, AL 35601

The Huntsville Times
2317 Memorial Pkwy SW
Huntsville, AL 35801

Courier Journal
219 W. Tennessee St.
Florence, AL 35630

1.1.10 Conforming Changes to Standard Indemnity Agreement

10 CFR 54.19(b) requires that license renewal applications include conforming changes to the standard indemnity agreement, 10 CFR 140.92, Appendix B, to account for the expiration term of the proposed renewal license." TVA requests that, as appropriate, conforming changes be made to Article VII of the indemnity agreement and Item 3 of the Attachment to that agreement, specifying the extension of agreement until the expiration date of the subsequent renewed facility operating licenses as sought in this application. TVA understands that no changes may be necessary for this purpose if the current license numbers for BFN Units 1, 2, and 3 are retained.

1.2 GENERAL LICENSE INFORMATION

1.2.1 Application Updates, Renewed Licenses, and Renewal Term Operation

In accordance with 10 CFR 54.21(b), during NRC review of this application, annual updates to the application to reflect any change to the current licensing basis that materially affects the contents of the license renewal application will be provided.

In accordance with 10 CFR 54.21(d), TVA will maintain a summary description in the BFN Final Safety Analysis Report (FSAR) of programs and activities that are required to manage the effects of aging for the systems, structures, and components determined to be subject to aging management during the subsequent period of extended operation, and summaries of the Time-Limited Aging Analyses (TLAAs) evaluations.

1.2.2 Incorporation by Reference

There are no documents incorporated by reference as part of the application. Any document references, either in text or in Section 1.7, are listed for information only.

1.2.3 Contact Information

In addition to the BFN service list, all communications concerning this application should be copied to the following:

Pete Donahue
Director, Subsequent License Renewal
Post Office Box 2000
Decatur, AL 35609-2000

Tennessee Valley Authority
e-mail: pjdonahue@tva.gov

1.3 PURPOSE

This document provides information required by 10 CFR 54 to support the application for subsequent renewed licenses for BFN Units 1, 2 and 3. The application contains technical information required by 10 CFR 54.21 and environmental information required by 10 CFR 54.23. The information contained herein is intended to provide the NRC with an adequate basis to make the findings required by 10 CFR 54.29.

1.4 DESCRIPTION OF THE PLANT

BFN Units 1, 2, and 3 are boiling water reactors (BWRs) located on the north shore of Wheeler Reservoir in Limestone County, Alabama, at Tennessee River Mile (TRM) 294. The site contains approximately 880 acres and is located approximately 30 miles west of Huntsville, Alabama. The plant is located on property owned by the United States and in the custody of TVA.

BFN Units 1, 2 and 3 are designed and supplied by General Electric with 251-inch diameter reactor vessels and 764 fuel assemblies. The primary containment of each unit is a Mark I design, consisting of a drywell, a suppression chamber in the shape of a torus, and a connecting vent system between the drywell and the suppression chamber. The reactor building is shared by all three units. The turbine building, control bay, radwaste building, diesel generator building, and intake pumping station house equipment used by all three units.

Each BFN unit was originally authorized to operate at steady state reactor core power levels not in excess of 3293 megawatts thermal (MWt). In 2007, for Unit 1 (ADAMS Accession No. ML063350404), and 1998, for Units 2 and 3 (ADAMS Accession No. ML020100022), the NRC granted power uprates allowing the BFN units to be operated at a maximum power level of 3458 MWt based upon original steam flow capability above rated power, improved analytical techniques, and more current fuel design.

An Extended Power Uprate (EPU) project was undertaken for the three units, resulting in maximum core power levels of 3952 MWt being approved by the NRC in August 2017 (ADAMS Accession No. ML17032A120). The bases for these increased allowable power levels included continuing improvements in analytical techniques, fuel and core design, and plant hardware modifications, enabling plant power to be increased to approximately 20 percent above original licensed thermal power.

1.5 APPLICATION STRUCTURE

This license renewal application is structured in accordance with Regulatory Guide 1.188, “Standard Format and Content for Applications to Renew Nuclear Plant Operating Licenses,” and NEI 17-01, “Industry Guideline for Implementing the Requirements of 10 CFR Part 54 for Subsequent License Renewal.” In addition, Section 3, “Aging Management Review Results” and Appendix B, “Aging Management Programs” are structured to address the guidance provided in NUREG-2192, “Standard Review Plan for Review of Subsequent License Renewal Applications for Nuclear Power Plants.” NUREG-2192 (SRP-SLR) references NUREG-2191, “Generic Aging Lessons Learned for Subsequent License Renewal (GALL-SLR) Report.” NUREG-2191 was used to determine the adequacy of existing programs for purposes of managing aging and which existing programs should be augmented for subsequent license renewal. The results of the aging management review, using NUREG-2191, have been documented and are illustrated in table format in Section 3, “Aging Management Review Results” of this application.

The application is divided into the following major sections:

Section 1 – Administrative Information

This section provides the administrative information required by 10 CFR 54.17 and 10 CFR 54.19. It describes the plant and states the purpose for this application. Included in this section are the names, addresses, business descriptions, and organization and management descriptions of the applicant, as well as other administrative information. This section also provides an overview of the structure of the application, general references, and a listing of acronyms used throughout the application.

Section 2 – Scoping and Screening Methodology for Identifying Structures and Components Subject to Aging Management Review and Implementation Results

This section describes and justifies the methods used in the integrated plant assessment to identify those systems, structures, and components subject to an aging management review in accordance with the requirements of 10 CFR 54.21(a)(2). These methods consist of: 1) scoping, which identifies the systems, structures, and components that are within the scope of 10 CFR 54.4(a), and 2) screening under 10 CFR 54.21(a)(1), which identifies those in scope systems, structures, and components that perform their intended function without moving parts or a change in configuration or properties, and that are not subject to replacement based on a qualified life or specified time period.

Additionally, the scoping and screening results for systems and structures are described in this section. Scoping results are presented in Section 2.2, “Plant Level Scoping Results.” Screening results are presented in Sections 2.3, 2.4, and 2.5.

The screening results consist of lists of passive long-lived mechanical and structural components that require aging management review. Brief descriptions of mechanical systems and structures within the scope of subsequent license renewal are provided as background information. Mechanical system and structure intended functions are provided for in scope systems and structures. For each in scope system and structure, components requiring an aging management review are identified; associated component intended functions are identified; and appropriate reference to the Section 3 table providing the aging management review results is made.

Electrical components and selected structural components, such as electrical insulation for electrical cables and connections and component supports, respectively, were evaluated as commodities. Under the commodity approach, components were evaluated based upon common environments and materials. Components requiring an aging management review are presented in Sections 2.4 and 2.5. Component intended functions and reference to the applicable Section 3 table is provided.

The descriptions of systems in Section 2 identify subsequent license renewal boundary drawings that depict the components subject to aging management review for mechanical systems. These drawings are provided in a separate submittal.

Section 3 – Aging Management Review Results

10 CFR 54.21(a)(3) requires a demonstration that the effects of aging will be adequately managed so that the intended functions will be maintained consistent with the current licensing basis throughout the subsequent period of extended operation. Section 3 presents the results of the aging management reviews. Section 3 provides the link between the scoping and screening results provided in Section 2, the Aging Management Programs (AMPs) provided in Appendix B, and the TLAA evaluations provided in Section 4.

Aging management review results are presented in tabular form, in a format in accordance with NUREG-2192, "Standard Review Plan for Review of Subsequent License Renewal Applications for Nuclear Power Plants." For mechanical systems, Aging Management Review (AMR) results are provided in Sections 3.1 through 3.4 for the Reactor Vessel, Internals, and Reactor Coolant System; Engineered Safety Features and Reactor Core Isolation Cooling System; Auxiliary Systems; and Steam and Power Conversion Systems, respectively. AMR results for Containments, Structures, and Component Supports are provided in Section 3.5. AMR results for electrical and instrumentation and controls (I&C) Systems are provided in Section 3.6.

Tables are provided in each of these sections in accordance with NUREG-2192, which provide AMR results for components, materials, environments, and aging effects which are addressed in NUREG-2191, and information regarding the degree to which the proposed AMPs are consistent with those recommended in NUREG-2191.

Section 4 – Time-Limited Aging Analyses

TLAAs, as defined in 10 CFR 54.3, are listed in this section. This section includes a screening of the generic TLAAs identified in NUREG-2192 and the results of a review of the current licensing basis for plant-specific TLAAs. This section includes a summary of the time-dependent aspects of the analyses. A demonstration is provided to show that the analyses remain valid for the subsequent period of extended operation, the analyses have been projected to the end of the subsequent period of extended operation, or the effects of aging on the intended function(s) will be adequately managed for the subsequent period of extended operation, consistent with 10 CFR 54.21(c)(1)(i)-(iii).

Appendix A – Final Safety Analysis Report Supplement

As required by 10 CFR 54.21(d), the FSAR supplement contains a summary of activities credited for managing the effects of aging for the subsequent period of extended operation. In addition, summary descriptions of TLAA evaluations are provided. NUREG-2191 Tables X-01 and XI-01, FSAR Supplement Summaries for GALL-SLR Report Chapters X and XI Aging Management Programs, respectively, were used as guidance for the content of the applicable AMP summaries. Following issuance of the subsequently renewed licenses, the information contained in this appendix, as updated through the NRC review process, will be incorporated into the FSAR.

Appendix B – Aging Management Programs

Appendix B describes the programs and activities that are credited for managing aging effects for components and structures during the subsequent period of extended operation based upon the AMR results provided in Section 3. Sections B.2 and B.3 discuss those programs that are contained in Section XI and Section X, respectively, of NUREG-2191. A description of the AMP is provided and a conclusion is drawn based upon the results of an evaluation to each of the ten elements provided in NUREG-2191. In some cases, exceptions and justifications for managing aging are provided for specific NUREG-2191 program elements. Additionally, operating experience related to the AMP is provided, including an assessment of the effectiveness of aging management activities in place for the initial period of extended operation, where applicable.

Appendix C – Response to BWRVIP License Renewal Applicant Action Items

This Appendix provides the requested responses to applicant action items contained in the NRC Safety Evaluation Reports associated with NRC approved Boiling Water Reactor Vessel and Internals Project (BWRVIP) reports.

Appendix D – Technical Specification Changes

This Appendix satisfies the requirement in 10 CFR 54.22 to identify technical specification changes or additions necessary to manage the effects of aging during the subsequent period of extended operation.

Appendix E – Applicant's Environmental Report - Operating License Renewal Stage

This Appendix satisfies the requirements of 10 CFR 54.23 to provide a supplement to the environmental report that complies with the requirements of subpart A of 10 CFR Part 51 for BFN Units 1, 2 and 3.

1.6 ACRONYMS

Acronym	Meaning
AAC	All Aluminum Conductor
AC	Alternating Current
ACAR	Aluminum Conductor Aluminum Alloy Reinforced
ACI	American Concrete Institute
ACSR	Aluminum Conductor Steel Reinforced

2.0 SCOPING AND SCREENING METHODOLOGY FOR IDENTIFYING STRUCTURES AND COMPONENTS SUBJECT TO AGING MANAGEMENT REVIEW, AND IMPLEMENTATION RESULTS

This section describes the process for identifying structures and components subject to aging management review in Browns Ferry Nuclear Plant (BFN) subsequent license renewal (SLR) integrated plant assessment (IPA). For the systems, structures, and components (SSCs) within the scope of subsequent license renewal, 10 CFR 54.21(a)(1) requires the license renewal applicant to identify and list those structures and components subject to Aging Management Review (AMR). 10 CFR 54.21(a)(2) further requires that the methods used to implement the requirements of 10 CFR 54.21(a)(1) be described and justified. Section 2 of this application satisfies these requirements.

The scoping and screening process is performed in two steps. Scoping refers to the process of identifying the plant systems and structures that are to be included within the scope of subsequent license renewal in accordance with 10 CFR 54.4. The intended functions that are the bases for including the systems and structures within the scope of subsequent license renewal are also identified during the scoping process. Screening is the process of determining which components associated with the in scope systems and structures are subject to an aging management review in accordance with 10 CFR 54.21(a)(1) requirements. A detailed description of the BFN scoping and screening process is provided in Section 2.1.

The scoping and screening methodology is consistent with the guidelines presented in Nuclear Energy Institute (NEI) 17-01, “Industry Guideline for Implementing the Requirements of 10 CFR Part 54 for Subsequent License Renewal” (Reference 1.7.3). The plant level scoping results identify the systems and structures within the scope of SLR in Section 2.2. The screening results identify components subject to aging management review as described in Section 2.3 for mechanical systems, Section 2.4 for structures and component supports, and Section 2.5 for electrical and instrumentation and control systems.

2.1 SCOPING AND SCREENING METHODOLOGY

2.1.1 Introduction

This introduction provides an overview of the scoping and screening process used at BFN. Subsequent sections provide details of how the process is implemented.

The initial step in the scoping process is to define the entire plant in terms of systems and structures. Each of these systems and structures were evaluated against the scoping criteria in 10 CFR 54.4(a)(1), (a)(2), and (a)(3), to determine if the system or structure performs or supports a safety-related intended function, if system or structure failure could prevent the satisfactory accomplishment of a safety-related function, or if the system or structure performs functions that demonstrate compliance with the requirement of one of the SLR regulated events. The intended function(s) that are the bases for including systems and structures within the scope of SLR are also identified.

Systems that contain mechanical components such as pumps, piping, valves, etc., are addressed as mechanical systems. A mechanical system is included within the scope of SLR if any portion of the system met the scoping criteria of 10 CFR 54.4. Mechanical systems determined to be within the scope of SLR are then further evaluated to determine those system components that are required to perform or support the identified system intended function(s).

SLR system descriptions were developed for each in scope mechanical system and are included in Section 2.3. These descriptions include relevant information from system descriptions included in the Final Safety Analysis Report (FSAR). The in scope boundaries of mechanical systems are identified. These boundaries are depicted on the subsequent license renewal boundary drawings by the use of boundary flags which identify SLR system interfaces. The in scope boundaries of the mechanical systems and in scope mechanical components are shown highlighted in red or blue. Mechanical components that are required to perform or support safety-related functions or are required to demonstrate compliance with one of the SLR regulated events are shown highlighted in red.

Nonsafety-related mechanical components that are included within the scope of SLR because they provide structural support to safety-related SSCs are shown highlighted in blue. Nonsafety-related mechanical components that are included within the scope of SLR because component failure could prevent the accomplishment of a safety-related function due to potential spatial interaction with safety-related SSCs are shown highlighted in blue. Additional details on system scoping evaluations and boundary drawing development are provided in Section 2.1.5.

A structure is included within the scope of SLR if any portion of the structure met the scoping criteria of 10 CFR 54.4. Structures are further evaluated to determine those structural components that are required to perform or support the identified structure intended function(s). SLR structure descriptions are developed for each in scope structure and are included in Section 2.4. These descriptions include relevant information from structure descriptions included in the FSAR. The structures that are within the scope of SLR are highlighted in red on the site plan. Additional details on structure scoping evaluations and boundary drawing development are provided in Section 2.1.5.

For the purposes of system level scoping, a bounding approach is used for plant electrical and instrumentation and control (I&C) systems. The electrical and I&C systems are all included in the scope of SLR. Electrical and I&C components in mechanical systems are also included in the scope of SLR. Intended functions for electrical and I&C systems are not identified since the bounding scoping approach makes it unnecessary to determine if an electrical or I&C system has an intended function. This method does not prevent elimination of commodity groups or specific plant systems from aging management review during the screening process. The 10 CFR 54.21 screening process eliminates commodities that are active, short lived, or do not perform a SLR intended function.

The one exception to this bounding approach methodology for electrical and I&C systems is to provide a scoping evaluation for components and commodities associated with providing offsite power to the plant, i.e., switchyard equipment. Scoping evaluation of this “system” is performed based on Nuclear Regulatory Commission (NRC) guidance in NUREG-2192, “Standard Review Plan for Review of Subsequent License Renewal Applications for Nuclear Power Plants,” Section 2.5.2.1.1 (Reference 1.7.5). This guidance identifies that the plant system portion of the offsite power system that is used to connect the plant to the offsite power source meets scoping criteria under 10 CFR 54.4(a)(3).

After completion of the scoping and boundary evaluations, the screening process is performed to evaluate the structures and components within the scope of SLR to identify the long-lived and passive structures and components subject to an AMR. In addition, the passive intended functions of structures and components subject to AMR are identified. Additional details on the screening process are provided in Section 2.1.6.

Selected components, such as component supports, hazard barriers and elastomers, electrical and instrumentation enclosures, and passive electrical components, are scoped and screened as commodities. As such, they were not evaluated with the individual system or structure, but were evaluated collectively as a commodity group. To support screening, passive structural commodities and passive electrical commodities are identified. Commodity groups utilized are consistent with Table 2.1-6 of NUREG-2192 (Reference 1.7.5).

2.1.2 Information Sources Used for Scoping and Screening

A number of different current licensing basis (CLB) and design basis information sources were utilized in the scoping and screening process. The CLB for BFN is consistent with the definition provided in 10 CFR 54.3. The significant source documentation is discussed below.

These source documents are available in hard copy or electronic format. Document records such as licensing correspondence and NRC Safety Evaluation Reports (SERs) are available in a searchable database, such that applicable documents can be identified and located by searching the appropriate topic.

2.1.2.1 Final Safety Analysis Report

The BFN FSAR, which is updated regularly in accordance with the requirements of 10 CFR 50.71(e), provided significant input for system and structure descriptions and functions.

2.1.2.2 Safe Shutdown Analysis Calculation

The BFN Safe Shutdown Analysis calculation was used as the primary source document to identify safety-related functions for systems. This calculation is a living document that systematically describes how each system is utilized in the documented safety analysis for each applicable event and summarizes the required systems' functions for safe shutdown for transients, accidents, and special events (e.g, external events and other events of regulatory concern, such as shutdown without control rods). The Safe Shutdown Analysis calculation documents the system safety actions for which credit has been taken in the FSAR, Reload Analyses, and other licensing communications concerning transient, accident, and special events.

2.1.2.3 Environmental Qualification Documentation Packages

Environmental Qualification Documentation Packages provide a compilation of documentation that supports environmental qualification for a given BFN component or equipment type and includes requirements for maintaining qualification of that component or equipment type for the life of the plant. The list of BFN components that are within the scope of 10 CFR 50.49 is maintained as part of the BFN component database (i.e., Master Equipment List).

2.1.2.4 Design Criteria Documents

System Design Criteria Documents (DCDs) are available for selected BFN systems. DCDs provide detailed descriptions of the associated system design basis, including system functions and design requirements. The system DCDs were reviewed, when available, during the system scoping review.

2.1.2.5 Engineering Drawings

Engineering drawings at BFN provide system, structure, and component configuration details and safety classification information. These drawings were utilized to determine SSC functional requirements and materials of construction in support of scoping and screening evaluations.

2.1.2.6 Controlled Plant Component Database

BFN maintains a controlled plant component database (i.e., Master Equipment List) containing integrated design and maintenance information. The Master Equipment List is maintained within the Maximo enterprise asset management software. The plant component database lists plant components at the level of detail for which discrete maintenance or modification activities are typically performed. The database provides a comprehensive listing of plant components and their quality classifications. Unique equipment component tag numbers identify each component in the database.

2.1.2.7 NFPA 805 Fire Protection Report

The scope of the BFN Fire Protection Program is based on 10 CFR 50.48(a) and National Fire Protection Association (NFPA) 805 as referenced in 10 CFR 50.48(c). The NFPA 805 Fire Protection Report describes the fire protection configuration for the confinement, detection, and suppression of fires, and demonstrates the capability to achieve and maintain safe and stable conditions in the event of a fire, in support of the Fire Protection Program functions.

2.1.2.8 Other CLB References

- <u>NRC Safety Evaluation Reports and Safety Evaluations</u> include NRC staff review of BFN licensing submittals. Some of these documents may identify licensee commitments.
- <u>Technical Specifications</u> provide safety limits, limiting conditions for operation, and surveillance requirements applicable to SSCs whose functions are critical to safety.

- Technical Specifications Bases provide the SSC functional characteristics that underlie the Technical Specification limits and requirements.
- Licensing correspondence includes relief requests, Licensee Event Reports, and responses to NRC communications such as NRC bulletins, generic letters, or enforcement actions. Some of these documents may contain licensee commitments.
- Engineering evaluations and calculations can provide additional information about the requirements or characteristics associated with the evaluated systems, structures, or components.

2.1.3 Technical Basis Documents

Technical basis documents (Task Reports) are prepared in support of the BFN SLR project. These Task Reports contain technical evaluations and bases for decisions or positions associated with SLR requirements as described below. Task Reports are prepared, reviewed, and approved in accordance with controlled project procedures, and are based on the CLB source documents described in Section 2.1.2.

2.1.3.1 Subsequent License Renewal Systems and Structures List

One of the first steps necessary to begin the SLR scoping process is to identify a comprehensive list of plant systems and structures to be evaluated for SLR scoping. A Task Report was prepared to establish this list and to document the basis for the list. While the Maximo equipment database list of BFN systems and structures is the primary source for identifying plant systems and structures appropriate for SLR consideration, other sources of information were reviewed to ensure that all plant systems and structures were identified. The other resources were evaluated for additional information and insight to ensure the list of plant systems and structures is complete: the initial BFN License Renewal Application (LRA); site drawings; the structures' DCD; the BFN FSAR; the Master Equipment List and other plant design/licensing basis documents.

Once the plant systems and structures are identified, each of them is evaluated to determine how to organize them for SLR consideration. In general, plant systems align with SLR systems at BFN. For scoping, BFN does not "realign" system components. However, for screening and aging management reviews, when a plant system contains components which support the basic function of a different plant system, those components have been administratively realigned to that other system for subsequent license renewal purposes. In addition, in some cases in scope components of a system are evaluated separately in commodity groups. For example, electrical, instrumentation and control isolation components in nonsafety-related systems separating the nonsafety-related system from a safety-related system, are included in scope as electrical commodities, evaluated by the spaces approach. This approach is consistent with the NRC guidance in NUREG-2192, Section 2.2.3.1 (Reference 1.7.5).

Commodity groups are also established, during the screening process, to facilitate a focused aging management review process. These commodity groups include electrical and instrumentation enclosures, component supports, penetrations and sleeves, and other general categories which are common to many systems and structures. This allows for evaluation in one location rather than in each system or structure in which they are applicable.

Once the systems and structures are identified, BFN systems and structures were grouped into the following categories:

- Reactor Vessel, Internals, and Reactor Coolant System

- Engineered Safety Features and Reactor Core Isolation Cooling System
- Auxiliary Systems
- Steam and Power Conversion System
- Containments, Structures and Component Supports
- Electrical and I&C Systems

This grouping of the BFN systems and structures is based on BFN FSAR and the guidance of NUREG-2191, “Generic Aging Lessons Learned for Subsequent License Renewal (GALL-SLR) Report” (Reference 1.7.6). The complete list of systems and structures evaluated for SLR is provided in Table 2.2-1.

Certain structures and equipment were excluded at the outset because they are not considered to be systems, structures, or components that are part of the CLB and do not have design or functional requirements related to the 10 CFR 54.4(a)(1), (a)(2), or (a)(3) scoping criteria. These include: driveways and parking lots, temporary equipment, health physics equipment, portable measuring and testing equipment, tools, and motor vehicles.

Those systems for which no functions are identified as satisfying any of the three scoping criteria are classified as systems outside the scope of license renewal, and no further evaluation is performed.

2.1.3.2 Identification of Safety-Related Systems and Structures

Safety-related systems and structures are included within the scope of SLR in accordance with 10 CFR 54.4(a)(1) scoping criterion. BFN plant systems and structures that have been designed to safety-related standards are identified in the FSAR. BFN plant components that have been classified as safety-related are identified as “SR” in the controlled safety classification data field in the controlled plant component database. BFN safety classification procedures are reviewed against the SLR “Safety-related” scoping criterion in 10 CFR 54.4(a)(1), to confirm that BFN safety-related classifications are consistent with SLR requirements. This review is included in a Task Report. The Task Report also provides summary lists of the systems and structures that are safety-related at BFN.

The TVA Nuclear Quality Assurance Plan definition of safety-related is as follows:

Safety-related structures, systems, and components - Those items that are necessary to ensure:

- The integrity of the reactor coolant pressure boundary.
- The capability to shut down the reactor and maintain it in a safe shutdown condition.
- The capability to prevent, or mitigate the consequences of an accident which could result in potential offsite exposures comparable to the applicable guideline exposures of 10 CFR 50.34(a)(1) or 10 CFR 100.11, as applicable.

This definition of safety-related SSCs is similar to the 10 CFR 54.4(a)(1) definition of safety-related SSCs, with the following exceptions:

Design Basis Events

The License Renewal Rule 10 CFR 54.4(a)(1) specifically refers to design basis events as defined in 10 CFR 50.49(b)(1), while the BFN definition of safety-related is applied to accidents in general terms. For the purposes of identifying SSCs within the scope of SLR, design basis events were identified using the FSAR and the Safe Shutdown Analysis Calculation, and include external hazards such as fire, earthquakes, flooding, wind and missiles, and high-energy line breaks. As such, applicable BFN Design Basis Events (DBEs), as defined in 10 CFR 50.49(b)(1), have been used for SLR scoping.

Exposure Limits

The guidelines specified in the License Renewal Rule refer to three different Code sections to address similar accident analyses performed by licensees for different reasons:
10 CFR 50.34(a)(1), 10 CFR 50.67(b)(2), and 10 CFR 100.11.

The guidelines in 10 CFR 50.34(a)(1) are applicable to facilities seeking a construction permit and are therefore not applicable to BFN.

With respect to 10 CFR 50.67(b)(2) and 10 CFR 100.11, the following discussion is provided. The FSAR Chapter 14 accident analyses were originally performed to address 10 CFR 100 guidelines. Radiological consequence analyses of the design basis accidents were performed to support a full-scope implementation of Alternative Source Term (AST) methodology in accordance with the guidance in Regulatory Guide 1.183. AST radiological consequence analyses were performed for the four BFN design basis accidents that result in offsite exposures. These four accidents are the Loss of Coolant Accident, Main Steam Line Break, Refueling Accident, and Control Rod Drop Accident. The dose consequences for these accidents result in doses that are within the guidelines of 10 CFR 50.67. On September 27, 2004, the NRC approved the BFN license amendment request regarding AST per 10 CFR 50.67(b)(2) for offsite dose exposure as the current licensing basis for BFN (ADAMS Accession No. ML042730028). As such, the AST analytical methods described in Regulatory Guide 1.183 and dose limits defined in 10 CFR 50.67 comprise the licensing basis for BFN design basis accidents. Since the definition of safety-related components as applied to the scoping of components for SLR can be either 10 CFR 50.67(b)(2) or 10 CFR 100.11, as applicable, and the AST submittal did not add new components within the SLR scope, it does not impact the definition of safety-related.

2.1.3.3 10 CFR 54.4(a)(2) Scoping Criteria

All nonsafety-related SSCs whose failure could prevent satisfactory accomplishment of any of the functions identified in 10 CFR 54.4(a)(1), are included within the scope of SLR in accordance with 10 CFR 54.4(a)(2) requirements. To assure complete and consistent application of this scoping criterion, a Task Report was prepared.

This SLR scoping criteria requires consideration of the following:

1. Functional support - A nonsafety-related SSC that is functionally relied upon in the CLB to (a) directly support a safety-related SSC in performing its 10 CFR 54.4(a)(1) function or (b) directly mitigate the consequences of a DBE.
2. Spatial interaction - The effect(s) of nonsafety-related SSC failure on a safety-related component, such as pipe whip, jet impingement, general flooding, spray, and displacement/ falling.
3. Structural interaction - Occurs in situations where a nonsafety-related piping system physically connects to a safety-related system and the nonsafety-related system is relied upon to provide

physical support to the safety-related system up to and including the first anchor (or alternate anchor) beyond the safety-related/nonsafety-related interface.

The first item is addressed during the scoping process, by identifying the nonsafety-related systems and structures required to functionally support the accomplishment of a safety-related intended function under 10 CFR 54.4(a)(1), and then including these supporting systems and structures in scope of SLR under 10 CFR 54.4(a)(2).

The remaining two items concern nonsafety-related systems with potential physical or spatial interaction with safety-related SSCs. Scoping of these systems is the subject of NEI 95-10, Appendix F (Reference 1.7.2), as referred to in NEI 17-01 (Reference 1.7.3). To assure complete and consistent application of 10 CFR 54.4(a)(2) requirements and NEI 95-10, a Task Report was prepared. The Task Report includes a review of the CLB references relevant to physical and spatial interactions.

The Task Report describes the BFN approach to scoping of nonsafety-related systems with a potential for physical or spatial interaction with safety-related SSCs. The Task Report provides appropriate documentation to demonstrate that SLR scoping for 10 CFR 54.4(a)(2) meets the requirements of the license renewal rule and NEI 95-10. Additional detail on the application of the 10 CFR 54.4(a)(2) scoping criterion is provided in Section 2.1.5.2.

2.1.3.4 Scoping for Regulated Events

In accordance with 10 CFR 54.4(a)(3), SLR Task Reports address SLR scoping of SSCs relied on in safety analyses or plant evaluations to perform a function that demonstrates compliance with the NRC regulations for Fire Protection, Environmental Qualification, Anticipated Transient Without Scram, and Station Blackout. The NRC regulations for pressurized thermal shock are not applicable to the BFN Boiling Water Reactor (BWR) design. These Task Reports are summarized below:

<u>Fire Protection</u>

The BFN Fire Protection Program is based upon the defense in depth concept. Defense in depth is achieved by fire prevention, fire detection and mitigation, and maintaining the capability to place the nuclear fuel in a safe and stable condition should a fire occur. Systems and structures in the scope of SLR for fire protection include those required for compliance with 10 CFR 50.48(c). Equipment relied on for fire protection includes SSCs credited for fire prevention, detection, and mitigation in areas containing equipment important to safe operation of the plant and equipment necessary to place and maintain the nuclear fuel in a safe and stable condition. The Fire Protection Program is described in the FSAR Section 10.11 and the BFN NFPA 805 Fire Protection Report.

The fire protection Scoping Task Report summarizes results of a detailed review of the BFN Fire Protection Program documents that demonstrate compliance with the requirements of 10 CFR 50.48 (Reference 1.7.7). The Task Report provides a list of systems and structures credited in the BFN Fire Protection Program documents. For the listed systems and structures, the Task Report also identifies appropriate CLB references. The identified systems and structures are included within the scope of subsequent license renewal in accordance with 10 CFR 54.4(a)(3) scoping criteria.

The fire detection and suppression systems at BFN are plant-wide systems that protect a wide variety of plant equipment. Not all portions of these systems are required to demonstrate compliance with 10 CFR 50.48. Some portions of the fire detection and suppression systems protect plant areas in which a fire would not impact any equipment important to safety or significantly increase the risk of radioactive releases to the environment. Portions of the fire suppression and detection systems that are not included within the scope of subsequent license renewal are identified on the Fire Protection System subsequent license renewal boundary drawings in black.

Environmental Qualification

Criterion 10 CFR 54.4(a)(3) requires that all SSCs relied on in safety analyses or plant evaluations to perform a function that demonstrates compliance with the NRC regulations for Environmental Qualification (EQ) (10 CFR 50.49) be included within the scope of SLR (Reference 1.7.8).

The BFN EQ program includes 1) safety-related electrical equipment, 2) nonsafety-related electrical equipment whose failure under postulated environmental conditions could prevent satisfactory accomplishment of safety functions, and 3) certain post-accident monitoring equipment as defined in 10 CFR 50.49(b)(1), 10 CFR 50.49(b)(2), and 10 CFR 50.49(b)(3). This equipment is included within the scope of SLR.

All systems were compared to the list of systems that contain environmentally qualified equipment as stated in the Master Equipment List of the Maximo equipment database. All structures were compared to the structures that contain harsh environments as defined by the BFN Harsh Environmental Data Drawing Series. The EQ Scoping Task Report summarizes the results of this review. The Task Report provides a list of systems that include EQ components. The Task Report also provides a list of structures that provide the physical boundaries for the postulated harsh environments, and contain environmentally qualified electrical equipment.

These systems and structures are included within the scope of SLR in accordance with 10 CFR 54.4(a)(3) scoping criteria.

Anticipated Transient Without Scram

Criterion 10 CFR 54.4(a)(3) requires that all SSCs relied on in safety analyses or plant evaluations to perform a function that demonstrates compliance with the NRC regulations for anticipated transient without scram (10 CFR 50.62) be included within the scope of SLR (Reference 1.7.9).

An Anticipated Transient Without Scram (ATWS) is an anticipated operational occurrence that generates an automatic scram signal, accompanied by a failure of the reactor protection system to automatically shutdown the reactor. The ATWS rule (10 CFR 50.62) requires improvements in the design and operation of light-water cooled water reactors to reduce the likelihood of failure to automatically shutdown the reactor, and to mitigate the consequences of an ATWS event. BFN Units 1, 2 and 3 are BWRs.

For BWRs, the following requirements apply:

- Each BWR must have an alternate rod injection (ARI) system with redundant scram air header exhaust valves. The ARI system must be independent of the existing reactor trip system.
- Each BWR must have a standby liquid control system with defined boron injection capabilities. Standby liquid control system automatic initiation is not required for plants issued a construction permit before July 26, 1984, unless already installed. The BFN standby liquid control system is manually initiated.
- Each BWR must have equipment to trip the recirculation pumps automatically under conditions indicative of an ATWS.

The ATWS Scoping Task Report summarizes the results of a review of the BFN CLB with respect to ATWS. The BFN design features to meet the requirements of 10 CFR 50.62 for ATWS mitigation include:

- ARI system features to satisfy the requirements of 10 CFR 50.62(c)(3). The ARI system is included in the Control Rod Drive system for SLR.
- Standby Liquid Control system to meet the requirements of 10 CFR 50.62(c)(4).
- ATWS Recirculation Pump Trip (RPT) system to satisfy the requirements of 10 CFR 50.62(c)(5). The ATWS-RPT function is included in the Reactor Recirculation system for SLR.

The Task Report provides a list of the systems required by 10 CFR 50.62 to reduce the risk from ATWS events. The Task Report also provides a list of structures that provide physical support and protection for the ATWS systems. These systems and structures are included within the scope of SLR in accordance with 10 CFR 54.4(a)(3) scoping criteria.

Station Blackout

Criterion 10 CFR 54.4(a)(3) requires that all SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the NRC regulations for station blackout (10 CFR 50.63) be included within the scope of SLR (Reference 1.7.10).

The Station Blackout (SBO) rule requires each plant to cope with the loss of off-site power concurrent with the failure of Emergency Diesel Generators (EDGs) in excess of those required for normal redundancy. For the SBO duration, the plant must be capable of maintaining core cooling and appropriate containment integrity. SBO coping duration for BFN is four hours. SBO is postulated as the failure of the two 4.16 kV EDGs that normally feed a respective unit's 480-Volt (V) Alternating Current (AC) shutdown boards concurrent with the loss of all offsite power. BFN capabilities, commitments, and analyses that demonstrate compliance with 10 CFR 50.63 are documented in FSAR Chapter 8 and in the NRC safety evaluation and correspondence related to the SBO rule.

The BFN SBO coping strategy is to shutdown the blacked-out unit with equipment powered from the 250-V Direct Current (DC) battery system. Alternate AC power from Emergency Diesel Generators (EDGs) in the non-blacked-out units, will be made available to power additional required heating, ventilation, and air conditioning (HVAC) and common loads. As set forth in Appendix B of Nuclear Utility Management and Resources Council (NUMARC) 87-00, “Guidelines and Technical Bases for NUMARC Initiatives Addressing Station Blackout at Light Water Reactors,” dated August 1991, the Alternate AC will be available within one hour through existing cross-ties. The 250-V unit batteries 1, 2, and 3 are adequate to supply the required BFN Unit 1, Unit 2, and Unit 3 loads for the coping duration of four hours. SBO on Unit 1 is the loss of EDGs A and C and loss of EDGs B and D for SBO on Unit 2. SBO on Unit 3 is the loss of EDGs 3A and 3C. Considering the failure of one EDG in each of non-blacked out units (A or C for Unit 1, B or D for Unit 2, and 3A or 3C for Unit 3), and additional failure of EDG 3B or 3D, a minimum of three diesel generators remain available for SBO. These provide sufficient power to supply required HVAC and common loads.

The NUREG-2192 (Reference 1.7.5) guidance on scoping of equipment relied on to meet the requirements of the SBO rule (10 CFR 50.63) for SLR has been incorporated into the BFN scoping methodology. In accordance with the NUREG-2192, the SSCs required to cope with and recover from the SBO event are included within the scope of SLR.

Coping is defined as the period of time when the station’s offsite sources and on-site ac sources (i.e., EDGs) are unavailable. Coping assessments are performed for condensate inventory, Class 1E battery capacity, compressed air, loss of ventilation, and containment isolation. As stated above, BFN is a four-hour coping duration plant, and the coping analysis credits an Alternate AC source. Consistent with the first license renewal application and aligned with the SLR scoping methodology, the SBO Alternate AC source is included in the scope of SLR. The SLR boundary for the SBO Alternate AC source was established based on BFN current licensing basis.

Figures 2-1, 2-2, and 2-3 show the Alternate AC source components and the connection to BFN safety-related buses.

Recovery is defined as the repowering of the plant AC distribution system from offsite sources or onsite emergency AC sources. In alignment with the SLR scoping methodology, for BFN SBO, the boundary between the offsite transmission system and the plant electrical distribution system has been defined for each of the incoming offsite sources.

The off-site and on-site AC Electrical Power Distribution System consist of the off-site AC power sources (preferred normal and alternate power sources), and the Class 1E onsite standby AC power sources (emergency diesel generators). The Class 1E AC distribution system is divided into redundant divisions, so loss of any one division does not prevent the minimum safety functions from being performed. Each of four 4kV shutdown boards has two off-site power supplies available and a single emergency diesel generator. An off-site circuit consists of breakers, transformers, switches, interrupting devices, bus, cabling, protective relaying, and controls required to transmit power from the off-site transmission network to the 4 kV shutdown boards. Off-site power is supplied to the 161 kV and 500 kV switchyards from the transmission network by seven transmission lines (two 161 kV lines and five 500 kV lines).

The following nonsafety-related electrical systems and structures are in the scope of 10 CFR 54 because they contain components that meet the criteria of 10 CFR 54.4(a)(3) for SBO offsite power restoration:

- System 57 - Electrical Distribution System (including 500 kV/161 kV Offsite Power System, 4 kV and 480 VAC Distribution Systems)
- System 202 - 4 kV Unit Boards
- System 204 - 4 kV Unit Start Board and Bus
- System 210 - 4 kV Bus Tie Board
- System 211 - 4 kV Shutdown Boards and Buses

- System 236 - Main Transformers
- System 243 - Unit Station Service Transformer
- System 245 - Common Station Service Transformer
- System 248 - 250 VDC Power System
- System 282 - 250 VDC Distribution Boards
- Transformer Yard
- 161 kV Switchyard
- 500 kV Switchyard

The portions of the nonsafety-related plant AC electrical systems required for SBO extend:

- From the first active component in the 500 kV switchyard, through main transformer 1 and unit station service transformer 1A or 1B to a 4kV unit board. That unit board feeds 4kV shutdown bus 1 or 2, which then feeds the Unit 1 and 2 4kV shutdown boards and 4kV bus tie board, which feeds Unit 3 4kV shutdown boards.
- From the first active component in the 500 kV switchyard, through main transformer 2 and unit station service transformer 2A or 2B to a 4kV unit board. That unit board feeds 4kV shutdown bus 1 or 2, which then feeds the Unit 1 and 2 4kV shutdown boards and 4kV bus tie board, which feeds Unit 3 4kV shutdown boards.
- From the first active component in the Trinity or Athens 161 kV transmission system, through common station service transformer A or B to start bus 1A or 1B via the 4kV unit start board, then to a 4kV unit board. That unit board feeds 4kV shutdown bus 1 or 2, which then feeds the Unit 1 and 2 4kV shutdown boards and also feeds the Unit 3 4kV shutdown boards via the 4kV bus tie board.
- From the first active component in the 500 kV switchyard, through main transformer 3 and unit station service transformer 3A or 3B to 4kV unit board(s) 3A, 3B, and/or 3C. Each unit board feeds two of the Unit 3 4kV shutdown boards.

This boundary is consistent with NRC standard review plan for SLR, NUREG-2192, Section 2.5.2.1.1 (Reference 1.7.5) for the boundary for the SBO recovery path. The NUREG states that the in scope plant system portion of the offsite power system that is used to connect the offsite power source is the equipment out to the first circuit breaker with the offsite distribution system. This typically includes equipment in the switchyard with the boundary point being a component that operates at transmission system distribution voltage. Control circuits and structures associated with in scope switchyard components are included in the scope for SLR. See Figures 2-1, 2-2, and 2-3 for the BFN SBO recovery path boundary.

The SBO Scoping Task Report summarizes the results of a review of the BFN CLB with respect to SBO. The Task Report provides lists of systems and structures credited in BFN SBO evaluations. For the listed systems and structures, the Task Report also identifies appropriate CLB references. These systems and structures are included within the scope of SLR in accordance with 10 CFR 54.4(a)(3) scoping criteria.

2.1.4 Interim Staff Guidance Discussion

As discussed in NEI 17-01 (Reference 1.7.3), the NRC has encouraged applicants for SLR to address SLR Interim Staff Guidance documents (ISG) in the SLR Applications (SLRAs). Since the issuance of NUREG-2191 (Reference 1.7.6) and NUREG-2192 (Reference 1.7.5), there have been four newly issued SLR-ISGs that are currently active on the NRC website. These SLR-ISGs are as follows:

- SLR-ISG-2021-01-PWRVI, Updated Aging Management Criteria for Reactor Vessel Internal Components for Pressurized-Water Reactors, dated January 2021 (Not applicable to BWRs)
- SLR-ISG-2021-02-MECHANICAL, Updated Aging Management Criteria for Mechanical Portions of Subsequent License Renewal Guidance, Interim Staff Guidance, dated February 2021
- SLR-ISG-2021-03-STRUCTURES, Updated Aging Management Criteria for Structures Portions of Subsequent License Renewal Guidance, Interim Staff Guidance, dated February 2021
- SLR-ISG-2021-04-ELECTRICAL, Updated Aging Management Criteria for Electrical Portions of Subsequent License Renewal Guidance, Interim Staff Guidance, dated February 2021

<u>NRC Position</u>

During the reviews of the first three SLRAs that were based on NUREG-2191 and NUREG 2192, the NRC and applicants identified improvements to the guidance that would assist in preparing and reviewing future SLRAs more effectively and efficiently. The three SLR-ISGs applicable to BWRs provide interim updates to NUREG-2191 and NUREG-2192 to implement these improvements. These ISGs are not intended for standalone use. They provide revisions to NUREG-2191 and NUREG-2192 sections and tables that supersede the content in the NUREGs and are intended to be used within the context of the NUREGs. The revisions captured in these ISGs include:

- Updates to recommended Aging Management Programs (AMPs)
- Changes to AMR items in NUREG-2191 tables and corresponding summary tables in NUREG-2192
- New AMR items in NUREG-2191 tables and corresponding summary tables in NUREG-2192
- Changes to "further evaluation" guidance sections in NUREG-2192
- Updates to references listed in affected NUREG-2191 sections
- Editorial corrections to relevant sections

<u>BFN Position</u>

The BFN SLRA is developed considering the updates to NUREG-2191 and NUREG 2192, provided by the three applicable SLR-ISGs.

2.1.5 Scoping Procedure

The scoping process is the systematic approach used to identify the BFN SSCs within the scope of SLR. The scoping process is initially performed at the system and structure level, in accordance with the scoping criteria identified in 10 CFR 54.4(a). System and structure functions and intended functions are identified from a review of the source CLB documents and the first LRA. In scope boundaries are established and documented in the subsequent license renewal boundary drawings, based on the identified intended functions. The in scope boundaries form the basis for identification of the in scope components, which is the first step in the screening process described in Section 2.1.6. The system and structure scoping results are provided in Section 2.2.

The BFN scoping process begins with the development of a comprehensive list of plant systems and structures, as described in Section 2.1.3.1. The systems and structures are grouped into one of the following categories:

- Reactor Vessel, Internals, and Reactor Coolant System
- Engineered Safety Features and Reactor Core Isolation Cooling System
- Auxiliary Systems
- Steam and Power Conversion System
- Containments, Structures and Component Supports
- Electrical and I&C Systems

Each system and structure is then scoped for SLR using the criteria of 10 CFR 54.4(a). These criteria are briefly identified as follows:

- Title 10 CFR 54.4(a)(1) - Safety-Related
- Title 10 CFR 54.4(a)(2) - Nonsafety-Related affecting safety-related
- Title 10 CFR 54.4(a)(3) - Regulated Events:
  - Fire Protection (10 CFR 50.48)
  - Environmental Qualification, EQ (10 CFR 50.49)
  - Pressurized Thermal Shock (10 CFR 50.61) (PWRs only)
  - Anticipated Transient Without Scram, ATWS (10 CFR 50.62)
  - Station Blackout, SBO (10 CFR 50.63)

The application of each of these criteria is discussed in Section 2.1.5.1, Section 2.1.5.2, and Section 2.1.5.3 below and the results of application of each of these criteria are provided in Table 2.2-1, Plant Level Scoping Results.

2.1.5.1 Safety-Related – 10 CFR 54.4(a)(1)

In accordance with 10 CFR 54.4(a)(1), the systems, structures, and components within the scope of SLR include:

Safety-related systems, structures, and components which are those relied upon to remain functional during and following design-basis events (as defined in 10 CFR 50.49(b)(1)) to ensure the following functions -

- The integrity of the reactor coolant pressure boundary;
- The capability to shutdown the reactor and maintain it in a safe shutdown condition; or
- The capability to prevent or mitigate the consequences of accidents which could result in potential offsite exposures comparable to those referred to in 10 CFR 50.34(a)(1), 10 CFR 50.67(b)(2), or 10 CFR 100.11, as applicable.

At BFN, the safety-related plant components are identified in controlled engineering drawings, calculations, and in the Maximo equipment database. The safety-related classifications in the BFN Maximo equipment database were populated using a controlled procedure with classification criteria consistent with the above 10 CFR 54.4(a)(1) criteria.

Safety-related classifications for systems and structures are based on system and structure descriptions and analyses in the FSAR, or on design basis documents such as engineering drawings, design specifications, evaluations, or calculations. Systems and structures that are identified as safety-related in the FSAR or in design basis documents are classified as satisfying the criteria of 10 CFR 54.4(a)(1) and are included within the scope of SLR. Safety-related components listed in the Maximo equipment database are reviewed and the system or structure associated with the safety-related component is included within the scope of SLR in accordance with 10 CFR 54.4(a)(1) criteria. The review also confirms that Abnormal Operating Transients (AOTs), Design Basis Accidents (DBAs), External Hazards, Internal Events, and Special Events as described in the CLB, are considered for SLR.

2.1.5.2 Nonsafety-Related Affecting Safety-Related – 10 CFR 54.4(a)(2)

In accordance with 10 CFR 54.4(a)(2), the SSCs within the scope of SLR include:

- All nonsafety-related SSCs whose failure could prevent satisfactory accomplishment of any of the functions identified in 10 CFR 54.4(a)(1)(i), (ii), or (iii).

This scoping criterion requires an assessment of nonsafety-related SSCs with respect to the following application or configuration categories:

- Functional support for safety-related SSC 10 CFR 54.4(a)(1) functions
- Connected to and provide structural support for safety-related SSCs
- Potential for spatial interactions with safety-related SSCs

These three categories are discussed below:

<u>Functional Support for Safety-Related SSC 10 CFR 54.4(a)(1) Functions</u>

This category addresses nonsafety-related SSCs that are required to function in support of a safety-related SSC intended function. The functional requirement distinguishes this category from the other categories, where the nonsafety-related SSCs are required only to maintain adequate integrity to preclude structural failure or spatial interactions. The nonsafety-related SSCs that are included within the scope of SLR to functionally support a safety-related SSC in performing a 10 CFR 54.4(a)(1) intended function are identified on the subsequent license renewal boundary drawings in red.

The FSAR and other CLB documents are reviewed to identify nonsafety-related systems required to support satisfactory accomplishment of a safety-related function. Nonsafety-related systems credited in CLB documents to support a safety-related function are included within the scope of SLR. BFN classifies systems that are required to perform or support a safety-related function as safety-related, with the following exceptions:

- Main Steam Alternate Leak Path; Secondary Containment; Standby Liquid Control (Post-Loss of Coolant Accident (LOCA) suppression pool pH control); and Carbon Dioxide (CO_2) Fire Protection (Prevent spurious actuation)

These nonsafety-related systems, or nonsafety-related portions of safety-related systems, are included within the scope of SLR in accordance with 10 CFR 54.4(a)(2) and are identified on the subsequent license renewal boundary drawings in red.

As an additional confirmation of scoping to meet 10 CFR 54.4(a)(2) criteria, a supporting system review is completed as part of the scoping process. The scoping process is performed on a system basis. For systems included within the scope of SLR in accordance with the requirements of 10 CFR 54.4(a)(1), the scoping evaluation included the identification of any additional systems, including nonsafety-related systems, that are required to support the safety-related system intended functions. Except as identified above, the BFN systems required to support 10 CFR 54.4(a)(1) functions are classified safety-related, and as such included within the scope of SLR in accordance with 10 CFR 54.4(a)(1). The identification of supporting systems is not required for structures since structural intended functions do not rely on supporting systems.

The next two 10 CFR 54.4(a)(2) scoping categories are the subject of NEI 95-10, Appendix F (Reference 1.7.2), as referred to in NEI 17-01 (Reference 1.7.3). The guidance requires that, when demonstrating that failures of nonsafety-related systems would not adversely impact the ability to maintain intended functions, a distinction must be made between nonsafety-related systems that are directly connected to safety-related systems and provide support for safety-related SSCs, and those that are not directly connected to safety-related systems and have the potential for spatial interactions with safety-related SSCs. The methodology as described below for the identification of BFN SSCs that satisfy the 10 CFR 54.4(a)(2) scoping criterion is based on a review of applicable CLB documents, as well as plant-specific and industry operating experience.

<u>Connected to and Provide Structural Support for Safety-Related SSCs</u>

For nonsafety-related SSCs directly connected to safety-related SSCs the nonsafety-related piping and supports, up to and including the first seismic or equivalent anchor (as described in (a) through (g) below) beyond the safety-related/nonsafety-related interface, are within the scope of SLR per 10 CFR 54.4(a)(2). The “first seismic or equivalent anchor” is defined such that the failure in the nonsafety-related pipe run beyond the first seismic or equivalent anchor will not render the safety-related portion of the piping unable to perform its intended function under CLB design conditions.

An alternative to specifically identifying a seismic anchor or equivalent anchor that supports the safety-related/nonsafety-related piping interface is to include enough of the nonsafety-related piping run to ensure these anchors are included and thereby ensure the piping and anchor intended functions are maintained. The intended function consists of two facets 1) providing structural support for the safety-related/nonsafety-related interface and 2) ensuring nonsafety-related piping loads are not transferred through the safety-related/nonsafety-related interface. In accordance with NEI 95-10, Appendix F, as referred to in NEI 17-01, the following methods a. through g. were considered to define end points for the portion of nonsafety-related piping attached to safety-related piping to be included in the scope of SLR. In these cases the nonsafety-related piping was included in scope for 10 CFR 54.4(a)(2) up to one of the following:

a. A combination of restraints or supports that encompasses at least two (2) supports in each of three (3) orthogonal directions.
b. A base-mounted component (e.g., pump, heat exchanger, tank, etc.) that is a rugged component and is designed not to impose loads on connecting piping. The SLR scope

includes the base-mounted component as it has a support function for the safety-related piping.

c. A flexible connection that is considered a pipe stress analysis model end point when the flexible connection effectively decouples the piping system (i.e. does not support loads or transfer loads across it to connecting piping).
d. A free end of nonsafety-related piping, such as a drain pipe that ends at an open floor drain.
e. For nonsafety-related piping runs that are connected at both ends to safety-related piping, the entire run of nonsafety-related piping is included in scope.
f. A point where buried piping exits the ground. The buried portion of the piping would be included in the scope of SLR, unless a determination that the buried piping is well founded on compacted soil that is not susceptible to liquefaction is documented.
g. A smaller branch line where the moment of inertia ratio of the larger piping to the smaller piping is equal to or greater than the acceptable ratio defined by the CLB, because significantly smaller piping does not impose significant loads on larger piping and has a negligible role in supporting larger piping. The moment of inertia ratio used is 25 to 1.

These scoping boundaries were determined from review of the physical installation details, design drawings, or seismic analysis calculations.

Failure in the nonsafety-related piping beyond the above anchor locations would not impact structural support for the safety-related piping. The associated piping and components included within the scope of SLR are identified on the subsequent license renewal boundary drawings in blue.

Potential for Spatial Interactions with Safety-Related SSCs

Nonsafety-related systems that are not connected to safety-related piping or components, or are outside the structural support boundary for the attached safety-related piping system, and have a spatial relationship such that their failure could adversely impact the performance of a safety-related SSC intended function, must be evaluated for SLR scope in accordance with 10 CFR 54.4(a)(2) requirements. The structures of concern for potential spatial interaction were identified based on a review of the CLB to determine which structures contained active or passive safety-related SSCs. Plant walkdowns are performed, as required, to confirm that all structures containing safety-related SSCs are identified.

As described in NEI 95-10, Appendix F, as referred to in NEI 17-01, there are two options when performing this scoping evaluation: a mitigative option and a preventive option.

Mitigative Option: The mitigative option involves crediting plant mitigative features to protect safety-related SSCs from failures of nonsafety-related SSCs. Plant mitigative features considered include pipe whip restraints, jet impingement shields, spray and drip shields, seismic supports, flood barriers, and physical barriers (e.g., floors, walls, doors, conduit). This option requires a demonstration that the mitigating features are adequate to protect safety-related SSCs from failures of nonsafety-related SSCs regardless of failure location. If this level of protection can be demonstrated, then only the mitigative features need be included within the scope of SLR. The mitigative option is used for scoping systems located in the Turbine Building, Intake Pumping Station, and Ventilation Vaults. The mitigative features are included in the scope of SLR.

Preventive Option: The preventive option involves identifying the nonsafety-related SSCs that have a spatial relationship such that failure could adversely impact the performance of a safety-related SSC intended function; the spatial relationship between safety-related and nonsafety-related SSCs within the scope of SLR will be identified without consideration of plant mitigative features. The preventive option is used for scoping systems located in the Reactor Building, Primary Containment Structures, Diesel Generator Building, Intake Pumping Station, Reinforced Concrete Chimney, Standby Gas Treatment Building, Vacuum Pipe Building, Turbine Building, Ventilation Vaults, Residual Heat Removal Service Water Tunnel, Electrical Cable Tunnel, Underground Concrete Encased Structure, and Radwaste Building.

Nonsafety-related piping and components that contain water, oil, or steam, and are located inside structures that contain safety-related SSCs, are included in scope for potential spatial interaction under criterion 10 CFR 54.4(a)(2), unless they are located in an area where there is no concern with spatial interaction due to crediting plant mitigative features. High-energy lines (normal operating service conditions above 200 degrees F and above 275 psig) with potential spatial interaction are included in the scope of SLR under 10 CFR 54.4(a)(1) or (a)(2) depending on their safety classification. Safety-related high-energy lines are in scope under 10 CFR 54.4(a)(1), and nonsafety-related high-energy lines are in scope under 10 CFR 54.4(a)(2). Potential spatial interaction due to leakage or spray is assumed for moderate/low-energy liquid systems (normal operating service conditions less than or equal to 200 degrees F or less than or equal to 275 psig) for system pressure as low as atmospheric.

SSCs containing air or gas cannot adversely affect safety-related SSCs due to leakage or spray, since gas systems contain no liquids that could spray or leak onto safety-related systems to cause shorts or other malfunctions. BFN operating experience was reviewed and confirmed that there have been no failures due to aging in systems containing air or gas that have adversely impacted the accomplishment of a safety function. As described in NEI 95-10, Appendix F, paragraph 5.2.2.2.2 for moderate/low energy liquid systems, physical impact from pipe whip or jet impingement do not occur and need not be considered. This same conclusion can be applied to systems containing air or gas. Thus, the nonsafety-related systems containing air or gas need not be included in the scope of SLR for spatial interaction.

The piping systems included in the scope of SLR under 10 CFR 54.4(a)(2) for potential spatial interaction with safety-related SSCs are identified on the subsequent license renewal boundary drawings in blue.

Scoping of Abandoned Equipment

Abandoned equipment is not included within the scope of SLR if it has been confirmed to be isolated (cut/capped), vented, and drained. If this confirmation cannot be made, the system or portions thereof, are included within the scope of SLR for aging management if there is the potential for 10 CFR 54.4(a)(2) spatial or structural interaction. Abandoned equipment is not relied on to perform any function delineated in 10 CFR 54.4(a)(1) or (a)(3) as it is nonoperational. However, failure of abandoned equipment could potentially impact the performance of the safety-related function of surrounding equipment if the abandoned equipment contains water, steam, or oil. If the abandoned equipment excluded from scope has been vented, fluids drained, and isolated (cut/capped), this equipment does not perform a 10 CFR 54.4(a)(2) intended function for SLR. In addition, disconnection of wiring for power, control, or parameter indication and air supplies is not necessary to assure that the abandoned equipment has no potential spatial interaction with surrounding equipment.

2.1.5.3 Regulated Events – 10 CFR 54.4(a)(3)

In accordance with 10 CFR 54.4(a)(3), the systems, structures, and components within the scope of SLR include:

> All systems, structures and components relied on in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for fire protection (10 CFR 50.48), environmental qualification (10 CFR 50.49), pressurized thermal shock (10 CFR 50.61), anticipated transient without scram (10 CFR 50.62), and station blackout (10 CFR 50.63).

The regulation for pressurized thermal shock (10 CFR 50.61) is applicable to pressurized water reactors only, and therefore not applicable to BFN which are BWRs. For each of the other four regulations, scoping task reports are developed. Each of the regulated event scoping task reports identify the systems and structures that are relied upon to demonstrate compliance with the applicable regulation. The task reports also identify the source documentation used for the scoping determination. Systems and structures credited in the regulated events are classified as satisfying criteria of 10 CFR 54.4(a)(3) and are included within the scope of SLR.

2.1.5.4 System and Structure Intended Functions

For the systems and structures within the scope of SLR, the intended functions that are the bases for including them within the scope of SLR are identified and documented in the associated scoping task reports. The system or structure intended functions are based on the applicable CLB reference documents. For systems, the system level intended function descriptions are based on the information obtained from the BFN FSAR, Safe Shutdown Analysis calculation, and other applicable design/licensing basis documents. The component level intended functions are the passive component functions that are necessary to support the system or structure intended function(s). The structure and component intended functions are further described in Section 2.1.6.2.

2.1.5.5 Scoping Boundary Determination

Systems and structures that are included within the scope of SLR are further evaluated to determine the population of in scope structures and components. This part of the process is also a transition from the scoping process to the screening process. The process for evaluating mechanical systems is different from the process for structures, primarily because the plant design document formats are different. Mechanical systems are depicted primarily on the system piping and instrumentation diagrams (P&IDs) that show the system components and their functional relationships, while structures are depicted on physical drawings. Electrical and I&C components of in scope electrical, I&C, and mechanical systems are placed into commodity groups and are screened as commodities. Scoping boundaries for mechanical systems, structures, and electrical and I&C systems are, therefore, described separately.

2.1.6 Screening Procedure

Once the SSCs within the scope of SLR are determined, the next step is to determine which structures and components are subject to an AMR.

2.1.6.1 Identification of Structures and Components Subject to AMR

The requirement to identify structures and components subject to an AMR is specified in 10 CFR 54.21(a)(1), which states:

> Each application must contain the following information:
>
> (a) An integrated plant assessment (IPA). The IPA must –
>
> (1) For those systems, structures, and components within the scope of this part, as delineated in §54.4, identify and list those structures and components subject to an aging management review. Structures and components subject to an aging management review shall encompass those structures and components –
>
> (i) That perform an intended function, as described in §54.4, without moving parts or without a change in configuration or properties. These structures and components include, but are not limited to, the reactor vessel, the reactor coolant system pressure boundary, steam generators, the pressurizer, piping, pump casings, valve bodies, the core shroud, component supports, pressure retaining boundaries, heat exchangers, ventilation ducts, the containment, the containment liner, electrical and mechanical penetrations, equipment hatches, seismic Category I structures, electrical cables and connections, cable trays, and electrical cabinets, excluding, but not limited to, pumps (except casing), valves (except body), motors, diesel generators, air compressors, snubbers, the control rod drive, ventilation dampers, pressure transmitters, pressure indicators, water level indicators, switchgears, cooling fans, transistors, batteries, breakers, relays, switches, power inverters, circuit boards, battery chargers, and power supplies; and
>
> (ii) That are not subject to replacement based on a qualified life or specified time period.

Structures and components that perform an intended function without moving parts or without a change in configuration or properties are defined as passive for SLR. Passive structures and components that are not subject to replacement based on a qualified life or specified time period are defined as long-lived for SLR. The screening procedure is the process used to identify the passive, long-lived structures and components within the scope of SLR that are subject to aging management review.

NUREG-2192 (Reference 1.7.5) and NEI 95-10, Appendix B (Reference 1.7.2), as referred to in NEI 17-01 (Reference 1.7.3), were used as the basis for the identification of passive structures and components. Most passive structures and components are long-lived. In the few cases where a passive component is determined not to be long-lived, such determination is documented in the screening evaluation.

The BFN structures and components subject to aging management review are identified in accordance with the requirements of 10 CFR 54.21(a)(1) described above. The processes implemented to meet these requirements for mechanical systems, structures, and electrical commodities are described as follows:

<u>Mechanical Systems</u>

The mechanical system screening process begins with the results from the scoping process. For in scope mechanical systems, the completed scoping task reports include written descriptions and specify the system's intended function. Based on this information, the system piping and instrumentation diagrams are marked up to clearly identify the in scope system boundary for

SLR. The marked up system piping and instrumentation diagrams are called subsequent license renewal boundary drawings. These system boundary drawings are reviewed to identify the passive, long-lived components and component types. Component listings from the Maximo equipment database are also reviewed to confirm that all system components are considered. In cases where the system piping and instrumentation diagram does not provide sufficient detail, such as for some large vendor supplied components (e.g., compressors, EDGs), the associated component drawings or vendor manuals are also reviewed. Plant walkdowns are performed when required for confirmation.

Some mechanical components, when combined, are considered a complex assembly. A complex assembly is a predominantly active assembly where the performance of its components is closely linked to that of the intended function of the entire assembly, such that testing and monitoring of the assembly is sufficient to identify degradation of these components. An example of a complex assembly are the EDGs. Complex assemblies are considered active and can be excluded from the requirements of AMR. However, to the extent that complex assemblies include piping or components that interface with external equipment, or components that cannot be adequately tested or monitored as part of the complex assembly, those components are identified and subject to AMR. This follows the screening methodology for complex assemblies as described in Table 2.1-2 of NUREG-2192.

Mechanical components are screened with the system in which they were scoped. For heat exchangers, the process side of the heat exchanger is evaluated with the process side system for aging management review. Likewise, the cooling water side of the heat exchanger is evaluated with the cooling water side system for aging management review.

Structures

The structure screening process also begins with the results from the scoping process. For in scope structures, the completed scoping task reports include written descriptions of the structure and specify the structure's intended function.The associated structure drawings are reviewed to identify the passive, long-lived structures and components, structure types, and component types.

Electrical and I&C Commodities

Screening of electrical and I&C components within the in scope electrical, I&C, and mechanical systems uses a bounding approach as described in NEI 17-01 (Reference 1.7.3). Electrical and I&C components for the in scope systems are assigned to commodity groups. The commodities subject to an aging management review are identified by applying the criteria of 10 CFR 54.21(a)(1). This method provides the most efficient means for determining the electrical commodities subject to an aging management review since many electrical and I&C components and commodities are active.

Electrical and I&C components such as resistance temperature detectors, sensors, thermocouples, and transducers as well as electric heaters primarily serve an electrical function; however, they can also serve a mechanical pressure boundary function. According to Appendix B of NEI 95-10 (Reference 1.7.2), as referred to in NEI 17-01 (Reference 1.7.3), the electrical portions of these components are active per 10 CFR 54.21(a)(1)(i) and are therefore not subject to aging management review. Only the pressure boundary of such an in scope component is subject to aging management review.

The sequence of steps and special considerations for identification of electrical commodities that require an AMR is as follows:

- Electrical and I&C components and commodities in systems within the scope of SLR at BFN are identified and listed. The listing provided by NUREG-2192, Table 2.1-6 (Reference 1.7.5), is the basis for this list. Electrical and I&C components and commodities are organized into groups such as circuit breakers, switches, and cables. Individual specific components are not identified. The electrical commodities are identified from a review of plant documents, controlled drawings, equipment databases, and interface with the parallel mechanical screening efforts.
- Following the identification of the electrical commodities, the criterion of 10 CFR 54.21(a)(1)(i) is applied to identify commodities that perform their functions without moving parts or without a change in configuration or properties (referred to as “passive” components). These commodities are identified utilizing the guidance of NUREG-2192, Table 2.1-6.
- The passive electrical commodities are reviewed to determine if the commodity performs a SLR intended function. If an electrical commodity does not perform a SLR intended function, it is not considered further and, therefore, is not subject to an AMR.
- The screening criterion found in 10 CFR 54.21(a)(1)(ii) excludes those commodities that are subject to replacement based on a qualified life or specific time period from the requirements of an AMR. The 10 CFR 54.21(a)(1)(ii) screening criterion is applied to those commodities that are not previously eliminated by the application of the 10 CFR 54.21(a)(1)(i) screening criterion. Components and commodities included in the plant EQ program are replaced on a specified interval based on a qualified life. Components and commodities in the EQ program do not meet the “long-lived” criterion of 10 CFR 54.21(a)(1)(ii) and are considered “short-lived” per the regulatory definition and are, therefore, not subject to an AMR.
- Components and commodities which support or interface with electrical components and commodities, for example, cable trays, conduits, instrument racks, panels and enclosures, are evaluated as structural components.

The passive commodities that are not subject to replacement based on a qualified life or specified time period are subject to an AMR. For BFN, the electrical commodities that require an AMR are identified in the Electrical and I&C Screening/Aging Management Review Task Report.

2.1.6.2 Intended Function Definitions

The intended functions that the components and structures must fulfill are those functions that are the bases for including them within the scope of SLR. A component intended function is defined as a passive component function that must be performed in order for the system or structure to be able to perform the system or structure intended function(s). For example, pressure boundary failure of a component would cause loss of inventory from the system, and the system would subsequently be unable to perform its intended function(s). Structures and components may have multiple intended functions. BFN has considered multiple intended functions where applicable, consistent with the staff guidance provided in Table 2.1-3 of NUREG-2192 (Reference 1.7.5).

Table 2.1-1 provides definitions of structure and component passive intended functions identified in the Screening/Aging Management Review Task Reports.

Table 2.1-1, Passive Structure and Component Intended Function Definitions

Function	Definition
Absorb Neutrons	Absorb neutrons.
Direct Flow	Provide spray shield or curbs for directing flow.
Electrical Continuity	Provide electrical connections to specified sections of an electrical circuit to deliver voltage, current, or signals.
Expansion/Separation	Provide for thermal expansion and/or seismic separation.
Filter	Provide filtration or foreign material exclusion.
Fire Barrier	Provide rated fire barrier to confine or retard fire from spreading to or from adjacent areas of the plant.
Fission Product Barrier	Provide barrier to fission products release.
Flood Barrier	Provide flood protection barrier (internal or external flood event).
Flood Protection	Provide protection from internal or external flooding events.
Flow Restriction	Provide restriction/throttling.
Gaseous Release Path	Provide path for release of filtered and unfiltered gaseous discharge
Heat Transfer	Provide heat transfer.
High Energy Line Break (HELB) Shielding	Provide shielding against HELB.
Holdup and Plateout	Provide post-accident containment, plateout of iodine and holdup (for radioactive decay) of iodine and non-condensable gases.
Insulate (Electrical)	Insulate and support an electric conductor.
Maintain Adhesion	Provide adhesion to the substrate.
Mechanical Closure	Provide closure of components.
Missile Barrier	Provide missile barrier (internal or external missiles).
Pipe Whip Restraint	Provide pipe whip restraint.
Pressure Boundary	Provide pressure-retaining boundary so that sufficient flow at adequate pressure is delivered, or provide fission product barrier for containment pressure boundary, or provide containment isolation for fission product retention.
Shelter and Protection	Provide shelter/protection to components.
Shelter and Support	Provide shelter/support to components.
Shielding	Provide shielding against radiation.
Spray	Convert fluid into spray.
Structural Integrity	Component that maintains mechanical and structural integrity to provide structural support to attached piping.

Table 2.1-1, Passive Structure and Component Intended Function Definitions (Continued)

Function	Definition
Structural Support	Provide structural support and/or functional support for components.
Structural Support to Maintain Core Configuration and Flow Distribution	Provide structural support of fuel assemblies, control rods, and incore instrumentation to maintain core configuration and flow distribution.
Thermal Insulation	Inhibit/prevent heat transfer across a thermal gradient.
Thermal Insulation Jacket Integrity	Provide moisture absorption and provide physical support of thermal insulation.
Throttle	Provide flow restriction.
Water Retaining Boundary	Provide an essentially leak-tight boundary.

2.1.6.3 Stored Equipment

Credit is taken for actions required to recover certain equipment which has failed as a result of fire-induced damage. In all cases, such credit is taken only to accomplish a function required to establish and maintain safe and stable conditions. Equipment that is stored on site for installation or use in achieving safe and stable condition in the event of a fire is considered to be within the scope of SLR. For each recovery action credited, a procedure has been written and is available to cover the recovery action, and, the quantity and specific type of materials required by the analysis and the procedure are stored onsite. Stored equipment may also be used as directed by emergency operating procedures. Periodic surveillances are performed to verify that the equipment and materials are at the designated location, in the quantity specified, and in good condition and capable of performing the intended function. Tools and supplies used to place the stored equipment in service are not within the scope of SLR.

2.1.6.4 Consumables

The evaluation process for consumables is consistent with the guidance provided in NUREG-2192, Table 2.1-3 (Reference 1.7.5). Consumables are divided into the following four groups for the purpose of SLR: (a) packing, gaskets, component seals, and O-rings; (b) structural sealants; (c) oil, grease, and component filters; and (d) system filters, fire extinguishers, fire hoses, and air packs.

Group (a) subcomponents (packing, gaskets, component seals, and O- rings): Managing loss of leak tightness due to degraded packing, gaskets, component seals, and O-rings for the pressure boundary and leakage boundary intended functions is not required. It is unlikely that leakage from packing, gaskets, component seals, and O-rings would result in failure of the system to deliver sufficient flow at adequate pressure. In regard to leakage, BFN routinely conducts tours/ walkdowns of the operating spaces. When leakage is detected it is entered into the corrective action program. The leakage is corrected by replacing the packing, gaskets, component seals, and O-rings as consumables.

Group (b) structural sealants: AMRs are required for structural sealants in structures within the scope of SLR. A summary of the AMR results is presented in Section 3.5.

Group (c) subcomponents (oil, grease, and component filters): These subcomponents are short-lived and are periodically replaced. Various plant procedures are used in the replacement of oil, grease, and filters in components that are in scope for SLR. Therefore, these subcomponents are not subject to an AMR.

Group (d) consumables (system filters, fire extinguishers, fire hoses, and air packs): System ventilation filters are replaced in accordance with plant procedures based on vendor manufacturers' requirements and system testing. Fire extinguishers, self-contained breathing air packs and fire hoses are within the scope of SLR, but are not subject to aging management because they are replaced based on condition. These components are periodically inspected in accordance with NFPA 10 for portable fire extinguishers, American National Standards Institute (ANSI) Z88.2-1980 for self-contained breathing air packs, and NFPA 1962 for fire hoses. These require replacement of equipment based on their condition or performance during testing and inspection. The periodic inspections are implemented by controlled BFN procedures. These components are subject to replacement based on requirements implemented by controlled procedures, and are therefore not long-lived and not subject to an aging management review.

2.1.7 Generic Safety Issues

In accordance with the guidance in NEI 17-01 (Reference 1.7.3) and Appendix A.3 of NUREG-2192 (Reference 1.7.5), review of NRC generic safety issues (GSIs) as part of the SLR process is required to satisfy 10 CFR 54.29.This guidance suggests that GSIs involving issues related to SLR AMRs or TLAAs should be addressed in the SLR. Based on NEI and NRC guidance, NUREG-0933 “Resolution of Generic Safety Issues,” Supplement 35 (Reference 1.7.14), and more recent Generic Issue Management Control System Reports, the following GSIs were reviewed to assure they did not involve aging effects for structures and components subject to an AMR or TLAA evaluation:

- GSI-186, Potential Risk and Consequences of Heavy Load Drops in Nuclear Power Plants - This GSI addresses heavy load issues related to crane design and operation. Aging effects are not central to these issues. The issue does not involve TLAAs, including typical crane-related TLAAs such as cyclic loading analyses. This issue is now closed. (ADAMS Accession No. ML120940306)
- GSI-189, Susceptibility of Ice Condenser and Mark III Containments to Early Failure from Hydrogen Combustion During a Severe Accident - This issue is not applicable to BFN. BFN Units 1, 2, and 3 do not have Ice Condenser or Mark III Containments. BFN Units 1, 2, and 3, have Mark I Primary Containments. This issue is now closed. (ADAMS Accession No. ML13190A254)
- GSI-191, Assessment of Debris Accumulation on PWR Sump Performance - This issue is not applicable to BFN. BFN Units 1, 2, and 2, are BWRs.
- GSI-193, BWR ECCS Suction Concerns - The Generic Issues Review Panel completed an assessment and found this issue does not present a significant safety hazard. No further regulatory actions are required. This issue is now closed. (ADAMS Accession No. ML16207A507)
- GSI-199, Implications of Updated Probabilistic Seismic Hazard Estimates in Central and Eastern United States for Existing Plants - This GSI addresses how current estimates of the seismic hazard level at some nuclear sites in the central and eastern United States

might be higher than the values used in their original designs and previous evaluations. Aging effects are not central to this issue. This issue does not involve TLAAs. Activities associated with this issue are covered by 10 CFR 50.54(f) Japan Near Term Task Force (NTTF) Recommendations. (ADAMS Accession No. ML13190A254)

In a letter dated September 24, 2020, the NRC documented the results of their review of the BFN Seismic Probabilistic Risk Assessment associated with Reevaluated Seismic Hazard Implementation of the NTTF Recommendation 2.1: Seismic. The NRC concluded that no further response or regulatory action associated with the NTTF recommendation was required. (ADAMS Accession No. ML20255A000)

- GSI-204, Flooding of Nuclear Power Plant Sites Following Upstream Dam Failures - This GSI addresses the potential flooding effects from upstream dam failure(s) on nuclear power plant sites, spent fuel pools, and sites undergoing decommissioning with spent fuel stored in spent fuel pools. Aging effects are not central to this issue. This issue does not involve TLAAs. Activities associated with this issue are covered by 10 CFR 50.54(f) Japan NTTF Recommendations. (ADAMS Accession No. ML13190A254)

  In a letter dated May 6, 2020, the NRC documented the results of their review of the BFN Flooding Focused Evaluation. The NRC concluded that, if implemented as described, BFN has effective flood protection for the beyond-design-basis local intense precipitation flood-causing mechanism. The NRC letter also documented the close-out of the BFN response for the reevaluated flooding hazard portion of the 10 CFR 50.54(f) letter. (ADAMS Accession No. ML20112F485)

Therefore, there are no GSIs involving issues related to AMRs or TLAAs that need to be addressed as part of the BFN SLRA.

2.1.8 Conclusion

The scoping and screening methodology described above was used for the BFN IPA to identify the SSCs that are within the scope of SLR and that are subject to an AMR. The methodology is consistent with and satisfies the requirements of 10 CFR 54.4 and 10 CFR 54.21(a)(1).

2.2 PLANT LEVEL SCOPING RESULTS

Table 2.2-1 lists the Browns Ferry Nuclear Plant (BFN) systems, structures and commodity groups that were evaluated to determine if they were within the scope of subsequent license renewal, using the methodology described in Section 2.1. A reference to the section of the application that contains the scoping and screening results is provided for each in-scope system, structure and commodity group in the Table.

Table 2.2-1, Plant Level Scoping Results

System, Structure, or Commodity Group	In Scope for SLR [a]	Reference
Reactor Vessel, Reactor Vessel Internals, and Reactor Coolant System		
Reactor Vessel	Yes - SR, ATWS, FP, SBO	Section 2.3.1.1
Reactor Vessel Internals	Yes - SR, NSR, ATWS, FP	Section 2.3.1.2
Reactor Vessel Vents and Drains System	Yes - SR, NSR, ATWS, SBO	Section 2.3.1.3
Reactor Recirculation System	Yes - SR, NSR, ATWS, EQ, FP	Section 2.3.1.4
Fuel Assemblies	Yes - SR	Section 2.3.1.5
Engineered Safety Features and Reactor Core Isolation Cooling Systems		
Primary Containment Integrity	Yes - SR, EQ, FP, SBO	Section 2.3.2.1
Reactor/Refuel Zone Ventilation System	Yes - SR, NSR, EQ, FP	Section 2.3.2.1
Secondary Containment	Yes - SR, EQ, FP	Section 2.3.2.1
Primary Containment Isolation	Yes - SR, ATWS, EQ, FP, SBO	Section 2.3.2.1
Standby Gas Treatment System	Yes - SR, EQ, FP	Section 2.3.2.2

2.3 SCOPING AND SCREENING RESULTS: MECHANICAL

The scoping and screening results for mechanical systems consist of lists of components and component groups that require aging management reviews, that are grouped, and presented on a system basis. Brief descriptions of mechanical systems within the scope of subsequent license renewal are provided as background information. Mechanical system intended functions are provided for in-scope systems.

The mechanical scoping and screening results are provided in four sections:

- Reactor Vessel, Internals, and Reactor Coolant System (2.3.1)
- Engineered Safety Features and Reactor Core Isolation Cooling Systems (2.3.2)
- Auxiliary Systems (2.3.3)
- Steam and Power Conversion Systems (2.3.4)

2.3.1 Reactor Vessel, Internals and Reactor Coolant System

The following systems are addressed in this section:

- Reactor Vessel (2.3.1.1)
- Reactor Vessel Internals (2.3.1.2)
- Reactor Vessel Vents and Drains System (2.3.1.3)
- Reactor Recirculation System (2.3.1.4)
- Fuel Assemblies (2.3.1.5)

2.3.1.1 Reactor Vessel

Description

The Reactor Vessel provides a floodable volume and coolant distribution to mitigate accidents.

The Reactor Vessel is part of the reactor coolant pressure boundary (RCPB) which provides physical support for the reactor core and reactor vessel internals.

The Reactor Vessel system includes the reactor vessel, including nozzles, penetrations, and safe ends and welds to connecting piping. The reactor vessel is a vertical, cylindrical pressure vessel with hemispherical heads and is of welded construction. The cylindrical shell and bottom hemispherical head of the reactor vessel are fabricated of low alloy steel plate. The shell is clad on the interior with a stainless steel overlay, and the bottom head with an Inconel overlay.

To withstand external and internal loadings while maintaining a high degree of corrosion resistance, a high-strength, carbon-alloy steel is used as the base metal with an internal cladding applied by weld overlay to the cylindrical shell and bottom head. Use of the ASME Boiler and Pressure Vessel Code, Section III, Class A, pressure vessel code design criteria provides assurance that a vessel designed, built, and operated within its design limits has an extremely low probability of failure due to any known failure mechanism.

The following systems are credited for maintaining the reactor coolant pressure boundary:

- Main Steam
- Feedwater

- Boiler Drains and Vents
- Sampling and Water Quality
- Standby Liquid Control (SLC)
- Reactor Recirculation
- Reactor Water Cleanup
- Reactor Core Isolation Cooling
- High Pressure Coolant Injection
- Residual Heat Removal
- Core Spray
- Control Rod Drive (CRD)
- Neutron Monitoring
- Traversing Incore Probe

The reactor vessel is discussed in FSAR Sections 4.2, 7.8 and Appendices J, K, and L. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide reactor coolant pressure boundary. The reactor vessel forms a barrier against the release of reactor coolant and radioactive material. 10 CFR 54.4(a)(1)
2. Provides support to the reactor internals. The reactor vessel, along with the reactor internals, maintains a floodable volume within the reactor. 10 CFR 54.4(a)(1)
3. Provides structural support or restraint to SSCs in the scope of SLR. The reactor vessel support skirt and stabilizer brackets provide structural support for the reactor vessel. 10 CFR 54.4(a)(1)
4. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The reactor vessel must remain intact to allow maintenance of the reactor vessel coolant level. 10 CFR 54.4(a)(3)
5. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The reactor vessel provides a portion of the reactor coolant pressure boundary. 10 CFR 54.4(a)(3)
6. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - Provide reactor coolant pressure boundary. The reactor vessel forms a barrier against the release of reactor coolant and radioactive material.
    - The reactor vessel, along with reactor vessel internals, maintains a floodable volume. Floodable volume is required to achieve Nuclear Safety Performance Criteria (NSPC) Inventory Control Performance Criteria.

The aging management review results for these components are provided in Table 3.1.2-1, Reactor Vessel - Summary of Aging Management Evaluation.

2.3.1.2 Reactor Vessel Internals

Description

The reactor vessel internals are installed to properly distribute the flow of coolant delivered to the vessel, to locate and support the fuel assemblies, and to provide an inner volume containing the core that can be flooded following a break in the nuclear system process barrier external to the reactor vessel. The reactor vessel internals are the following components:

The reactor vessel internals include partitions between regions within the reactor vessel to provide proper coolant distribution, thereby allowing power operation without fuel damage due to inadequate cooling. It provides positioning and support for the fuel assemblies, control rods, incore flux monitors, and other components to assure that control rod movement is not impaired. he Reactor Vessel is a floodable volume in which the core can be adequately cooled if there is a breach in the nuclear system process barrier external to the reactor vessel. The reactor vessel internals are considered safety-related because most of its components are safety-related and work together to ensure safe reactor operation. The reactor vessel internals also includes nonsafety-related components such as the reactor steam dryer assembly that have the potential for spatial and structural interactions with safety-related SSCs.

The reactor vessel internals are the following components:

- Core shroud
- Shroud head and steam separator assembly
- Core support (core plate)
- Top guide
- Fuel support pieces
- Control rod guide tubes
- Jet pump assemblies
- Steam dryers
- Feedwater spargers
- Core spray lines and spargers
- Vessel head cooling spray nozzle
- Differential pressure and liquid control line
- In-core instrumentation (Source Range Monitor, Intermediate Range Monitor, Local Power Range Monitor) dry tubes
- Incore neutron flux monitor (Traversing Incore Probe) guide tubes
- Startup neutron sources
- Surveillance sample holders

The differential pressure and [standby] liquid control line serves a dual function within the reactor vessel to inject standby liquid control solution into the coolant stream (discussed in FSAR Section 3.8, Standby Liquid Control System) and to sense the differential pressure across the core support assembly (see FSAR Section 4.2, Reactor Vessel and Appurtenances Mechanical Design).

The reactor vessel internals are discussed in FSAR Sections 3.3, 4.2 and Appendices J, K, and L. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

<u>Intended Functions</u>

1. Maintain reactor core assembly geometry. The reactor vessel provides support to the reactor internals. The reactor vessel, along with the reactor vessel internals, maintains a floodable volume within the reactor. 10 CFR 54.4(a)(1)
2. Introduce negative reactivity to achieve and maintain subcritical reactor condition. The control rods and CRD assemblies adjust the concentration of the neutron absorber in the core during normal operations and shutdown conditions. 10 CFR 54.4(a)(1)
3. Introduce emergency negative reactivity to make the reactor subcritical. When a Reactor Protection System scram signal is received, high pressure water is applied to the CRD assemblies to rapidly insert each control rod into the core. he core plate differential pressure and standby liquid control line provides a flow path for injecting a neutron absorber into the reactor core when control rods are unavailable. 10 CFR 54.4(a)(1)

4. Sense process conditions and generate signals for reactor trip or engineered safety features actuation. Neutron flux detectors within the reactor core initiate a Reactor Protection System scram signal to shutdown the reactor upon a high flux condition. 10 CFR 54.4(a)(1)
5. Provide emergency core cooling where the equipment provides coolant directly to the core. The core spray piping and spargers, internal to the reactor vessel, distribute emergency core cooling flow within the shroud to the reactor core. 10 CFR 54.4(a)(1)
6. Resist spatial interaction of nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The reactor vessel internals include nonsafety-related components such as the steam dryer assembly which have the potential for spatial interaction with safety-related SSCs in the reactor vessel. 10 CFR 54.4(a)(2)
7. Resist structural interactions from mechanically connected nonsafety-related components that could prevent satisfactory accomplishment of a safety-related function. The reactor vessel internals include nonsafety-related components such as the steam dryer assembly that help maintain structural integrity of the safety-related portions of the system. 10 CFR 54.4(a)(2)
8. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The reactor vessel internals provide the flow path for standby liquid control injection. 10 CFR 54.4(a)(3)
9. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). The reactor vessel internals maintain reactor core assembly geometry and control rod insertion capability to introduce negative reactivity to make the reactor subcritical. 10 CFR 54.4(a)(3)
   - This system is necessary to assure control rod movement is not impaired to meet NSPC Reactivity Control. Introduce negative reactivity to make the reactor subcritical.
   - Maintain reactor core assembly geometry. The reactor vessel provides support to the reactor vessel internals. The reactor vessel, along with the reactor vessel internals, maintains a floodable volume within the reactor.

2.3.1.3 Reactor Vessel Vents and Drains System

Description

The Reactor Vessel (RV) Vents and Drains System consists of manual valves and piping connected to the Reactor Coolant Pressure Boundary inside primary containment and includes the RV head vent piping, the RV bottom head drain piping, and the blowdown piping for the Nuclear System Pressure Relief System, from the Main Steam Relief Valves (MSRV) to the pressure suppression chamber. All system piping and components are located within the primary containment. The RV Vents and Drains System for each unit share no components with the other units.

Some of the RV Vents and Drains System non-safety functions are to provide for venting the RV head to the drywell equipment drain sump during filling and draining operations.

The RV Vents and Drains System components that are non-safety related include non-safety-related fluid filled lines in the Reactor Building that have the potential for spatial interactions with safety-related SSCs. The RV Vents and Drains non-safety-related piping is mechanically connected and provide structural support to the safety-related portion of the RV Vents and Drains System.

The RV Vents and Drains System components that are non-safety-related meet the criteria of 10 CFR 54.4(a)(2) as they include non-safety-related fluid filled lines in the Reactor Building that have the potential for spatial interactions with safety-related SSCs. The RV Vents and Drains non-safety-related piping is mechanically connected and provide structural support to the safety-related portion of the RV Vents and Drains System, and therefore meets the criterion of 10 CFR 54.4(a)(2).

The RV Vents and Drains system is discussed in FSAR Sections 4.2 and 4.4. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide reactor coolant pressure boundary. The RV Vents and Drains System is a part of the reactor coolant pressure boundary (RCPB), which forms a barrier against the release of reactor coolant and radioactive material. 10 CFR 54.4(a)(1)
2. Provide the flow path for the MSRV steam blowdown to the primary containment suppression pool. Steam released by the MSRVs shall be vented to the pressure suppression chamber to

prevent increasing the drywell atmosphere radiation, pressure, temperature, and humidity. 10 CFR 54.4(a)(1)

3. Resist spatial interactions from non-safety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The RV Vents and Drains System includes non-safety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)
4. Resist structural interactions from mechanically connected non-safety-related piping that could prevent satisfactory accomplishment of a safety-related function. The RV Vents and Drains System non-safety-related piping is mechanically connected and provide structural support to the safety-related portion of the RV Vents and Drains System. 10 CFR 54.4(a)(2)
5. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The RV Vents and Drains System provides a portion of the reactor coolant pressure boundary. 10 CFR 54.4(a)(3)
6. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)
   - The RV Vents and Drains System provides a portion of the reactor coolant pressure boundary.
   - The RV Vents and Drains System provides a path for the MSRVs steam blowdown to the primary containment suppression pool. Steam released by the MSRVs shall be vented to the pressure suppression chamber to prevent increasing the drywell atmosphere radiation, pressure, temperature, and humidity.

2.3.1.4 Reactor Recirculation System

Description

The Reactor Recirculation System is a reactivity control system that serves to control reactor power levels by varying the coolant rate through the core over a limited range so that greater versatility is available in making power adjustments without the use of control rods.

The Reactor Recirculation System consists of two independent loops, external to the reactor vessel, each with a motor driven centrifugal pump, suction and discharge valves, and piping. The Reactor Recirculation System is part of the reactor coolant pressure boundary, and functions to maintain the pressure boundary during normal operation, transients, and accident scenarios to prevent the release of radioactive liquid and gas. The system piping and pump design pressures are based on peak steam pressure in the reactor dome plus the static head above the lowest point in the recirculation loop.

The Reactor Recirculation System provides flow paths out of the reactor vessel for Residual Heat Removal (RHR) System and Reactor Water Cleanup (RWCU) System and into the reactor vessel for RHR shutdown cooling and low pressure coolant injection.

The coolant flow rate through the reactor core is varied by using adjustable speed drives and flow control instrumentation to change the speed of the centrifugal pumps to control the recirculation system drive flow rate.

The Reactor Recirculation System includes non-safety-related fluid filled components (drain lines, seal supply lines, instrument piping, etc.) in the Drywell and Reactor Building which have the potential for spatial interaction with safety-related components. Also, non-safety-related Reactor Recirculation components are mechanically connected to safety-related Reactor Recirculation piping.

A recirculation pump trip on reactor high pressure or reactor low water level has been provided to limit the consequences of a failure to scram during a transient.

The Reactor Recirculation System is discussed in FSAR Sections 4.3 and 7.9. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide reactor coolant pressure boundary. The Reactor Recirculation System forms a barrier to minimize the release of reactor coolant and radioactive material to the Reactor Building. 10 CFR 54.4(a)(1)
2. Provide primary containment boundary. The Reactor Recirculation System includes primary containment isolation valves. 10 CFR 54.4(a)(1)
3. Sense process conditions and generate signals for reactor trip or engineered safety features actuations. The Reactor Recirculation System includes instrumentation and process controls that provide input signals to the Reactor Protection System and Emergency Core Cooling Systems. 10 CFR 54.4(a)(1)
4. Resist spatial interactions from non-safety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Reactor Recirculation System includes non-safety-related fluid filled components which have the potential for spatial interaction with safety-related components. 10 CFR 54.4(a)(2)
5. Resist structural interactions from mechanically connected non-safety-related piping that could prevent satisfactory accomplishment of a safety-related function. The Reactor Recirculation System includes non-safety-related piping that is relied upon to preserve the structural integrity of safety-related Reactor Recirculation piping. 10 CFR 54.4(a)(2)
6. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The Reactor Recirculation System provides a portion of the reactor coolant pressure boundary. 10 CFR 54.4(a)(3)
7. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). Reactor Recirculation System components receive the recirculation pump trip signal from the Reactor Protection System. 10 CFR 54.4(a)(3)
8. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
9. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3).
   - The Reactor Recirculation pump must be turned off during low pressure coolant injection to meet NSPC Inventory Control Performance Criteria.
   - Reactor Recirculation pump suction or discharge valve must be closed during shutdown cooling to meet NSPC Decay Heat Removal Performance Criteria.
   - The Reactor Recirculation System maintains the reactor coolant pressure boundary.

Component Type	Passive Intended Functions
Heat Exchanger - (Recirculation Pump Seal Cooler) Tubes	Pressure Boundary
Heat Exchanger - Variable Frequency Drives	Pressure Boundary
Piping, Piping Components (Hoses)	Pressure Boundary
Piping Elements	Pressure Boundary
Piping, Piping Components	Pressure Boundary,
Piping, Piping Components: Class 1 greater than or equal to 4" NPS	Pressure Boundary
Piping, Piping Components: Class 1 piping, fittings, and branch connections less than 4" NPS and greater than or equal to 1" NPS	Pressure Boundary
Pump Casing (Recirculation Pump)	Pressure Boundary
Piping, Piping Components (Strainers)	Filter
Tanks (Recirc Pump Motor Upper and Lower Bearing Oil Reservoir)	Pressure Boundary
Piping, Piping Components (Valve Body)	Pressure Boundary,
Piping, Piping Components (Valve Body (Class 1))	Pressure Boundary

The aging management review results for these components are provided in Table 3.1.2-4, Reactor Recirculation System - Summary of Aging Management Evaluation.

2.3.1.5 Fuel Assemblies

Description

The Fuel Assemblies consist of nuclear fuel bundles that are high integrity assemblies of fissionable material that can be arranged in a critical array. Each nuclear fuel bundle must be capable of transferring the generated fission heat to the circulating coolant water while maintaining structural integrity and containing the fission products.

The nuclear fuel bundles are designed to assure that fuel damage limits will not be exceeded during either normal operation or anticipated operational occurrences. The Fuel Assemblies are utilized as the initial barrier for containment of fission products.

There are 764 nuclear fuel bundles in each reactor, with each nuclear fuel bundle consisting of a matrix of fuel rods.

Intended Functions

1. Maintain reactor core assembly geometry. The fuel assembly maintains geometry for any event to ensure core cooling, core reactivity control, and the integrity of the fuel cladding as a radioactive material boundary. 10 CFR 54.4(a)(1)

2.3.2 Engineered Safety Features and Reactor Core Isolation Cooling Systems

The following systems are addressed in this section:

- Containment System (2.3.2.1)
- Standby Gas Treatment System (2.3.2.2)
- Reactor Core Isolation Cooling System (2.3.2.3)
- High Pressure Coolant Injection System (2.3.2.4)
- Residual Heat Removal System (2.3.2.5)
- Core Spray System (2.3.2.6)
- Containment Atmosphere Dilution System (2.3.2.7)

2.3.2.1 Containment System

Description

For the purpose of SLR, the Containment System includes the mechanical portions of the following systems, subsystems and components.

- Primary Containment System
- Primary Containment Isolation System
- Traversing In-Core Probe System
- Secondary Containment System
- Reactor/Refuel Zone Ventilation System

A description of each of these systems is provided below.

Primary Containment System

The Primary Containment System of each unit employs a pressure suppression containment system which houses the reactor vessel, the reactor coolant recirculating loops, and other branch connections of the Reactor Coolant System. The pressure suppression system consists of a drywell, a pressure suppression chamber (alternatively referred to as the torus or wetwell) which stores a large volume of water, a connecting vent system between the drywell and the pressure suppression chamber, isolation valves, containment cooling systems, equipment for establishing and maintaining a pressure differential between the drywell and pressure suppression chamber, and other service equipment.

In the event of a process system piping failure within the drywell, reactor water and steam would be released into the drywell air space. The resulting increased drywell pressure would then force a mixture of air, steam, and water through the vents into the pool of water which is stored in the pressure suppression chamber. The steam would condense rapidly and completely in the pressure suppression pool, resulting in rapid pressure reduction in the drywell. Air that is transferred to the pressure suppression chamber pressurizes the chamber and is subsequently vented to the drywell to equalize the pressure between the two volumes.

Cooling systems are provided to remove heat from the drywell and from the water in the pressure suppression chamber, thus cooling the primary containment, when required, under accident conditions.

The Primary Containment System is discussed in FSAR Sections 5.2.3, 5.2.5, 14.6, and 14.12.

The results of screening evaluations for the following components (valves, piping, penetrations, structural steel, etc.) that are essential for primary containment integrity are presented the associated system's screening evaluation in the following in the following sections of this application.

Section Number	System Name
2.3.4.1	Main Steam
2.3.4.2	Condensate/Demineralized Water
2.3.4.3	Reactor Feedwater
2.3.3.11	Control Air
2.3.3.12	Service Air
2.3.3.15	Sampling And Water Quality
2.3.3.18	Standby Liquid Control
2.3.2.2	Standby Gas Treatment
2.3.1.4	Reactor Recirculation
2.3.3.22	Reactor Water Cleanup
2.3.3.23	Reactor Building Closed Cooling Water
2.3.2.3	Reactor Core Isolation Cooling
2.3.2.4	High Pressure Coolant Injection
2.3.2.5	Residual Heat Removal
2.3.2.6	Core Spray
2.3.3.25	Containment Inerting
2.3.3.26	Radwaste
2.3.2.7	Containment Atmosphere Dilution
2.3.3.31	Control Rod Drive
2.3.3.37	Radiation Monitoring
2.4.2	Primary Containment Structures

Primary Containment Isolation System

The Primary Containment Isolation System is a plant protection system that provides timely protection against the onset and consequences of accidents involving the gross release of radioactive materials from the fuel and nuclear system process barrier. The PCIS also includes steam leak detection systems. The primary containment isolation system initiates automatic isolation of appropriate lines that penetrate the primary containment whenever monitored variables exceed pre-selected operational limits.

The system initiates isolation of the reactor vessel, isolation of piping which penetrate primary containment, and isolation of piping in selected balance of plant systems that provide potential paths for the release of radioactive materials. Primary containment isolation signals are provided by diverse and redundant safety grade equipment, isolating, in general, on low reactor level, or high drywell pressure. There are several other isolation modes in addition to the main Primary Containment Isolation System logic. For example, main steam isolation valves (MSIVs) will also close as a result of high steam flow or high steam line tunnel temperature. The primary containment ventilation system isolates on Reactor Building high radiation. The High Pressure

Coolant Injection (HPCI) and Reactor Core Isolation Cooling (RCIC) systems have instrumentation to detect pipe breaks within their own flow paths, and to subsequently isolate the associated system.

The primary containment isolation valves and associated primary containment penetrations and piping from the systems included in FSAR Table 5.2-2 are aligned to the Primary Containment Isolation System.

The Primary Containment Isolation System is discussed in FSAR Sections 5.2.3 and 7.3.

Traversing In-Core Probe System

Appropriate isolation valves are actuated during this period to ensure containment of radioactive materials within the primary containment which might be released from the reactor during the course of the accident. In addition to the Traversing In-core Probe System isolation valves, the tubing between the isolation valves and primary containment penetration are included in the Containment System for SLR.

The Traversing In-core Probe System is discussed in FSAR Section 7.3.4.7.

Secondary Containment System

The Reactor Building, in conjunction with the Reactor/Refuel Zone Ventilation System and the Standby Gas Treatment System (up to and including the second outboard isolation valve), constitutes the secondary containment. This includes penetrations of the Reactor Building. The penetrations for piping, ventilation ducts, electrical cables, and instrument leads are sealed. The ventilation ducts are provided with valves for automatic closure when reactor building isolation is required.

The Secondary Containment System interfaces with the Reactor/Refuel Zone Ventilation System (i.e., the valves which isolate secondary containment, along with the associated ductwork and controls), which is evaluated separately. The Secondary Containment System interfaces with the Standby Gas Treatment System, which is also evaluated separately. The Reactor Building is evaluated with the Reactor Building structure, and the penetrations and doors are evaluated with Hazard Barriers and Elastomers structural commodity.

The Reactor Building completely encloses the primary containment, and essentially all of the Emergency Core Cooling systems, and houses the associated spent fuel storage pool, dryer and separator storage pool, and reactor well. The secondary containment serves as the containment during reactor refueling when the primary containment is open, and as an additional fission product barrier when the primary containment is functional.

The Secondary Containment system is discussed in FSAR Sections 5.3, 14.6, and Appendix F.7.1.

The results of screening evaluations for the following components (valves, piping, penetrations, structural steel, etc.) that are essential for secondary containment integrity are presented with the associated system's screening evaluation in the following sections of this application.

Section Number	System Name
2.3.4.1	Main Steam
2.3.4.2	Condensate/Demineralized Water
2.3.4.3	Reactor Feedwater
2.3.3.2	Auxiliary Boiler
2.3.3.4	Residual Heat Removal Service Water
2.3.3.5	Raw Cooling Water
2.3.3.6	Raw Service Water
2.3.3.7	High Pressure Fire Protection (Diesel Drive Pump)
2.3.3.8	Potable Water
2.3.3.9	Normal Ventilation
2.3.3.10	Air Conditioning
2.3.3.11	Control Air
2.3.3.12	Service Air

2.3.3.21	Emergency Equipment Cooling Water
2.3.3.22	Reactor Water Cleanup
2.3.3.23	Reactor Building Closed Cooling Water
2.3.2.3	Reactor Core Isolation Cooling
2.3.3.24	Auxiliary Decay Heat Removal
2.3.2.4	High Pressure Coolant Injection
2.3.2.5	Residual Heat Removal
2.3.2.6	Core Spray
2.3.3.25	Containment Inerting
2.3.3.26	Radwaste
2.3.3.27	Spent Fuel Pool Cooling/Cleanup
2.3.2.7	Containment Atmosphere Dilution
2.3.3.31	Control Rod Drive

Reactor/Refuel Zone Ventilation System

The Reactor/Refuel Zone Ventilation System is divided into four ventilation zones which may be isolated independently. The refueling room which is common to the three units forms the refueling zone. The individual units below the refueling floor form the three reactor zones. The four-zone ventilation control system provides increased capability for localizing the consequences of an accident or radioactive release such that the effect may be localized in one zone while maintaining the ability to isolate the entire Reactor Building if necessary. The zone system is not an engineered safeguard, and the failure of the zone system would not prevent isolation or reduce the capacity of the Secondary Containment System.

A reactor zone is isolated upon isolation of the primary containment in that particular zone, by high radiation level in the ventilation exhaust duct leaving that particular zone, or by manual alignment. The refueling zone is always isolated when any reactor zone is isolated. The refueling zone only is isolated by a manual signal or by a high radiation signal from any of the six radiation monitors that serve the refueling zone. Upon isolation, all of the ventilation systems serving the isolated zone or zones are shut down, the ducts are isolated, and the Standby Gas Treatment System is started and begins exhausting from the isolated zone or zones.

The Reactor/Refuel Zone Ventilation System is discussed in FSAR Sections 5.3.3.2, 7.12.5, and Appendix F.7.5.

The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Maintain structural integrity. The Primary Containment System functions to prevent the release of airborne radioactive materials to the plant environment. 10 CFR 54.4(a)(1)
2. Provide pressure suppression of steam release from the nuclear system or steam turbine exhaust from the RCIC System and/or the HPCI System. The Primary Containment System functions to prevent the Primary Containment from exceeding its internal design pressure. 10 CFR 54.4(a)(1)
3. Provide secondary containment boundary. The Reactor/Refuel Zone Ventilation System includes piping, ductwork and valves that are part of the secondary containment boundary. The function of the Secondary Containment System is to provide treatment and controlled release of radioactive materials that may leak from or may be released outside of the primary containment. 10 CFR 54.4(a)(1)
4. Sense process conditions and generate signals for secondary containment isolation and Standby Gas Treatment System actuation. The Reactor/Refuel Zone Ventilation System includes instrumentation that provides signals for secondary containment isolation and Standby Gas Treatment System actuation. 10 CFR 54.4(a)(1)
5. Provide a primary containment boundary during refueling and maintenance operations. The function of the Secondary Containment System is to provide a primary envelope for radiation releases when the Primary Containment System is open such as during refueling and maintenance operations. 10 CFR 54.4(a)(1)

6. Provide reactor coolant pressure boundary. The Primary Containment Isolation System includes piping and valves that are part of the reactor coolant pressure boundary. 10 CFR 54.4(a)(1)
7. Provide primary containment boundary. The Primary Containment Isolation System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
8. Sense process conditions and generate signals for reactor trip or engineered safety features actuation. The Primary Containment Isolation System includes instrumentation that provides signals for reactor vessel and primary containment isolation, various system isolations, and equipment interlocks. 10 CFR 54.4(a)(1)
9. Resist structural interactions from mechanically connected nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Reactor Building Ventilation System includes nonsafety-related components that maintain structural integrity of safety-related components. 10 CFR 54.4(a)(2)
10. Directly support a safety-related function. The Reactor Building Ventilation System includes nonsafety-related piping, valves and instruments that are relied upon to preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)
11. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The Primary Containment Isolation System is credited for reactor vessel isolation to provide reactor coolant pressure boundary. 10 CFR 54.4(a)(3)
12. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). The Containment System maintains the primary containment boundary, the secondary containment boundary, and is also credited to meet NFPA 805 Performance Criteria. 10 CFR 54.4(a)(3)
    - The Containment System prevents the release of radioactive materials to the plant environment.
    - Provide pressure suppression of steam release from the main steam relief valves (MSRVs) or steam turbine exhaust from the RCIC System and/or the HPCI System. Pressure suppression is required to meet the NSPC Inventory and Pressure Control performance criterion.
    - The Primary Containment System functions to prevent the Primary Containment System from exceeding its internal design pressure. Indications for drywell pressure, drywell temperature, suppression pool temperature, and suppression pool level are required to meet NSPC Process Monitoring Performance Criteria.
    - The Secondary Containment System prevents the release of radioactive materials to the environment and is required to meet the NSPC Radioactive Release Performance Criteria.
    - The Reactor/Refuel Zone Ventilation System includes piping, ductwork and valves that are part of the secondary containment boundary.
    - Reactor zone ventilation fire dampers prevent propagation of fire between fire areas.
    - The Secondary Containment System provides primary containment when any of the three Primary Containment Systems are open such as during refueling and maintenance operations and is required to meet the NSPC Radioactive Release Performance Criteria.

13. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)
    - The Primary Containment System provides the primary containment boundary to limit leakage during and following a Station Blackout.
    - The Primary Containment Isolation System is credited for reactor vessel and primary containment isolation, various system isolations, and equipment interlocks for Station Blackout.
14. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49) 10 CFR 54.4(a)(3).

Components Subject to AMR

The component types that require aging management review are indicated in the below Table 2.3.2-1, Containment System.

Table 2.3.2-1, Containment System

Component Type	Passive Intended Functions
Closure Bolting	Mechanical Closure, Structural Support
Ducting, Ducting Components	Pressure Boundary
External Surfaces	Pressure Boundary
Fire Damper Assemblies	Fire Barrier
Heat Exchanger Components	Pressure Boundary
Piping, Piping Components	Pressure Boundary

The aging management review results for these components are provided in Table 3.2.2-1, Containment System - Summary of Aging Management Evaluation.

2.3.2.2 Standby Gas Treatment System

Description

The Standby Gas Treatment System provides a means for minimizing the release of radioactive material from the containment to the environs by filtering and exhausting the air from any or all zones of the Reactor Building and maintaining the building at a negative pressure (such that air leakage is into, not out of, the building) during containment isolation conditions. Elevated release is assured by exhausting to the plant stack.

The Standby Gas Treatment System is a plant-shared system. The Standby Gas Treatment System consists of a suction duct system, three filter trains and blowers, and a discharge vent system. The common suction duct system takes suction from the normal ventilation exhaust duct of each of the three reactor zones and from the refueling zone independent of the normal ventilation system. Each filter train contains a moisture separator, a heater, a prefilter, an upstream High Efficiency Particulate Air (HEPA) filter, a charcoal filter, and a downstream HEPA filter. The three filter trains and blowers are arranged in parallel. The three blowers share a common discharge header that discharges to the 600-foot high plant stack. The Standby Gas Treatment System is normally in standby and starts automatically when required. The filter trains and blowers are located in the Standby Gas Treatment Building.

The Standby Gas Treatment System is discussed in FSAR Sections 5.3.3.7, 5.3.4.2, 7.12.5, 14.6, and Appendix F.7.18. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

<u>Intended Functions</u>

1. Control and treat radioactive materials released to the secondary containment. The Standby Gas Treatment System maintains a negative pressure within Reactor Building, and filters the exhaust air to reduce halogen and particulate concentrations in gases prior to their elevated release point. 10 CFR 54.4(a)(1)
2. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). The Standby Gas Treatment System includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
3. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). The Standby Gas Treatment System is credited to meet NFPA 805 Performance Criteria. 10 CFR 54.4(a)(3).

2.3.2.3 Reactor Core Isolation Cooling System

Description

The RCIC System provides makeup water to the reactor vessel during shutdown and isolation from the main heat sink to supplement or replace the normal makeup sources and operates automatically in time to obviate any requirement for the Core Standby Cooling Systems

The RCIC System consists of a steam-driven, turbine-pump unit and associated valves and piping capable of delivering makeup water to the reactor vessel. The primary water source is from the condensate storage tank, with a backup supply of water available from the suppression pool. Delivery of water to the reactor vessel is via the feedwater system. Steam supply to the RCIC turbine is from the reactor vessel via the main steam system. The RCIC system includes a test line from the pump discharge to facilitate functional testing. A minimum-flow bypass line to the pressure suppression pool is provided for pump protection. This minimum flow bypass line has an interface with the RHR system. The exhaust steam from the turbine is directed to the suppression pool.

The RCIC components that are nonsafety-related meet the criteria of 10 CFR 54.4 (a)(2) as they include nonsafety-related fluid filled lines in the Reactor Building that have the potential for spatial interactions with safety-related SSCs and the nonsafety-related piping is mechanically connected and provide structural support to the safety-related portion of the RCIC System.

In addition, the RCIC System contains nonsafety-related components that also serve the following safety functions: 1) provide the Alternate Leakage Treatment (ALT) path from the MSIVs to the condenser that limit radioactive materials release to the environment; and 2) to preserve structural integrity of the Secondary Containment boundary to prevent a radioactive discharge to the environment.

The RCIC System is described in detail in FSAR Section 4.7. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Remove residual heat from the reactor coolant system. The RCIC system provides high pressure coolant flow to the reactor vessel. 10 CFR 54.4(a)(1)
2. Provide reactor coolant pressure boundary. The RCIC System includes piping and valves that are part of the reactor coolant pressure boundary. 10 CFR 54.4(a)(1)
3. Provide primary containment boundary. The RCIC System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
4. Sense process conditions and generate signals for reactor trip or engineered safety features actuation. The RCIC System includes instrumentation that provides signals for interlocks, automatic controls, and to initiate credited manual actions. 10 CFR 54.4(a)(1)
5. Provide system pressure boundary integrity. The RCIC pump minimum flow bypass line includes piping at the RHR System interfaces that are required to maintain their pressure boundary integrity so as not to jeopardize the ability of the RHR System to perform its nuclear safety functions. 10 CFR 54.4(a)(1)

6. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The RCIC System includes nonsafety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)
7. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The RCIC nonsafety-related piping is mechanically connected and provide structural support to the safety-related portion of the RCIC System. 10 CFR 54.4(a)(2)
8. Directly support a safety-related function. Some the RCIC nonsafety-related components are relied upon to provide a safety-related function following a DBE, those components provide the ALT path from the MSIVs to the Condenser. 10 CFR 54.4(a)(2)
9. Directly support a safety-related function. Some of the RCIC nonsafety-related components preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)
10. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The RCIC System provides a portion of the reactor coolant pressure boundary. 10 CFR 54.4(a)(3)
11. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR54.4(a)(3)
12. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). The RCIC System maintains the reactor coolant pressure boundary and is also credited to meet NFPA 805 Performance Criteria. 10 CFR 54.4(a)(3)
13. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The RCIC System is credited for reactor vessel makeup for Station Blackout. 10 CFR 54.4(a)(3).

2.3.2.4 High Pressure Coolant Injection System

Description

The HPCI System is provided to assure that the reactor is adequately cooled to limit fuel cladding temperature in the event of a small break in the nuclear system and loss of coolant which does not result in rapid depressurization of the reactor vessel. The HPCI System permits the nuclear plant to be shut down, while maintaining sufficient reactor vessel water inventory until the reactor vessel is depressurized. The HPCI System continues to operate until the reactor vessel pressure is below the pressure at which low pressure coolant injection operation or Core Spray System operation maintains core cooling.

The HPCI System consists of a steam turbine assembly driving a constant-flow pump assembly and system piping, valves, controls, and instrumentation. The system includes a pressurized hydraulic oil control system that also provides lubrication to the pump and turbine. The safety-related water source for the HPCI System is from the suppression pool, with a back-up supply from the nonsafety-related condensate storage tank. Delivery of water to the reactor vessel occurs via the Feedwater System. Steam supply to the HPCI turbine is from the reactor vessel via the Main Steam System. The HPCI system is equipped with a full flow test line to the condensate storage tank to facilitate functional testing. A minimum flow bypass is provided for pump protection. The exhaust steam from the turbine is discharged to the suppression pool.

The HPCI System is described in detail in FSAR Section 6.4.1. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide emergency core cooling where the equipment provides coolant directly to the reactor core. The HPCI System is an emergency core cooling system that provides high pressure coolant to the reactor vessel for small reactor coolant system breaks. The HPCI System fulfills

the objectives of the RCIC System in the event that the RCIC System is not available. 10 CFR 54.4(a)(1)

2. Provide reactor coolant pressure boundary. The HPCI System includes piping and valves that are part of the reactor coolant pressure boundary. 10 CFR 54.4(a)(1)
3. Provide primary containment boundary. The HPCI System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
4. Sense process conditions and generate signals for reactor trip or engineered safety features actuation. The HPCI System includes instrumentation that provides signals for interlocks, automatic controls, and to initiate credited manual actions. 10 CFR 54.4(a)(1)
5. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The HPCI System includes nonsafety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)
6. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The HPCI System includes nonsafety-related components that maintain structural integrity of HPCI System with reactor coolant pressure boundary and primary containment boundary. 10 CFR 54.4(a)(2)
7. Directly support a safety-related function. Some of the HPCI nonsafety-related components are relied upon to provide a safety-related function following a DBE, those components provide the ALT path from the MSIVs to the Condenser. 10 CFR 54.4(a)(2)
8. Directly support a safety-related function. Some of the HPCI nonsafety-related components preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)
9. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). The HPCI System maintains the reactor coolant pressure boundary and is also credited to meet NFPA 805 Performance Criteria. 10 CFR 54.4(a)(3)
10. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). The HPCI System includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
11. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The HPCI System is credited for reactor vessel pressure control, reactor vessel inventory control, and decay heat removal for Station Blackout. 10 CFR 54.4(a)(3)
12. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). 10 CFR 54.4(a)(3)
    - The HPCI System maintains the reactor coolant pressure boundary for SLC injection.
    - The HPCI System is credited for reactor makeup if the feedwater system is not available.

2.3.2.5 Residual Heat Removal System

Description

The Residual Heat Removal (RHR) System is designed for five modes of operation:

- Shutdown cooling
- Containment spray and pool cooling
- Low pressure coolant injection
- Standby Coolant
- Supplemental fuel pool cooling

The major equipment of the RHR System consists of four heat exchangers and four pumps for each unit. The equipment is connected by associated valves and piping, and the controls and instrumentation are provided for proper system operation.

The RHR pumps are sized on the basis of the flow required during the low pressure coolant injection (LPCI) mode of operation, which is the mode requiring the maximum flow rate. The heat exchangers are sized on the basis of their required duty for the pressure suppression pool cooling function.

The shutdown cooling subsystem is an integral part of the RHR system and is placed in operation during a normal shutdown and cooldown. The RHR system is typically placed in the shutdown cooling mode of operation when reactor vessel pressure has decreased sufficiently to clear the interlocks associated with the shutdown cooling suction valves. The shutdown cooling subsystem is capable of achieving reactor cooldown to maintain the reactor in cold shutdown condition.

The containment cooling subsystem provides a means for cooling the containment when operating in either the suppression pool cooling or containment spray modes. The suppression pool cooling mode provides a means to remove the reactor core decay heat and sensible heat discharged to the suppression pool in the event of a design basis accident or event. The containment cooling subsystem also provides the ability to reduce containment pressure by using the spray headers in the drywell and above the suppression pool.

The LPCI subsystem operates to restore and, if necessary, maintain the coolant inventory in the reactor vessel after a LOCA so that the core is sufficiently cooled to preclude excessive fuel clad temperature. The LPCI subsystem operates in conjunction with the high pressure coolant injection system, the automatic depressurization system, and the core spray system to achieve this goal. The LPCI subsystem is designed to reflood the reactor vessel to at least two-thirds core height and maintain this level. After the core has been flooded to this height, the capacity of one RHR pump is more than sufficient to maintain the level.

Standby coolant supply connection and RHR crossties are provided to maintain a long-term reactor core and primary containment cooling capability irrespective of primary containment integrity or operability of the RHR System associated with a given unit. The standby coolant supply connection and RHR crossties provide added long-term redundancy to the other emergency core and containment cooling systems and are designed to accommodate certain situations which, although unlikely to occur, could jeopardize the functioning of these systems.

The RHR System heat exchangers can be used to assist fuel pool cooling when required.

The RHR pump room coolers are included as part of the RHR System.

The RHR components that are nonsafety-related meet the criteria of 10 CFR 54.4(a)(2) as they include nonsafety-related fluid filled lines in the Reactor Building that have the potential for spatial interactions with safety-related SSCs and the RHR nonsafety-related piping is mechanically connected and provides structural support to the safety-related portion of the RHR System providing support to the structural integrity of the safety-related piping of the RHR.

The RHR System is described in detail in FSAR Section 4.8. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide reactor coolant pressure boundary. The RHR System provides Class 1 piping and valves which are part of the reactor coolant pressure boundary. 10 CFR 54.4(a)(1)
2. Remove residual heat from the reactor coolant system. The RHR System removes decay and sensible heat from the reactor coolant system. 10 CFR 54.4(a)(1)
3. Provide emergency core cooling where the equipment provides coolant directly to the core. The RHR System provides water from the suppression pool to be injected directly into the core region of the reactor vessel following a LOCA. 10 CFR 54.4(a)(1)
4. Provide primary containment boundary. The RHR System provides safety-related primary containment isolation capability on containment spray discharge, suppression pool suction, test return, and sample lines penetrating the primary containment. 10 CFR 54.4(a)(1)
5. Provide emergency heat removal from primary containment and provide containment pressure control. The RHR System supports maintaining the suppression pool temperature below required limits following a reactor blowdown. The RHR System also provides spray headers in the drywell and suppression pool vapor spaces to maintain internal pressure below design limits. 10 CFR 54.4(a)(1)
6. Sense process conditions and generate signals for reactor trip or engineered safety features actuation. The RHR System provides for associated actuation and system protection logic for engineered safety features operation. 10 CR 54.4(a)(1)
7. Maintain emergency temperature limits within areas containing safety-related components. The RHR System provides room coolers for the RHR pump rooms to maintain emergency temperature limits within areas containing safety-related components. 10 CFR 54.4(a)(1)
8. Ensure adequate cooling in the spent fuel pool to maintain stored fuel within acceptable temperature limits. The RHR System provides additional cooling capacity for spent fuel pool cooling. 10 CFR 54.4(a)(1)
9. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The RHR System includes nonsafety-related fluid filled piping and components in the Reactor Building which have the potential for spatial interaction with safety-related SSCs. 10 CFR 54.4(a)(2)
10. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The RHR System includes nonsafety-related piping and components that are directly connected to RHR safety related. 10 CFR 54.4(a)(2)
11. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The RHR System provides a portion of the reactor coolant pressure boundary. 10 CFR 54.4(a)(3)
12. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
13. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). The RHR System maintains the reactor coolant pressure boundary and is also credited to meet NFPA 805 Performance Criteria. 10 CFR 54.4(a)(3)

2.3.2.6 Core Spray System

Description

The Core Spray System provides a redundant means for removal of decay heat from the core following a postulated LOCA. The system also provides a means for flooding the reactor vessel to remove decay heat from the core to support alternate shutdown cooling.

The system consists of two independent loops per unit, each with two 50 percent capacity motor driven pumps and associate piping, valves and instrumentation necessary to perform the system intended functions. The Core Spray System automatically sprays water onto the top of the fuel assemblies upon receipt of signals indicative of a LOCA. The system delivers cooling water at a sufficient flow rate to cool the core and prevent excessive fuel clad temperature. The Core Spray System initiates on the same signal as the LPCI subsystems. Both Core Spray and LPCI operate independently to fulfill the same objective. The Core Spray System is maintained in a standby condition, powered by independent safeguard buses in the electrical distribution system.

The Core Spray System provides protection to the core for large break scenarios with resultant low reactor pressure. In addition protection can be afforded for small break scenarios in which the automatic depressurization system has initiated to lower reactor vessel pressure.

The core spray pump room coolers are included in the scope of the Core Spray System.

The Core Spray System is described in detail in FSAR Section 6.4.3. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

<u>Intended Functions</u>

1. Provide emergency core cooling where the equipment provides coolant directly to the core. The Core Spray System automatically sprays water onto the top of the fuel assemblies upon receipt of signals indicative of a LOCA. 10 CFR 54.4(a)(1)
2. Provide reactor coolant pressure boundary. The Core Spray System includes piping and valves that are part of the reactor coolant pressure boundary. 10 CFR 54.4(a)(1)
3. Provide primary containment boundary. The Core Spray System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
4. Sense process conditions and generate signals for reactor trip or engineered safety features actuation. The Core Spray System includes instrumentation that provides signals for interlocks, automatic controls, and to initiate credited manual actions. 10 CFR 54.4(a)(1)
5. Maintain emergency temperature limits within areas containing safety-related components. The Core Spray System includes room coolers that maintain acceptable temperatures in the core spray pump rooms during Core Spray System operation. 10 CFR 54.4(a)(1)
6. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Core Spray System includes nonsafety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)
7. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The Core Spray System includes nonsafety-related components that are mechanically connected to safety-related Core Spray components. 10 CFR 54.4(a)(2)
8. Directly support a safety-related function. The Core Spray System includes nonsafety-related piping and valves which preserve the structural integrity of the Secondary Containment boundary and pressure boundary interface with the condensate system ring header. 10 CFR 54.4(a)(2)
9. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram

(10 CFR 50.62). The Core Spray System provides a portion of the reactor coolant pressure boundary. 10 CFR 54.4(a)(3)

10. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components.
11. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). The Core Spray System maintains the reactor coolant pressure boundary and is also credited to meet NFPA 805 Performance Criteria. 10 CFR 54.4(a)(3)

2.3.2.7 Containment Atmosphere Dilution System

Description

The CAD System is a safety-related standby system used following a LOCA to maintain the oxygen concentration within the containment at less than five percent by volume. The CAD System nitrogen supply tank also supplies pressurized nitrogen to the Automatic Depressurization System (ADS) MSRV accumulators.

The CAD system nitrogen supply facilities include two trains, each of which is capable of supplying nitrogen through separate piping systems to the drywell and suppression chamber. Each train includes a liquid nitrogen supply tank, an ambient vaporizer, an electric heater, a manifold with branches to each primary containment, and pressure, flow, and temperature controls. The Containment Inerting System, including the combustible gas analyzers, is evaluated separately.

The CAD System is described in FSAR Section 5.2.6. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide primary containment boundary. The CAD System includes piping and valves that are part of the primary containment boundary. The CAD nitrogen supply tank supplies pressurized nitrogen to the ADS MSRV accumulators and the reactor building to torus vacuum breaker butterfly valves. 10 CFR 54.4(a)(1)
2. Control combustible gas mixtures within the primary containment atmosphere. The CAD System provides the capability to purge the containment with nitrogen and maintain containment atmosphere at less than five percent oxygen following a LOCA. 10 CFR 54.4(a)(1)
3. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
4. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). The CAD System controls combustible gas mixtures within the primary containment atmosphere and is also credited to meet NFPA 805 Performance Criteria. 10 CFR 54.4(a)(3)
5. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The CAD System is credited with being able to provide the ADS main steam safety relief valve accumulators with additional compressed gas inventory using the CAD System crosstie. 10 CFR 54.4(a)(3)

2.3.3 Auxiliary Systems

The following systems are addressed in this section:

- Emergency High Pressure Makeup System (2.3.3.1)
- Auxiliary Boiler System (2.3.3.2)
- Fuel Oil System (2.3.3.3)
- Residual Heat Removal Service Water System (2.3.3.4)
- Raw Cooling Water System (2.3.3.5)
- Raw Service Water System (2.3.3.6)
- High Pressure Fire Protection (Diesel Drive Pump) System (2.3.3.7)
- Potable Water System (2.3.3.8)

- Normal Ventilation System, includes Turbine Building Ventilation System, Radwaste Ventilation System, and Diesel Generator Room Ventilation System (2.3.3.9)
- Air Conditioning System (2.3.3.10)
- Control Air System (2.3.3.11)
- Service Air System (2.3.3.12)
- CO_2 Storage, Fire Protection/Purge System (2.3.3.13)
- Station Drainage System (2.3.3.14)
- Sampling and Water Quality System (2.3.3.15)
- Building Heating System (2.3.3.16)
- Hypochlorite System (2.3.3.17)
- Demineralizer Backwash Air System (2.3.3.18)
- Standby Liquid Control System (2.3.3.19)
- Off-Gas System (2.3.3.20)
- Emergency Equipment Cooling Water System (2.3.3.21)
- Reactor Water Cleanup System (2.3.3.22)
- Reactor Building Closed Cooling Water System (2.3.3.23)
- Auxiliary Decay Heat Removal System (2.3.3.24)
- Containment Inerting System (2.3.3.25)
- Radwaste System (2.3.3.26)
- Spent Fuel Pool Cooling/Cleanup System (2.3.3.27)
- Fuel Handling and Storage System (2.3.3.28)
- Standby Diesel Generators (2.3.3.29)
- Supplemental Diesel Generator System (2.3.3.30)
- Control Rod Drive System (2.3.3.31)
- Diesel Generator Starting Air System (2.3.3.32)
- Cranes and Hoists (2.3.3.33)
- Sewage System (2.3.3.34)
- Diverse and Flexible Coping Strategies (FLEX) System (2.3.3.35)
- Security System (2.3.3.36)
- Radiation Monitoring System (2.3.3.37)
- Hardened Containment Venting System (2.3.3.38)

2.3.3.1 Emergency High Pressure Makeup System

Description

The Emergency High Pressure Makeup (EHPM) System consists of a motor driven pump unit and associated valves and piping capable of delivering makeup water to the reactor vessel. The EHPM System includes dedicated medium and low voltage electrical components to ensure EHPM system power independence from existing site power distribution to the extent practicable. The EHPM System also includes electric room ventilation fans and associated duct work. The pump takes suction from the condensate system via the bottom of the condensate storage tank (CST) and discharges into the reactor feedwater line for delivery to the reactor vessel. The EHPM system provides emergency makeup water from the CST to the reactor vessel during fire events where the fire results in the normal (e.g., reactor feedwater) and emergency (e.g., emergency core cooling systems and RCIC) methods of reactor vessel inventory control are non-functional or ineffective.

Following any reactor shutdown, steam generation continues due to heat produced by the radioactive decay of fission products. The EHPM system provides inventory to a shutdown and isolated reactor vessel to compensate for inventory loss due to boil-off and reactor coolant leakage. During fire events where the normal (e.g., reactor feedwater) and emergency (e.g., emergency core cooling systems and RCIC) methods of reactor vessel inventory control are non-functional or ineffective, the EHPM system has a makeup capacity sufficient to maintain the core in a safe and stable state. The EHPM system is manually initiated and controlled.

The EHPM System is described in FSAR Section 10.25. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48).
   10 CFR 54.4(a)(3)
   - This system is included in the fire protection analysis to improve risk margin for core damage frequency and large and early release frequency. The EHPM system is used pump water from the CST to the reactor to improve risk margin for the NSPC Reactor Inventory Control Performance Criteria.

2.3.3.2 Auxiliary Boiler System

Description

The Auxiliary Boiler System provides a supply steam for the following:

- Building heating
- HPCI and RCIC testing
- Steam seal regulator at startup
- Condenser hotwell deaeration and heating at startup (Unit 1 and Unit 3)
- Steam jet air ejector (SJAE) operation at startup
- Radwaste evaporator (in place but not generally used)
- Off-gas preheater at startup
- Nitrogen evaporator
- Sellers jet
- Pegging steam for auxiliary deaerator

The Auxiliary Boiler System nonsafety-related components include fluid filled piping which is inside the Reactor Building with the potential for spatial interactions with safety-related SSCs.

In addition, the Auxiliary Boiler System contains nonsafety-related components that also serve the following safety functions: 1) provide the Alternate Leakage Treatment (ALT) path from the MSIVs to the condenser that limits radioactive materials release to the environment; and 2) preservation of the structural integrity of the Secondary Containment boundary and prevention of radioactive discharge to the environment.

The Auxiliary Boiler System is described in FSAR Section 10.20. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Auxiliary Boiler System includes nonsafety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)
2. Directly support a safety-related function. There are Auxiliary Boiler System nonsafety-related components that are relied upon to provide a safety-related function following a DBE. Those

components maintain the pressure boundary of the ALT path from the MSIVs to the Condenser. 10 CFR 54.4(a)(2)

3. Directly support a safety-related function. The Auxiliary Boiler System nonsafety-related components penetrate the Reactor Building and must preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)

2.3.3.3 Fuel Oil System

Description

The Fuel Oil System is a plant-shared system. The system provides fuel oil for the Standby Diesel Generators and the Auxiliary Boilers. The system includes fuel oil storage tanks and transfer equipment to supply the Standby Diesel Generators and the Auxiliary Boilers. The system also includes the piping, valves and connections to supply fuel oil from a temporary fuel oil tanker.

The Fuel Oil system consists of three interconnected, horizontal, cylindrical tanks for each diesel unit, a total of twenty-four for the eight diesel generators. The tanks are embedded in the substructure of the Standby Diesel Generator Buildings. The minimum storage capacity contains an adequate fuel supply for operating each diesel generator for seven days of post-LOCA operation. The seven day diesel generator run time is supported by meeting the Technical Specification requirements for minimum fuel oil level and fuel oil quality. Transfer pumps are provided to transfer fuel from the 7-day storage tanks to their associated diesel day tank. Each diesel has a day tank and pumps that supply the fuel injectors. The system is normally in standby and starts automatically when required to supply fuel to an operating diesel generator. Although not required to support the safety function of the diesels, each of the embedded seven-day storage tank assemblies can be supplied by either of two large nonsafety-related storage tanks or from a tank truck.

The Fuel Oil System is described in FSAR Sections 8.5.3.4 and 8.10. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide fuel oil to the Standby Diesel Generators. The Fuel Oil System provides and maintains an adequate fuel supply for operation of the Standby Diesel Generators for a period of seven days. 10 CFR 54.4(a)(1)
2. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Fuel Oil System includes nonsafety-related fluid filled lines in the Diesel Generator Building which have the potential for spatial interaction with safety-related SSCs in the Diesel Generator Building. 10 CFR 54.4(a)(2)
3. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The Fuel Oil System includes nonsafety-related components that are directly connected to the Standby Diesel Generator System (safety-related SSCs). 10 CFR 54.4(a)(2)
4. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
   - The Fuel Oil System maintains an adequate fuel supply for operation of the Standby Diesel Generator engines during the maximum-expected time interval between replenishment (seven days) and is required to meet the NSPC Vital Auxiliaries Performance Criteria.
   - The Fuel Oil System also supplies fuel to the High Pressure Fire Pump diesel engine.
5. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). Provide fuel oil to the Standby Diesel Generators. 10 CFR 54.4(a)(3)

2.3.3.4 Residual Heat Removal Service Water System

Description

The RHRSW System is a plant-shared system. The RHRSW System functions to remove heat from the RHR System and Emergency Equipment Cooling Water (EECW) System components by pumping water from Wheeler Reservoir through the Residual Heat Removal (RHR) heat exchangers and Emergency Equipment Cooling Water (EECW) System components and discharges back to Wheeler Reservoir.

The RHRSW System consists of 12 pumps, with four headers and the necessary piping, valves and controls to provide cooling water to the RHR heat exchangers and EECW System components. The pumps are located in the Intake Pumping Station. The EECW System is evaluated separately. Four pairs of pumps are normally assigned to the RHR System and four additional pumps are normally assigned to the EECW System. Each of the pairs (assigned to the RHRSW System) feeds one independent RHR service water header which, in turn, feeds one RHR heat exchanger in each unit. The entire system is seismic Class I.

The RHRSW pumps take suction below the breach of Wheeler Dam and will, therefore, remain operable in the unlikely event of failure of the dam. Each pump has the capacity to supply 100 percent of the cooling water required by one RHR heat exchanger.

The RHRSW and EECW Systems have the capability of utilizing FLEX pumps to provide make-up water to the reactor vessel and spent fuel pools, Drywell Spray header, and cooling water to the RHR heat exchanger and other essential equipment such as the core spray room coolers. The FLEX connections to RHRSW headers in Intake Pump Station Rooms B and D are designed to be utilized during a Beyond Design Basis External Event condition for a loss of off-site power event and if the site Standby Diesel Generators are inoperable.

The RHRSW System is described in detail in FSAR Section 10.9. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide heat removal from safety-related heat exchangers. The RHRSW System provides cooling water flow to transfer heat from the RHR Heat Exchangers and EECW System components. 10 CFR 54.4(a)(1)

2. Provide secondary containment boundary. The RHRSW System includes piping and valves that are part of the secondary containment boundary. 10 CFR 54.4(a)(1)
3. Provide flood protection. The RHRSW System includes sump pumps in the Intake Pumping Station to provide flood protection of essential equipment located in the pump rooms. 10 CFR 54.4(a)(1)
4. Resist spatial interaction of nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The RHRSW System includes nonsafety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)
5. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The RHRSW System includes nonsafety-related components that maintain structural integrity of the safety-related portions of the system. 10 CFR 54.4(a)(2)
6. Directly supports a safety-related function. The RHRSW System includes nonsafety-related piping that is relied upon to preserve the Secondary Containment safety-related function. 10 CFR 54.4(a)(2)
7. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). The RHRSW System is credited to remove decay heat to meet NSPC Decay Heat Removal Performance Criteria. 10 CFR 54.4(a)(3)

2.3.3.5 Raw Cooling Water System

Description

The Raw Cooling Water (RCW) System furnishes cooling water to the following plant components:

- Turbine lube oil coolers
- Generator stator water coolers
- Generator hydrogen coolers
- Reactor feed pump turbine oil coolers
- Service and control air compressors
- SJAE precoolers
- Generator exciter air coolers
- Air conditioning condensers
- Recirculation pump Variable Frequency Drive heat exchangers
- Reactor Building Closed Cooling Water heat exchangers
- Condensate booster pump motor heat exchanger
- CRD pump speed changer oil cooler and pump thrust bearing cooler
- Other miscellaneous coolers

There are 12 main RCW System pumps, located in the Turbine Building, and they are supplied with river water from the condenser circulating water conduits of each unit. For Units 1 and 2, three pumps are required per unit and one is provided as a spare, for a total of 7 RCW pumps. For Unit 3, three pumps are required and two are provided as spares, for a total of 5 RCW pumps. All pumps discharge into a common header.

The RCW System is described in FSAR Sections 5.3 and 10.7 and Appendix F.6.5. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide pressure boundary integrity to the EECW System 10 CFR 54.4(a)(1)
2. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The RCW System includes nonsafety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)
3. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function The RCW System includes nonsafety-related components that are directly connected and maintain structural integrity of safety related components. 10 CFR 54.4(a)(2)

4. Directly support a safety-related function. The RCW System nonsafety-related components penetrate the Reactor Building and must preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)
5. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
   - The RCW system provides cooling to the Condensate Pump and Condensate Booster Pump area cooling units, to the Condensate Pump motor bearings, and the Condensate Booster Pump lube oil coolers for all units. RCW supplies cooling water for the Unit 1 and Unit 2 Condensate Booster Pump motor bearings. The RCW system is needed to meet NSPC Inventory Control Performance Criteria.
   - The RCW system provides cooling to the Control Air System air compressors. The RCW system is needed to meet the NSPC Vital Auxiliaries Performance Criteria.
   - In the event of a real or spurious accident signal during a fire event, components within this system are designed and required to load shed in order to meet Performance Criteria.

2.3.3.6 Raw Service Water System

Description

The objective of the Raw Service Water (RSW) System is to supply river water for yard-watering, cooling for plant equipment which the RCW System may not conveniently serve, and to function as a keep-fill system for the raw water Fire Protection System. The RSW system supplies Condenser Circulating Water (CCW) bearing seal and lubrication water. The CCW system is required to meet the NFPA 805 Vital Auxiliaries Nuclear Safety Performance Criteria.

The RSW System furnishes water for yard-watering, cooling for miscellaneous plant equipment which require small quantities of cooling water, and functions as a keep-fill system for the raw water fire protection system. The RSW System is supplied river water from the CCW inlet conduit through a strainer section to the main RCW pump suction header for each unit. Unit 1 and Unit 2 each have one RSW pump and Unit 3 has two RSW pumps. Therefore, four pumps supply the common plant system. The pumps discharge into a distribution system common to the raw service water and fire protection systems. Two 10,000-gallon capacity storage tanks are located atop the Reactor Building. Water level in the tanks controls operation of the RSW pumps except during operation of the High Pressure Fire Protection (HPFP) pumps or when the RSW pumps are in manual with the storage tanks isolated from the system. When the HPFP pumps are operating, the RSW pumps will automatically be de-energized (unless in manual) and the RSW storage tanks will also be isolated from the system.

The RSW System is described in FSAR Section 10.8. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The RSW System includes nonsafety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)
2. Directly support a safety-related function. The RSW System nonsafety-related components penetrate the Reactor Building and must preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)

3. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48).
   10 CFR 54.4(a)(3)
   - The RSW system provides water to function as a keep-fill system for the HPFP System.
   - The RSW system provides CCW pump bearing seal and lubricating water to support the vital auxiliaries NSPC

2.3.3.7 High Pressure Fire Protection (Diesel Driven Pump) System

Description

The objective of the HPFP System is to provide an adequate water delivery and distribution system to extinguish fires inside and outside of buildings and provide adequate fire protection for the entire plant. It supplies water for fixed water spray, pre-action sprinkler, and aqueous foam systems for selected equipment and areas in the Control Bay (which includes the control rooms) of the Reactor Buildings, the Reactor Buildings, the Turbine Buildings, the Intake Pumping Station, the Transformer Yard, Diesel Generator Buildings, and Service Buildings.

The HPFP System is a plant-shared system. The system is supplied water by three motor- driven pumps at the Intake Pumping Station and a single diesel driven pump located in a building adjacent to Gate Structure Number 2 on the cold water channel. The pumps discharge into a common header for distribution throughout the plant to hydrants, hose racks, hose connections, and water spray systems. Included in the HPFP System are detection and alarm devices that automatically initiate the system and prompt manual fire firefighting activities using the system.

The HPFP System is described in FSAR Sections 1.6.5.4 and 10.11 and Appendix F.6.9. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide secondary containment boundary. The HPFP System includes safety related components (valves) that are part of the Secondary Containment boundary.
   10 CFR 54.4(a)(1)
2. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The HPFP System includes nonsafety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Buildings and Diesel Generator Buildings.
   10 CFR 54.4(a)(2)
3. Directly support a safety-related function. The HPFP System nonsafety-related components penetrate the Reactor Building and must preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)
4. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48).
   10 CFR 54.4(a)(3)
   - The HPFP System ensures adequate fire protection features are available to detect, confine, and extinguish fires occurring in any portion of the facility where NFPA 805 credited equipment or equipment in risk significant areas is located.

2.3.3.8 Potable Water System

Description

The Potable Water System is a plant-shared system which supplies potable water to various areas in the plant. This water source is supplied by the city of Athens, Alabama. Backflow preventers are installed at each cross connection to other systems to protect the potable water supply from possible contamination due to backflow.

The Potable Water System is described in FSAR Section 10.15. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Potable Water System includes nonsafety-related fluid filled components which have the potential for spatial interaction with safety-related components. 10 CFR 54.4(a)(2)
2. Directly support of a safety-related function. The Potable Water System includes nonsafety-related piping that is relied upon to preserve the Secondary Containment safety-related function. 10 CFR 54.4(a)(2)

2.3.3.9 Normal Ventilation System

Description

The Ventilation System has subsystems to provide ventilation and heating for various plant buildings. Reactor Building, Turbine Building, Radwaste Building, and Diesel Generator Buildings have separate systems for year-round ventilation. The Turbine Building, Radwaste Building, and Diesel Generator Building Ventilation Systems are included in this screening evaluation of the Normal Ventilation System. The Control Bay Ventilation System is evaluated separately (Air Conditioning System). A common plant heating system serves the Reactor, Turbine, and Radwaste Buildings. The Diesel Generator Buildings are equipped with electric resistance heaters. Heating systems are evaluated separately (Building Heat System).

The Reactor Building Normal Ventilation System interfaces with the Secondary Containment System, which is evaluated separately. The Reactor Building Normal Ventilation System is isolated and operation of the Standby Gas Treatment System initiated by low reactor water level, high drywell pressure, high radiation in a Reactor Building ventilation system, or a manual signal from the Main Control Room.

The Radwaste Building Ventilation System contains air/gas filled lines which connect with safety-related and nonsafety-related SSCs. Portions of the nonsafety-related components provide direct structural support for the safety-related SSCs.

The Unit 3, 250-V Battery Room 3EB, is ventilated and maintained at a negative pressure with two redundant roof mounted exhaust fans, each with associated backdraft dampers. The Unit 1 and 2, 250-V Battery Rooms are ventilated and maintained at a negative pressure by the Control Bay Ventilation System, which is evaluated separately.

For the four 4160-V Shutdown Board Rooms of Unit 3 (3EA, 3EB, 3EC, and 3ED) and the Bus Tie Board Room, air conditioning is provided. In addition, outdoor air is available for pressurization and exhaust. The Unit 1 and 2, 4160-V Electric Board Rooms are ventilated by the Control Bay Ventilation System, which is evaluated separately.

The Normal Ventilation System (including the Turbine Building Ventilation System, Radwaste Building Ventilation System, and Diesel Generator Room Ventilation System) are described in FSAR Section 10.12. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide secondary containment boundary. The Normal Ventilation System includes piping, ductwork, and valves that are part of the secondary containment boundary. 10 CFR 54.4(a)(1)
2. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. Nonsafety-related Radwaste Building Ventilation SSCs are mechanically connected and provide structural support to the safety-related SSCs. 10 CFR 54.4(a)(2) (Radwaste Building Ventilation System Only)

3. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The Diesel Generator Room Ventilation System is relied upon to be operable following a Station Blackout event. 10 CFR 54.4(a)(3)
4. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
   - The Reactor Building Ventilation, Turbine Building Ventilation, and Radwaste Building Ventilation Systems prevent the release of radioactive materials to the environment and is required to meet the NSPC Radioactive Release Performance Criteria.
   - The Reactor Building Ventilation, Turbine Building Ventilation, Radioactive Waste Building Ventilation, and Diesel Generator Room Ventilation Systems Fire Dampers prevent propagation of fire between fire areas.
   - The Diesel Generator Room Ventilation System provides ventilation to the safety-related equipment in the Diesel Generator Buildings. This supports NSPC Vital Auxiliaries Performance Criteria.
   - Battery vent hoods and exhaust ducts associated with the Diesel Generator Room Ventilation System prevent combustible concentrations of hydrogen buildup.
   - In the event of a real or spurious accident signal during a fire event, components within the Normal Ventilation Systems must load shed to meet the NSPC Vital Auxiliaries Performance Criteria.

2.3.3.10 Air Conditioning System

Description

The Air Conditioning System otherwise known as the Control Building Heating, Ventilating, and Air Conditioning Systems serve the three floors in the control bay and the six shutdown electrical board rooms in the Reactor Building immediately adjacent to, and normally entered from, the control bay. There are several separate subsystems serving these areas. The Control Building air conditioning is divided into eight general areas.

The HVAC subsystems provide air-conditioned ventilation for various plant areas. The HVAC Systems provide:

- Environmental control of the control bay so that personnel occupancy can be maintained in the control room during any type of accident, including events that produce radioactive and toxic gas hazards.
- Ventilation and cooling so that the temperatures of the control bay and shutdown electrical board rooms (including those in the Unit 3 Diesel Generator Building) are maintained within acceptable limits for the operation of instruments and other equipment during accidents and events.
- Battery room ventilation to prevent the buildup of explosive gases.
- Cooling of various electrical equipment rooms, e.g., computer and communications so that the temperature is maintained within acceptable limits for the operation of instruments and other equipment when required.

The Control Room Emergency Ventilation System (CREVS) processes outside air needed to provide ventilation and pressurization for the Control Room Habitability Zone (CRHZ) during isolated conditions. When the CRHZ is isolated, a fixed amount of outside air is processed through a HEPA filter bank, air heater, charcoal absorbers, and post filters. A seismically-qualified safety-related CREVS, composed of two redundant trains, is provided in the Unit 2 control bay area. This system of filtered outside air aids in positive pressurization of the CRHZ with respect to the outdoors. The CREVS is started automatically by a primary containment isolation signal or high radiation signal from the Control Building intake duct radiation monitors, or it can be started manually.

The Air Conditioning System is described in FSAR Sections 10.12 and Appendix F.7.11. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

<u>Intended Functions</u>

1. Provide centralized area for control and monitoring of nuclear safety-related equipment. The Air Conditioning System maintains environmental conditions and ensures the safety and comfort of operating personnel in the control room. The system also provides a filtered fresh air supply during adverse plant conditions. 10 CFR 54.4(a)(1)
2. Maintain temperature limits within areas containing safety-related components. The Air Conditioning System maintains environmental conditions to ensure that the operability of safety-related equipment in the control room and electric board rooms. 10 CFR 54.4(a)(1)
3. Provide secondary containment boundary. The Air Conditioning System includes piping, ductwork, and valves that are part of the Secondary Containment boundary. 10 CFR 54.4(a)(1)
4. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Air Conditioning System includes nonsafety-related fluid filled lines in the Control Bay which have the potential for spatial interaction with safety-related SSCs in the Control Bay. 10 CFR 54.4(a)(2)
5. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The Air Conditioning System nonsafety-related piping is mechanically connected and provides structural support to the safety-related portion of the Air Conditioning System. 10 CFR 54.4(a)(2)
6. Directly supports a safety-related function. The Air Conditioning System nonsafety-related components penetrate the Reactor Building and must preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)
7. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
8. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The Air Conditioning System maintains environmental conditions and ensures the safety and comfort of operating personnel in the control room. 10 CFR 54.4(a)(3)
9. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The Air Conditioning System maintains environmental conditions to ensure that the operability of safety-related equipment in the control room and electric board rooms. 10 CFR 54.4(a)(3)
10. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - Provides cooling and pressurization of the Control Bay Mechanical Equipment Rooms. The system also recirculates air conditioning of the Main Control Rooms, Auxiliary

Instrument Rooms, Battery Board Rooms, Relay Room, essential MG Set Rooms, and the Reactor Building Board Rooms of Units 1, 2, and 3. The system also provides a filtered fresh air supply during adverse plant conditions. The Air Conditioning system is needed to meet NSPC Vital Auxiliaries Performance Criteria.

- Control Bay HVAC Fire Dampers prevent propagation of fire between fire areas.
- In the event of a real or spurious accident signal during a fire event, components within the Air Conditioning System may load shed to meet the NSPC Vital Auxiliaries Performance Criteria.

<u>Components Subject to AMR</u>

The component types that require aging management review are indicated in the below Table 2.3.3-10, Air Conditioning System.

Table 2.3.3-10, Air Conditioning System

Component Type	Passive Intended Functions
Closure Bolting	Mechanical Closure
Ducting, Ducting Components	Pressure Boundary, Fire Barrier, Structural Support
External Surfaces	Pressure Boundary, Fire Barrier
Fire Damper	Pressure Boundary, Fire Barrier, Structural Support
Heat Exchangers	Pressure Boundary, Heat Transfer
Insulated Piping, Piping Components, Tank	Pressure Boundary, Structural Support
Piping, Piping Components	Pressure Boundary, Structural Support

The aging management review results for these components are provided in Table 3.3.2-10, Air Conditioning System - Summary of Aging Management Evaluation.

2.3.3.11 Control Air System

Description

The Control Air and Drywell Control Air System provides clean, dry, oil free compressed air or nitrogen (Drywell Control Air portion only) as motive force for numerous plant components during normal and post-accident operations. The Control Air portion supplies compressed air to various users throughout the plant except for user locations inside the drywell which is supplied compressed nitrogen taken from the containment inerting system and delivered by Drywell Control Air portions of the system.

The Control Air System provides:

- Motive power for numerous plant components during normal operations
- Post-accident motive power to the MSIV and the MSRVs for reactor vessel overpressure relief protection, and reactor vessel depressurization including the ADS function
- Post-accident motive power to torus vacuum breaker valves

Each unit has a separate compressed nitrogen system for its primary containment. The primary containment system for each unit consists of two compressors that take suction from the primary containment atmosphere and supply components in the primary containment. The Primary Containment System normally operates and isolates post accident. Post accident and post event motive force for primary containment components is provided by accumulators and, long term, by manually initiated interconnections with the CAD System or bottled nitrogen.

The Control Air System has five air compressors that are connected to a common discharge header. The common discharge header supplies an air dryer in each unit that then discharges into a unit header that supplies all unit loads. Valving allows each unit header to be connected to the adjacent unit's header. The system is normally operating. Essential components that are actuated by this portion of the control air system will fail to their required post accident configuration upon loss of control air. In some cases (such as the outboard MSIVs), an accumulator is provided to boost the accident actuation.

The Control Air System is described in FSAR Section 10.14. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide motive power to safety-related components. The Control Air System provides compressed air to accumulators to assure the ADS MSRVs will be held open, and the inboard MSIVs may be closed following control air failure. The Control Air System also provides compressed air to accumulators to assure the outboard MSIVs may be closed. 10 CFR 54.4(a)(1)
2. Provide primary containment boundary. The Control Air System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
3. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The Control Air System nonsafety-related piping is mechanically connected and provides structural support to the safety-related portion of the Control Air System. 10 CFR 54.4(a)(2)
4. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
5. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
   - The Control Air System provides air to several air operated valves required for safe shutdown, including valves in the main flow paths and valves that must close to prevent flow diversion to meet NSPC Reactor Inventory Control Performance Criteria.
   - The Control Air System is a support system for systems required to meet the NSPC Vital Auxiliaries Performance Criteria.
6. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). Provide motive force for operating MSRVs. 10 CFR 54.4(a)(3)

2.3.3.12 Service Air System

Description

The Service Air System is a plant-shared system. The Service Air System consists of two air compressors located in the turbine building and associated piping that extends throughout the plant including into the reactor buildings.

The Service Air System provides pressurized air to:

- Hose connections throughout the plant and yard
- Miscellaneous equipment in the SLC System, Amertap Condenser Tube Cleaning System (subsystem of the CCW System), Condensate Demineralizer Air Surge System, and the Radwaste System

The Service Air System is described in FSAR Section 10.14. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Directly support a safety-related function. The Service Air System includes nonsafety-related piping that is relied upon to preserve the structural integrity of the Secondary Containment safety-related function. 10 CFR 54.4(a)(2)
2. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3).
    - The Service Air System is a backup to the Control Air System which is a support system for systems required to meet the NSPC Vital Auxiliaries Performance Criteria.

2.3.3.13 CO_2 Storage, Fire Protection/Purge System

Description

The primary function of the CO_2 Storage, Fire Protection/Purging (CO_2/FP) System is to mitigate the consequences of a fire in protected areas such as the Diesel Generator (DG) buildings and control bays. In addition to the primary function, the CO_2/FP system supplies CO_2 for purging hydrogen from the main generator.

The CO_2/FP System is a fire suppression system contain electrical, lubricating oil, or fuel oil components. Units 1 and 2 share a system that includes a 17-ton storage tank. Unit 3 has a separate system with a 6-ton tank. The system is normally in standby and initiates automatically when required. When initiated, ventilation systems that could reduce the effectiveness of the CO_2 discharge are isolated. Detection and alarm devices that automatically initiate the system or would prompt manual fire firefighting activities are included in the CO_2/FP System.

The CO_2/FP system is a nonsafety-related system designed not to inadvertently initiate during a shutdown after the applicable DBEs. Release of CO_2 into the control bays would adversely affect manual operation of safety-related equipment and habitability in the protected rooms as well as cause temperature buildup due to HVAC System isolation. Release of CO_2 into the diesel generator compartments would cause sealing of the compartments and possible overheating of the diesel generator rooms because of inadequate ventilation. The prevention of overheating of the diesel generator rooms is a safety-related protective function of the CO_2/FP System.

The CO_2/FP System is described in FSAR Section 1.6.5.4 and Appendices F.6.9 and F.7.6. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Directly support a safety-related function. The CO_2/FP System nonsafety-related components are relied upon to not inadvertently release CO_2 in the diesel generator rooms and control bays. 10 CFR 54.4(a)(2)
2. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
   - The CO_2/FP System is to mitigate the consequences of a fire in protected areas such as the Diesel Generator Building and control bay.
   - In the event of a real or spurious accident signal during a fire event, components within this system are designed and required to load shed in order to meet the NSPC Vital Auxiliaries Performance Criteria.

2.3.3.14 Station Drainage System

Description

The Station Drainage System is a plant-shared system. The Station Drainage System collects, processes, stores, and disposes of non-radioactive liquid waste.

The Station Drainage System is described in FSAR Section 10.16. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Station Drainage System includes nonsafety-related fluid filled components in the Reactor Buildings and Diesel Generator Buildings which have the potential for spatial interaction with safety-related components. 10 CFR 54.4(a)(2)
2. Directly support of a safety-related function. The Station Drainage System includes nonsafety-related piping that is relied upon to preserve the Secondary Containment safety-related function. 10 CFR 54.4(a)(2)

2.3.3.15 Sampling and Water Quality System

Description

The Sampling and Water Quality System provides the capability to obtain representative samples for testing to obtain data. The data is used to evaluate the performance of the plant, equipment, and systems during normal plant operations. Water samples can be obtained from the RWCU, Main Steam, Condensate, Feedwater, Radwaste, Fuel Pool Cooling, Reactor Building Closed Cooling Water, RHRSW, and various auxiliary systems. Gas samples can be obtained from SJAEs, the Off-Gas System, and the main stack.

Using a post accident sample subsystem, representative samples of reactor coolant, torus liquid, drywell atmosphere, torus atmosphere, and secondary containment atmosphere can be obtained after a LOCA to guide post-LOCA actions.

Portions of the Sampling and Water Quality System contain components that interface with systems in the reactor building, including RWCU, RHR, and RHRSW. Other portions of the system interface with the Reactor Recirculation System and the Reactor Building Closed Cooling Water System in the primary containment.

The Sampling and Water Quality System includes non-safety-related fluid and gas filled components (piping, tanks, heat exchangers, etc.) in the Reactor Building which have the potential for spatial interaction with safety-related components. Also, non-safety-related Sampling and Water Quality System piping is mechanically connected to other same system safety-related piping. Non-safety-related Sampling and Water Quality piping penetrates the Primary and Secondary Containment boundaries.

The Sampling and Water Quality System is described in FSAR Sections 10.17 and 10.21. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide primary containment boundary. The Sampling and Water Quality System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
2. Provide system pressure boundary integrity. The Sampling and Water Quality System includes piping and components that interface with the RWCU, RHR, RHRSW, Reactor Recirculation and the Reactor Building Closed Cooling Water Systems that are required to maintain their pressure boundary integrity so as not to jeopardize the ability of those systems to perform their nuclear safety functions. 10 CFR 54.4 (a)(1)
3. Provide reactor coolant pressure boundary. The Sampling and Water Quality System includes piping and valves that are part of the reactor coolant pressure boundary. 10 CFR 54.4 (a)(1)
4. Resist spatial interaction of non-safety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Sampling and Water Quality System includes non-safety related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)
5. Resist structural interactions from mechanically connected non-safety related piping that could prevent satisfactory accomplishment of a safety-related function. The Sampling and

Water Quality System includes non-safety related components that maintain structural integrity of the safety-related portions of the system. 10 CFR 54.4(a)(2)

6. Directly support a safety-related function. The Sampling and Water Quality System includes non-safety related piping and valves that are relied upon to preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)
7. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The Sampling and Water Quality System provides a portion of the reactor coolant pressure boundary. 10 CFR 54.4(a)(3)
8. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)

The aging management review results for these components are provided in Table 3.3.2-15, Sampling and Water Quality System - Summary of Aging Management Evaluation.

2.3.3.16 Building Heating System

Description

The Building Heating System maintains required temperatures for equipment protection and personnel comfort during the winter months. The Building Heating System is a plant-shared system. The Building Heating System is a forced hot water system that operates as required to maintain a minimum temperature of 55 degrees F in various plant buildings including the reactor building. The hot water is heated by the Auxiliary Boiler System and preheats building intake air. The nonsafety-related fluid filled piping in the Reactor Building has the potential for spatial interaction with safety-related components. Additionally, nonsafety-related Building Heating System piping penetrates the Secondary Containment boundary.

The Building Heating System is described in FSAR Section 10.12.5. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Building Heating System includes nonsafety-related liquid filled piping in the Reactor Building which has the potential for spatial interaction with safety-related components. 10 CFR 54.4(a)(2)
2. Directly support a safety-related function. The Building Heating System includes nonsafety-related piping and valves that are relied upon to preserve the Secondary Containment safety-related function. 10 CFR 54.4(a)(2)

3. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48).
   10 CFR 54.4(a)(3)
   - In the event of a real or spurious accident signal during a fire event, components within the Building Heating System are designed and required to load shed in order to meet the NSPC Vital Auxiliaries Performance Criteria.

2.3.3.17 Hypochlorite System

Description

The Hypochlorite System, also called the Raw Water Chemical Treatment System, prevents bio-fouling of systems (including the EECW and RHRSW Systems) that use water from Wheeler Reservoir by providing the capability of injecting a biocide into the fluid stream.

Hypochlorite System piping and components at the RHRSW and EECW System interfaces are required to maintain their pressure boundary so as not to jeopardize the ability of the RHRSW and EECW Systems to perform their nuclear safety functions.

The Hypochlorite System is not described in the FSAR. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide pressure boundary integrity. The Hypochlorite System includes piping and components at the RHRSW and EECW System interfaces that are required to maintain their pressure boundary integrity so as not to jeopardize the ability of the RHRSW and EECW Systems to perform their nuclear safety functions. 10 CFR 54.4(a)(1)
2. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Hypochlorite System includes nonsafety-related fluid filled lines in the Intake Pumping Station which have the potential for spatial interaction with safety-related SSCs in the Intake Pumping Station. 10 CFR 54.4(a)(2)
3. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The Hypochlorite System nonsafety-related piping is mechanically connected and provide structural support to the safety-related portion of the Hypochlorite System. 10 CFR 54.4(a)(2)

2.3.3.18 Demineralizer Backwash Air System

Description

The Demineralizer Backwash Air System supplies a high volume of low pressure air for backwashing plant demineralizers. The system is a plant-shared system that has two compressors located in the turbine building. The system supplies the condensate demineralizers in the turbine building and penetrates secondary containment to supply the RWCU and fuel pool cooling demineralizers in the Reactor Building. The system is normally in standby and is operated manually when required for backwashing demineralizers. The Demineralizer Backwash Air System includes nonsafety-related piping and valves that are relied upon to preserve structural integrity for the safety-related function of Secondary Containment.

The Demineralizer Backwash Air System is discussed in FSAR Section 5.3.3. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Directly support a safety-related function. The Demineralizer Backwash Air System includes nonsafety-related piping and valves in the Reactor Building that are relied upon to preserve structural integrity for the safety-related function of Secondary Containment.

2.3.3.19 Standby Liquid Control System

Description

The purpose of the SLC System is to provide a backup method, which is independent of the control rods, to make the reactor subcritical over its full range of operating conditions and provide sufficient buffering agent to maintain the suppression pool pH at or above 7.0 following a DBA LOCA involving fuel damage. Making the reactor subcritical is essential to permit the nuclear system to cool to the point where corrective actions can be carried out. Maintaining the suppression pool pH at or above 7.0 following a LOCA involving fuel damage supports the LOCA radiological dose analyses that do not consider the re-evolution of iodine to the containment atmosphere.

The system is designed to make the reactor subcritical from rated power to a cold shutdown at any time in core life. The reactivity compensation provided will reduce reactor power from rated to the after-heat level and allow cooling the nuclear system to normal temperature with the control rods remaining withdrawn in the rated power pattern. It includes the reactivity gains due to complete decay of the rated power xenon inventory. It also includes the positive reactivity effects from eliminating steam voids, changing water density from hot to cold, reduced Doppler effect in uranium, reduction of neutron leakage from the boiling to cold condition, and decreasing control rod worth as the moderator cools.

The system consists of a boron solution tank, a test water tank, two positive-displacement pumps, two explosive-actuated valves, and associated local valves and controls. They are mounted in the Reactor Building outside the primary containment. The liquid is piped into the reactor vessel via the differential pressure and liquid control line and discharged near the bottom of the core lower support plate through a standpipe so it mixes with the cooling water rising through the core.

The SLC System is described in FSAR Section 3.8. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide reactor coolant pressure boundary. The SLC System includes piping and valves that are part of the reactor coolant pressure boundary. 10 CFR 54.4(a)(1)
2. Provide primary containment boundary. The SLC System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
3. Resist spatial interaction of nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The SLC System includes nonsafety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)
4. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The SLC System includes nonsafety-related components that maintain structural integrity of SLC mechanical connections with reactor coolant pressure boundary and primary containment boundary. 10 CFR 54.4(a)(2)
5. Directly support a safety-related function. The SLC system is relied upon for the safety-related function of maintaining pH in the suppression pool above 7.0 in the event of a DBA LOCA by injecting a buffering agent to the Reactor Vessel. 10 CFR 54.4(a)(2)
6. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The SLC System the reactor coolant pressure boundary for SLC injection. 10 CFR 54.4(a)(3)
7. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The SLC System injects sodium pentaborate solution into the reactor to achieve shutdown for mitigation of an ATWS. 10 CFR 54.4(a)(3)
8. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)

- The SLC System is included in the NFPA 805 analyses only for potential spurious operation causing credited EDG overload to demonstrate the NSPC Vital Auxiliaries Performance Criteria is met.
- Provide reactor coolant pressure boundary. The SLC System includes piping and valves that are part of the reactor coolant pressure boundary.

Components Subject to AMR

The component types that require aging management review are indicated in the below Table 2.3.3-19, Standby Liquid Control System.

Table 2.3.3-19, Standby Liquid Control

Component Type	Passive Intended Functions
Class 1 Piping, Fittings and Branch Connections < NPS 4	Pressure Boundary
Closure Bolting	Mechanical Closure
External Surfaces	Pressure Boundary
Insulated Piping, Piping Components, Tanks	Pressure Boundary
Piping, Piping Components	Pressure Boundary
Reactor Coolant Pressure Boundary Components	Pressure Boundary

The aging management review results for these components are provided in Table 3.3.2-19, Standby Liquid Control System - Summary of Aging Management Evaluation.

2.3.3.20 Off-Gas System

Description

The Off-Gas System includes subsystems that process and dispose of the gases produced during normal operation from the main condenser SJAEs, the startup condenser vacuum pumps, the condensate drain tank vent, and the steam packing exhauster. The Off-Gas System includes dilution fans and stack cubicle exhaust fans that provide dilution air for the main stack. One Off-Gas System is provided for each unit. The gases are processed to minimize the radioactive release and then are routed to the plant stack for dilution and elevated release to the atmosphere. The Standby Gas Treatment System discharges into the Off-Gas System and routed to the plant stack. Backdraft dampers limit the amount of a ground level radioactive release during accidents that require operation of the Standby Gas Treatment System.

The Off-Gas System is described in FSAR Sections 9.5 and 11.4. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide system pressure boundary integrity. The Off-Gas System includes piping and components including backdraft dampers that interface with the Standby Gas Treatment System that are required to maintain their pressure boundary integrity so as not to jeopardize the ability of the Standby Gas Treatment System to perform its nuclear safety functions. 10 CFR 54.4(a)(1)
2. Sense process conditions and generate signals for automatic closure of back-draft prevention dampers. The Off-Gas System includes instrumentation that provides signals for automatic closure of back-draft prevention dampers to prevent back flow and potential ground level release of radiation during a design basis accident or event. 10 CFR 54.4(a)(1)
3. Resist structural interactions from mechanically connected nonsafety-related ductwork that could prevent satisfactory accomplishment of a safety-related function. The Off-Gas System includes nonsafety-related ductwork that maintain structural integrity of safety-related Off-Gas System components. 10 CFR 54.4(a)(2)
4. Resist spatial interaction of nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Off-Gas System includes nonsafety-related fluid filled lines in the Radwaste Building which have the potential for spatial interaction with safety-related SSCs in the Radwaste Building. 10 CFR 54.4(a)(2)
5. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
   - In the event of a real or spurious accident signal during a fire event, components within the Off-Gas System are designed and required to load shed in order to meet the NSPC Vital Auxiliaries Performance Criteria.

2.3.3.21 Emergency Equipment Cooling Water System

Description

The EECW System provides cooling water to equipment that is essential for safe shutdown. The EECW System also provides backup cooling water supply to the Reactor Building Closed Cooling Water System heat exchangers.

The RHRSW System supplies water to the EECW System. The RHRSW System is evaluated separately. The EECW System is a plant-shared system. The EECW System has two headers that use dedicated RHRSW pumps to supply water from Wheeler Reservoir to heat exchangers cooling the following equipment: EDG engine coolers, Core Spray pump room coolers, RHR pump seal coolers and room coolers, Control Bay chillers, hydrogen and oxygen containment gas analyzers, and Electric Board Room chillers. Four pumps from the RHRSW System are assigned to the EECW System and are paired, with one pair serving each of the two EECW headers. If necessary, one of each pair of pumps normally assigned to the RHRSW System can be manually realigned to the EECW System.

The EECW System is described in FSAR Section 10.10. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provides heat removal from safety-related heat exchangers. The EECW System provides cooling water to transfer heat from safety-related heat exchangers. 10 CFR 54.4(a)(1)

2. Sense process conditions and generate signals to support accomplishment of a safety-related function. The EECW System includes instrumentation that provides a valve position interlock signal for auto-start of RHRSW pumps. 10 CFR 54.4(a)(1)
3. Provide secondary containment boundary. The EECW System includes piping and valves that are part of the secondary containment boundary. 10 CFR 54.4(a)(1)
4. Resist spatial interaction of nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The EECW System includes nonsafety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)
5. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The EECW System includes nonsafety-related components that maintain structural integrity of the safety-related portions of the system. 10 CFR 54.4(a)(2)
6. Directly supports a safety-related function. The EECW System nonsafety-related components penetrate the Reactor Building and must preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)
7. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
8. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - The EECW System supports the LPCI mode of RHR and Core Spray which are needed to meet NSPC Reactor Inventory Control Performance Criteria.
    - The EECW System supports the suppression pool cooling mode, LPCI mode during alternate shutdown cooling, and the shutdown cooling mode of the RHR system which is needed to meet the Decay Heat Removal Performance Criteria.
    - The EECW System supports the drywell spray mode of RHR which is needed to meet the NSPC Vital Auxiliaries Performance Criteria.
    - The EECW System is required to meet the Vital Auxiliaries Performance Criteria.
    - The EECW System supports the Control Bay HVAC and the Electric Board Room Chillers, which are needed to meet the NSPC Vital Auxiliaries Performance Criteria.
    - The EECW System supports the EDGs, which are support systems needed to meet NSPC Vital Auxiliaries Performance Criteria.
    - The EECW System serves as a backup to the RCW System for Control Air components, which is needed for the NSPC Vital Auxiliaries Performance Criteria.
9. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The EECW System provides cooling water to transfer heat from safety-related heat exchangers for equipment credited for a Station Blackout. 10 CFR 54.4(a)(3)

2.3.3.22 Reactor Water Cleanup System

Description

The RWCU System maintains high reactor-water purity to limit chemical and corrosive action, thereby limiting fouling and deposition on heat transfer surfaces. The RWCU System also removes corrosion products to limit impurities available for activation by neutron flux and resultant radiation from deposition of corrosion products. The system also provides a means for removal of reactor water.

The RWCU System provides continuous purification of a portion of the recirculation flow. The processed fluid is returned to the reactor vessel via the Feedwater System through the RCIC System and the HPCI System (Unit 3 only), to the Radwaste System, or to the main condenser. Regenerative heat exchangers are provided to limit heat loss from the nuclear system. The system can be placed in service at any time during normal reactor operation or shutdown conditions.

The major equipment of the RWCU System is located in the Reactor Building and consists of two pumps, regenerative and non-regenerative heat exchangers, and two filter/demineralizers with supporting equipment. The entire system is connected by associated valves and piping, and controls and instrumentation are provided for proper system operation. The RWCU System automatically isolates upon accident initiation and upon SLC System actuation.

The RWCU System is described in FSAR Section 4.9. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide reactor coolant pressure boundary. The RWCU System includes piping and valves that are part of the reactor coolant pressure boundary. 10 CFR 54.4(a)(1)
2. Provide primary containment boundary. The RWCU System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
3. Provide system pressure boundary to support accomplishment of a safety-related function. The RWCU System includes a return isolation check valve to interconnections with the HPCI System to prevent diversion of HPCI flow from the reactor vessel. (Unit 3 only) 10 CFR 54.4(a)(1)
4. Resist spatial interaction of nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The RWCU System includes nonsafety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)
5. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The RWCU System includes nonsafety-related components that maintain structural integrity of the safety-related portions of the system. 10 CFR 54.4(a)(2)
6. Directly supports a safety-related function. The RWCU system includes nonsafety-related piping and valves in the blowdown/drain to radwaste that are relied upon to preserve the structural integrity of the Secondary Containment boundary. 10CFR 54.4(a)(2)
7. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The RWCU System provides a portion of the reactor coolant pressure boundary. 10 CFR 54.4(a)(3)
8. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The RWCU System includes valves that are required to isolate upon SLC System initiation in order to prevent removing sodium pentaborate in the RWCU demineralizers. 10 CFR 54.4(a)(3)
9. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
10. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - Reactor vessel isolation is required to meet NSPC Inventory Control Performance Criteria. The RWCU System must isolate for NSPC to succeed.

- Provide reactor coolant pressure boundary. The RWCU System includes piping and valves that are part of the reactor coolant pressure boundary.

2.3.3.23 Reactor Building Closed Cooling Water System

Description

The Reactor Building Closed Cooling Water System provides a continuous supply of cooling water during normal operation to designated plant equipment located in the primary and secondary containment. A separate Reactor Building Closed Cooling Water System is provided for each unit. However, a single spare pump and heat exchanger located in Unit 1 may also be used by Unit 2 or Unit 3 through unit crosstie piping. The major components of each unit's Reactor Building Closed Cooling Water System are located in its respective reactor building and consist of two pumps and two heat exchangers cooled by the RCW System. The system is a closed system. Water cooled in the heat exchangers provides cooling water for components such as the Reactor Recirculation System pumps and motor, the RWCU System pumps and the non-regenerative heat exchanger, the fuel pool cooling heat exchanger, the drywell atmosphere cooling coils, the reactor building equipment drain sump heat exchanger, the drywell equipment drain sump heat exchanger, the drywell air compressors and aftercoolers, and sample coolers in the Sampling and Water Quality System. The system is normally operating. It automatically trips on accident initiation, but may be restarted manually, if desired.

The Reactor Building Closed Cooling Water System is described in FSAR Section 10.6. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide primary containment boundary. The Reactor Building Closed Cooling Water System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
2. Provide secondary containment boundary. The Reactor Building Closed Cooling Water System includes piping and valves that are part of the secondary containment boundary. 10 CFR 54.4(a)(1)
3. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Reactor Building Closed Cooling Water System includes nonsafety-related fluid filled components which have the potential for spatial interaction with safety-related components. 10 CFR 54.4(a)(2)
4. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The Reactor Building Closed Cooling Water System includes nonsafety-related piping that is relied upon to preserve the structural integrity safety-related RBCCW piping. 10 CFR 54.4(a)(2)
5. Directly support of a safety-related function. The Reactor Building Closed Cooling Water System includes nonsafety-related piping that is relied upon to preserve the Secondary Containment safety-related function. 10 CFR 54.4(a)(2)
6. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
7. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - The Reactor Building Closed Cooling Water System is included in the NFPA 805 analyses for multiple spurious operation and in the event of a real or spurious accident signal during a fire event, components within this system are designed and required to load shed in order to meet the NSPC Vital Auxiliaries Performance Criteria.

2.3.3.24 Auxiliary Decay Heat Removal System

Description

The Auxiliary Decay Heat Removal (ADHR) System can be used to remove residual heat from the spent fuel pool and reactor cavity during outages. The ADHR System supplements the Fuel Pool Cooling and Cleanup System.

The ADHR System consists of two cooling water loops. The primary cooling loop circulates spent fuel pool water entirely inside the Reactor Building and rejects heat from the spent fuel pool to a secondary loop by means of a heat exchanger. The secondary loop transfers heat to the atmosphere outside the Reactor Building by means of evaporative cooling towers. The ADHR System includes piping and valves that are part of the secondary containment boundary.

The ADHR System is described in FSAR Section 10.22. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide secondary containment boundary. The ADHR System includes piping and valves that are part of the secondary containment boundary 10 CFR 54.4(a)(1)
2. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The ADHR System includes nonsafety-related fluid filled components which have the potential for spatial interaction with safety-related components. 10 CFR 54.4(a)(2)
3. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The ADHR System includes nonsafety-related piping that is relied upon to preserve the structural integrity safety-related ADHR components located at the Secondary Containment boundary. 10 CFR 54.4(a)(2)

2.3.3.25 Containment Inerting System

Description

Following each startup (within 24-hours after thermal power is greater than 15% rated thermal power), the primary containment is purged of air with pure nitrogen until the atmosphere contains less than 4 percent oxygen. The Containment Inerting System is used during the initial purging of the primary containment and provides a supply of makeup nitrogen. The system consists of two liquid nitrogen storage tanks with two makeup vaporizers, a common purge vaporizer, pressure reducing valves and controllers, instrumentation valves and piping.

Nitrogen is supplied from the common onsite storage tanks through the common purge vaporizer or makeup vaporizers where the liquid nitrogen is converted to the gaseous state. The gaseous nitrogen then flows through the purge or makeup pressure-reducing valves and flow meters into each containment pressure suppression chamber or drywell, where it mixes with the air. A safety valve in the nitrogen supply system prevents over pressurization of the containment.

The primary containment atmosphere is monitored for oxygen and hydrogen by two redundant combustible gas analyzer subsystems. Each subsystem monitors torus and drywell oxygen and hydrogen for both the CAD System and Containment Inerting System. The CAD System is evaluated separately.

The Containment Inerting System is described in FSAR Sections 5.2.3.8 and 5.2.4.9. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide primary containment boundary. The Containment Inerting System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
2. Control combustible gas mixtures within the primary containment atmosphere. The Containment Inerting System includes instrumentation that monitors hydrogen and oxygen levels in primary containment during accident conditions in support of CAD System operation. 10 CFR 54.4(a)(1)
3. Directly support a safety-related function. The Containment Inerting system includes nonsafety-related piping and valves from the nitrogen tank that are relied upon to preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)
4. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
5. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - The Containment Inerting System supplies nitrogen to support MSRV operation to meet the NSPC Reactor Pressure Control Performance Criteria.
    - The Containment Inerting System supplies nitrogen to support MSRV operation to support the NSPC Reactor Inventory Control Performance Criteria.
    - The Containment Inerting System supplies nitrogen to support MSRV operation to support the NSPC Reactor Decay Heat Removal Performance Criteria.
    - The Containment Inerting System supplies nitrogen to support MSRV operation to meet the NSPC Vital Auxiliaries Performance Criteria.
    - Control combustible gas mixtures within the primary containment atmosphere. The Containment Inerting System includes instrumentation that monitors hydrogen and oxygen levels in primary containment during accident conditions in support of CAD System operation.

2.3.3.26 Radwaste System

Description

The Radwaste Systems are plant-shared systems that are designed to process the liquid and solid radioactive wastes generated during plant operation.

The Liquid Radwaste System collects, treats, and returns processed radioactive liquid wastes to the plant for reuse. Treated radioactive wastes not suitable for reuse are discharged from the plant through the condenser circulating water discharge system or are solidified and processed as solid radwaste. The collection system consists of sumps, tanks, piping and pumps for equipment and floor drains located in various areas of the plant including the primary and secondary containments. Treatment systems are located in the radwaste building.

The Solid Radwaste System collects, processes, stores, packages, and prepares solid radioactive waste materials for transfer to approved onsite storage areas or shipment to offsite processing or disposal facilities. Processing equipment is located in the radwaste building.

Gaseous radioactive waste is processed through the Ventilation Systems, the Standby Gas Treatment System, and the Off-Gas System.

The Low Level Radwaste Storage Facility is a series of modules for long-term storage of radioactive waste. Each module contains a sump with a through wall stainless steel pipe that is valved and blind flanged. This allows for sampling of potential drainage from materials. These mechanical components of the Low Level Radwaste Storage Facility are screened and evaluated as part of the Radwaste System.

The Radwaste System is described in FSAR Sections 4.10, 5.3, 9.1, 9.2, 9.3,10.16 and 12.2.5 and Appendix F.6.7, F.6.8, F.6.20, F.7.14. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide primary containment boundary. The Radwaste System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
2. Provide pressure boundary integrity. The Radwaste System includes piping and components connecting to the safety-related Standby Gas Treatment System and safety-related portion of the Off-Gas System that are required to maintain their pressure boundary integrity so as not to jeopardize the ability of the Standby Gas Treatment and Off-Gas Systems to perform their nuclear safety functions. 10 CFR 54.4(a)(1)
3. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Radwaste System includes nonsafety-related fluid filled lines which have the potential for spatial interaction with safety-related components. 10 CFR 54.4(a)(2)
4. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The Radwaste System includes nonsafety-related piping that is relied upon to preserve the structural integrity of safety-related Radwaste piping. 10 CFR 54.4(a)(2)
5. Directly support a safety-related function. The Radwaste System includes nonsafety-related piping that is relied upon to preserve the Secondary Containment safety-related function. 10 CFR 54.4(a)(2)
6. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
7. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
   - NSPC Radioactive Release Performance Criteria: The Radwaste System contains effluent from the fire and fire suppression activities.
   - NSPC Vital Auxiliaries Performance Criteria: The Radwaste system is included in the NFPA 805 analyses for load shed considerations, in order to demonstrate the NSPC Vital Auxiliaries Performance Criteria is met.
   - NSPC Inventory Control Performance Criteria: The Radwaste system is included in the NFPA 805 analyses for multiple spurious operations considerations. Multiple spurious

operation could create a drain path from the reactor vessel, or divert makeup water sources away from the reactor vessel. Multiple spurious operation could also affect containment overpressure and ECCS pumps net positive suction head impacting inventory control.

- NSPC Decay Heat Removal Performance Criteria: Multiple spurious operation could also affect containment overpressure and RHR pumps net positive suction head impacting decay heat removal.

2.3.3.27 Spent Fuel Pool Cooling/Cleanup System

Description

The Spent Fuel Pool Cooling/Cleanup System removes residual heat from the fuel assemblies and maintains the fuel pool water within specified temperature limits. It minimizes corrosion product buildup, controls water clarity in the fuel pool water so that the fuel assemblies can be efficiently handled underwater and minimizes fission product concentration in the fuel pool water.

The Spent Fuel Pool Cooling/Cleanup System for each unit has two pumps that circulate the fuel pool water through a heat exchanger and a filter demineralizer. Each unit has two heat exchangers cooled by the Reactor Building Closed Cooling Water System. The Spent Fuel Pool Cooling/Cleanup System has a cross-connection with the RHR System by which the RHR System can provide supplemental cooling. The pumps and heat exchangers are located in the Reactor Building. Four filter demineralizers are located in the Radwaste Building. One filter demineralizer is a spare that may be used by any unit. Provisions are made for secondary containment integrity. The system is normally operating. Provisions are made to prevent siphoning the fuel pool, check valves in each of the fuel pool cleanup return diffuser lines are provided with a siphon breaking vent pipe in order to prevent siphoning of fuel pool water to no more than 6 inches below the normal water level.

The Spent Fuel Cooling/Cleanup System is described in FSAR Section 10.5. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide pressure boundary integrity. The Spent Fuel Pool Cooling/Cleanup System includes piping and components at the RHR System interfaces that are required to maintain their pressure boundary integrity so as not to jeopardize the ability of the RHR System to perform its nuclear safety functions. 10 CFR 54.4(a)(1)
2. Prevent inadvertent siphoning of the spent fuel pool. Check valves in each of the fuel pool cleanup return diffuser lines are provided with a siphon breaking vent pipe in order to prevent siphoning of fuel pool water to no more than 6 inches below the normal water level.
   10 CFR 54.4(a)(1)

3. Resist spatial interaction of nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Spent Fuel Pool Cooling/Cleanup System includes nonsafety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)
4. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The Spent Fuel Pool Cooling/Cleanup System includes nonsafety-related components that maintain structural integrity of safety-related components in RHR system and secondary containment structures. 10 CFR 54.4(a)(2)
5. Directly support a safety-related function. The Spent Fuel Pool Cooling/Cleanup system includes nonsafety-related piping and valves in the drain to main condenser that are relied upon to preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)
6. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - The Spent Fuel Pool Cooling and Cleanup System is included in the NFPA 805 analyses for multiple spurious operation and in the event of a real or spurious accident signal during a fire event, components within this system are designed and required to load shed in order to meet the NSPC Vital Auxiliaries Performance Criteria.

2.3.3.28 Fuel Handling and Storage System

Description

Each unit is provided with a dry new fuel storage vault. The new fuel storage racks provide a storage place in the new fuel storage vaults for new fuel. However, new fuel is not placed in the new fuel storage racks until a criticality analysis of optimum moderator configuration is performed. In accordance with BFN Technical Specification 4.3.1.2, “The new fuel storage vault shall not be used for fuel storage. New fuel shall be stored in the spent fuel storage racks.”

There are three spent fuel storage pools, one per reactor. A transfer canal is provided to join the Unit 1 and the Unit 2 pools. The spent fuel storage racks provide a storage place at the bottom of each fuel pool for the spent fuel received from the reactor vessel. The racks are full length, top entry, and are designed to maintain the spent fuel in a spatial geometry that precludes the possibility of criticality. The racks are made of staggered, stainless-steel container tubes. Each tube wall has a core of Boral sandwiched within stainless steel.

Servicing equipment is provided to facilitate refueling, fuel inspection and fuel maintenance.

The Fuel Handling and Storage System is described in FSAR Sections 10.2, 10.3, 10.4, and 10.5. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Maintain structural integrity. The fuel storage pool of the Fuel Handling and Storage System shall maintain structural integrity to ensure that a minimum required water level is maintained in the pool. 10 CFR 54.4(a)(1)
2. Provide criticality protection. The fuel storage racks of the Fuel Handling and Storage System shall maintain stored new and spent fuel subcritical by a substantial margin by utilizing storage racks with integral Boral neutron absorption sheets and physical spacing. 10 CFR 54.4(a)(1)
3. Resist spatial interaction of nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Fuel Handling and Storage System includes nonsafety-related heavy equipment such as cranes and hoists in the Reactor Building/Refuel Floor that have the potential for spatial interactions with safety-related SSCs.
   10 CFR 54.4(a)(2)
4. Provides a safe means for handling safety-related components and loads above or near safety-related components. The Fuel Handling and Storage System components within the

scope of license renewal handle equipment and fuel above or near safety-related components or irradiated fuel. 10 CFR 54.4(a)(2)

2.3.3.29 Standby Diesel Generators

Description

The Standby Diesel Generator System provides an alternate source of power to the ECCS and the safe shutdown systems when the normal power supplies are not available. Each Diesel Generator unit consists of a diesel engine, a generator, and auxiliary systems (starting air, fuel oil, jacket cooling, engine exhaust and combustion air, and lubricating oil). Diesel Generator Starting Air and Fuel Oil, are each evaluated separately.

The Standby Diesel Generator System is a plant-shared system. The Standby Diesel Generator System consists of four independent Diesel Generator units coupled as an alternate independent source of power to four 4160-V shared shutdown boards for Units 1 and 2. There are four additional Diesel Generator units that provide an alternate independent source of power to four Unit 3 4160-V shutdown boards. Breaker ties allow a Unit 1 and Unit 2 Diesel Generators to feed a Unit 3 shutdown board. The same breaker ties allow a Unit 3 Diesel Generator to feed a Unit 1 and Unit 2 shutdown board. The Diesel Generators are normally in standby and start automatically when required. Each Diesel Generator is automatically started on loss of offsite power, low reactor water level, or high drywell pressure signals coincident with low reactor pressure. The Diesel Generators are located in the Diesel Generator Buildings.

Most of the Standby Diesel Generators system is safety-related but it includes nonsafety-related oil filled lines in the Diesel Generator Building that have the potential for spatial interactions with safety-related SSCs.

The Standby Diesel Generator System is described in FSAR Section 8.5. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide motive power to safety-related components. The Standby Diesel Generator System is required to power safety-related equipment in the event normal offsite power sources are not available. 10 CFR 54.4(a)(1)
2. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. Nonsafety-related Standby Diesel Generator System piping is relied upon to maintain structural integrity of safety-related Standby Diesel Generator System components. 10 CFR 54.4(a)(2)
3. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Standby Diesel Generator System includes nonsafety-related fluid filled lines in the Diesel Generator Building which have the potential for spatial interaction with safety-related SSCs. 10 CFR 54.4(a)(2)
4. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
5. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - The Standby Diesel Generator System is a support system for the NSPC Vital Auxiliaries Performance Criteria. Provide motive power to safety-related components. The Standby Diesel Generator System is required to power safety-related equipment in the event normal offsite power sources are not available.
6. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The Standby Diesel Generators in the non-blacked-out units are credited with providing power to common equipment supporting the blacked-out unit and as a source of power restoration using existing cross-ties.

2.3.3.30 Supplemental Diesel Generator System

Description

The Supplemental Diesel Generator (SDG) System provides a non-safety related highly reliable backup source of power for the Emergency High Pressure Makeup (EHPM) System and auxiliaries. The SDG System is manually started and aligned to provide an alternate source of power for the EHPM system and auxiliaries during fire events where the normal power supply to the EHPM system has failed. Each SDG is capable of supplying the EHPM system loads for all three units.

The SDG System consists of two 4160 V, 3250 kW air-cooled Diesel Generators and associated equipment in an enclosure located in the yard. All support equipment required to maintain standby readiness and normal utility loads are normally powered by an external utility power feed and are automatically transferred to the SDGs in emergency conditions. Power required to start the SDGs and energize the SDG distribution system is supplied by SDG mounted batteries. This allows the SDG system to be placed in emergency service without dependence on external support systems. Additionally, an external 480 V connection is provided for connection of a temporary external power source to the Supplemental DG distribution system.

The SDG System is described in FSAR Section 10.24. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48).
   10 CFR 54.4(a)(3)
   - The SDG system is included in the fire protection analysis to improve risk margin for core damage frequency and large and early release frequency in support of the NSPC Inventory Control Performance Criteria

2.3.3.31 Control Rod Drive System

Description

The CRD System is a reactivity control system that utilizes pressurized demineralized water to rapidly insert control rods to shutdown the reactor upon receipt of a scram signal from the Reactor Protection System. The CRD mechanisms are part of the CRD System. The CRD System hydraulically operates the CRD mechanisms using water from the condensate storage system as a hydraulic fluid. The CRD System also provides for manual control of core reactivity and power generation by incrementally positioning neutron-absorbing control rods in response to signals from the Reactor Manual Control System. The CRD System includes the ARI System, which provides an alternate means of venting the scram air header and inserting control rods that is independent of the Reactor Protection System. The ARI function serves to reduce the probability of an ATWS event and may be initiated automatically or manually.

The CRD System provides reactivity control by allowing positioning of the control rods at a controlled rate during normal operation, providing scram and diverse scram (ARI) functions to ensure a rapid shutdown when required. It also limits rod drop rate to minimize the consequences of a rod drop accident, and limits a rod ejection accident.

Each unit has separate hydraulic CRDs and hydraulic control units that control flow from the CRD hydraulic subsystem that enables the system to rapidly and fully insert all control rods when a scram is required. CRD provides normal drive flow to re-position individual control rods at slow speed when required and is used for control rod positioning during normal plant operations. It also provides cooling water flow that continually ensures required cooling of all CRDs without control rod motion.

A scram discharge volume receives the water displaced from the drives during a scram and maintains the reactor coolant pressure boundary and primary containment integrity. Control rod drop speed is limited by an integral velocity limiter and a control rod ejection is limited by the CRD housing support. The CRD hydraulic subsystem is a plant-shared system. Each unit has its dedicated pump that takes suction from the Condensate Transfer System. There is a spare pump shared between Unit 1 and Unit 2. Unit 3 has a dedicated spare pump. The CRD System has safety-related components that are relied upon to preserve structural integrity of primary containment and reactor coolant pressure boundaries. The CRD System also includes nonsafety-related water filled lines in the Reactor Building that have the potential for spatial and structural interactions with safety-related SSCs. Additionally, the CRD System directly supports a safety-related function, because nonsafety components are relied upon to preserve the structural integrity of the Secondary Containment boundary.

The CRD System is described in FSAR Sections 3.4 and 3.5. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide primary containment boundary. The CRD System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
2. Provide reactor coolant pressure boundary. The CRD System includes piping and valves that are part of the reactor coolant pressure boundary. 10 CFR 54.4(a)(1)
3. Introduce negative reactivity to achieve or maintain subcritical reactor condition. The CRD System hydraulic control units provide the motive force to the control rod drive mechanisms to rapidly insert control rods during a scram event to prevent or limit fuel damage following abnormal transients and design bases accidents. 10 CFR 54.4(a)(1)
4. Resist spatial interaction of nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The CRD System includes nonsafety-related fluid filled lines in the Reactor Building which have the potential for spatial interaction with safety-related SSCs in the Reactor Building. 10 CFR 54.4(a)(2)

5. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The CRD System includes nonsafety-related components that maintain structural integrity of the safety-related portions of the system. 10 CFR 54.4(a)(2)
6. Directly support a safety-related function. The CRD System includes nonsafety-related piping and valves in the drain to main condenser that are relied upon to preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)
7. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The CRD System provides a portion of the reactor coolant pressure boundary. 10 CFR 54.4(a)(3)
8. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The CRD System includes the ARI System that provides an alternate means of venting the scram air header and inserting control rods that is independent of the Reactor Protection System. 10 CFR 54.4(a)(3)
9. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
10. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - Provide reactor coolant pressure boundary. The CRD System includes piping and valves that are part of the reactor coolant pressure boundary.
    - Introduce negative reactivity to achieve or maintain subcritical reactor condition. The CRD System hydraulic control units provide the motive force to the control rod drive mechanisms to rapidly insert control rods during a scram event to prevent or limit fuel damage following abnormal transients and design bases accidents.

2.3.3.32 Diesel Generator Starting Air System

Description

The Diesel Generator Starting Air System consists of piping, valves, air dryers, air receiver tanks, air motors, filters and associated equipment that assist the Standby Diesel Generator System to start the diesel engines and provide an alternate source of power.

Each Diesel Generator has its own independent Starting Air System. The Diesel Generator Starting Air System for each Diesel Generator consists of two independent subsystems, either one of which can start the Diesel Generator. Each subsystem consists of an air compressor with associated filters and coolers and a bank of air receivers. The air compressors operate automatically to maintain the receivers pressurized. The Diesel Generator Starting Air System is located in the Diesel Generator Buildings.

The Diesel Generator Starting Air System is described in FSAR Section 8.5.3.3. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Support the Diesel Generators in performing their nuclear safety function. The Diesel Generator Starting Air System provides Diesel Generator starting air to support the Diesel Generators providing motive power to safety-related components in the event normal offsite power sources are not available. 10 CFR 54.4(a)(1)
2. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The Diesel Generator Starting Air System includes nonsafety-related components that maintain structural integrity of the safety-related portions of the system. 10 CFR 54.4(a)(2)
3. Directly supports a safety-related function. The Diesel Generator Starting Air System includes nonsafety-related piping and valves in the drain to main condenser that are relied upon to preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)
4. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
   - The Standby Diesel Generator System is a support system for the NSPC Vital Auxiliaries Performance Criteria. Provide motive power to safety-related components. The Standby Diesel Generator System is required to power safety-related equipment in the event normal offsite power sources are not available.
5. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The Diesel Generator Starting Air System provides Diesel Generator starting air to support the Diesel Generators in the non-blacked-out units. 10 CFR 54.4(a)(3)

2.3.3.33 Cranes and Hoists

Description

The Cranes and Hoists System has individual cranes and hoists in each unit, as well as the Reactor Building (overhead) Crane, shared between units. Cranes and hoists are essentially self-contained and primarily mechanical components, although in most cases, cranes and hoists are electrically powered, and operated by electric motors and controls. Cranes and hoists are nonsafety-related.

The Reactor Building crane is a single-trolley, overhead electric traveling-type with a 125-ton main hoist, a 5-ton auxiliary hoist, and a span of 106 ft 5 in. All motions are driven by AC motors. Single-failure protection is provided for all crane components except the hoist wire rope drum shell, trolley cross girts and bridge girders. The one crane is used for three reactor units. It handles the spent fuel casks, dry storage casks and equipment, equipment for the service and maintenance of the reactors, and equipment which is received or shipped through the equipment access lock.

Each unit Turbine Building is provided with an overhead, electric, single-trolley, traveling crane. The main hoist of the Unit 3 Turbine Building crane is rated at 180 tons and the auxiliary hoists at 25 tons. The Units 1 and 2 main hoist are rated at 210 tons and the auxiliary hoist at 25 tons. The cranes are designed as Class II equipment.

Overhead-handling systems located in structures that contain safety-related SSCs are designed to meet seismic II/I criteria if, by nature of their location, they would have the potential to drop a load resulting in damage to a structure or component that prevents the satisfactory accomplishment of a safety-related intended function. The Cranes and Hoists System includes cranes, monorails, hoists, and mobile A-frames.

Cranes and Hoists are described in FSAR Sections 10.4 and 12.2, Appendix C.8, and Appendix F.7.4.

Intended Functions

1. Resist spatial interaction of nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Cranes and Hoists System includes nonsafety-related cranes, monorails, hoists, and mobile A-frames in safety-related structures which have the potential for spatial interaction with safety-related systems and components. 10 CFR 54.4(a)(2)
2. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3).
    - In the event of a real or spurious accident signal during a fire event, components within the Cranes and Hoists System are designed and required to load shed in order to meet the NSPC Vital Auxiliaries Performance Criteria.

2.3.3.34 Sewage System

Description

The potable water for use in the plumbing systems is supplied by the city of Athens, Alabama. Backflow preventers have been installed at each cross connection to other systems to protect the potable water supply from possible contamination due to backflow. Sewage from the BFN site is collected and treated.

These shared systems do not influence the operational safety of the plant. The portions of the systems which penetrate secondary containment were evaluated to ensure they could prevent seismically induced failure from causing a breach of containment. The lines are provided with valves to ensure the containment integrity if the piping systems are damaged by seismically induced loads.

The Sewage System is described in FSAR Sections 10.15 and 11.6.

Intended Functions

1. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3).
   - In the event of a real or spurious accident signal during a fire event, components within the Sewage System are designed and required to load shed in order to meet the NSPC Vital Auxiliaries Performance Criteria.

2.3.3.35 Diverse and Flexible Coping Strategies (FLEX) System

Description

The FLEX System is a collection of equipment and strategies implemented through procedures that provides extended coping capability for Beyond Design Basis External Events.

The FLEX System strategies are accomplished through the use of FLEX equipment which interfaces or connects with other plant systems and equipment. These connections are generally made through the use of non-FLEX system plant equipment, such as test connections used for the Drywell Control Air and CAD Systems, or by temporary connections to electrical distribution systems.

There are FLEX System components which provide a permanent interface to the RHRSW System and EECW Systems. The FLEX connection manifolds to RHRSW System headers B and D and the EECW System are located in the Intake Pumping Station rooms.

The FLEX System is described in FSAR Sections 5.2.6, 10.9, 10.10, and 10.14.4. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide pressure boundary integrity. The FLEX System includes piping and components at the RHRSW and EECW System interfaces that are required to maintain their pressure boundary integrity so as not to jeopardize the ability of the RHRSW and EECW Systems to perform their nuclear safety functions. 10 CFR 54.4(a)(1)
2. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. Nonsafety-related FLEX drain lines and valves are mechanically connected to the safety-related FLEX manifold isolation valves. 10 CFR 54.4(a)(2)
3. Resist spatial interaction of nonsafety-related FLEX equipment that could prevent satisfactory accomplishment of a safety-related function. The FLEX equipment includes nonsafety-related pumps, valves, and supports/restraints in safety-related structures which have the potential for spatial interaction with safety-related systems and components. 10 CFR 54.4(a)(2)

2.3.3.36 Security System

Description

The Security System provides the physical security features of the plant. In addition to components related to physical security, the system provides card readers that support access/ egress during fire events and station blackout events. A diesel generator provides backup power for the system. The security system diesel generator consists of the diesel generator and associated fuel oil, lubricating oil, cooling water, intake, and exhaust support subsystems.

The Security System facilitates access to locations requiring credited operator recovery actions. Specifically, the security card reader and magnetic lock are required for entry through security doors. The card readers and magnetic locks are active components. As discussed in the associated calculation, the failure modes for these components continue to allow access through the door. The intended function of these components is met when power is lost.

Intended Functions

1. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). The Security System facilitates access to locations requiring credited operator recovery actions. 10 CFR 54.4(a)(3)
2. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout. (10 CFR 50.63) The Security System facilitates access to locations requiring credited operator recovery actions. 10 CFR 54.4(a)(3)

2.3.3.37 Radiation Monitoring System

Description

The Radiation Monitoring System is a system which monitors various processes and areas for radioactivity levels. Portions of the Radiation Monitoring System are common to all three units. The Radiation Monitoring System consists of safety-related and nonsafety-related portions and is in scope for subsequent license renewal; however, nonsafety-related portions that are not required to perform subsequent license renewal intended functions are not in scope.

The safety-related radiation monitors included in the system are as follows:

- Reactor Building Ventilation Radiation
- Refuel Zone Ventilation Radiation
- Drywell Leak Detection Radiation
- Primary Containment Area High-Range Radiation
- Control Room Air Supply Duct Radiation

The nonsafety-related radiation monitors included in the system are as follows:

- Main Steam Line Radiation
- Air Ejector Off-gas Radiation
- Main Stack Radiation Monitoring
- Process Liquid Radiation (RHRSW discharge, RCW discharge, Liquid Radioactive Waste discharge, Reactor Building Closed Cooling Water
- Plant Ventilation Exhaust Radiation
- Air Particulate Radiation

The reactor building ventilation radiation monitors detect the radiation in the Reactor Building ventilation exhaust line prior to its discharge from the structure. If an abnormal condition is detected, an input is provided to initiate Standby Gas Treatment System, Primary Containment Isolation, Secondary Containment Isolation, and CREV System.

The refueling zone ventilation exhaust radiation monitors detect the radiation near the spent fuel pools on the refueling floor. If an abnormal condition is detected, an input is provided to initiate Standby Gas Treatment System, Primary Containment Isolation, Secondary Containment Isolation, and CREV System.

The drywell leak detection radiation monitors provide diverse primary coolant leak detection ability. In the event of abnormally high concentrations of radioactive particulates, iodines, and noble gases within the drywell due to primary coolant leakage, these monitors will initiate annunciation in the control room. To prevent the release of radioactive material to areas of the plant outside of the containment boundary, primary containment isolation signals are provided to initiate closure of containment isolation valves on the suction and return line to the drywell leak detection radiation monitors.

The primary containment area high-range radiation monitors detect and measure the radiation level within the drywell during and following an accident. These monitors provide information to the operators to help assess the extent of post-accident core damage.

The control room air supply duct radiation monitors detect radioactivity in the control bay ventilation supply line for the control rooms. The ventilation supply line is monitored to detect the amount of radioactive material entering the control rooms, to assure that personnel are not exposed to excessive doses. If an abnormal condition is detected, the control room air supply duct radiation monitors provide input to initiate filtration of the ventilation supply air through the CREV System.

The Main Stack Radiation Monitoring System indicates whenever limits on the release of radioactive noble gases to the environment are reached or exceeded, to obtain representative samples of radioactive iodine and particulates for laboratory analysis, and to indicate the rate of radioactive noble gas release during planned operations and during or following an accident. The Main Stack Radiation Monitoring System includes nonsafety-related piping components attached to safety-related ductwork associated with the Off-Gas System.

The RHRSW discharge radiation monitors detect the radiation level in the RHRSW System discharge. Changes in the normal radiation level in the RHRSW discharge could indicate leakage in the RHR heat exchangers. System pressure boundary integrity at the RHRSW discharge radiation monitors interface of the RHRSW discharge header is required to be maintained to prevent flooding of the Reactor Building.

The Process Liquid Radiation Monitoring System processes streams for RCW and RHRSW that normally discharge to the environment, and indicates when operational limits for the normal release of radioactive material to the environment are exceeded. These systems include nonsafety-related components that are connected to piping that penetrate the Reactor Building and are required to preserve the structural integrity of the secondary containment boundary.

The portions of the Radiation Monitoring System that are not in scope for subsequent license renewal include main steam line radiation monitoring, air ejector off-gas radiation monitoring, process liquid radiation monitoring (excluding RHRSW discharge radiation monitoring), plant ventilation exhaust radiation monitoring, and air particulate radiation monitoring.

The Radiation Monitoring System is described in FSAR Sections 5.2.3, 7.12, 7.13, 7.14, and Appendix F.7.5. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

<u>Intended Functions</u>

1. Provide primary containment boundary. The Radiation Monitoring System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
2. Sense process conditions and generate signals for engineered safety features actuation. The Radiation Monitoring System monitors parameters for radiation level and initiates appropriate protective action to limit the potential release of radioactive materials if predetermined levels are exceeded. 10 CFR 54.4(a)(1)

3. Directly support a safety-related function. The Radiation Monitoring System includes nonsafety-related components that are relied on to preserve the structural integrity of the secondary containment boundary. 10 CFR 54.4(a)(2)
4. Resist nonsafety-related SSC failure that could prevent satisfactory accomplishment of a safety-related function. The Radiation Monitoring System includes nonsafety-related piping components that have the potential for structural interaction with safety related SSCs that perform a 10 CFR 54.4(a)(1) function. 10 CFR 54.4(a)(2)
5. Resist spatial interaction of nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Radiation Monitoring System includes nonsafety-related liquid-filled piping components that have the potential for spatial interaction with safety-related RHRSW discharge piping. This includes the nonsafety-related portions of the system located within the Reactor Building. 10 CFR 54.4(a)(2)
6. Maintain system pressure boundary integrity. System pressure boundary integrity at the Radiation Monitoring System interface of the RHRSW discharge header is required to be maintained to prevent flooding. 10 CFR 54.4(a)(2)
7. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). The Radiation Monitoring System includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)

2.3.3.38 Hardened Containment Venting System

Description

The Hardened Containment Venting System provides a direct vent path from the torus (wetwell) to independent release points above the Reactor Building. There is one separate Hardened Containment Venting System for each unit. The vent flow path exits the torus via the pressure suppression chamber supply line. The vent pathway consists of a torus penetration, the pressure suppression chamber supply piping, primary containment isolation valves, and a line that exits the Reactor Building. The line that exits the Reactor Building transitions to the exterior in an underground valve pit before turning and routing vertically up the Reactor Building. At the elevation of the Reactor Building refuel floor area, the line re-enters the Reactor Building and then continues to the vent termination/release point above the Reactor Building roof. Two pneumatically operated butterfly valves provide primary containment isolation and can be remotely operated from the Main Control Room. During normal plant operation, the Hardened Containment Venting System primary containment isolation valves remain closed.

The Hardened Containment Venting System is credited in the Fire Probabilistic Risk Assessment (PRA) model for decay heat removal when all other decay heat removal functions are lost. The portion of the Hardened Containment Venting System upstream of and including the outboard primary containment isolation valve also serves a Primary Containment System function.

The portion of the Hardened Containment Venting System upstream of and including the outboard primary containment isolation valve is addressed in Section 2.3.2.1, Containment System. The portion of the Hardened Containment Venting System downstream of the outboard primary containment isolation valve is addressed in this Section.

The Hardened Containment Venting System is described in FSAR Section 5.2.8. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). The Hardened Containment Venting System is credited in the Fire PRA model to remove decay heat to meet NSPC Decay Heat Removal performance criteria. 10 CFR 54.4(a)(3)

2.3.4 Steam and Power Conversions Systems

The following systems are addressed in this section:

- Main Steam System (2.3.4.1)
- Condensate/Demineralized Water System (2.3.4.2)
- Reactor Feedwater System (2.3.4.3)
- Heater Drains and Vents System (2.3.4.4)
- Miscellaneous Turbine Connections System (2.3.4.5)
- Condenser Circulating Water System (2.3.4.6)
- Gland Seal Water System (2.3.4.7)

2.3.4.1 Main Steam System

Description

The Main Steam System provides steam from the reactor vessel through the primary containment to the high pressure turbine over the full range of reactor power operation. Four steam lines are utilized between the reactor vessel and the high pressure turbine. The Main Steam System provides steam on demand to the HPCI System and RCIC System turbines via main steam lines.

Overpressure protection of the reactor vessel is provided via the main steam safety relief valves. This function ensures the integrity of the reactor coolant pressure boundary and associated piping.

The Main Steam System also includes the ADS which is an ECCS. Six designated MSRVs fulfill the ECCS function to ensure that the low pressure ECCS provide adequate core cooling during accident and post-accident conditions in the event that the high pressure coolant injection systems are unavailable or unable to maintain level in the vessel.

The Main Steam System operates in conjunction with the primary containment isolation system to mitigate the consequences of accidents which could result in potential offsite exposure due to a breach of the main steam system. The MSIVs will close on signals indicative of a LOCA or leak in the Main Steam System to containment. he main steam line flow restrictors limit the loss of coolant from the reactor coolant pressure boundary prior to MSIV closure following a main steam line rupture outside of containment. In the event that a main steam line rupture occurs inside the primary containment, closure of the isolation valve outside the containment acts to seal the primary containment itself.

Post-accident holdup and plateout of MSIV bypass leakage is credited in accident analyses when calculating airborne activities. Plateout and holdup are credited in the main steam line piping for a LOCA.

The Main Steam System is described in FSAR Sections 4.4, 4.5, 4.6, 4.11, 6.4.2, 6.5, and 7.4. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide emergency heat removal from primary containment and provide containment pressure control. The MSRV discharge quenchers condense the steam from MSRV operation to minimize pressure and thermal effects on the primary containment during plant events. 10 CFR 54.4(a)(1)
2. Sense process conditions and generate signals for reactor trip or engineered safety functions. The ADS uses drywell pressure, reactor water level sensor inputs and emergency core cooling pump pressure indication, arranged in trip systems, to initiate automatic depressurization. Additionally, Main Steam process conditions provide input signals to the Primary Containment Isolation System and the Reactor Protection System. 10 CFR 54.4(a)(1)
3. Provide reactor coolant pressure boundary. he Main Steam System forms a barrier to minimize the release of reactor coolant and radioactive material to the Reactor Building. The Main Steam System, in conjunction with the Reactor Protection System, provides overpressure protection for the reactor vessel and the Reactor Recirculation System. The main steam flow restrictors limit the loss of coolant from the reactor coolant pressure boundary prior to MSIV closure following a steam line rupture outside of containment. 10 CFR 54.4(a)(1)
4. Provide primary containment boundary. The Main Steam System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
5. Provide support for emergency core cooling systems where the equipment provides cooling directly to the core. The ADS functions to depressurize the reactor vessel to allow low pressure emergency core cooling systems to inject if high pressure systems are unavailable. The Main Steam System also delivers steam to the HPCI and RCIC systems as a motive force for the turbines. 10 CFR 54.4(a)(1)
6. Provides secondary containment boundary. The Main Steam System includes piping and valves that are part of the secondary containment boundary. 10 CFR 54.4(a)(1)
7. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The Main Steam System includes nonsafety-related components that maintain structural integrity of Main Steam System mechanical connections with reactor coolant pressure boundary and primary containment boundary. 10 CFR 54.4(a)(2)

8. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Main Steam System includes nonsafety-related fluid filled lines which have the potential for spatial interaction with safety-related components. 10 CFR 54.4(a)(2)
9. Directly support a safety-related function. The Main Steam System includes nonsafety-related piping and valves that is relied upon for providing an ALT path from outboard MSIVs to condenser. 10 CFR 54.4(a)(2)
10. Directly support a safety-related function. The Main Steam System includes nonsafety-related piping that is relied upon to preserve the structural integrity of the Secondary Containment boundary. 10 CFR 54.4(a)(2)
11. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The Main Steam System provides a portion of the reactor coolant pressure boundary. 10 CFR 54.4(a)(3)
12. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
13. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - NSPC Inventory Control Performance Criteria: The ADS function of MSRVs depressurize the Reactor Coolant System. Depressurization facilitates using low pressure injection sources. The Main Steam System also delivers steam to the HPCI and RCIC systems as a motive force for the turbines. The Main Steam Isolation Valves in conjunction with the Turbine Stop Valves and Turbine Control Valves are evaluated in the Multiple Spurious Operation for inventory diversion flow path.
    - Provide reactor coolant pressure boundary. The Main Steam System forms a barrier to minimize the release of reactor coolant and radioactive material to the Reactor Building.
    - NSPC Pressure Control Performance Criteria: The Main Steam System, in conjunction with the Reactor Protection System, provides overpressure protection for the reactor vessel and the Reactor Recirculation System. MSRVs are also used to depressurize the reactor for NSPC Pressure Control Performance Criteria.
    - NSPC Decay Heat Removal Performance Criteria. MSRVs are used for alternate shutdown cooling flow path.
14. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The Main Steam System provides the flow path and maintains the pressure boundary for reactor safe shutdown. The MSRV discharge quenchers condense the steam from MSRV operation to minimize pressure and thermal effects on the primary containment during station blackout. 10 CFR 54.4(a)(3)

2.3.4.2 Condensate/Demineralized Water System

Description

The Condensate System provides treated water at required flow rates for the Feedwater System during normal plant operation. The Condensate System for each unit shares no components with the other units. The Condensate System for each unit consists of the condenser and piping to transfer water from the condenser to the Feedwater System. The condenser provides a heat sink for the closed loop steam cycle and removes non-condensable gases. The Condensate System has three motor-driven condensate pumps and three motor-driven condensate booster pumps. Impurities are removed by a full flow Demineralizer System. The water is heated by three sets of low pressure heaters. The Condensate System cools the steam jet air ejector intercondenser, the Off-Gas condenser, and the steam packing exhauster condenser. Major components are located in the turbine building

The condenser is credited in analyses for MSIV ALT.

Subsystems of the Condensate/Demineralized Water System are the Condensate Storage and Transfer System (radioactive high purity water) and the Demineralized Water System (non-radioactive high purity water). These are shared systems. The Condensate Water Storage Tanks that are the preferred source of water to the HPCI and RCIC Systems, provide a surge volume for flow testing of HPCI, RCIC and Core Spray Systems, provide condenser makeup, and a supply to the CRD System. The Condensate Water Storage Tanks and the Demineralized Water Storage Tank provide high purity water for miscellaneous makeup uses throughout the plant including flushing and filling of the RHR and Core Spray Systems within the Reactor Building. The tanks are located in the yard and major components are located in the Turbine Building.

The Condensate/Demineralized Water System is described in FSAR Sections 10.13, 11.8, 11.9, and Appendix F.6.10 and F.6.18. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide emergency core cooling where the equipment provides coolant directly to the core. The Condensate Storage System includes safety-related piping between the Condensate Water Storage Tanks and the HPCI and RCIC pumps. 10 CFR 54.4(a)(1)
2. Sense process conditions and generate signals for reactor trip or engineered safety features actuation. The Condensate Storage System includes safety-related level instrumentation that

provides a signal to realign the HPCI pump suction from the Condensate Water Storage Tanks to the suppression pool, when Condensate Water Storage Tanks water level reaches prescribed low level limits. 10 CFR 54.4(a)(1)

3. Provides primary containment boundary. The Condensate/Demineralized Water System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
4. Provide system pressure boundary integrity. The Condensate Storage System includes piping that interfaces with the RHR System interfaces and separately with the Core Spray System that are required to maintain their pressure boundary integrity so as not to jeopardize the ability of the RHR System and the Core Spray System to perform their nuclear safety functions. 10 CFR 54.4(a)(1)
5. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Condensate/Demineralized Water System includes nonsafety-related fluid filled lines which have the potential for spatial interaction with safety-related components. 10 CFR 54.4(a)(2)
6. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The Condensate/ Demineralized Water System includes nonsafety-related piping that is mechanically connected to safety-related piping for various systems in the Reactor Building. 10 CFR 54.4(a)(2)
7. Directly support a safety-related function. The nonsafety-related condenser is relied upon for holdup of leakage from the MSIVs for radioactive decay in the ALT analyses. 10 CFR 54.4(a)(2)
8. Directly support a safety-related function. The Condensate/Demineralized Water System includes nonsafety-related piping that is relied upon to preserve the structural integrity of the Secondary Containment safety-related function. 10 CFR 54.4(a)(2)
9. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - The Condensate system is required to meet NSPC Inventory Control Performance Criteria.
    - Provide emergency core cooling where the equipment provides coolant directly to the core. The Condensate Storage System includes safety-related piping between the Condensate Water Storage Tanks and the HPCI and RCIC pumps.
    - The Condensate Storage System provides inventory for the EHPM pumps.
    - Condensate provides a source of water for low to medium pressure makeup to the reactor vessel. Water from the hotwell can be injected via the condensate and condensate booster pumps.
10. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the commission's regulations for Station Blackout (10 CFR 50.63). The Condensate Storage and Transfer System is the credited suction source for the HPCI and RCIC systems for Station Blackout coping and recovery. 10 CFR 54.4(a)(3)

2.3.4.3 Reactor Feedwater System

Description

The Reactor Feedwater System provides feedwater to the reactor to maintain a constant reactor water level. During normal plant operation, the Reactor Feedwater System receives its supply of water from the outlet of the condensate demineralizers. The system consists of three feedwater heater strings (with cascading drains) connected in parallel, each consisting of five low pressure feedwater heaters and one drain cooler in series. The feedwater heaters receive steam from the main turbine system and preheat feedwater prior to entering the reactor feed pumps, thus increasing the heat cycle efficiency. The outlets of the three heater strings are cross-connected and provide a common suction header for the three reactor feed pumps. The reactor feed pumps are mounted in parallel with each having an individual suction valve, discharge check valve, and discharge valve. The reactor feed pumps discharge to a common discharge header that connects to two feedwater headers. These two feedwater headers contain inboard and outboard primary containment isolation valves. Inside containment, these two feedwater headers each split into three piping runs for a total of six, which then go to the reactor vessel. The Reactor Feedwater System provides the injection path for HPCI and RCIC during transient and accident conditions. HPCI and RCIC join the Reactor Feedwater System outside the primary containment. Flow is then channeled through the feedwater piping to the reactor vessel.

The Reactor Feedwater System is described in FSAR Sections 4.11, 7.10 and 11.8. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provides reactor coolant pressure boundary. The Reactor Feedwater System includes piping and valves that are part of the reactor coolant pressure boundary. 10 CFR 54.4(a)(1)
2. Provide primary containment boundary. The Reactor Feedwater System includes piping and valves that are part of the primary containment boundary. 10 CFR 54.4(a)(1)
3. Provide emergency core cooling where the equipment provides coolant directly to the core. The Reactor Feedwater System provides an injection path into the reactor vessel for the HPCI System. 10 CFR 54.4(a)(1)
4. Remove residual heat from the Reactor Coolant System. The Reactor Feedwater System provides an injection path into the reactor vessel for the HPCI and RCIC Systems. 10 CFR 54.4(a)(1)
5. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Reactor Feedwater System includes nonsafety-related fluid filled lines which have the potential for spatial interaction with safety-related components. 10 CFR 54.4(a)(2)
6. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The Reactor Feedwater System includes nonsafety-related piping that is relied upon to preserve the structural integrity of safety-related Reactor Feedwater System piping. 10 CFR 54.4(a)(2)

7. Directly support a safety-related function. The Reactor Feedwater System includes nonsafety-related piping that is relied upon to preserve the Secondary Containment safety-related function. 10 CFR 54.4(a)(2)
8. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). The Reactor Feedwater System provides a portion of the reactor coolant pressure boundary. 10 CFR 54.4(a)(3)
9. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
10. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - The Reactor Feedwater system is required to meet NSPC Inventory Control Performance Criteria.
    - Provides reactor coolant pressure boundary. The Reactor Feedwater System includes piping and valves that are part of the reactor coolant pressure boundary.
    - Provide emergency core cooling where the equipment provides coolant directly to the core. The Reactor Feedwater System provides an injection path into the reactor vessel for the HPCI, RCIC, Condensate and EHPM Systems to meet NSPC Inventory Control Performance Criteria.
11. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The Reactor Feedwater System provides an injection path into the reactor vessel for both HPCI and RCIC. In addition, the feedwater pump emergency bearing oil pumps are required to operate following a Station Blackout. 10 CFR 54.4(a)(3)

Piping, Piping Components • RCPB • Non-RCPB	Pressure Boundary
Tanks	Pressure Boundary

The aging management review results for these components are provided in Table 3.4.2-3, Reactor Feedwater System - Summary of Aging Management Evaluation.

2.3.4.4 Heater Drains and Vents System

Description

The Heater Drains and Vents system supports feedwater heaters and drain coolers as follows. Each unit is provided with three parallel strings of feedwater heaters, each consisting of three low-pressure feedwater heaters and two high-pressure feedwater heaters. Condensate drainage from the drain coolers of each feedwater heater flows to the next lower-pressure heater by means of pressure differential between successive heaters. Condensate drainage exiting from the separate drain cooler of the lowest-pressure heater is returned to the condenser.

The entire set of piping and components that make up the Heater Drains and Vents system is located in the Turbine Building and is nonsafety-related. The piping and components are neither connected to or in the vicinity of safety-related components. However, a small portion of this system serves the unique safety-related function to provide the ALT path from the MSIVs to the condenser to limit release of radioactive materials to the environment.

The Heater Drains and Vents System is discussed in FSAR Section 11.8. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Directly support a safety-related function. The Heater Drains and Vents system includes nonsafety-related piping and valves that is relied upon for providing an ALT path from outboard MSIVs to condenser. 10 CFR 54.4(a)(2)

2.3.4.5 Miscellaneous Turbine Connections System

Description

Miscellaneous Turbine Connections is a nonsafety-related system which directs controlled leakage from various MS System components to the condenser. Some of these components are credited in analyses for MSIV ALT. Since failure of nonsafety-related Miscellaneous Turbine Connections system components could prevent satisfactory accomplishment of safety-related functions, criterion 10 CFR 54.4(a)(2) is met.

Miscellaneous Turbine Connections are not described in the FSAR. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Directly support a safety-related function. Nonsafety-related Miscellaneous Turbine Connections system components are relied upon for holdup of leakage from the MSIVs for radioactive decay in the ALT analyses. 10 CFR 54.4(a)(2)

2.3.4.6 Condenser Circulating Water System

Description

The CCW System for each unit shares components with the other units. Each unit has three circulation water pumps that take water from a common intake channel in Wheeler Reservoir. After passing through the condensers the heated water is cooled by the cooling towers or discharged directly back to Wheeler Reservoir. Provisions (a loop in the discharge conduit with a vacuum breaker) are made for the prevention of backflow of heated water into the intake channel that serves as the ultimate heat sink if normal offsite power is lost. The CCW System for each unit normally operates independently, however a cross-tie is provided between the three CCW tunnels so that any one pump in an emergency can supply water to all units. One CCW pump has more than adequate capacity to dissipate the shutdown heat for the three units.

The CCW System is described in FSAR Sections 2.4.2.2.2, 11.6, 12.2.7, and Appendix F.6.4. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Prevent backflow to protect decay removal and cooling functions of safety-related systems. The CCW System provides manual vacuum breaking capability to prevent backflow from the cooling tower warm channel into the forebay upon trip of the CCW pumps. This capability protects the decay heat removal functions of the RHRSW System and the cooling functions of the EECW System post accident. 10 CFR 54.4(a)(1)
2. Resist spatial interaction of nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The CCW System includes nonsafety-related fluid filled lines in the Vacuum Pipe Building which have the potential for spatial interaction with safety-related vacuum breaker vent valves. 10 CFR 54.4(a)(2)
3. Resist structural interactions from mechanically connected nonsafety-related piping that could prevent satisfactory accomplishment of a safety-related function. The CCW System includes nonsafety-related piping that maintain structural integrity of mechanical connections with safety-related vacuum breaker vent valves. 10 CFR 54.4(a)(2)
4. Portions of this system are relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). This system includes environmentally qualified electrical components. 10 CFR 54.4(a)(3)
5. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
   - The CCW System is a support system required to meet NSPC Vital Auxiliaries Performance Criteria.
   - Portions of the CCW System are considered in the NSCA due to the ability of CCW System to supply water to the RCW pumps. The CCW System supports the NSPC Vital Auxiliaries Performance Criteria.

2.3.4.7 Gland Seal Water System

Description

The Gland Seal Water System provides pressurized sealing water to condenser and Condensate System components that are under a vacuum to prevent air leakage into the condenser. The Gland Seal Water System for each unit shares no components with the other units. However, any unit's Gland Seal Tank may pressurize any other unit's system. The Gland Seal Water System for each unit has an elevated Gland Seal Tank located in the Reactor Building and associated piping that maintains a static pressure on seals (e.g., packing) of components of the main condenser and Condensate Systems that are under vacuum during normal plant operations.

The Gland Seal Water System is described in FSAR Section 9.5.4, Figures 1.6-2, and 1.6-11. The system boundaries for SLR are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. The Gland Seal Water system includes nonsafety-related fluid filled components in the Reactor Building which have the potential for spatial interaction with safety-related components. 10 CFR 54.4(a)(2)
2. Directly support a safety-related function. The Gland Seal Water System includes nonsafety-related piping that is relied upon to preserve the Secondary Containment safety-related function. 10 CFR 54.4(a)(2)

2.4 SCOPING AND SCREENING RESULTS: STRUCTURES

The scoping and screening results for structures consist of lists of structures and structural commodities that require aging management reviews, that are grouped, and presented on a structure and commodity group basis. Brief descriptions of structures and structural commodities within the scope of subsequent license renewal are provided as background information. Structure and structural commodity intended functions are provided for in-scope structures and structural commodities.

The following structures and commodity groups are addressed in this section:

- Reactor Buildings (2.4.1)
- Primary Containment Structures (2.4.2)
- Diesel Generator Buildings (2.4.3)
- Intake Pumping Station (2.4.4)
- Reinforced Concrete Chimney (2.4.5)
- Standby Gas Treatment Building (2.4.6)
- Off-Gas Treatment Building (2.4.7)
- Equipment Access Lock (2.4.8)
- Vacuum Pipe Building (2.4.9)
- Turbine Buildings (2.4.10)
- Radwaste Building (2.4.11)
- Service Building (2.4.12)
- Vent Vaults (2.4.13)
- Gate Structure Number 2 (2.4.14)
- Gate Structure Number 3 (2.4.15)
- Discharge Control Structure (2.4.16)
- Circulating Water Conduits (2.4.17)
- Diesel High Pressure Fire Pump House (2.4.18)
- Low Level Radwaste Storage Facility (2.4.19)
- Transformer Yard (2.4.20)
- 161 kV Switchyard (2.4.21)
- 500 kV Switchyard (2.4.22)
- Condensate Water Storage Tanks Foundations, Trenches, and Tunnels (2.4.23)
- Nitrogen Storage Tank Foundation (2.4.24)
- Supplemental Diesel Generator Building (2.4.25)
- Containment Atmosphere Dilution System Storage Tank Foundation (2.4.26)
- Intake Channel (2.4.27)
- North Bank of Cool Water Channel East of Gate Structure Number 2 (2.4.28)
- South Dike of Cool Water Channel between Gate Structures Number 2 and Number 3 (2.4.29)
- Earth Berm (2.4.30)
- Residual Heat Removal Service Water Tunnel (2.4.31)
- Electrical Cable Tunnel (from Intake Pumping Station to Powerhouse) (2.4.32)

- Underground Concrete Encased Structures (2.4.33)
- Yard, General (2.4.34)
- South Access Retaining Wall (2.4.35)
- Structural Commodities (2.4.36)
    - Cable Trays and Supports
    - Conduit and Conduit Supports
    - Electrical Panels, Racks, Cabinets, and other Enclosures
    - Equipment Supports and Foundations
    - Hazard Barriers and Elastomers
    - HVAC Duct Supports
    - Miscellaneous Steel
    - Penetrations and Sleeves
    - Pilings
    - Pipe Whip Restraints and Jet Impingement Shields
    - Piping Supports
    - Thermal Insulation
    - Tube Track
- Isolation Valve Pits (2.4.37)

2.4.1 Reactor Buildings

Description

The Reactor Building for each unit completely encloses the reactors, the primary containment structures, and the auxiliary and emergency systems of the nuclear steam supply system. A major sub-structure of the Reactor Building is the reinforced concrete biological shield that surrounds the drywell portion of primary containment. The Reactor Buildings also house features such as the spent fuel pool, steam dryer/moisture separator storage pool, reactor cavity, reactor auxiliary equipment, refueling equipment, reactor servicing equipment, and the Control Bay. The Control Bay houses the main control room for plant operation and other important auxiliary systems required for plant operation. The Reactor Building consists of monolithic reinforced concrete floors and walls from its foundation to the refueling floor. The refueling floor, which is common for all three units, is enclosed by the steel superstructure with metal siding and a built-up roof. Blowout or pressure relief panels are installed as part of the Reactor Building superstructure metal siding to relieve pressure during a DBA or DBE. The Reactor Buildings are an overall integral part of the Fire Protection Program and essential to the NFPA 805 NSCA Performance Goals.

Components not included in the evaluation boundary of the Reactor Buildings are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

Roof downspouts drains are evaluated with the Station Drainage System. The Reactor Building cranes and other miscellaneous cranes are evaluated with the Cranes and Hoists System and Fuel Handling and Storage System. Ventilation components, such as dampers and ducting, are evaluated with the ventilation systems. In addition, other mechanical and electrical systems and components housed in or located within the boundary of the Reactor Building are evaluated with their respective mechanical and electrical subsequent license renewal systems or commodities groups.

The Reactor Buildings are described in FSAR Figure 2.2-4, Sections 5.3 and 12.2.2, and Appendices F.7.1, F.7.2, and F.7.3. The structures are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for safety-related SSCs. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for nonsafety-related SSCs whose failure could prevent satisfactory accomplishment of safety-related systems intended function(s). 10 CFR 54.4(a)(1)
3. Provide protection for safe storage of new and spent fuel. 10 CFR 54.4(a)(1)
4. Control the potential release of fission products to the external environment so that offsite consequences of DBEs are within acceptable limits. 10 CFR 54.4(a)(1)
5. Provide for the discharge of treated gaseous waste to meet the requirements of 10 CFR 50.67 or 10 CFR 100. 10 CFR 54.4(a)(1)
6. Prevent liquid radioactive waste from being released to the environment in the event of a Safe Shutdown Earthquake. 10 CFR 54.4(a)(1)
7. Prevent criticality of fuel assemblies stored in the spent fuel pool. 10 CFR 54.4(a)(1)
8. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient without Scram (10 CFR 50.62). 10 CFR 54.4(a)(3)
9. Portions of this structure/component support provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). 10 CFR 54.4(a)(3)
10. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
11. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)

2.4.2 Primary Containment Structures

Description

The Primary Containment structures are a General Electric Mark I containment design. The primary containment for each unit consists of a drywell, pressure suppression chamber and a connecting vent system. The Primary Containment structure for each unit is completely enclosed within each unit's Reactor Building.

The drywell is a steel pressure vessel enclosed in reinforced concrete. The drywell contains the reactor vessel, the reactor recirculation system, and portions of other systems that form the reactor coolant pressure boundary. It also includes structural steel framing, electrical and mechanical equipment and system supports, a concrete shield wall around the reactor vessel, a removable steel head, a personnel airlock with two mechanically interlocked doors, two equipment hatches, and miscellaneous electrical and mechanical penetrations.

The pressure suppression chamber is a steel toroidal shaped pressure vessel. The pressure suppression chamber is commonly known as the torus. The torus includes internal steel framing, vent header, supports, access hatches, and penetrations. The torus is mounted on support structures that transmit loads to the concrete foundation of the Reactor Building.

The drywell is connected to the pressure suppression chamber with eight equally spaced vent lines. These drywell vent lines are connected to a header which is contained within the air space of the pressure suppression chamber. The pressure suppression chamber contains a large pool of water that condenses steam from a failure of reactor coolant pressure boundary piping in the drywell. The pool also condenses steam from MSRV discharge, and HPCI and RCIC turbine discharge.

The Primary Containment structure limits the release of fission products to the environment in the event of a design basis LOCA.

Components not included in the evaluation boundary of the Primary Containment Structures are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The containment isolation valves are evaluated in the Primary Containment Isolation System. Ventilation components, such as dampers and ducting, are evaluated with the ventilation systems. In addition, other mechanical and electrical systems and components housed in or located within the boundary of the Containment Structure are evaluated with their respective mechanical and electrical subsequent license renewal systems or commodities group. The reinforced concrete structures that enclose the drywell for shielding purposes, such as the drywell shield wall and shield plugs at the top of the reactor well, are evaluated with the Reactor Building.

The Primary Containments are an overall integral part of the Fire Protection Program and essential to the NFPA 805 NSCA Performance Goals. The Primary Containments prevents excessive radioactive release and supports the Fire Probabilistic Risk Assessment (FPRA) Large Early Release Frequency (LERF) metric.

The Primary Containment structures are described in FSAR Figure 5.2-1a, Sections 5.2.3 and 12.2.2, and Appendix C.5.The structures are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provides physical support, shelter, and protection for safety-related systems and components. 10 CFR 54.4(a)(1)
2. Provides physical support, shelter, and protection for nonsafety-related SSCs whose failure could prevent satisfactory accomplishment of safety-related system intended function(s). 10 CFR 54.4(a)(1).
3. Provides primary containment boundary. 10 CFR 54.4(a)(1)
4. Limits and controls the release of fission products to the secondary containment and the external environment during DBAs so that offsite consequences are within acceptable limits. 10 CFR 54.4(a)(1)
5. Provides sufficient air and water volumes to absorb the energy released to the containment in the event of DBEs so that the pressure is within acceptable limits. 10 CFR 54.4(a)(1)
6. Provides a source of water for ECCS. 10 CFR 54.4(a)(1)
7. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient Without Scram (10 CFR 50.62). 10 CFR 54.4(a)(3)
8. Portions of this structure/component support provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). 10 CFR 54.4 (a)(3)
9. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
   - Primary Containment Boundary is maintained as an inerted atmosphere such that fires are not required to be postulated when at-power.
   - Primary Containment is considered a Physical Analysis Unit (PAU) for non-power operational modes when it is no longer inerted.
   - The Primary Containment structure limits the release of fission products to the environs, and supports the FPRA LERF metric
10. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)

2.4.3 Diesel Generator Buildings

Description

The Units 1/2 Diesel Generator Building is a Class I concrete structure, located adjacent to the west side of the Reactor Building and the south side of the Radwaste Building. It is separated from these buildings by a two-inch expansion joint filled with fiberglass insulation. The south end of the building faces an earth backfill varying to a height of approximately 29 feet above the lower floor level. The west side of the building is exposed. The foundation for the structure is earth backfill. The structure is a two-story concrete box, with one longitudinal dividing wall full length and height, and four transverse dividing walls full height terminating at the longitudinal wall.

Built later, the Unit 3 Diesel Generator Building is also a Class I concrete structure and has the same configuration and foundation as that of the Units 1/2 Diesel Generator Building

Diesel Generator Buildings provide structural support and shelter/protection for the diesel generators and other in-scope components that are essential for safe shutdown in the event of a sustained loss of offsite power. The Units 1/2 Diesel Generator Building houses four diesel generators that provide power to the four shared Unit 1 and 2 shutdown boards located in the Reactor Buildings. The Unit 3 Diesel Generator Building houses four diesel generators that provide power to the four Unit 3 shutdown boards located in the Unit 3 Diesel Generator Building. The Diesel Generator Buildings are an overall integral part of the Fire Protection Program and essential to the NFPA 805 NSCA Performance Goals.

Components not included in the evaluation boundary of the Diesel Generator Buildings are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

Ventilation components, such as dampers and ducting, are evaluated with the ventilation systems.

The Diesel Generator Buildings are described in FSAR Figure 2.2-4, Sections 8.5, 12.2.8, and 12.2.13, and Appendix F.7.6.The structures are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provides physical support, shelter, and protection for safety-related SSCs. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for nonsafety-related SSCs whose failure could prevent satisfactory accomplishment of safety-related system intended function(s). 10 CFR 54.4(a)(1)
3. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
4. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)

2.4.4 Intake Pumping Station

Description

The Intake Pumping Station is a reinforced concrete structure that provides structural support and shelter/protection for the condenser circulating water pumps, the electric fire pumps, and pumps supplying the RHRSW and EECW Systems. The Intake Pumping Station houses components for all three units. The Intake Pumping Station protects safety-related equipment and components such as the pumps supplying the RHRSW and EECW Systems from design basis events (e.g., earthquakes, flooding, tornadoes). The Intake Pumping Structure is an overall integral part of the Fire Protection Program and essential to the NFPA 805 NSCA Performance Goals.

Components not included in the evaluation boundary of the Intake Pumping Station are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

Ventilation components, such as dampers and ducting, are evaluated with the ventilation systems.

The Intake Pumping Station is described in FSAR Figure 2.2-4, Sections 12.2.7 and 12.2.16, and F.7.7. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for safety-related SSCs. 10 CFR 54.4(a)(1)
2. Provide a source of water for ECCS. 10 CFR 54.4(a)(1)
3. Provide physical support, shelter, and protection for nonsafety-related SSCs whose failure could prevent satisfactory accomplishment of safety-related system intended function(s). 10 CFR 54.4(a)(1)
4. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
5. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)

The aging management review results for these components are provided in Table 3.5.2-4, Intake Pumping Station - Summary of Aging Management Evaluation.

2.4.5 Reinforced Concrete Chimney

Description

The Reinforced Concrete Chimney provides an elevated release point for radioactive gases from the gaseous radwaste processing systems during normal plant operations and from the Standby Gas Treatment System during secondary containment isolation and during primary containment venting. The Reinforced Concrete Chimney is an overall integral part of the Fire Protection Program and essential to the NFPA 805 NSCA Performance Goals.

The Reinforced Concrete Chimney is a single structure that serves all three units. The Reinforced Concrete Chimney is a 600-foot-high Class I structure designed so that Class I structures (with the exception of the Off-Gas Treatment building) will not be damaged during DBEs.

Components not included in the evaluation boundary of the Reinforced Concrete Chimney are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Reinforced Concrete Chimney is described in FSAR Figure 2.2-4, Section 12.2.4, and Appendix F.7.14. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for safety-related SSCs. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for nonsafety-related SSCs whose failure could prevent satisfactory accomplishment of safety-related. 10 CFR 54.4(a)(1)
3. Performs a function credited to demonstrate compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
   - The Reinforced Concrete Chimney structure contains effluents and limits the release of radioactivity to the environment to satisfy NSPC Radioactive Release Performance Criteria.

2.4.6 Standby Gas Treatment Building

Description

The Standby Gas Treatment Building provides a protected environment for the Standby Gas Treatment System. The Standby Gas Treatment Building houses shared components for all three units. The Standby Gas Treatment Building consists of two double-barreled reinforced concrete box frame structures with closed ends. The two structures are located side-by-side adjacent to the southwest corner of the Unit 1 Reactor Building and lie within the Earth Berm. One structure house two of the three Standby Gas Treatment trains. The other structure houses the third Standby Gas Treatment train. The Standby Gas Treatment Building is an overall integral part of the Fire Protection Program and essential to the NFPA 805 NSCA Performance Goals.

Components not included in the evaluation boundary of the Standby Gas Treatment Building are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

Ventilation components, such as dampers and ducting, are evaluated with the ventilation systems.

The Standby Gas Treatment Building is described in FSAR Figure 2.2-4, Sections 5.3.3.7 and 12.2.10, and Appendix F.7.8. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for safety-related SSCs. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for nonsafety-related SSCs whose failure could prevent satisfactory accomplishment of safety-related system intended function(s). 10 CFR 54.4(a)(1)
3. Portions of this structure/component support provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). 10 CFR 54.4(a)(3)
4. The Standby Gas Treatment Building performs a function credited to demonstrate compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - The Standby Gas Treatment Building contains effluents and limits the release of radioactivity to the environment to satisfy NSPC Radioactive Release Performance Criteria.

The aging management review results for these components are provided in Table 3.5.2-6, Standby Gas Treatment Building - Summary of Aging Management Evaluation.

2.4.7 Off-Gas Treatment Building

<u>Description</u>

The Off-Gas Treatment Building is an underground structure that houses the Off-Gas System charcoal adsorbers and supporting equipment for all three units. The exterior walls and bottom slab are designed and constructed to maintain their structural integrity during a partial collapse of the Reinforced Concrete Chimney during an external event (seismic, tornadic, etc.) so that they will not permit water leakage into or out of the building below elevation 566.25 feet. The Off-Gas Treatment Building contains the effluents and limits the release of radioactivity to the environment during the fire and fire suppression activities.

Components not included in the evaluation boundary of the Off-Gas Treatment Building are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

Ventilation components, such as dampers and ducting, are evaluated with the ventilation systems.

The Off-Gas Treatment Building is described in FSAR Figure 2.2-4 and Section 12.2.14. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for safety-related SSCs. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for nonsafety-related SSCs whose failure could prevent satisfactory accomplishment of safety-related system intended function(s). 10 CFR 54.4(a)(1)
3. The Off-Gas Treatment Building performs a function credited to demonstrate compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - The Off-Gas Treatment Building contains effluents and limits the release of radioactivity to the environment during the fire and fire suppression activities.

The aging management review results for these components are provided in Table 3.5.2-7, Off-Gas Treatment Building - Summary of Aging Management Evaluation.

2.4.8 Equipment Access Lock

Description

The Equipment Access Lock is a concrete box structure approximately 26 feet wide by 26 feet high, extending outward from the south side of the Reactor Building approximately 106 feet. The structure is supported by a row of steel bearing piles to rock under each vertical wall, and another row at the midpoint of the ground level slab. In this manner, differential settlement and alignment problems are eliminated at the face of the rock-supported Reactor Building. The structure is covered to a depth of approximately three feet by the 30-foot-high earth berm which surrounds the reactor building. Separation from the Reactor Building is provided for by a two-inch expansion joint filled with fiberglass insulation.

The Equipment Access Lock contains effluents and limits the release of radioactivity to the environment during the fire and fire suppression activities.

Components not included in the evaluation boundary of the Equipment Access Lock are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Equipment Access Lock is described in FSAR Figure 2.2-4, Sections 5.3.3.5 and 12.2.9. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for safety-related SSCs. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for nonsafety-related SSCs whose failure could prevent satisfactory accomplishment of safety-related system intended function(s). 10 CFR 54.5(a)(1)
3. Provide secondary containment boundary. Limits and controls the release of fission products to the external environment during design basis accidents so that offsite consequences are within acceptable limits. 10 CFR 54.4(a)(1)
4. The Equipment Access Lock performs a function credited to demonstrate compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - The Equipment Access Lock contains effluents and limits the release of radioactivity to the environment during the fire and fire suppression activities.

2.4.9 Vacuum Pipe Building

<u>Description</u>

The Vacuum Pipe Building is an underground Class 1 structure that provides structural support and shelter/protection for the condenser circulating water system vacuum breaker components that prevent backflow from the warm water channel to the intake channel. This ensures that maximum temperature analysis assumptions for emergency cooling systems are maintained during accidents and events. The Vacuum Pipe Building is a shared feature for all three units. The Vacuum Pipe Building is identified as a NFPA 805 NSPC necessary structure for a system required to achieve safe and stable fuel conditions for any fire area in BFN.

The Vacuum Pipe Building is basically a single-barreled concrete box frame with closed ends. The below grade pipe building is located directly above the hump or steel lined siphon portion of the warm water conduits. Earth backfill covers the top of this building to a depth of about 2 feet. The building is founded on earth backfill.

Components not included in the evaluation boundary of the Vacuum Pipe Building are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip

Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Vacuum Pipe Building is described in FSAR Figure 2.2-4 and Section 12.2.7.8.3. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for safety-related SSCs. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)

2.4.10 Turbine Buildings

Description

The Turbine Buildings are a common Class II structure consisting of a reinforced concrete structure with a steel superstructure. The buildings are compartmentalized with the primary consideration for the design of the walls being radiation shielding. The Turbine Buildings house the turbine generators (one for each unit) and other secondary equipment needed for power generation. The Turbine Buildings are an overall integral part of the Fire Protection Program and essential to the NFPA 805 NSCA Performance Goals.

In addition to the generators, the buildings house the turbines, condensers, other auxiliary systems and related piping. The Turbine Buildings are designed to not damage the Reactor Buildings when subjected to postulated loading conditions

The Turbine Building, below the operating floor, is a reinforced concrete framed structure supported on steel piles to bedrock. The Turbine Building, above the operating floor, is framed by transverse welded steel rigid frames. An expansion joint is provided between a 2-bay frame for Units 1/2 and a single-bay frame for Unit 3. These buildings house common services to all three units. For longitudinal expansion, the superstructure is provided with joints by using double rows of frames. Assurance that the Turbine Building will not damage the Reactor Building is provided by the inherent strength of that part of the Turbine Building that is adjacent to the Reactor Building.

Components not included in the evaluation boundary of the Turbine Buildings are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities. The building crane and other miscellaneous cranes and hoists are evaluated with the Cranes and Hoists System. Fire barriers (doors, dampers, fire rated enclosures, fire proofing material, penetration seals, fire barrier function of walls and slabs) are evaluated with the Fire Protection System. Mechanical and electrical systems and components housed inside the structure are separately evaluated with their respective mechanical systems, electrical systems, or commodities.

The Turbine Buildings are discussed in FSAR Figure 2.2-4, Section 12.2, and Appendix F.6.14. The structures are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provides structural support and shelter/protection for the main steam tunnel temperature switches and for the outboard MSIVs leakage pathway to condenser. 10 CFR 54.4(a)(2)
2. Not adversely impact other Class I structures as a result of a DBE. 10 CFR 54.4(a)(2)
3. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient without Scram (10 CFR 50.62). 10 CFR 54.4(a)(3)
4. Portions of this structure/component support provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that

demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). 10 CFR 54.4(a)(3)

5. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
6. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)

2.4.11 Radwaste Building

Description

The Radwaste Building houses common services to all three units. It is located adjacent to the Turbine Building, Service Building, Reactor Building, and Diesel Generator Building. The Radwaste Building is a Class II structure (excluding the exterior wall of the waste surge and waste collection tank room adjacent to the Diesel Generator Building) extending approximately 20 feet below grade and 30 feet above ground. It is isolated from the Reactor and Diesel Generator Buildings by a two-inch expansion joint filled with fiberglass insulation. The roof is mostly a steel framed structure except for the waste packing area, which consists of a concrete roof. The Radwaste Building is an overall integral part of the Fire Protection Program and essential to the NFPA 805 NSCA Performance Goals.

Components not included in the evaluation boundary of the Radwaste Building are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Radwaste Building is described in FSAR Section 12.2.5. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provides structural support and shelter/protection for the Standby Gas Treatment System drain line to the off-gas condensate sump in the Radwaste Building. 10 CFR 54.4 (a)(2)
2. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
    - The Radwaste Building contains effluents and limits the release of radioactivity to the environment to satisfy NSPC Radioactive Release Performance Criteria.

2.4.12 Service Building

Description

The nonsafety-related Class II Service Building consists of exterior concrete walls and footings with an interior structural steel frame supported by concrete footings. Concrete floor slabs are used. The structure is designed for applicable dead loads, wind loads, and floor live loads. Portions of the HPFP System that are relied upon for compliance with regulations for Fire Protection (10CFR 50.48) traverse through the Service Building. The HPFP System traverses through the Service Building and into the Radwaste Building and Turbine Building.

Components not included in the evaluation boundary of the Service Building are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Service Building is described in FSAR Figure 2.2-4 and Section 12.2.6. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)

2.4.13 Vent Vaults

Description

A Vent Vault is provided for each unit. Each Vent Vault is an open-top concrete structure with its base foundation founded on compacted backfill located within the Earth Berm adjacent to its associated Reactor Building. The Vent Vaults contain components required for the Reactor Building Ventilation System supply, including the secondary containment isolation dampers.

Components not included in the evaluation boundary of the Vent Vaults are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Vent Vault structures are shown on FSAR Figure 2.2-4. The structures are shown in the subsequent license renewal boundary drawings listed below.

2.4.14 Gate Structure Number 2

Description

Gate Structure Number 2 is located in the cool water channel between the discharge control structure and the intake channel. The primary structural components of the gate structure are the concrete gravity section, the machinery deck, and the cellular cofferdams.

Components not included in the evaluation boundary of the Gate Structure Number 2 are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

Gate Structure Number 2 is discussed in FSAR Section 12.2.7. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical barrier to separate the warmer water discharged from the cooling towers during their operation with the water in the intake pumping station channel. This barrier function ensures that RHRSW makeup water does not exceed the design temperature limit. 10 CFR 54.4(a)(1)
2. Provide physical barrier to separate the warmer water discharged from the cooling towers during their operation with the water in the intake pumping station channel. This barrier function ensures that RHRSW makeup water does not exceed the design temperature limit.

RHRSW is required to meet NSPC Vital Auxiliaries and Decay Heat Removal Performance criterion. 10 CFR 54.4(a)(3)

Steel Components: All Structural Steel	Structural Support

The aging management review results for these components are provided in Table 3.5.2-14, Gate Structure Number 2 - Summary of Aging Management Evaluation.

2.4.15 Gate Structure Number 3

Description

Gate Structure Number 3 is located at the south-east end of the plant, below the Intake Pumping Station and Intake Channel. The structure consists of a skimmer wall, machinery deck, gate guide cells, and gates. The gate guide cells consist of steel sheet piling driven to bedrock and filled with concrete. Gate Structure Number 3 is a common structure for all three units.

Gate Structure No. 3 acts as a skimmer wall for cooling water drawn from Wheeler Reservoir into the plant. Gate Structure No. 3 provides the protective safety function of supplying a source of cooling water to safety-related components. Gate Structure No. 3 is designed so that a sufficient flow of water from Wheeler Reservoir is provided to the Intake Channel to supply the RHRSW System and the EECW System.

Components not included in the evaluation boundary of the Gate Structure Number 3 are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip

Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

Gate Structure No 3 is described in FSAR Sections 11.6 and 12.2.7. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provides a source of cooling water to safety-related components. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
3. Provides physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). Provides a source of cooling water to safety-related components. 10 CFR 54.4(a)(3)

2.4.16 Discharge Control Structure

Description

The Discharge Control Structure is a nonsafety-related structure which has the intended function of distributing flow from the cool water channel to the discharge diffusers via Gate Structure Number 1 and to limit the potential overflowing of the safety-related Gate Structure Number 2 such that the ultimate heat sink is protected during periods of cooling tower operation. Gate Structure Number 2 provides the safety-related function of limiting the potential thermal mixing of the warmer water discharged from the cooling towers during their operation with the water in the intake pumping station channel which provides the makeup for the RHRSW System.

Components not included in the evaluation boundary of the Discharge Control Structure are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Discharge Control Structure is described in FSAR Section 12.2.7. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Distribute flow from the cool water channel to the discharge diffusers via Gate Structure No. 1 to limit the potential overflowing of Gate Structure Number 2 such that the ultimate heat sink is protected during periods of cooling tower operation. 10 CFR 54.4(a)(2)

2.4.17 Circulating Water Conduits

Description

The CCW System for each unit shares components with the other units. Each unit has three circulation water pumps that take water from a common intake channel in Wheeler Reservoir. After passing through the condensers the heated water is cooled by the cooling towers or discharged directly back to Wheeler Reservoir. Provisions (a loop in the discharge conduit with a vacuum breaker) are made for the prevention of backflow of heated water into the intake channel that serves as the ultimate heat sink if normal offsite power is lost. Each pump is installed in a separate suction well with entering water strained by trash racks and traveling screens, operating in parallel. Each pump discharge is equipped with motor-operated butterfly valves. The discharges of the three pumps are brought together in a steel trifurcation transition to a single tunnel. The water is channeled to the condenser by this tunnel. The conduits are constructed of reinforced concrete. The Circulating Water Conduits are credited in the NFPA 805 NSCA to support the CCW System intended function to supply water to the RCW system.

Components not included in the evaluation boundary of the Circulating Water Conduits are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

Circulating Water Conduits are described in FSAR Sections 2.4.2.2.2, 11.6, and 12.2.7.7, and Appendix F.6.4. The structures are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for systems, structures, and components relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)

2.4.18 Diesel High Pressure Fire Pump House

Description

The Diesel High Pressure Fire Pump House is located at elevation 565 feet adjoining safety-related Gate Structure No. 2 where the diesel fire pump takes its suction from the cool water channel. The Diesel High Pressure Fire Pump House is a non-category I structure consisting of a steel frame structure and concrete.

The HPFP System supplies water for required water suppression systems, hydrants, and hose stations within the power block. The HPFP water supply system at BFN consists of one diesel engine driven and three electric motor driven fire pumps and water distribution piping. The one diesel engine driven fire pump is located in Diesel High Pressure Fire Pump House. The Diesel High Pressure Fire Pump House is a shared structure for all three units.

Components not included in the evaluation boundary of the Diesel High Pressure Fire Protection House are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Diesel High Pressure Fire Pump House is shown on FSAR Figure 2.2-4. The structure is shown in the subsequent license renewal boundary drawings listed below.

<u>Intended Functions</u>

1. Resist spatial interactions from nonsafety-related SSCs that could prevent satisfactory accomplishment of a safety-related function. A failure of the Diesel High Pressure Fire Pump House could adversely affect the structural integrity of safety-related Gate Structure Number 2. 10 CFR 54.4(a)(2)
2. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)

2.4.19 Low Level Radwaste Storage Facility

<u>Description</u>

The Low Level Radwaste Storage Facility includes four modules. Only module numbers 1 and 2 are usable and within the scope of subsequent license renewal. The modules are designed for long-term storage of low level radioactive waste. The modules are segmented into compartments. The modules are above ground, safety-related structures constructed of reinforced concrete. Access to the modules is provided only from above and is primarily used for placing low level radwaste in or removing low level radwaste from the modules.

Each module is normally closed. Each module has five solid sides, and the only access point is the solid concrete top section. The modules have no moving parts or electrical components. No ventilation equipment is installed within the modules.

Each module contains a sump, with a through wall stainless steel pipe that is valved and blank flanged. This configuration allows for sampling of any potential drainage from materials. The physical structure, internal sump, and secured drain point provide engineering controls to prevent leakage from the module. By design, the module will contain the effluent in the event of a fire.

The Low Level Radwaste Storage Facility structure is not required to serve any safety functions directly related to safe shutdown of the reactors. The storage modules are safety related structures and are designed to resist loads resulting from extreme environmental events, such as high winds, tornadoes, and seismic events.

Components not included in the evaluation boundary of the Low Level Radwaste Storage Facility are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe

Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Low Level Radwaste Storage Facility are discussed in the FSAR Sections 9.3.4.2.1 and 12.2.17. The structures are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for the storage modules and their contents to prevent or mitigate a significant offsite release of radioactivity. 10 CFR 54.4(a)(1)
2. The Low Level Radwaste Storage Facility contains effluents and limits the release of radioactivity to the environment to satisfy NFPA 805 NSPC Radioactive Release Performance Criteria. 10 CFR 54.4(a)(3)

2.4.20 Transformer Yard

Description

The Transformer Yard is a shared feature for all three units. The plant electric power system consists of the main generators, the main step-up transformers, the USSTs, the CSSTs, the cooling tower transformers (CTTs), the batteries, and the electric distribution system. Under normal plant operating conditions, the main generators supply electrical power through isolated-phase buses to the main step-up transformers and the unit station service transformers which are physically located adjacent to the Turbine Building. The primaries of the USSTs are connected to the isolated-phase bus at a point between the load side of the generator breaker terminals and the low-voltage connection of the main transformers. The CSSTs and CTTs are located outside.

During normal operation, station auxiliary power is taken from the main generator through the unit station service transformers. During startup and shutdown, auxiliary power is supplied from the 500 kV system through the main transformers to the USST with the main generators isolated by the main generator breakers. Auxiliary power is also available through the two CSSTs which are fed from the 161 kV system. The Transformer Yard provides support for the main transformers by providing a power path from the 500 kV system to the plant. Electrical power distribution is required to support the NFPA 805 Vital Auxiliaries NSPC.

Components not included in the evaluation boundary of the Transformer Yard are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The BFN transformers are described in detail in FSAR Section 8.4. The Transformer Yard is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
2. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)
    - The BFN transformers that are credited for offsite power recovery following a Station Blackout, are located within the Transformer Yard.

2.4.21 161 kV Switchyard

Description

The 161 kV Switchyard is a shared feature for all three units. The switchyard routes power from off-site transmission lines into BFN for on-site use. The 161 kV Switchyard is supplied by two 161 kV transmission lines. One of these lines connects to the Trinity 500-161 kV Substation, and the other connects to the Athens, Alabama, 161 kV Substation. The 161 kV Switchyard contains a series of structures including pull-off tower structures, switch support structures, potential transformer support structures, carrier current structures, and bus support structures.

Components not included in the evaluation boundary of the 161 kV Switchyard are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The 161 kV Switchyard is described in Sections 8.1, 8.3 and 8.4 and Appendix F.6.1. The switchyard is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The 161 kV Switchyard is utilized to restore offsite power following a Station Blackout. 10 CFR 54.4(a)(3)

2.4.22 500 kV Switchyard

Description

The BFN Units 1, 2, and 3 generators are connected into an existing network supplying large load centers. All three units are tied into TVA's 500 kV transmission system via seven 500 kV transmission lines. The 161 kV Switchyard is supplied by two 161 kV transmission lines. The 500 kV and 161 kV Switchyards supply startup, running, and shutdown power through stepdown transformers. The 161 kV Switchyard also supplies the cooling tower power.

The 500 kV Switchyard includes seven line bays and three transformer bays. The 500 kV connections consist of one line to the Madison 500 kV Substation; two lines to the Trinity 500 kV Substation; one line to the Maury 500 kV substation; one line to the West Point 500 kV Substation; one line to the Union 500 kV Substation; and one line to the Limestone 500 kV Substation.

The basic function of the normal auxiliary electrical power system is to provide power for plant auxiliaries during startup, operation, and shutdown, and to provide highly reliable power sources for plant loads which are important to its safety. The Normal Auxiliary Power System is to furnish power to start up and operate all the station auxiliary loads necessary for plant operation, and to furnish normal and alternate sources of power for safe shutdown.

The 500 kV Switchyard includes cable trenches, duct banks and control buildings, towers and tower foundations between the power block and substations, and switchgear buildings. Electrical power distribution is required to support the NFPA 805 Vital Auxiliaries NSPC. The 500 kV Switchyard also provides support for the 500 kV equipment which is credited for offsite power restoration by transferring power from the 500 kV and 161 kV electrical grid to the plant.

Components not included in the evaluation boundary of the 500 kV Switchyard are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The 500 kV Switchyard is described in detail in FSAR Sections 8.3, 8.4, Appendix F.6.1. The switchyard is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
2. Relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). The 500 kV Switchyard provides support for equipment used to restore offsite power following a Station Blackout. 10 CFR 54.4(a)(3)

2.4.23 Condensate Water Storage Tanks Foundations, Trenches, and Tunnels

<u>Description</u>

The Condensate Water Storage Tanks Foundations, Trenches, and Tunnels are shared features for all three units. The Condensate Water Storage Tank transfer piping is routed through reinforced concrete trenches and tunnels that provide physical support, shelter, and protection for condensate transfer piping routed to and from the Condensate Water Storage Tanks. There are five Condensate Water Storage Tanks. The two 500,000 gallon capacity tanks are not in-scope, and the three 375,000 gallon capacity tanks are in-scope. Each of the three in-scope Condensate Water Storage Tanks is supported on a foundation consisting of a concrete ring, under the perimeter of the tank bottom, which surrounds a bed of compacted sand. The 500,000 gallon Condensate Water Storage Tanks are supported on concrete slab foundations; However, the foundations for the 500,000 gallon Condensate Water Storage Tanks are not in-scope for subsequent licensing renewal.

The Condensate Water Storage Tanks provide the preferred source of water supply to the HPCI and RCIC Systems. The Condensate Water Storage Tanks also serve as a suction source for multiple systems required to meet the NFPA 805 Inventory Control NSPC.

Components not included in the evaluation boundary of the Condensate Water Storage Tanks Foundations, Trenches, and Tunnels are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Condensate Water Storage Tanks Foundations, Trenches, and Tunnels are not discussed in the FSAR. The structures are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
2. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). Provides structural support for the Condensate Water Storage Tanks. 10 CFR 54.4(a)(3)

2.4.24 Nitrogen Storage Tank Foundation

Description

The Nitrogen Storage Tank Foundation is a reinforced concrete slab that provides structural support for the Nitrogen Storage Tank. The Nitrogen Storage Tank Foundation is part of the Containment Inerting System which is used during the initial purging of the primary containment and provides a supply of makeup nitrogen. The system consists of two liquid nitrogen storage tanks with two makeup vaporizers, a common purge vaporizer, pressure reducing valves and controllers, instrumentation valves and piping. Nitrogen is supplied from the common onsite storage tanks through the common purge vaporizer or makeup vaporizers where the liquid nitrogen is converted to the gaseous state. The Nitrogen Storage Tank Foundations provide support for the Nitrogen Storage Tanks, which are credited to demonstrate compliance with Fire Protection regulated events.

Components not included in the evaluation boundary of the Nitrogen Storage Tank Foundation are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Nitrogen Storage Tank Foundation is not discussed in FSAR. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)

2.4.25 Supplemental Diesel Generator Building

Description

The Supplemental Diesel Generator Building houses two Supplemental Diesel Generator sets and associated supporting equipment on an elevated steel sub-base fuel tank. The Supplemental Diesel Generator building is a pre-fabricated, insulated metal walk-in structure. A reinforced concrete foundation is provided for the Supplemental Diesel Generator building and access galleries. The Supplemental Diesel Generators System is included in the NFPA 805 fire protection analysis to improve risk margin for CDF and LERF.

Components not included in the evaluation boundary of the Supplemental Diesel Generator Building are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe

Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Supplemental Diesel Generator Building is described in FSAR Section 12.2.19. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for the Fire Protection system relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)

Steel Components: All Structural Steel	Shelter and Protection, Structural Support
Structural Bolting	Structural Support

The aging management review results for these components are provided in Table 3.5.2-25, Supplemental Diesel Generator Building - Summary of Aging Management Evaluation.

2.4.26 Containment Atmosphere Dilution System Storage Tank Foundations

Description

The CAD System Storage Tank Foundations are reinforced concrete slabs on grade or foundations that provide structural support for the CAD System tanks. The CAD System tanks are used to control the concentration of combustible gases in the primary containment after an accident and to provide a backup pneumatic supply to selected components when the Control Air System is not available. The CAD System Storage Tank Foundations provide support for the CAD System Storage Tanks which are credited to demonstrate compliance with Fire Protection and Station Blackout regulated events.

Components not included in the evaluation boundary of the CAD System Storage Tank Foundations are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The CAD System Storage Tank Foundations are not discussed in the FSAR. The structures are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provides physical support and protection for safety-related SSCs. 10CFR54.4(a)(1)
2. Provide physical support, shelter, and protection for the Fire Protection system relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
3. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)

2.4.27 Intake Channel

Description

The Intake Channel provides the following:

- A source of water to the condenser circulating water system and other plant cooling systems during normal operation.
- A source of cooling water post-transient and post-accident for decay heat removal, containment cooling, spent fuel cooling, control bay cooling, essential equipment cooling, and fire protection.
- A sufficient flow and heat sink capacity to maintain safe shutdown following a failure of the downstream Wheeler Dam.

The Intake Channel is common to all three units. The Intake Channel is an excavated channel that extends from the Intake Pumping Station into the river channel that would exist if the Wheeler Dam failed. The Intake Channel is a plant structure that supports the RHRSW System, which is credited to demonstrate compliance with Fire Protection and Station Blackout regulated events

Components not included in the evaluation boundary of the Intake Channel are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Intake Channel is described in FSAR Sections 2.4.2 and 12.2.7 and Appendix F.7.7. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provides a source of cooling water to safety-related systems and components. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for the Fire Protection system relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
3. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)

2.4.28 North Bank of Cool Water Channel East of Gate Structure Number 2

Description

The North Bank of Cool Water Channel East of Gate Structure Number 2 is an earthen embankment on the north side of the cool water channel and south of the Reactor Buildings. The bank is a safety-related earthen structure with the sloped portion of the bank protected with vegetation and rock rip-rap. The bank is designed to support and protect the buried RHRSW System discharge piping located within the bank that discharges into Wheeler Reservoir. The North Bank of Cool Water Channel East of Gate Structure Number 2 is a structure relied on to provide physical support, in addition to shelter and protection, for the RHRSW piping, which is credited to demonstrate compliance with Fire Protection and Station Blackout regulated events.

Components not included in the evaluation boundary of the North Bank of Cool Water Channel East of Gate Structure Number 2 are Cable Trays and Supports; Conduit and Conduit Supports;

Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The North Bank of Cool Water Channel East of Gate Structure Number 2 is described in FSAR Section 12.2.7. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for safety-related SSCs. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for the Fire Protection system relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
3. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)

2.4.29 South Dike of Cool Water Channel between Gate Structures Number 2 and Number 3

Description

The South Dike of Cool Water Channel between Gate Structures Number 2 and Number 3 is an earthen dike on the south side of the cool water channel which forms a boundary with Wheeler Reservoir. The dike is a safety-related earthen structure with a sloped portion of the dike protected by vegetation and rock rip-rap. The dike is designed to protect the buried RHRSW System discharge piping located within the dike that discharges into Wheeler Reservoir. The South Dike of Cool Water Channel between Gate Structure Number 2 and Number 3 is a structure relied on to provide physical support, as well as shelter and protection, for the RHRSW piping, which is credited to demonstrate compliance with Fire Protection and Station Blackout regulated events.

Components not included in the evaluation boundary of the South Dike of Cool Water Channel between Gate Structures Number 2 and Number 3 are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The South Dike of Cool Water Channel between Gate Structures Number 2 and Number 3 is described in FSAR Figure 2.2-4 and Section 12.2.7. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for safety-related SSCs. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for the Fire Protection system relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
3. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)

2.4.30 Earth Berm

Description

The Earth Berm extends along the west, south, and east walls of the Reactor Building from the Unit 1/2 Diesel Generator Building to the Unit 3 Diesel Generator Building. The Earth Berm has the following structures located within it: Equipment Access Lock, the RHRSW Tunnels, Vent Vaults, and Standby Gas Treatment Building. The Earth Berm is a plant feature common to all three units.

Components not included in the evaluation boundary of the Earth Berm are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Earth Berm is described in FSAR Section 12.2.9 and 12.2.10. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for safety-related SSCs. 10CFR 54.4(a)(1)

2.4.31 Residual Heat Removal Service Water Tunnels

Description

The RHRSW Tunnels are underground multi-plate arch tunnels that protect safety-related piping systems (i.e., RHRSW and EECW supply and discharge piping) that penetrate the south wall of the Reactor Building until they are buried below grade near the south end of the tunnels. The RHRSW Tunnels are safety related structures. The RHRSW Tunnels are structures relied on to provide physical support as well as shelter and protection for the RHRSW and EECW piping, which is credited to demonstrate compliance with Fire Protection regulated events.

Components not included in the evaluation boundary of the RHRSW Tunnels are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The RHRSW Tunnels are not described in the FSAR. The structures are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provides structural support and shelter/protection for safety-related components in the RHRSW Tunnels. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for the Fire Protection system relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)

2.4.32 Electrical Cable Tunnel (from Intake Pumping Station to Powerhouse)

Description

The Electrical Cable Tunnel from the Intake Pumping Structure to the Powerhouse is an underground concrete-encased tunnel that provides structural support and shelter/protection for the power cables for components (including the RHRSW System, EECW System, and the electric fire pumps) in the Intake Pumping Station. A fire rated wall separates the Turbine Building from the electrical cable tunnel that routes to the Intake Pumping station.

The tunnel also runs east-west under the southern portion of the Turbine Buildings. The Electrical Cable Tunnel provides physical support as well as shelter and protection for the electric cables associated with RHRSW (Residual Heat Removal Service Water), EECW (Emergency Equipment Cooling Water), and CCW (Condenser Circulating Water) Systems in addition to the electric fire pumps, all of which are credited to demonstrate compliance with the Fire Protection regulated event. The Electric Cable Tunnel is also relied on to provide physical support as well as shelter and protection for safety-related systems, structures, and components, and power cables, for the RHRSW and EECW Systems, which are credited to demonstrate compliance with the Station Blackout regulated event.

Components not included in the evaluation boundary of the Electrical Cable Tunnel (from Intake Pumping Station to Powerhouse) are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping

Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Electrical Cable Tunnel (from the Intake Pumping Structure to the Powerhouse) is discussed in FSAR Section 1.6.5.4. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for safety-related SSCs, power cables for the RHRSW System and EECW System. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for the Fire Protection system relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
3. Provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)

2.4.33 Underground Concrete Encased Structures

Description

The Underground Concrete Encased Structures include safety-related manholes, handholes and duct banks that span between safety-related structures, manholes and handholes. This group of structures also includes those manholes, handholes, and duct banks required for Fire Protection and Station Blackout.

Components not included in the evaluation boundary of the Underground Concrete Encased Structures are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

Components in-scope for the Underground Concrete Encased Structures include:

- Safety-related concrete duct bank (inaccessible) that spans from the Intake Pumping Station to Handhole (HH)-15 to HH-26 and to the Electrical Cable Tunnel from the Intake Pumping Station to the Powerhouse
- Safety-related concrete duct bank (inaccessible) that spans from the Unit 1/2 Diesel Generator Building to the Standby Gas Treatment Building
- Safety-related concrete duct bank (inaccessible) that spans from the Unit 3 Diesel Generator Building to the Electrical Cable Tunnel from the Intake Pumping Station to the Powerhouse
- Safety-related concrete duct bank (inaccessible) that spans from the CAD Storage Tanks A and B foundations to the Reactor Building.
- Duct Banks associated with HH-1 through HH-13 (inaccessible) located in the Transformer Yard on the north side of the Turbine Building
- The concrete tunnel located in the 161 kV and 500 kV Switchyards
- Catch Basins 31, 32 and 33 located in the yard south of the Earth Berm.
- HH-1 through HH-13, HH-15, and HH-26 (RHRSW/EECW Division 1 Cables)
- Manholes (MH): MH-A, MH-B, MH-C and MH-D

Only the below grade portions of the associated structures are evaluated as part of Underground Concrete Encased Structures, all above grade portions of associated structures are evaluated as part of Yard Structures, General (see Section 2.4.34).

Underground Concrete Encased Structures are not discussed in FSAR. The structures are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for safety-related SSCs. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for the Fire Protection system relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)

3. Provide physical support, shelter, and protection for safety-related SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)

2.4.34 Yard Structures, General

Description

Yard Structures, General (Manholes, Duct Banks, etc.) includes various structures and components in the yard, inside of the Protected Area, around the power block and intake pumping station. The Yard Structures, General consist of various conduit duct banks, electrical and other manholes, valve pits, pipe tunnels and trenches, retaining walls, roads, storm drainage, lighting poles, storage tank foundations, and other miscellaneous yard features. Yard Structures determined to be in scope for subsequent license renewal are various electrical manholes which include the curbs, manhole access covers, and the buried duct banks that carry electrical cables in scope for subsequent license renewal. Other tank foundations, supports, pipe trenches, manholes, valve pits, roadways, lighting poles, storm drains, tunnels, and other components within the boundary of Yard Structures were evaluated and determined to be not in scope since the components do not perform an intended function.

Components not included in the evaluation boundary of the Yard Structures, General, which are in the yard area around the power block, are structural commodities, such as electrical panels, racks, cabinets, and other enclosures; conduit and conduit supports; cable trays and cable supports; and tube track; which are evaluated separately. Fire barriers (doors, dampers, fire rated enclosures, fire proofing material, penetration seals, fire barrier function of walls and slabs - including oil retaining dikes and walls that separate transformers) are evaluated with the Fire Protection System. Cable trenches, duct banks and control buildings in substations, towers and tower foundations between the power block and substations, and outdoor transformer foundations, and switchgear buildings are evaluated within the Transformer Yard, 161 kV Switchyard, and 500 kV Switchyard Structures. Any mechanical and electrical systems and components housed inside or supported by the Yard Structures, General or within any manhole or duct bank are separately evaluated with their respective mechanical systems, electrical systems, or commodities.

Only the above grade portions of the associated structures are evaluated as part of Yard Structures, General, all below grade portions of associated structures are evaluated as part of Underground Concrete Encased Structures (see Section 2.4.33).

Yard Structures, General is included in FSAR Table 10.11-1. Yard Structures, General is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provides physical support, shelter, and protection for safety-related SSCs. 10 CFR 54.4(a)(1)
2. Provide physical support, shelter, and protection for nonsafety-related SSCs whose failure could prevent satisfactory accomplishment of function(s) identified for 10 CFR 54.4(a)(1). 10 CFR 54.4(a)(1) and 10CFR 54.4(a)(2)
3. Provide physical support, shelter, and protection for the Fire Protection system relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)

2.4.35 South Access Retaining Walls

Description

The South Access Retaining Walls are located east of the Equipment Access Lock. The South Access Retaining Walls are required to support the Earth Berm which is classified as a safety-related structure.

Components not included in the evaluation boundary of the South Access Retailing Walls are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The South Access Retaining Walls are not discussed in FSAR. The structures are shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide physical support, shelter, and protection for safety-related SSCs; the Earth Berm. 10 CFR 54.4(a)(1)

2.4.36 Structural Commodities

Description

Structural commodities include the following component groups: Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints and Jet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. The component groupings are based on similarities in design, material, aging effect, and environment.

- Cable Trays and Supports

  The Cable Tray and Supports commodity group includes components such as cable trays and cable tray covers. Components evaluated in this group include cable trays, and their structural support members, welds, bolting, anchorage and building concrete at anchorage, that comprise the interface between the structure and the electrical or instrument component.

- Conduit and Conduit Supports

  The Conduit and Conduit Supports commodity group includes components such as rigid and flexible electrical conduits and fittings. Components evaluated in this group include conduit, and its structural support members, welds, bolting, anchorage and building concrete at anchorage, etc., that comprise the interface between the structure and the electrical, or instrument component. These commodity groups also include the associated supports.

- Electrical Panels, Racks, Cabinets and Other Enclosures

  The Electrical Panels, Racks, Cabinets and Other Enclosures commodity group includes components such as electrical panels, frames and racks, cabinets, and boxes, and enclosures that contain sample stations. Components evaluated in this group also include support structural members, welds, bolting, anchorage and building concrete at anchorage, that comprise the interface between the structure and the electrical or instrument component.

- Equipment Supports and Foundations

  The Equipment Supports and Foundations commodity group includes the equipment supports and foundations within the following structures: the Reactor Buildings, Primary Containment Structures, the Unit 1/2 Diesel Generator Buildings, the Unit 3 Diesel Generator Building, the Intake Pumping Station, the Reinforced Concrete Chimney, the Standby Gas Treatment Building, the Equipment Access Lock, the Vacuum Pipe Building, the Turbine Buildings, the Diesel High Pressure Fire Pump House; the Transformer Yard; the 161 kV Switchyard; and the 500 kV Switchyard. The Condensate Water Storage Tanks Foundations, Nitrogen Storage Tank Foundation and the CAD System Storage Tank Foundations are addressed separately in Sections 2.4.23, 2.4.24 and 2.4.26, respectively. Components evaluated in this group include equipment foundations within the structures, and support structural members, welds, bolting, anchorage and building concrete at anchorage, that comprise the interface between the structure and the mechanical component.

- Hazard Barriers and Elastomers

  Hazard Barriers and Elastomers commodity group includes those hazard barriers not associated with the overall structure, such as a floor or wall. Hazard barriers include penetration seals, hazard barrier doors, fire wraps, fire coatings, fire dampers and other hazard barriers such as missile, radiation, and spray shields. Elastomer components include expansion joint seals (seismic joint seal material, control joint seal material, and seismic separation joint seal material), gaskets at hatches and doors, spent fuel pool gate seals, blowout panel seals, and metal siding gap seals. Hazard Barriers and Elastomers also include roofing assemblies and permanent lead shielding blankets.

- HVAC Duct Supports

  The HVAC Duct Supports commodity group includes the supports and support anchorage for HVAC ducts and associated components. Components evaluated in this group include HVAC ducting and their structural support members, welds, bolting, anchorage and building concrete at anchorage, that comprise the interface between the structure and the HVAC ducts and associated components.

- Miscellaneous Steel

  The Miscellaneous Steel commodity group includes platforms, grating, stairs, ladders, steel curbs, handrails, kick plates, diamond plate type decking, hatches, plugs and manhole covers. This commodity group also includes vents, louvers, and roof scuttles. These steel and other metal components are generally installed throughout BFN structures. Some components are exposed to the outdoor environment. Components evaluated in this group include miscellaneous steel components and their structural support members, welds, bolting, anchorage and building concrete at anchorage, that comprise the interface between the structure and the miscellaneous steel components.

- Penetrations and Sleeves

  The Penetrations and Sleeves commodity group includes the equipment used for mechanical and electrical penetrations. Penetrations and sleeves are located in openings of walls, floors, roofs, or ceilings and allow components such as piping, conduits, duct banks, and tubing to be routed through the opening. The majority of the system components are penetrations and sleeves that provide physical support to the mechanical or electrical system components passing through the penetration. These penetrations and sleeves and other penetration support equipment are evaluated as structural components. Components evaluated in this group include penetrations and sleeves and their structural support members, welds, bolting, anchorage and building concrete at anchorage, that comprise the interface between the structure and the penetration and sleeves components.

- Pilings

  The Pilings commodity group includes piles that support the following structures: the Equipment Access Lock; the Turbine Buildings; the Radwaste Building; Gate Structure Number 2; Gate Structure Number 3; the Discharge Control Structure; the Diesel High Pressure Fire Pump House; the Transformer Yard; and the RHRSW Tunnel. Piles are used under these structures to transfer foundation loadings to greater depths below grade. The function of the piles is to support superimposed structural loads and to transfer the structural loads to soil or rock of good bearing capacity.

- Pipe Whip Restraints and Jet Impingement Shields

  The Pipe Whip Restraint and Jet Impingement Shields commodity group consists of the restraints relied upon to limit pipe displacement in the event of a high energy pipe break. Components evaluated in this group include structural members, welds, bolting, anchorage, and the building concrete at anchorage that comprises the interface between the structure and the pipe whip restraint or jet impingement shield.

  Pipe whip restraints and jet impingement shields that are designed and installed to protect safety-related equipment from the effects of a HELB, are within the scope of subsequent license renewal. Along with this mitigative option, BFN also employs the preventive option of including nonsafety-related liquid-filled lines with potential leakage or spray spatial interaction within the scope of subsequent license renewal.

- Piping Supports

  The Piping Support commodity group includes the supports and support anchorage for piping and piping components. Components evaluated in this group include support structural members, welds, bolting, anchorage and building concrete at anchorage, that comprise the interface between the structure and the piping and piping component.

- Thermal Insulation

  The Thermal Insulation commodity group consists of insulation and jacketing that are installed on piping and other mechanical components for the purpose of heat conservation, temperature control, and prevention of condensation. Components evaluated in this group include insulation and insulation jacketing.

- Tube Track

  The Tube Track commodity group includes the supports and support anchorage for tube track. Components evaluated in this group include tube track and its structural support members, welds, bolting, anchorage and building concrete at anchorage, that comprise the interface between the structure and the tube track.

Structural commodities components in scope for subsequent license renewal are those components in structures and areas with mechanical or electrical components in scope for subsequent license renewal. Structural commodities components are not in scope for subsequent license renewal were installed in other structures and areas where there are no mechanical or electrical components in scope for subsequent license renewal.

Structural commodities groups are not described in the FSAR. Refer to the “Components Subject to Aging Management Review” tables below for a list of components included in the boundaries of each of the structural commodities groups. Structural commodities are not shown on the subsequent license renewal boundary drawing since these commodities are included where located in structures in scope for subsequent license renewal.

Intended Functions

1. Portions of the structural commodities provide physical support, shelter, and protection for safety-related SSCs. 10 CFR 54.4(a)(1)
2. Portions of the structural commodities provide physical support, shelter, and protection for nonsafety-related SSCs whose failure could prevent satisfactory accomplishment of function(s) identified for 10 CFR 54.4(a)(1). 10 CFR 54.4(a)(2)
3. Portions of the structural commodities provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Anticipated Transient without Scram (10 CFR 50.62). 10 CFR 54.4(a)(3)
4. Portions of the structural commodities provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Environmental Qualification (10 CFR 50.49). 10 CFR 54.4(a)(3)
5. Portions of the structural commodities provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Fire Protection (10 CFR 50.48). 10 CFR 54.4(a)(3)
6. Portions of the structural commodities provide physical support, shelter, and protection for SSCs relied upon in safety analyses or plant evaluations to perform a function that demonstrates compliance with the Commission's regulations for Station Blackout (10 CFR 50.63). 10 CFR 54.4(a)(3)

Components Subject to AMR

The component types that require aging management review are indicated in the below Table 2.4-36, Structural Commodities.

Table 2.4-36, Structural Commodities

Component Type	Passive Intended Functions
Cable Trays and Supports	
Building Concrete at Locations of Expansion and Grouted Anchors; Grout Pads for Support Base Plates	Structural Support
Structural Bolting	Structural Support
Support Members; Welds; Bolted Connections; Support Anchorage to Building Structure	Structural Support
Conduit and Conduit Supports	
Building Concrete at Locations of Expansion and Grouted Anchors; Grout Pads for Support Base Plates	Structural Support
Conduit	Structural Support, Shelter and Protection
Steel Components: All Structural Steel	Structural Support
Structural Bolting	Structural Support
Support Members; Welds; Bolted Connections; Support Anchorage to Building Structure	Structural Support
Electrical Panels, Racks, Cabinets, and Other Enclosures	
Building Concrete at Locations of Expansion and Grouted Anchors; Grout Pads for Support Base Plates	Structural Support
Structural Bolting	Structural Support
Support Members; Welds; Bolted Connections; Support Anchorage to Building Structure	Structural Support
Equipment Supports and Foundations	
Building Concrete at Locations of Expansion and Grouted Anchors; Grout Pads for Support Base Plates	Structural Support
Constant And Variable Load Spring Hangers; Guides; Stops	Structural Support
Sliding Surfaces	Structural Support
Structural Bolting	Structural Support
Support Members; Welds; Bolted Connections; Support Anchorage to Building Structure	Structural Support
Vibration Isolation Elements	Structural Support
Hazard Barriers and Elastomers	
Controlled Leakage Door	Fire Barrier, Flood Barrier, HELB Shielding, Pressure Boundary, Shelter and Protection

Table 2.4-36, Structural Commodities (Continued)

Component Type	Passive Intended Functions
Fire Barriers Fire Barrier Penetration Seals Fire Dampers Fireproofing; Fire Barriers Fire Rated Doors Structural Fire Barrier Walls Structural Fire Barriers: Walls, Ceilings And Floors	Fire Barrier, Flood Barrier, Structural Support
Membrane	Shelter and Protection
Moisture Barriers (Caulking, Flashing, Other Sealants)	Flood Barrier, Pressure Boundary, Shelter and Protection
Radiation Protection Blankets	Shielding
Compressible Joints And Seals Seals; Gaskets; Moisture Barriers (Caulking, Flashing, And Other Sealants) Seals; Gaskets; Moisture Barriers (Spent Fuel Pool Gates)	Flood Barrier, Pressure Boundary, Water Retaining Boundary
Steel Components: All Structural Steel	Shelter and Protection, Structural Support
Structural Bolting	Structural Support
HVAC Duct Supports	
Building Concrete at Locations of Expansion and Grouted Anchors; Grout Pads for Support Base Plates	Structural Support
Structural Bolting	Structural Support
Support Members; Welds; Bolted Connections; Support Anchorage to Building Structure	Structural Support
Miscellaneous Steel	
Building Concrete at Locations of Expansion and Grouted Anchors; Grout Pads for Support Base Plates	Structural Support
Equipment Hatch, CRD Hatch Hatches / Plugs Steel Components: All Structural Steel	Flood Barrier, Pressure Boundary, Shelter and Protection, Structural Support
Structural Bolting	Structural Support
Support Members; Welds; Bolted Connections; Support Anchorage to Building Structure	Structural Support
Penetration and Sleeves	
Building Concrete at Locations of Expansion and Grouted Anchors; Grout Pads for Support Base Plates	Structural Support

Table 2.4-36, Structural Commodities (Continued)

Component Type	Passive Intended Functions
Penetrations; Electrical and I&C Penetrations; Mechanical Penetration Sleeves Steel Components: Penetrations	Flood barrier, Pressure Boundary, Shelter and Protection, Structural Support

Component Type	Passive Intended Functions
Structural Bolting	Structural Support
Support Members; Welds; Bolted Connections; Support Anchorage to Building Structure	Structural Support

The aging management review results for these components are provided in Table 3.5.2-36, Structural Commodities - Summary of Aging Management Evaluation.

2.4.37 Isolation Valve Pits

Description

The Isolation Valve Pits provide structural support and shelter/protection for the Hardened Containment Venting System. These Class II (non-safety-related) structures are attached to the south wall of the Reactor Building.

The Isolation Valve Pits house a portion of the Hardened Containment Venting System. The Hardened Containment Venting System is credited in the Fire Probabilistic Risk Assessment (PRA) model for decay heat removal when all other decay heat removal functions are lost. The portion of the Hardened Containment Venting System upstream of and including the outboard isolation valve also serves a Primary Containment System function.

Components not included in the evaluation boundary of the Isolation Valve Pits are Cable Trays and Supports; Conduit and Conduit Supports; Electrical Panels, Racks, Cabinets, and Other Enclosures; Equipment Supports and Foundations; Hazard Barriers and Elastomers; HVAC Duct Supports; Miscellaneous Steel; Penetration and Sleeves; Pilings; Pipe Whip Restraints andJet Impingement Shields; Piping Supports; Thermal Insulation; and Tube Track. These components are evaluated as Structural Commodities.

The Isolation Valve Pits are not described in the FSAR. The structure is shown in the subsequent license renewal boundary drawings listed below.

Intended Functions

1. Provide structural support and shelter/protection for components of the Hardened Containment Venting System. 10 CFR 54.4(a)(3)

FSAR References

None

Subsequent License Renewal Boundary Drawings

0-10E201-01-SLR

Components Subject to AMR

The component types that require aging management review are indicated in the below Table 2.4-37, Isolation Valve Pits.

Table 2.4-37, Isolation Valve Pits

Component Type	Passive Intended Functions
Concrete (accessible areas): Above Grade Exterior Concrete (accessible areas): All Concrete (accessible areas): Exterior Above And Below Grade; Foundation Concrete (accessible areas): Interior Concrete (inaccessible areas): All Concrete (inaccessible areas): Below Grade Exterior; Foundation Concrete (inaccessible areas): Exterior Above And Below Grade; Foundation Concrete (inaccessible areas): Foundation Concrete: Above Grade Exterior Concrete: All Concrete: Interior	Shelter and Protection, Structural Support
Steel components: All Structural Steel	Structural Support
Structural Bolting	Structural Support

The aging management review results for these components are provided in Table 3.5.2-37, Isolation Valve Pits - Summary of Aging Management Evaluation.

2.5 SCOPING AND SCREENING RESULTS: ELECTRICAL

The determination of electrical systems that fall within the scope of license renewal is made through the application of the process described in Section 2.1. The results of the electrical systems scoping review are contained in Section 2.2.

Subsection 2.1.6.1 provides the screening methodology for determining which electrical components and commodity groups within the scope of 10 CFR 54.4 meet the requirements contained in 10 CFR 54.21(a)(1). The electrical commodity groups that meet those screening requirements are identified in this section. These identified electrical commodity groups consequently require an aging management review.

As described in Subsection 2.1.6.1, the screening was performed on a commodity group basis for the in scope electrical and I&C systems as well as the electrical and I&C component types associated with in scope mechanical systems listed in Table 2.2-1.

Components which support or interface with electrical and I&C components, for example, cable trays, conduits, instrument racks, panels and enclosures, are assessed as part of the Structural Commodities in Section 2.4.36.

2.5.1 Electrical and I&C Systems

The results of the electrical and I&C systems scoping review are contained in Section 2.2. Additional system details are included in the FSAR Section 2.5.5, Chapter 5, Chapter 7 and Chapter 8. In addition to the electrical and I&C systems and components, certain switchyard components are credited to restore offsite power following an SBO. The boundary for offsite power restoration following an SBO is shown in Figures 2-1, 2-2, and 2-3. The Figures also show the Alternate AC power source for the SBO coping period.

2.5.2 Electrical and I&C Commodities

2.5.2.1 Identification of Electrical and I&C Commodities

The first step of the screening process for electrical and I&C commodities is to use plant documentation to identify the electrical and I&C components and commodities within the electrical, I&C, and mechanical systems. This identification is based on review of plant design documentation, drawings, and the Maximo equipment database, as well as review of the parallel mechanical and civil screening efforts. The electrical and I&C components and commodities identified at BFN are listed below. This list includes electrical and I&C components and commodities identified in NUREG-2192, Table 2.1-6, as applicable at BFN.

Electrical and I&C Components and Commodities for In-Scope Systems:

- Alarm Units
- Analyzers
- Annunciators
- Batteries
- Cable Connections (Metallic Parts)
- Cable Tie Wraps
- Chargers

- Circuit Breakers
- Communication Equipment
- Computers
- Controllers
- Converters
- Electric Heaters
- Electrical Controls and Panel Internal Assemblies
- Electrical Insulation for Electrical Cables and Connections
- Electrical Penetrations
- Elements, Sensors, Thermocouples, Transducers
- Fuses
- Fuse Holders (part of active equipment)
- Fuse Holders (not part of active equipment)
- Generators, Motors
- Heat Trace
- High Voltage Electrical Insulators
- Indicators
- Inverters
- Isolators
- Light Bulbs
- Metal Enclosed Bus
- Meters
- Modifier (analog/digital input/output modules, signal converters, pre-amps, etc.)
- Power Supplies
- Radiation Monitors
- Recorders
- Regulators
- Relays
- Signal Conditioners
- Solenoid Operators
- Solid State Devices
- Splices
- Switches
- Switchgear, Load Centers, Motor Control Centers, Distribution Panels
- Switchyard Bus and Connections
- Terminal Blocks
- Transformers
- Transmission Conductors
- Transmission Connectors
- Transmitters
- Uninsulated Ground Conductors

2.5.2.2 Application of Screening Criterion 10 CFR 54.21(a)(1)(i) to the Electrical and I&C Components and Commodities

Following the identification of the electrical and I&C components and commodities, the criteria of 10 CFR 54.21(a)(1)(i) were applied to identify components and commodities that perform their functions without moving parts or without a change in configuration or properties. The following electrical and I&C commodities were determined to meet the screening criteria of 10 CFR 54.21(a)(1)(i):

- Cable Connections (Metallic Parts)
- Cable Tie Wraps
- Electrical Insulation for Electrical Cables and Connections
- Electrical Penetrations
- Fuse Holders (not part of active equipment)
- High Voltage Electrical Insulators
- Metal Enclosed Bus
- Switchyard Bus and Connections, Transmission Conductors and Transmission Connectors
- Uninsulated Ground Conductors

2.5.2.3 Elimination of Electrical and I&C Commodity Groups With No Subsequent License Renewal Intended Function

The following electrical and I&C commodities were determined to not have a subsequent license renewal intended function:

- Cable Tie Wraps

  Tie wraps are used in cable installations as cable ties. Cable ties hold groups of cables together for restraint and ease of maintenance. Cable ties are used to bundle wires and cables together to keep the wire and cable runs neat and orderly. Cable ties are used to restrain wires and cables within raceways to facilitate cable installation. There are no current license basis requirements for BFN that cable tie wraps remain functional during and following design basis events. Cable ties are not credited for maintaining cable ampacity, ensuring maintenance of cable minimum bending radius, or maintaining cables within vertical raceways at BFN. The seismic qualification of cable trays does not credit the use of cable ties. Cable tie wraps are not credited in the BFN design basis in terms of any 10 CFR 54.4 intended function. Therefore, cable tie wraps are not within the scope of subsequent license renewal and therefore, are not subject to aging management review.

- Uninsulated Ground Conductors

  The uninsulated ground conductor commodity is comprised of grounding cable and associated connectors. Ground conductors are provided for equipment and personnel protection. They do not perform an intended function for license renewal. Therefore, uninsulated ground conductors are not within the scope of subsequent license renewal and therefore, are not subject to aging management review.

2.5.2.4 Application of Screening Criteria 10 CFR 54.21 (a)(1)(ii) to Electrical and I&C Commodities

The 10 CFR 54.21(a)(1)(ii) screening criterion was applied to the specific commodities that remained following application of the 10 CFR 54.21(a)(1)(i) criterion. 10 CFR 54.21(a)(1)(ii) allows the exclusion of those commodities that are subject to replacement based on a qualified life or specified time period. The only electrical and I&C commodities identified for exclusion by the criteria of 10 CFR 54.21(a)(1)(ii) are electrical and I&C commodities included in the EQ of Electric Equipment program (B.3.1.3). This is because electrical and I&C commodities included in the EQ Program have defined qualified lives and are replaced prior to the expiration of their qualified lives. No electrical and I&C commodities within the EQ Program are subject to aging management review in accordance with the screening criteria of 10 CFR 54.21(a)(1)(ii). See Section 4.4 for the TLAA evaluation of the EQ of Electric Equipment Aging Management Program. The remaining commodities, all or part of which are not in the EQ Program, require aging management review and are discussed below.

2.5.2.5 Electrical and I&C Commodities Subject to Aging Management Review

The electrical and I&C commodities subject to aging management review are summarized in Table 2.5.2-1, along with the associated intended functions. These electrical commodities are discussed below.

2.5.2.5.1 Cable Connections (Metallic Parts)

The Cable Connectors (Metallic Parts) commodity includes metallic portions of cable connections that are not included in the EQ Program. The metallic connections evaluated include splices, threaded connectors, compression type termination lugs, and terminal blocks. Therefore, Cable Connections (Metallic Parts) meet the screening criterion of 10 CFR 54.21(a)(1)(ii) and are subject to aging management review.

2.5.2.5.2 Electrical Insulation for Electrical Cables and Connections

The insulated cables and connections commodities are separated for aging management review into subcategories based on their treatment in NUREG-2191:

- Electrical Insulation for Electrical Cables and Connections, which includes:
    - Electrical Penetration Pigtails
    - Splices
    - Insulating Portion of Terminal Blocks
    - Insulating Portion of Fuse Holders (not part of active equipment).
- Electrical Insulation for Electrical Cables and Connections Used in Instrumentation Circuits
- Electrical Insulation for Inaccessible Medium Voltage Power Cables
- Electrical Insulation for Inaccessible Instrumentation and Control Cables
- Electrical Insulation for Inaccessible Low Voltage Power Cables

Numerous insulated cables and connections are included in the EQ Program and, therefore, are not subject to an aging management review in accordance with the screening criteria of 10 CFR 54.21 (a)(1)(ii). Insulated cables and connections not included in the EQ Program meet the criterion of 10 CFR 54.21(a)(1)(ii) and are subject to an aging management review.

Insulated cables and connections inside the enclosure of an active device (e.g., motor leads and connections, cables and connections internal to relays, chargers, switchgear, transformers, power supplies) are maintained along with the other subcomponents inside the enclosure and are not subject to an aging management review.

2.5.2.5.3 Electrical Penetrations

A portion of the electrical penetrations at BFN are environmentally qualified. These electrical penetrations are evaluated as a TLAA, Section 2.5.2.4, and are managed by the EQ of Electrical Equipment program (B.3.1.3). For the remainder of the electrical penetrations, the electrical penetration pigtails and associated connections that could potentially be exposed to an adverse localized environment is included in the evaluation for Electrical Insulation for Electrical Cables and Connections, Section 2.5.2.5.2. The shelter, protection and pressure boundary intended functions of electrical penetrations are included in the evaluation for Structural Commodities (Section 2.4.36).

2.5.2.5.4 Fuse Holders (not part of active equipment)

The Fuse Holders commodity includes fuse holders that are not part of a larger active assembly and are not included in the EQ program. Both the metallic and non-metallic portions of fuse holders that are not part of a larger active assembly and are not included in the EQ program meet the screening criterion of 10 CFR 54.21(a)(1)(ii) and are subject to an aging management review.

2.5.2.5.5 High Voltage Electrical Insulators

The High Voltage Electrical Insulators' intended function is to insulate (electrical) for Switchyard Bus, Transmission Conductors, and switchyard active components that are part of the circuits that supply power from the transmission system to plant buses, including connecting the alternate ac source in the event of an SBO. These circuits provide power to in scope subsequent license renewal components used for coping during and recovery from an SBO event and used for achieving and maintaining safe and stable conditions in the event of a fire, when offsite power is credited. High Voltage Electrical Insulators are not included in the EQ program. Therefore, High Voltage Electrical Insulators meet the screening criterion of 10 CFR 54.21(a)(1)(ii) and are subject to an aging management review.

2.5.2.5.6 Metal Enclosed Bus

The metal enclosed buses at BFN include the sections of isolated phase bus that connect the USSTs and the Main Generator Breaker to the Main Transformers, the sections of non-segregated phase bus that connect the CSSTs to the 4 kV Unit Start Boards, and the sections of non-segregated phase bus that connect the USSTs to the 4 kV Unit Boards and the 4 kV Recirculation Pump Boards. The Metal Enclosed Buses are the circuits that supply power from the Main Transformers to plant buses, including connecting the alternate ac source in the event of an SBO. These portions of the power distribution system are in scope for subsequent license renewal. The metal enclosed buses are not in the EQ Program. Therefore, metal enclosed buses meet the screening criterion of 10 CFR 54.21(a)(1)(ii) and are subject to aging management review.

2.5.2.5.7 Switchyard Bus and Connections, Transmission Conductors and Transmission Connectors

The Switchyard Bus and Connections are part of the switchyard circuits that supply power from the transmission system to plant buses, including connecting the alternate AC source in the event of an SBO. These circuits provide power to in scope subsequent license renewal components used for coping during and recovery from an SBO and used for achieving and maintaining safe and stable conditions in the event of a fire, when offsite power is credited. The

Switchyard Bus and Connections are not included in the EQ program. Therefore, Switchyard Bus and Connections meet the screening criterion of 10 CFR 54.21(a)(1)(ii) and are subject to an aging management review.

The Transmission Conductors and the Transmission Connectors are part of the switchyard circuits that supply power from the transmission system to plant buses including connecting the alternate ac source in the event of an SBO. These circuits provide power to in scope subsequent license renewal components used for coping during and recovery from an SBO and used for achieving and maintaining safe and stable conditions in the event of a fire, when offsite power is credited. The Transmission Conductors and the Transmission Connectors are not included in the EQ program. Therefore, the Transmission Conductors and the Transmission Connectors meet the screening criterion of 10 CFR 54.21(a)(1)(ii) and are subject to an aging management review.

Table 2.5.2-1, Electrical and I&C Commodities Subject to Aging Management Review

Commodity	Passive Intended Functions
Cable Connections (Metallic Parts)	Electrical Continuity
Electrical Insulation for Electrical Cables and Connections	Insulate (Electrical)
Fuse Holders (not part of active equipment)	Insulate (Electrical), Electrical Continuity
High Voltage Electrical Insulators	Insulate (Electrical)
Metal Enclosed Bus	Electrical Continuity, Insulate (Electrical), Shelter, Protection
Switchyard Bus and Connections	Electrical Continuity
Transmission Conductors	Electrical Continuity
Transmission Connectors	Electrical Continuity

The aging management review results for these commodities are provided in Table 3.6.2-1, Electrical and I&C Commodities – Summary of Aging Management Evaluation.

3.0 AGING MANAGEMENT REVIEW RESULTS

This section provides the results of the aging management review for those structures and components identified in Section 2.0 as being subject to aging management review. Descriptions of the service environments that were used in the aging management review to determine aging effects requiring management are included in Table 3.0-1, Browns Ferry Nuclear Plant Service Environments. The environments used in the aging management reviews are listed in the BFN Aging Management Review (AMR) Environment column. The third column identifies one or more of the NUREG-2191 environments that were used when comparing the Browns Ferry Nuclear Plant (BFN) AMR results to the NUREG-2191 results.

Most of the AMR results information in Section 3 is presented in the following two tables:

Table 3.x.1 - where '3' indicates the SLRA section number, 'x' indicates the subsection number from NUREG-2192, and '1' indicates that this is the first table type in Section 3. For example, in the Reactor Vessel, Internals, and Reactor Coolant System subsection, this table would be number 3.1.1; in the Engineered Safety Features and Reactor Core Isolation Cooling System subsection, this table would be 3.2.1; and so on. For ease of discussion, this table will hereafter be referred to in this Section as “Table 1.”

Table 3.x.2-y - where '3' indicates the SLRA section number, 'x' indicates the subsection number from NUREG-2192, and '2' indicates that this is the second table type in Section 3; and 'y' indicates the table number for a specific system. For example, for the Reactor Vessel, within the Reactor Vessel, Internals, and Reactor Coolant System subsection, this table would be 3.1.2-1 and for the Reactor Pressure Vessel Instrumentation System, it would be table 3.1.2-2. For the Containment Atmosphere Dilution System, within the Engineered Safety Features (ESF) and Reactor Core Isolation Cooling (RCIC) System subsection, this table would be 3.2.2-1. For the next system within the ESF and RCIC System subsection, it would be table 3.2.2-2. For ease of discussion, this table will hereafter be referred to in this section as “Table 2.”

Table Description

NUREG-2191 contains the generic evaluation of existing plant programs. It documents the technical basis for determining where existing programs are adequate without modification, and where existing programs should be augmented for the second extended period of operation. The evaluation results documented in NUREG-2191 indicate that many of the existing programs are adequate to manage the aging effects for particular structures or components, within the scope of license renewal, without change. NUREG-2191 also contains recommendations on specific areas for which existing programs should be enhanced for license renewal. In order to take full advantage of NUREG-2191, a comparison between the BFN AMR results and the tables of NUREG-2191 has been performed. The results of that comparison are provided in Table 1 and Table 2.

Table 1

The purpose of Table 1 is to provide a summary comparison of how the facility aligns with the corresponding tables of NUREG-2192. The table is essentially the same as Tables 3.1-1 through 3.6-1 provided in NUREG-2192, except that the first three columns, “New, Modified, Deleted, Edited Item", "ID", and "Type", have been replaced by an "Item Number" column and the "GALLSLR Item" column has been replaced by a "Discussion" column.

The "Item Number" column provides the reviewer with a means to cross-reference from Table 2 to Table 1.

The "Discussion" column is used to provide clarifying or amplifying information. The following are examples of information that might be contained within this column:

- "Further Evaluation Recommended" information or reference to where that information is located
- The name of a plant-specific aging management program being used, if applicable
- Exceptions to the NUREG-2192 assumptions, if applicable
- A discussion of how the line is consistent with the corresponding line item in NUREG2192, when that may not be intuitively obvious
- A discussion of how the item is different than the corresponding line item in NUREG-2192 when it may appear to be consistent (e.g., when there is exception taken to an aging management program that is listed in NUREG-2192), if applicable

The format of Table 1 provides the reviewer with a means of aligning a specific Table 1 row with the corresponding NUREG-2192 table row, thereby allowing for the ease of checking consistency.

Table 2

Table 2 provides the detailed results of the aging management reviews for those components identified in SLRA Section 2 as being subject to aging management review. There is a Table 2 for each of the in-scope systems, structures, and commodities within each Chapter 3 Section grouping. For example, for BFN, the Engineered Safety Features and Reactor Core Isolation Cooling Systems Group contains tables specific to the Containment System, Standby Gas Treatment System, Reactor Core Isolation Cooling System, High Pressure Coolant Injection System, Residual Heat Removal System, Core Spray System, and Containment Atmosphere Dilution System.

Table 2 consists of the following nine columns:

- Component Type
- Intended Function
- Material
- Environment
- Aging Effect Requiring Management
- Aging Management Programs
- NUREG-2191 Item
- NUREG-2192 Table 1 Item
- Notes

Component Type - The first column identifies all of the component types from Section 2 of the SLRA that are subject to aging management review. They are listed in alphabetical order.

Intended Function - The second column contains the license renewal intended functions for the listed component types. Definitions of intended functions are contained in Table 2.1-1.

Material - The third column lists the particular materials of construction for the component type.

Environment - The fourth column lists the environments to which the component types are exposed. Service environments are indicated and a list and description of these environments is provided in Table 3.0-1.

Aging Effect Requiring Management - As part of the aging management review process, the aging effects that are required to be managed in order to maintain the intended function of the component type are identified for the material and environment combination. These aging effects requiring management are listed in the fifth column.

Aging Management Programs - The aging management programs used to manage the aging effects requiring management are listed in the sixth column of Table 2. Aging management programs are described in Appendix B.

NUREG-2191 Item - Each combination of component type, material, environment, aging effect requiring management, and aging management program that is listed in Table 2, is compared to NUREG-2191, with consideration given to the standard notes, to identify consistency. Consistency is documented by noting the appropriate NUREG-2191 item number in the seventh column of Table 2. If there is no corresponding item number in NUREG-2191, this field in column seven is left blank. Thus, a reviewer can readily identify the correlation between the plant-specific tables and the NUREG-2191 tables.

NUREG-2192 Table 1 Item - Each combination of component, material, environment, aging effect requiring management, and aging management program that has an identified NUREG-2191 item number must also have a Table 3.x.1 line item reference number. The corresponding line item from Table 1 is listed in the eighth column of Table 2. If there is no corresponding item in NUREG-2191, this field in column eight is left blank. The NUREG-2192 Table 1 Item allows correlation of the information from the two tables.

Notes - The notes provided in each Table 2 describe how the information in the table aligns with the information in NUREG-2191. Each Table 2 contains standard lettered notes and, if applicable, plant-specific numbered notes. The standard lettered notes (e.g., A, B, C) provide standard information regarding comparison of the BFN aging management review results with the NUREG-2191 Aging Management Table line item identified in the seventh column. In addition to the standard lettered notes, numbered plant-specific notes provide additional clarifying information when appropriate.

<u>Table Usage</u>

Table 1

The reviewer may evaluate each row in Table 1 by moving from left to right across the table. Since the Component, Aging Effect, Aging Management Programs and Further Evaluation Recommended information is taken directly from NUREG-2192, no further analysis of those columns is required. Summary plant-specific information is provided within the Discussion column to demonstrate how the BFN aging management review evaluations and aging management programs align with NUREG-2192. This may be in the form of descriptive information within the Discussion column, or the reviewer may be referred to other locations within the SLRA for further information.

Table 2

Table 2 contains all of the Aging Management Review information for the plant, including whether or not it aligns with NUREG-2191 recommendations. For a given row within the table, the reviewer is able to see the intended function, material, environment, aging effect requiring management and aging management program combination for a particular component type within a system. In addition, if there is a correlation between the combination in Table 2 and a combination in NUREG-2191, this is identified by a referenced item number in column seven, NUREG-2191 Item. The reviewer can refer to the item number in NUREG-2191, if desired, to verify the correlation. If the column is blank, no corresponding combination in NUREG-2191 was found. As the reviewer continues across the table from left to right, within a given row, the next column is labeled NUREG-2192 Table 1 Item. If there is a reference number in this column, the reviewer is able to use that reference number to locate the corresponding row in Table 1 and see how the aging management program for this particular combination aligns with NUREG-2191.

Table 2 provides the reviewer with a means to navigate from the components subject to AMR in SLRA Section 2 all the way through the evaluation of the programs that will be used to manage the effects of aging of those components.

A listing of the acronyms used in this section is provided in Section 1.6.

<u>Cumulative Fatigue Damage and Time Limited Aging Analyses in Table 2</u>

A fatigue analysis is considered to be a time-limited aging analysis (TLAA) as defined in 10 CFR 54.3 when it is within the current licensing basis and is based upon transient cycle assumptions associated with 60 years of plant operation. Additionally, there are other TLAAs that affect identified aging effects for specific components. TLAAs are required to be evaluated in accordance with 10 CFR 54.21(c)(1).

Table 1 and Table 2 include an entry in the Aging Management Program column indicating “TLAA” for each line item where the component for which a TLAA has been identified. See SLRA Section 4 for details regarding the BFN design bases, TLAAs identified, and TLAA evaluations for the subsequent period of extended operation.

Table 3.0-1, Browns Ferry Nuclear Plant Service Environments

BFN AMR Environment	Description	Corresponding NUREG 2191 Environments
10 CFR 50.49 EQ Environments	This environment is used for areas of the plant that could be subject to harsh environmental effects of a loss of coolant accident (LOCA), high energy line break, or post LOCA environment, in which the requirements of 10 CFR 50.49 would be applicable.	Areas of the plant that could be subject to harsh environmental effects of a loss of coolant accident LOCA), high energy line break, or post LOCA environment.
Adverse localized environment	An adverse localized environment (ALE) is an environment limited to the immediate vicinity of a component that is hostile to the component material, thereby leading to potential aging effects. Electrical insulation used for electrical cables can be subjected to an adverse localized environment. Adverse localized environment can be due to any of the following: (1) exposure to significant moisture, or (2) heat, radiation, or moisture and are represented by specific GALL-SLR AMR items.	Adverse localized environment
Adverse localized environment caused by significant moisture	This environment is the same as the Adverse Localized Environment, except that it is caused by the presence of significant moisture.	Adverse localized environment caused by significant moisture
Air	Any indoor or outdoor air environment where the cited aging effects could occur regardless of the particular air environment (e.g., air-indoor uncontrolled, air-outdoor). For example: (a) hardening or loss of strength of elastomeric components occurs in many different air environments depending upon environmental parameters such as temperature, ozone, ultraviolet light, and radiation; (b) loss of preload for closure bolting can occur in a variety of air environments. The term “air” was incorporated to allow the aging management review line items to be more succinct in regard to citing environments. This term does not encompass the air environment downstream of instrument air dryers, air-dry, or the underground environment. The potential for leakage from bolted connections (e.g., flanges, packing) impacting in-scope components exists when citing the air environment.	Air
Air-dry	Air that has been treated to reduce its dew point well below the system operating temperature and treated to control lubricant content, particulate matter, and other corrosive contaminants. Use of this term is only associated with internal air environments located downstream of the compressed air system air dryers.	Air-dry

Table 3.0-1, Browns Ferry Nuclear Plant Service Environments (Continued)

BFN AMR Environment	Description	Corresponding NUREG 2191 Environments
Air-indoor controlled Air-indoor	An environment where the specified internal or external surface of the component or structure is exposed to a humidity-controlled (i.e., air conditioned) environment. For electrical components and structures, the controlled environment must be sufficient to show that the electrical component(s) or structure(s) are not subjected to the cited aging effect(s) (e.g., reduced insulation resistance). The potential for leakage from bolted connections (e.g., flanges, packing) impacting in-scope components exists when citing the air-indoor controlled environment.	Air-indoor controlled
Air-indoor uncontrolled Air-indoor	Air-indoor uncontrolled is associated with systems with temperatures higher than the dew point (i.e., condensation can occur, but only rarely; equipment surfaces are normally dry). The potential for leakage from bolted connections (e.g., flanges, packing) impacting in-scope components exists when citing the air-indoor uncontrolled environment.	Air-indoor uncontrolled
Air-outdoor	The outdoor environment consists of moist air, cooling tower plumes (which might contain chemical additives), industrial pollutants (e.g., fly ash, soot), ambient temperatures and humidity, and exposure to weather events, including precipitation and wind. The outdoor air environment also potentially includes component contamination due to animal infestation including by-products or excrement containing uric acid, ammonia, phosphates, or other compounds. The outdoor air environment can also result in submergence of components (particularly when they are in vaults) due to the potential for water to accumulate or due to external or internal buildup of condensation.	Air-outdoor
Closed-cycle cooling water Closed-cycle cooling water (Treated)	A subset of treated water that is subject to the closed treated water systems program. Systems are closed in that the rate of recirculation is much higher than the rate of makeup water addition. Examples include the closed portions of Heating, Ventilation, and Air Conditioning (HVAC) systems and diesel generator cooling water systems.	Closed-cycle cooling water
Closed-cycle cooling water >60°C (>140°F)	The Closed Cycle Cooling Water >60°C (>140°F) environment is the same as the Closed Cycle Cooling Water environment, except the Closed Cycle Cooling Water >60°C (>140°F) environment is used for components with an operating temperature >60°C (>140°F0)that are constructed of stainless steel. Closed-cycle cooling water systems above 60°C (>140°F) exceed the threshold for Stainless Steel (SS) Stress Corrosion Cracking (SCC).	Closed-cycle cooling water Closed-cycle cooling water >60°C (>140°F)
Concrete	This environment consists of components that sit on concrete or are embedded in concrete.	Concrete

Table 3.0-1, Browns Ferry Nuclear Plant Service Environments (Continued)

BFN AMR Environment	Description	Corresponding NUREG 2191 Environments
Condensation	Condensation on the surfaces of systems at temperatures below the dew point facilitates loss of material in steel caused by general, pitting, and crevice corrosion. It also facilitates cracking in those materials susceptible to stress corrosion cracking due to the potential for internal or external surface contamination. The former term “moist air” is subsumed by the usage of the term “condensation.” Moisture in the air can result in loss of material or cracking due to hygroscopic surface contaminants. Condensation can form between thermal insulation and a component when air intrusion occurs through minor gaps in the insulation and the operating temperature of the component is below the dew point of the penetrating air.	Condensation
Diesel exhaust	This environment consists of gases, fluids, and particulates present in diesel engine exhaust.	Diesel exhaust
Embedded / Encased	Polyurethane foam is attached to the Drywell steel liner on one side and separated from the reactor building concrete by fiberglass laminate forms on the other side such that the polyurethane foam is embedded/encased.	Not applicable
Fuel oil	Diesel oil, Number 2 oil, or other liquid hydrocarbons used to fuel diesel engines. Fuel oil used for combustion engines may be contaminated with water, which may promote additional aging effects.	Fuel oil
Gas	Internal gas environments include inert or nonreactive gases. This generic term is used where aging effects are not expected to degrade the ability of the structure or component to perform its intended function for the subsequent period of extended operation. The term “gas” is not meant to comprehensively include all gases in the fire suppression system. The GALL-SLR Report AMP XI.M26, “Fire Protection,” is used for the periodic inspection and testing of the halon/carbon dioxide fire suppression system.	Gas
Groundwater/soil	Groundwater is subsurface water that can be detected in wells, tunnels, or drainage galleries, or that flows naturally to the earth's surface via seeps or springs. Soil is a mixture of organic and inorganic materials produced by the weathering of rock and clay minerals or the decomposition of vegetation. Voids containing air and moisture can occupy 30-60% of the soil volume. Concrete subjected to a groundwater/soil environment can be vulnerable to an increase in porosity and permeability, cracking, loss of material (spalling, scaling), or aggressive chemical attack. Other materials with prolonged exposures to groundwater or moist soils are subject to the same aging effects as those systems and components exposed to raw water.	Groundwater/soil

Table 3.0-1, Browns Ferry Nuclear Plant Service Environments (Continued)

BFN AMR Environment	Description	Corresponding NUREG 2191 Environments
Lubricating oil	Lubricating oils are low-to-medium viscosity hydrocarbons that can contain contaminants and/or moisture. This usage also functionally encompasses hydraulic oil (nonwater based). These oils are used for bearing, gear, and engine lubrication. Piping and piping components, whether copper, SS, or steel, when exposed to lubricating oil with some water, will have limited susceptibility to aging degradation due to general or localized corrosion. Lubricating oil (waste oil) and lubricating oil are two different environments. Lubricating oil (waste oil) is oil that has been collected as it leaks from a component (e.g., reactor coolant pumps) and as such, contains potential contaminants such as water and dirt. Lubricating oil is unlikely to contain contaminants due to the testing of the oil and corrective actions when contaminants are detected. As a result, one-time inspections for components exposed to these environments are treated as two separate populations.	Lubricating oil
Raw water	Raw water is water that has not been demineralized or treated to any significant extent. Raw water may be rough filtered to remove large particles and may contain biocide and inhibitor additives for control of micro- and macro-organisms.	Raw water
Raw water (potable)	Raw water (potable) is water that has been demineralized, filtered, or otherwise treated, but is not maintained by a chemistry program.	Raw water
Reactor coolant	Reactor coolant is treated water in the reactor coolant system and connected systems at or near full operating temperature, including steam associated with BWRs.	Reactor coolant
Reactor coolant >250°C (>482°F)	Reactor coolant is treated water in the RCS and connected systems and is always assumed to be >482 °F (>250 °C). This applies to thermal embrittlement of Cast Austenitic Stainless Steel.	Reactor coolant >250°C (>482°F)
Reactor coolant and neutron flux	The reactor core environment that will result in a neutron fluence exceeding 1017 n/cm^2 (E >1 MeV) at the end of the license renewal term.	Reactor coolant and neutron flux
Sodium pentaborate solution	Treated water that contains sodium pentaborate, used in the Standby Liquid Control System.	Sodium pentaborate solution
Soil	Soil is a mixture of inorganic materials produced by the weathering of rock and clay minerals, and organic material produced by the decomposition of vegetation. Voids containing air and moisture occupy 30-60% of the soil volume. Properties of soil that can affect degradation kinetics include moisture content, pH, ion exchange capacity, density, and hydraulic conductivity. External environments included in the soil category consist of components at the air/soil interface, buried in the soil, or exposed to groundwater in the soil.	Soil
Steam	The steam environment is managed by the BWR water chemistry program. Defining the temperature of the steam is not considered necessary for analysis.	Steam

Table 3.0-1, Browns Ferry Nuclear Plant Service Environments (Continued)

BFN AMR Environment	Description	Corresponding NUREG 2191 Environments
System temperature up to 288°C (550°F)	This environment consists of a metal temperature of BWR components < 288°C (550°F).	System temperature up to 288°C (550°F)
Treated water	Treated water is water whose chemistry has been altered and is maintained (as evidenced by testing) in a state which differs from naturally-occurring sources so as to meet a desired set of chemical specifications. Treated water generally falls into one of two categories. The first category is based on demineralized water and generally contains minimal amounts of any additions. This water is generally characterized by high purity, low conductivity, and very low oxygen content. This category of treated water is generally used as BWR. The second category may be but need not be based on demineralized water. It contains corrosion inhibitors and also may contain biocides or other additives. This water will generally be comparatively higher in conductivity and oxygen content than the first category of treated water. This category of treated water is generally used in HVAC systems, auxiliary boilers, and diesel engine cooling systems. Closed-cycle cooling water is a subset of this category of treated water.	Treated water
Treated water >60°C (>140°F)	Treated water above the SCC temperature threshold for SS. Treated water above the 60°C (140°F) is the same as the Treated water environment, except the >60°C (>140°F) environment is used for systems operating at temperatures >60°C (>140°F) that are constructed of stainless steel. For materials other than stainless steel, the Treated Water environment is used.	Treated water Treated water >60°C (>140°F)
Treated water >93°C (>200°F)	Treated water above the SCC temperature threshold for SS. The Treated Water >93°C (>200°) environment is the same as the Treated Water environment, except the Treated Water >93°C (>200°F) environment is to be selected for Reactor Water Cleanup (RWCU) System, piping and piping components outboard of the second containment isolation valves with a diameter ≥4 inches nominal pipe size (NPS) and for Reactor Coolant Pressure Boundary Class 1 piping, piping components greater than or equal to 4 NPS.	Treated water Treated water >60°C (>140°F)
Treated water >250°C (>482°F)	Treated water above the thermal embrittlement threshold for Cast Austenitic Stainless Steel (CASS) The Treated Water >250°C (>482°F) environment is the same as the Treated Water environment, except the Treated Water >250°C (>482°F) environment is to be selected for components with an operating temperature >250°C (>482°F) that are constructed of CASS.	Treated water Treated water >60°C (>140°F)
Underground	Underground piping and tanks are below grade, but are contained within a tunnel or vault such that they are in contact with air and are located where access for inspection is limited (e.g., special lifting equipment is required to gain access to the vault). When the underground environment is cited, the term includes exposure to air-outdoor, air-indoor uncontrolled, air, raw water, groundwater, and condensation.	Underground

Table 3.0-1, Browns Ferry Nuclear Plant Service Environments (Continued)

BFN AMR Environment	Description	Corresponding NUREG 2191 Environments
Waste water	Radioactive, potentially radioactive or nonradioactive waters that are collected from equipment and floor drains. Waste waters may contain contaminants, including oil and boric acid, depending on location, as well as originally treated water that is not monitored by a chemistry program.	Waste water
Water-flowing	Water that is refreshed; thus, it has a greater impact on leaching and can include rainwater, raw water, groundwater, or water flowing under a foundation.	Water-flowing
Water-standing	Water that is stagnant and unrefreshed, thus possibly resulting in increased ionic strength up to saturation.	Water-standing

3.1 AGING MANAGEMENT OF REACTOR VESSEL, INTERNALS, AND REACTOR COOLANT SYSTEM

3.1.1 Introduction

This section provides the results of the aging management review for those components identified in Section 2.3.1, Reactor Vessel, Internals, and Reactor Coolant System, as being subject to aging management review. The systems, or portions of systems, which are addressed in this section are described in the indicated sections.

- Reactor Vessel (2.3.1.1)
- Reactor Vessel Internals (2.3.1.2)
- Reactor Vessel Vents and Drains System (2.3.1.3)
- Reactor Recirculation System (2.3.1.4)
- Fuel Assemblies (2.3.1.5)

3.1.2 Results

The following tables summarize the results of the aging management review for Reactor Vessel, Internals, and Reactor Coolant System.

- Table 3.1.2-1 Reactor Vessel - Summary of Aging Management Evaluation
- Table 3.1.2-2 Reactor Vessel Internals - Summary of Aging Management Evaluation
- Table 3.1.2-3 Reactor Vessel Vents and Drains System - Summary of Aging Management Evaluation
- Table 3.1.2-4 Reactor Recirculation System - Summary of Aging Management Evaluation
- Table 3.1.2-5 Fuel Assemblies - Summary of Aging Management Evaluation

3.1.2.1 Materials, Environments, Aging Effects Requiring Management and Aging Management Programs

3.1.2.1.1 Reactor Vessel

Materials

The materials of construction for the Reactor Vessel components are:

- Carbon or Low Alloy Steel with Stainless Steel Cladding
- Carbon or Low Alloy Steel with Nickel Alloy Cladding
- Nickel Alloy
- Stainless Steel
- Steel
- Steel Bolting
- High Strength Steel Bolting

Environments

The Reactor Vessel components are exposed to the following environments:

- Air - Indoor Uncontrolled
- Reactor Coolant

- Reactor Coolant and Neutron Flux
- Condensation
- Treated water >60°C [>140°F]

Aging Effects Requiring Management

The following aging effects associated with the Reactor Vessel components require management:

- Cracking
- Cumulative fatigue damage
- Loss of fracture toughness
- Loss of material
- Long-term loss of material
- Loss of preload
- Wall thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Reactor Vessel components:

- Neutron Fluence Monitoring (B.3.1.2)
- ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1)
- Water Chemistry (B.2.1.2)
- Reactor Head Closure Stud Bolting (B.2.1.3)
- BWR Stress Corrosion Cracking (B.2.1.5)
- BWR Penetrations (B.2.1.6)
- BWR Vessel Internals (B.2.1.7)
- Flow-Accelerated Corrosion (B.2.1.9)
- Bolting Integrity (B.2.1.10)
- Reactor Vessel Material Surveillance (B.2.1.19)
- One-Time Inspection (B.2.1.20)
- ASME Code Class 1 Small-Bore Piping (B.2.1.22)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)

3.1.2.1.2 Reactor Vessel Internals

Materials

The materials of construction for the Reactor Vessel Internals components are:

- Nickel Alloy
- Stainless Steel
- Stainless Steel bolting
- Cast Austenitic Stainless Steel (CASS)
- Steel

Environments

The Reactor Vessel Internals components are exposed to the following environments:

- Reactor Coolant
- Reactor Coolant and Neutron Flux
- Air - Indoor Uncontrolled

Aging Effects Requiring Management

The following aging effects associated with the Reactor Vessel Internals components require management:

- Cracking
- Cumulative fatigue damage
- Loss of material
- Loss of fracture toughness
- Loss of preload
- Long-Term loss of material

Aging Management Programs

The following aging management programs manage the aging effects for the Reactor Vessel Internals components:

- Water Chemistry (B.2.1.2)
- BWR Vessel ID Attachment Welds (B.2.1.4)
- BWR Vessel Internals (B.2.1.7)
- One-Time Inspection (B.2.1.20)

3.1.2.1.3 Reactor Vessel Vents and Drains System

Materials

The materials of construction for the Reactor Vessel Vents and Drains System components are:

- Carbon and Low Alloy Steel
- High-Strength Steel
- Stainless Steel
- Stainless Steel - CASS

Environments

The Reactor Vessel Vents and Drains System components are exposed to the following environments:

- Air - Indoor Uncontrolled
- Air
- Treated Water

Aging Effects Requiring Management

The following aging effects associated with the Reactor Vessel Vents and Drains System components require management:

- Cracking
- Cumulative fatigue damage
- Loss of fracture toughness
- Loss of material
- Loss of preload
- Long-term loss of material

Aging Management Programs

The following aging management programs manage the aging effects for the Reactor Vessel Vents and Drains System components:

- ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1)
- Water Chemistry (B.2.1.2)
- BWR Stress Corrosion Cracking (B.2.1.5)
- Flow-Accelerated Corrosion (B.2.1.8)
- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)

3.1.2.1.4 Reactor Recirculation System

Materials

The materials of construction for the Reactor Recirculation System components are:

- Steel
- Carbon and Low Alloy Steel
- Cast Austenitic Stainless Steel (CASS)
- Copper Alloy with 15% Zinc or Less
- Copper Alloy with Greater Than 15% Zinc
- Glass
- High Strength Steel Bolting
- Stainless Steel
- Steel Bolting

Environments

The Reactor Recirculation System components are exposed to the following environments:

- Air - Indoor Uncontrolled
- Air, condensation
- Closed-Cycle Cooling WaterLubricating Oil
- Raw Water

- Treated Water
- Treated Water > 60°C (>140°F)
- Treated Water > 93°C (>200°F)
- Treated Water > 250°C (>482°F)

Aging Effects Requiring Management

The following aging effects associated with the Reactor Recirculation System components require management:

- Cracking
- Cumulative fatigue damage
- Long-term loss of material
- Loss of fracture toughness
- Loss of material
- Loss of preload
- Wall thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Reactor Recirculation System components:

- ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1)
- Water Chemistry (B.2.1.2)
- BWR Stress Corrosion Cracking (B.2.1.5)
- Thermal Aging Embrittlement of Cast Austenitic Stainless Steel (CASS) (B.2.1.8)
- Flow-Accelerated Corrosion (B.2.1.9)
- Bolting Integrity (B.2.1.8)
- Open-Cycle Cooling Water System (B.2.1.11)
- Closed Treated Water Systems (B.2.1.12)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- ASME Code Class 1 Small-Bore Piping (B.2.1.22)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Lubricating Oil Analysis (B.2.1.25)

3.1.2.1.5 Fuel Assemblies

Materials

The materials of construction for the Fuel Assemblies components are:

- Not Applicable (Fuel Assemblies are short-lived components)

Environments

The Fuel Assemblies components are exposed to the following environments:

- Not Applicable

Aging Effects Requiring Management

The following aging effects associated with the Fuel Assemblies components require management:

- None

Aging Management Programs

The following aging management programs manage the aging effects for the Fuel Assemblies components:

- None

3.1.2.2 AMR Results for Which Further Evaluation is Recommended by the GALL-Report

NUREG-2191 provides the basis for identifying those programs that warrant further evaluation by the reviewer in the license renewal application. For the Reactor Vessel, Internals, and Reactor Coolant System, those programs are addressed in the following subsections.

3.1.2.2.1 Cumulative Fatigue Damage

Evaluations involving time-dependent fatigue or cyclical loading parameters may be time-limited aging analyses (TLAAs), as defined in 10 CFR 54.3. TLAAs are required to be evaluated in accordance with 10 CFR 54.21(c)(1). This TLAA is addressed separately in Section 4.3, “Metal Fatigue,” of this SRP-SLR. For plant-specific cumulative usage factor calculations that are based on stress-based input methods, the methods are to be appropriately defined and discussed in the applicable TLAAs.

Table 3.1.1 Item Number 3.1-1, 001: This item evaluates steel reactor vessel closure flange assembly components exposed to air-indoor uncontrolled for cumulative fatigue damage due to fatigue and cyclic loading. Cumulative fatigue damage of steel reactor vessel closure flange assembly components is evaluated and dispositioned as a TLAA for the Reactor Vessel as discussed in Section 4.3.

Table 3.1.1 Item Number 3.1-1, 003: This item evaluates stainless steel and nickel alloy reactor vessel internal components exposed to reactor coolant with neutron flux for cumulative fatigue damage due to fatigue and cyclic loading. Cumulative fatigue damage of stainless steel and nickel alloy reactor vessel internal components is evaluated and dispositioned as a TLAA for the Reactor Vessel Internals System as discussed in Section 4.3.

Table 3.1.1 Item Number 3.1-1, 004: This item evaluates steel reactor vessel support skirt, and attachment welds for cumulative fatigue damage due to fatigue and cyclic loading. Cumulative fatigue damage of carbon steel reactor vessel external attachments, support skirt, and welds is evaluated and dispositioned as a TLAA for the Reactor Vessel as discussed in Section 4.3.

Table 3.1.1 Item Number 3.1-1, 006: This item evaluates steel (with or without nickel alloy or stainless steel cladding), stainless steel, and nickel alloy reactor coolant pressure boundary components including piping, piping components, and other reactor coolant pressure boundary components exposed to reactor coolant for cumulative fatigue damage due to fatigue and cyclic loading. Cumulative fatigue damage of carbon steel and stainless steel Class 1 piping, piping components is evaluated and dispositioned as a TLAA for the Reactor Vessel, Reactor Vessel Vents and Drains System, the Reactor Recirculation System, the Reactor Core Isolation Cooling

System, the High Pressure Coolant Injection System, the Residual Heat Removal System, the Core Spray System, the Main Steam System, and the Reactor Feedwater System as discussed in Section 4.3.

Table 3.1.1 Item Number 3.1-1, 007: This item evaluates stainless steel, steel (with or without nickel alloy or stainless steel cladding), and nickel alloy reactor vessel components including nozzles, penetrations, safe ends, thermal sleeves, vessel shells, heads, and welds exposed to reactor coolant for cumulative fatigue damage due to fatigue and cyclic loading. Cumulative fatigue damage of carbon steel, carbon or low alloy steel with nickel alloy cladding, carbon or low alloy steel with stainless steel cladding, nickel alloy, and stainless steel penetrations, nozzles, safe ends, vessel internal attachments, vessel shell components, and associated welds is evaluated and dispositioned as a TLAA for the Reactor Vessel and Reactor Vessel Internals Systems as discussed in Section 4.3.

Table 3.1.1 Item Number 3.1-1, 011: This item evaluates steel and stainless steel pump and valve closure bolting exposed to high temperature and thermal cycles for cumulative fatigue damage due to fatigue and cyclic loading. Cumulative fatigue damage of carbon and low alloy steel bolting, and high strength low alloy steel bolting is evaluated and dispositioned as a TLAA for the Reactor Vessel, the Reactor Vessel Vents and Drains System, the Reactor Recirculation System, the Reactor Core Isolation Cooling System, and the High Pressure Coolant Injection System as discussed in Section 4.3.

Table 3.1.1 Item Number 3.1-1, 002, Item Number 3.1-1, 005, Item Number 3.1-1, 008, Item Number 3.1-1, 009, and Item Number 3.1-1, 010: These items are applicable to Pressurized Water Reactors (PWRs) only, and therefore are not used for BFN.

3.1.2.2.2 Loss of Material Due to General, Pitting, and Crevice Corrosion

1. *Loss of material due to general, pitting, and crevice corrosion could occur in the steel PWR SG upper and lower shell and transition cone exposed to secondary feedwater and steam. The existing program relies on control of water chemistry to mitigate corrosion and inservice inspection (ISI) to detect loss of material. The extent and schedule of the existing SG inspections are designed to ensure that flaws cannot attain a depth sufficient to threaten the integrity of the welds. However, according to NRC Information Notice (IN) 90-04, “Cracking of the Upper Shell-to-Transition Cone Girth Welds in Steam Generators,” the program may not be sufficient to detect pitting and crevice corrosion if general and pitting corrosion of the shell is known to exist. Augmented inspection is recommended to manage this aging effect. Furthermore, this issue is limited to Westinghouse Model 44 and 51 Steam Generators, where a high-stress region exists at the shell to transition cone weld. Acceptance criteria are described in Branch Technical Position (BTP) RLSB-1 (Appendix A.1 of this SRP- SLR).*

   Table 3.1.1 Item Number 3.1-1, 012: This item is applicable to PWRs only, and therefore is not used for BFN.

2. *Loss of material due to general, pitting, and crevice corrosion could occur in the steel PWR steam generator shell assembly exposed to secondary feedwater and steam. The existing program relies on control of secondary water chemistry to mitigate corrosion. However, some applicants have replaced only the bottom part of their recirculating SGs, generating a cut in the middle of the transition cone, and, consequently, a new transition cone closure weld. It is*

recommended that volumetric examinations be performed in accordance with the requirements of ASME Code Section XI for upper shell and lower shell-to-transition cones with gross structural discontinuities for managing loss of material due to general, pitting, and crevice corrosion in the welds for Westinghouse Model 44 and 51 SGs, where a high-stress region exists at the shell-to-transition cone weld.

The new continuous circumferential weld, resulting from cutting the transition cone as discussed above, is a different situation from the SG transition cone welds containing geometric discontinuities. Control of water chemistry does not preclude loss of material due to pitting and crevice corrosion at locations of stagnant flow conditions. The new transition area weld is a field weld as opposed to having been made in a controlled manufacturing facility, and the surface conditions of the transition weld may result in flow conditions more conducive to initiation of general, pitting, and crevice corrosion than those of the upper and lower transition cone welds. Crediting of the ISI program for the new SG transition cone weld may not be an effective basis for managing loss of material in this weld, as the ISI criteria would only perform a VT-2 visual leakage examination of the weld as part of the system leakage test performed pursuant to ASME Code Section XI requirements. In addition, ASME Code Section XI does not require licensees to remove insulation when performing visual examination on nonborated treated water systems. Therefore, the effectiveness of the chemistry control program should be verified to ensure that loss of material due to general, pitting and crevice corrosion is not occurring.

For the new continuous circumferential weld, further evaluation is recommended to verify the effectiveness of the chemistry control program. A one-time inspection at susceptible locations is an acceptable method to determine whether an aging effect is not occurring or an aging effect is progressing very slowly, such that the component's intended function will be maintained during the subsequent period of extended operation. Furthermore, this issue is limited to replacement of recirculating SGs with a new transition cone closure weld.

Table 3.1.1 Item Number 3.1-1, 012: This item is applicable to PWRs only, and therefore is not used for BFN.

3.1.2.2.3 Loss of Fracture Toughness Due to Neutron Irradiation Embrittlement

1. *Neutron irradiation embrittlement is a TLAA to be evaluated for the subsequent period of extended operation for all ferritic materials that have a neutron fluence greater than 10^{17} n/cm2 (E >1 MeV) at the end of the subsequent period of extended operation. Certain aspects of neutron irradiation embrittlement are TLAAs as defined in 10 CFR 54.3. TLAAs are required to be evaluated in accordance with 10 CFR 54.21(c)(1). This TLAA is addressed separately in Section 4.2, "Reactor Vessel Neutron Embrittlement Analysis," of this SRP-SLR.*

   Table 3.1.1 Item Number 3.1-1, 013: This item addresses loss of fracture toughness due to neutron irradiation embrittlement in steel (with or without stainless steel or nickel alloy cladding) reactor vessel beltline shell, nozzle, and weld components exposed to reactor coolant and neutron flux. The BFN reactor vessel beltline shell, nozzle, and weld components are carbon or low alloy steel with stainless steel cladding. The evaluation of neutron irradiation embrittlement for all ferritic reactor vessel shell components and welds that have a projected neutron fluence value greater than 1 x 10^{17} n/cm^2 (E>1 MeV) at the end of the subsequent license renewal term is performed as a TLAA as discussed in Section 4.2.

2. *Loss of fracture toughness due to neutron irradiation embrittlement could occur in BWR and PWR reactor vessel beltline shell, nozzle, and welds exposed to reactor coolant and neutron flux. A reactor vessel material surveillance program monitors neutron irradiation embrittlement of the reactor vessel. The reactor vessel material surveillance program is either a plant-specific surveillance program or an integrated surveillance program, depending on matters such as the composition of limiting materials and the availability of surveillance capsules.*

   In accordance with 10 CFR Part 50, Appendix H, an applicant is required to submit its proposed withdrawal schedule for approval prior to implementation. Untested capsules placed in storage must be maintained for future insertion. Thus, further NRC staff evaluation is required for a subsequent license renewal (SLR). Specific recommendations for an acceptable AMP are provided in GALL-SLR Report AMP XI.M31, "Reactor Vessel Material Surveillance."

   A neutron fluence monitoring program may be used to monitor the neutron fluence levels that are used as the time-dependent inputs for the plant's reactor vessel neutron irradiation embrittlement TLAAs. These TLAAs are the subjects of the topics discussed in SRP-SLR Section 3.1.2.2.3.1 and "acceptance criteria" and "review procedure" guidance in SRP-SLR Section 4.2. For those applicants that determine it is appropriate to include a neutron fluence monitoring AMP in their SLRAs, the program is to be implemented in conjunction with the applicant's implementation of an AMP that corresponds to GALL-SLR Report AMP XI.M31, "Reactor Vessel Material Surveillance." Specific recommendations for an acceptable neutron fluence monitoring AMP are provided in GALL-SLR Report AMP X.M2, "Neutron Fluence Monitoring."

   <u>Table 3.1.1 Item Number 3.1-1, 014:</u> This item addresses loss of fracture toughness due to neutron irradiation embrittlement in steel (with or without stainless steel or nickel alloy cladding) reactor vessel beltline shell, nozzle, and weld components exposed to reactor coolant and neutron flux. The Reactor Vessel Material Surveillance program (B.2.1.19) in conjunction with the Neutron Fluence Monitoring program (B.3.1.2) will be implemented to manage loss of fracture toughness due to neutron irradiation embrittlement of the carbon or low alloy steel with stainless steel cladding reactor vessel beltline components and welds exposed to a reactor coolant and neutron flux environment.

   The BFN Reactor Vessel Material Surveillance program meets the requirements of 10 CFR Part 50, Appendix H via BFN's participation in the BWRVIP Integrated Surveillance Program (ISP) in lieu of a plant-specific capsule removal and testing schedule. For Units 1, 2, and 3, ISP implementation and surveillance specimen schedule withdrawal and testing for the original 40 year operating license and the License Renewal period of extended operation is governed and controlled by BWRVIP-86 Revision 1-A, the BWRVIP responses to NRC Requests for Additional Information dated May 30, 2001, and December 22, 2001, and the NRC Safety Evaluation dated February 1, 2002 (Note: BWRVIP-86, Revision 1-A was approved by the NRC and issued in October 2012, superseding both BWRVIP-86-A and BWRVIP-116). For the SLR subsequent period of extended operation, the ISP will be extended through the subsequent period of extended operation in accordance with BWRVIP-321 Revision 1-A, “Boiling Water Reactor Vessel and Internals Project Plan for Extension of the BWR Integrated Surveillance Program (ISP) Through the Second License Renewal (SLR),” which has been reviewed and approved by the NRC. The plan established in BWRVIP-321 Revision 1-A not only satisfies the requirements of 10 CFR 50 Appendix H for an ISP through the subsequent period of extended operation, it also meets NRC expectations for an ISP in the subsequent period of extended operation as stated in NUREG-2191.

Two BFN Unit 2 test specimen surveillance capsules have previously been withdrawn and tested as part of the original plant-specific capsule removal and testing schedule and the ISP. An additional BFN Unit 2 test specimen surveillance capsule is scheduled for withdrawal during the License Renewal period of extended operation. ISP capsules that are designated for withdrawal and testing during the period of extended operation are designated as ISP(E) capsules to differentiate them from the ISP capsules withdrawn during the original license period. This ISP(E) capsule is the third set of Unit 2 test specimens, located at Azimuth 300°, which are currently scheduled for removal in the refueling outage closest to, but without exceeding, 40 Effective Full Power Years (EFPY) of operation. At the present time, this would correspond to Unit 2 Refueling Outage 25 (U2R25) in 2029. The BWRVIP ISP, as currently constituted and approved by NRC, does not require additional BFN capsule withdrawals beyond the third BFN Unit 2 capsule. It is noted that in Table 7-1 of BWRVIP-86, Revision 1-A, it is stated that the third set of Unit 2 test specimens are scheduled for withdrawal in 2026. However, the BWRVIP ISP recognizes that some uncertainty exists in the projections for the exact year plants will reach the target EFPY; therefore, the BWRVIP closely coordinates with the ISP plants and informs the NRC of any schedule changes that exceed two years of the scheduled removal. A review of the current ISP(E) capsule withdrawal schedule has recently been performed by the BWRVIP, which considered such things as recent early plant shutdowns, adjustments due to refuel outage schedules, more recent fluence calculations, estimated lead factors and capacity factors, as well as changes in plant operation that could impact the fleet and the ISP host capsule withdrawal and testing program. Schedule changes to the ISP(E) capsule withdrawal schedule are under consideration, including a possible delay to the withdrawal of the third set of Unit 2 test specimens, located at Azimuth 300° from 2026 until the Spring of 2029. This schedule change, if it is implemented by the BWRVIP ISP, will be reflected in a future supplement of the BFN SLRA if it becomes official prior to NRC approval of the BFN SLRA.

BWRVIP-321 Revision 1-A documents the plan for meeting ISP requirements through the 80 years of operation (SLR) for the U.S. BWR fleet. The plan calls for installation of a single Supplemental SLR (SSLR) capsule holder in a host plant to obtain the needed catch-up fluence to support 80 years of operation for the U.S. fleet. The single SSLR capsule holder will contain three capsules which correspond to 3 capsule grouping (Groups 1, 2, and 3) that are defined in BWRVIP-321 Revision 1-A based on the amount of catch-up fluence needed for the ISP representative material specimens to attain a neutron fluence that meets or exceeds (by up to a factor of 2) the target reactor vessel fluence for 80 years or operation, within a desired time frame of 10 years or less. Group 1 requires the lowest amount of catch-up fluence, while Group 3 requires the largest amount of catch-up fluence. The ISP representative material specimens for BFN are assigned to either Group 1 or Group 2.

The approach that the BWRVIP ISP is using to expand the program for the subsequent period of extended operation, is to ensure that all ISP representative materials have specimens that are irradiated to a fluence that bounds the SLR fluences of all target materials represented by that surveillance material. This will be accomplished by irradiating, reconstituting, and testing previously-tested ISP capsule materials as necessary to ensure that any plant which pursues SLR will have appropriate data available for its representative materials.

When all remaining capsules are tested under the ISP for the License Renewal period of extended operation, the current set of representative material specimens will have been fully used, with the exception of potential existing reconstituted capsules. For materials which require additional surveillance data, previously tested specimens from the BWRVIP ISP repository will be used for reconstitution. New Charpy test specimens will be fabricated by machining an insert, or central portion of the test specimen, from the broken Charpy halves and welding end tabs to the insert. Prior to reconstitution, the specimen inserts will be placed into specially designed SSLR capsules and be reinserted into a host reactor vessel to continue to irradiate the specimens to accumulate sufficient fluence to meet or exceed 80-year projected reactor vessel fluences. All SSLR capsules will be irradiated in one host plant. After irradiation is complete, reconstituted specimens will be fabricated and tested only for those materials that are needed by BWRs pursuing SLR.

The BWRVIP has selected the reactor that will serve as the SSLR capsule host plant. As part of the selection process, a plant-specific analysis was performed to determine the neutron flux profiles and fluence that can be expected at the proposed SSLR capsule location between the Core Shroud and the reactor vessel inside wall for each fuel type that the host plant plans to load on the core periphery in the future. This includes an advanced fuel design with improved neutronic efficiency design which yields a significantly lower neutron leakage flux than current designs. The analysis indicated that the capsule withdrawal schedule approved by the NRC in the original BWRVIP-321-A is no longer suitable for the ISP for SLR due in large part to the lower neutron flux that the SSLR capsule will be subjected to after the loading of the advanced fuel design on the periphery. Consequently, 12 years of irradiation will be required to attain the needed catch-up fluence for the Group 3 SSLR capsule. A revised SSLR capsule withdrawal schedule has been reviewed and approved by the NRC on December 14, 2022 (ADAMS Accession No. ML22290A191). The revised schedule specifies that all three SSLR capsules/ groups be irradiated for the full 12 years. The original schedule proposed in BWRVIP-321-A specified separate irradiation periods/capsule withdrawals for each capsule group. Elimination of intermediate capsule withdrawals for Groups 1 and 2 significantly reduces the costs and risks associated with the ISP. It was recognized that by irradiating all three capsules for the full 12 years, the Group 1 and Group 2 capsules will be exposed to neutron fluence levels significantly beyond their projected plant specific accumulated fluence levels at 80 years of operation. However, the highest expected fluence level for these capsules is still well below the fluence values where any unusual ΔRT_{NDT} values might be expected. Accordingly, no unusual embrittlement trends are expected for these BWR surveillance materials. The revised withdrawal schedule is contained in Appendix F of BWRVIP-321, Revision 1-A.

Based on this revised withdrawal schedule, all three of the SSLR capsules will be installed in host reactor in the Fall of 2023 and withdrawn 12 years later in the Fall of 2035. When the SLRA for BFN is approved, Unit 1 will enter the subsequent period of extended operation on December 20, 2033, Unit 2 will enter the subsequent period of extended operation on June 28, 2034, and Unit 3 will enter the subsequent period of extended operation on July 2, 2036. Thus, the revised withdrawal schedule will result in the withdrawal of the SSLR capsule holder before any BFN unit progresses significantly (at most 2 years) into its subsequent period of extended operation.

The reserved surveillance capsules from BFN Units 1 and 3, represent reactor vessel material surveillance resources that could be employed to support further license extensions. BFN is committed to the BWRVIP ISP program and will support the program through additional capsule withdrawals as deemed appropriate by the BWRVIP and NRC. Presently, there are no plans to withdrawal any capsules from either Unit 1 or Unit 3, as the BFN Unit 2 capsules provide the best representative plate material for all three units and the best representative weld material for Units 2 and 3 (the best representative weld material for Unit 1 was found in capsules pulled from other plants as part of the BWR Owners' Group Supplemental Surveillance Program). Although the surveillance capsules for Units 1 and 3 will be deferred and not tested as part of the ISP, these capsules that were previously credited as part of BFN plant-specific surveillance programs will continue to be irradiated in their host reactors.

The Neutron Fluence Monitoring program (B.3.1.2) will be used to monitor the neutron fluence levels that are used as the time-dependent inputs for the time-limited aging analyses (TLAAs) that evaluate loss of fracture toughness due to neutron irradiation embrittlement of the reactor vessel.

3. *Reduction in Fracture Toughness is a plant-specific TLAA for Babcock & Wilcox (B&W) reactor internals to be evaluated for the subsequent period of extended operation in accordance with the NRC staff's safety evaluation concerning "Demonstration of the Management of Aging Effects for the Reactor Vessel Internals," B&W Owners Group report number BAW-2248, which is included in BAW-2248A, March 2000. Plant-specific TLAAs are addressed in Section 4.7, "Other Plant-Specific Time-Limited Aging Analyses," of this SRP-SLR.*

Table 3.1.1 Item Number 3.1-1, 015: This item is applicable to PWRs only, and therefore is not used for BFN.

3.1.2.2.4 Cracking Due to Stress Corrosion Cracking and Intergranular Stress Corrosion Cracking

1. *Cracking due to stress corrosion cracking (SCC) and intergranular stress corrosion cracking (IGSCC) could occur in stainless steel (SS) and nickel alloy reactor vessel (RV) flange leak detection lines of BWR light-water reactor facilities. The plant-specific operating experience (OE) and condition of the RV flange leak detection lines are evaluated to determine if SCC or IGSCC has occurred. The aging effect of cracking in SS and nickel alloy RV flange leak detection lines is not applicable and does not require management if (a) the plant-specific OE does not reveal a history of SCC or IGSCC and (b) a one-time inspection demonstrates that the aging effect is not occurring. The applicant documents the results of the plant- specific OE review in the SLRA. GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that cracking is not occurring. If cracking has occurred, GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," describes an acceptable program to manage cracking in RV flange leak detection lines.*

Table 3.1.1 Item Number 3.1-1, 016: This item evaluates cracking due to stress corrosion cracking (SCC) or intergranular stress corrosion cracking (IGSCC) in stainless steel or nickel alloy reactor vessel flange leak detection lines exposed to air-indoor uncontrolled or reactor coolant leakage environments. Plant-specific OE associated with the stainless steel or nickel alloy piping and piping components in the Reactor Vessel System, including the reactor vessel flange leak detection lines, has been evaluated to determine if cracking due to SCC or IGSCC has occurred in the reactor vessel flange leak detection lines. The OE evaluation did not identify any occurrences of cracking due to SCC or IGSCC in the BFN reactor vessel flange leak detection lines. Accordingly, the One-Time Inspection (B.2.1.20) program will be implemented to demonstrate that the aging effect of cracking due to SCC, IGSCC is not occurring in the stainless steel or nickel alloy reactor vessel top head enclosure flange leakage detection line exposed to air-indoor uncontrolled or reactor coolant leakage environments. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

2. *Cracking due to SCC and IGSCC could occur in SS BWR isolation condenser components exposed to reactor coolant. The existing program relies on control of reactor water chemistry to mitigate SCC and on ASME Code Section XI ISI to detect cracking. However, the existing program should be augmented to detect cracking due to SCC and IGSCC. An augmented program is recommended to include temperature and radioactivity monitoring of the shell-side water and eddy current testing of tubes to ensure that the component's intended function will be maintained during the subsequent period of extended operation. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

   Table 3.1.1 Item Number 3.1-1, 017: This item is not used since the BFN Boiling Water Reactor (BWR) design does not include an isolation condenser.

3.1.2.2.5 Crack Growth Due to Cyclic Loading

Crack growth due to cyclic loading could occur in reactor pressure vessel (RPV) shell forgings clad with SS using a high-heat-input welding process. Therefore, the current licensing basis (CLB) may include flaw growth evaluations of intergranular separations (i.e., underclad cracks) that have been identified in the RPV-to-cladding welds for the vessel. The evaluations apply to SA-508 Class 2 RPV forging components where the cladding was deposited and welded to the vessel using a high-heat-input welding process. Tor CLBs that include these types of evaluations, the evaluations may need to be identified as TLAAs if they are determined to conform to the six criteria for defining TLAAs in 10 CFR 54.3(a). The methodology for evaluating the underclad flaw should be consistent with the flaw evaluation procedure and criterion in the ASME Code Section XI[1]. See SRP-SLR, Section 4.7, “Other Plant-Specific Time-Limited Aging Analyses,” for generic guidance for meeting the requirements of 10 CFR 54.21(c).

Table 3.1.1 Item Number 3.1-1, 018: This item is applicable to PWRs only, and therefore is not used for BFN.

3.1.2.2.6 Cracking Due to Stress Corrosion Cracking

1. *Cracking due to SCC could occur in PWR SS bottom-mounted instrument guide tubes exposed to reactor coolant. Further evaluation is recommended to ensure that these aging effects are adequately managed. A plant-specific AMP should be evaluated to ensure that this aging effect is adequately managed. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

   Table 3.1.1 Item Number 3.1-1, 019: This item is applicable to PWRs only, and therefore is not used for BFN.

2. *Cracking due to SCC could occur in Class 1 PWR cast austenitic stainless steel (CASS) reactor coolant system piping and piping components exposed to reactor coolant. The existing program relies on control of water chemistry to mitigate SCC; however, SCC could occur in CASS components that do not meet the NUREG-0313, "Technical Report on Material Selection and Process Guidelines for BWR Coolant Pressure Boundary Piping" guidelines with regard to ferrite and carbon content. Further evaluation is recommended of a plant-specific program for these components to ensure that this aging effect is adequately managed. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

   Table 3.1.1 Item Number 3.1-1, 020: This item is applicable to PWRs only, and therefore is not used for BFN.

3. *Cracking due to SCC could occur in SS or nickel alloy RV flange leak detection lines of PWR light-water reactor facilities. The plant-specific OE and condition of the RV flange leak detection lines are evaluated to determine if SCC has occurred. The aging effect of cracking in SS and nickel alloy RV flange leak detection lines is not applicable and does not require management if (a) the plant-specific OE does not reveal a history of SCC and (b) a one-time inspection demonstrates that the aging effect is not occurring. The applicant documents the results of the plant-specific OE review in the SLRA. GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that cracking is not occurring. If cracking has occurred, GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," describes an acceptable program to manage cracking in RV flange leak detection lines.*

   Table 3.1.1 Item Number 3.1-1, 139: This item is applicable to PWRs only, and therefore is not used for BFN.

3.1.2.2.7 Cracking Due to Cyclic Loading

Cracking due to cyclic loading could occur in steel and SS BWR isolation condenser components exposed to reactor coolant. The existing program relies on ASME Code Section XI ISI. However, the existing program should be augmented to detect cracking due to cyclic loading. An augmented program is recommended to include temperature and radioactivity monitoring of the shell-side water and eddy current testing of tubes to ensure that the component's intended *function will be maintained during the subsequent period of extended operation. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

Table 3.1.1 Item Number 3.1-1, 021: This item is not used since the BFN BWR design does not include an isolation condenser.

3.1.2.2.8 Loss of Material Due to Erosion

Loss of material due to erosion could occur in steel steam generator feedwater impingement plates and supports exposed to secondary feedwater. Further evaluation is recommended of a plant-specific AMP to ensure that this aging effect is adequately managed. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP- SLR).

Table 3.1.1 Item Number 3.1-1, 022: This item is applicable to PWRs only, and therefore is not used for BFN.

3.1.2.2.9 Aging Management of Pressurized Water Reactor Vessel Internals (Applicable to Subsequent License Renewal Periods Only)

Electric Power Research Institute (EPRI) Topical Report (TR)-1022863, "Materials Reliability Program: Pressurized Water Reactor Internals Inspection and Evaluation Guidelines (MRP-227-A)" (Agencywide Documents Access and Management System (ADAMS) Accession Nos. ML12017A191 through ML12017A197 and ML12017A199), provides the industry's current aging management recommendations for the reactor vessel internal (RVI) components that are included in the design of a PWR facility. In this report, the EPRI Materials Reliability Program (MRP) identified that the following aging mechanisms may be applicable to the design of the RVI components in these types of facilities: (a) SCC, (b) irradiation-assisted stress corrosion cracking (IASCC), (c) fatigue, (d) wear, (e) neutron irradiation embrittlement, (f) thermal aging embrittlement, (g) void swelling and irradiation growth, or (h) thermal or irradiation- enhanced stress relaxation or irradiation enhanced creep. The methodology in MRP-227-A was approved by the NRC in a safety evaluation dated December 16, 2011 (ADAMS Accession No. ML11308A770), which includes those plant-specific applicant/licensee action items that a licensee or applicant applying the MRP-227-A report would need to address and resolve and apply to its licensing basis.

The EPRI MRP's functionality analysis and failure modes, effects, and criticality analysis bases for grouping Westinghouse-designed, B&W-designed and Combustion Engineering (CE)-designed RVI components into these inspection categories was based on an assessment of aging effects and relevant time-dependent aging parameters through a cumulative 60-year licensing period (i.e., 40 years for the initial operating license period plus an additional 20 years during the initial period of extended operation). The EPRI MRP has not assessed whether operation of Westinghouse-designed, B&W-designed and CE-designed reactors during an SLR operating period would have any impact on the existing susceptibility rankings and inspection categorizations for the RVI components in these designs, as defined in MRP-227-A or its applicable MRP background documents (e.g., MRP-191 for Westinghouse-designed or CE-designed RVI components or MRP-189 for B&W-designed components).

As described in GALL-SLR Report AMP XI.M16A, the applicant may use the MRP-227-A based AMP as an initial reference basis for developing and defining the AMP that will be applied to the RVI components for the subsequent period of extended operation. However, to use this alternative basis, GALL-SLR Report AMP XI.M16A recommends that the MRP-227-A based

AMP be enhanced to include a gap analysis of the components that are within the scope of the AMP. The gap analysis is a basis for identifying and justifying any potential changes to the MRP-227-A based program that may be necessary to provide reasonable assurance that the effects of age-related degradation will be managed during the subsequent period of extended operation. The criteria for the gap analysis are described in GALL-SLR Report AMP XI.M16A.

Alternatively, the PWR SLRA may define a plant-specific AMP for the RVI components to demonstrate that the RVI components will be managed in accordance with the requirements of 10 CFR 54.21(a)(3) during the proposed subsequent period of extended operation. Components to be inspected, parameters monitored, monitoring methods, inspection sample size, frequencies, expansion criteria, and acceptance criteria are justified in the SLRA. The NRC staff will assess the adequacy of the plant-specific AMP against the criteria for the 10 AMP program elements that are defined in Section A.1.2.3 of SRP-SLR Appendix A.1.

Table 3.1.1 Item Numbers 3.1-1, 028, 3.1-1, 051a, 3.1-1, 051b, 3.1-1, 052a, 3.1-1, 052b, 3.1-1, 052c, 3.1-1, 053a, 3.1-1, 053b, 3.1-1, 053c, 3.1-1, 055a, 3.1-1, 055b, 3.1-1, 055c, 3.1-1, 056a, 3.1-1, 056b, 3.1-1, 056c, 3.1-1, 058a, 3.1-1, 058b, 3.1-1, 059a, 3.1-1, 059b, 3.1-1, 059c, 3.1-1, 118, and 3.1-1, 119: These items are applicable to PWRs only, and therefore are not used for BFN.

3.1.2.2.10 Loss of Material Due to Wear

1. *Industry OE indicates that loss of material due to wear can occur in PWR control rod drive (CRD) head penetration nozzles made of nickel alloy due to the interactions between the nozzle and the thermal sleeve centering pads of the nozzle (see Ref. 29). The CRD head penetration nozzles are also called control rod drive mechanism (CRDM) nozzles or CRDM head adapter tubes. The applicant should perform a further evaluation to confirm the adequacy of a plant-specific AMP or analysis (with any necessary inspections) for management of the aging effect. The applicant may use the acceptance criteria, which are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR), to demonstrate the adequacy of a plant-specific AMP. Alternatively, the applicant may perform an analysis with any necessary inspections to confirm that loss of material due to wear does not affect the intended function(s) of these CRD head penetration nozzles, consistent with the current licensing basis (CLB).*

   Table 3.1.1 Item Number 3.1-1, 116: This item is applicable to PWRs only, and therefore is not used for BFN.

2. *Industry OE indicates that loss of material due to wear can occur in the SS thermal sleeves of PWR CRD head penetration nozzles due to the interactions between the nozzle and the thermal sleeve (e.g., where the thermal sleeve exits from the head penetration nozzle inside the reactor vessel as described in Ref. 30). Therefore, the applicant should perform a further evaluation to confirm the adequacy of a plant- specific AMP for management of the aging effect. The applicant may use the acceptance criteria, which are described in BTP RLSB-1 (Appendix A.1 of this SRP- SLR), to demonstrate the adequacy of a plant-specific AMP.*

   Table 3.1.1 Item Number 3.1-1, 117: This item is applicable to PWRs only, and therefore is not used for BFN.

3.1.2.2.11 Cracking Due to Primary Water Stress Corrosion Cracking

1. *Foreign OE in steam generators with a design similar to that of Westinghouse steam generators (particularly Model 51) has identified cracks due to primary water stress corrosion cracking (PWSCC) in steam generator (SG) divider plate assemblies fabricated of Alloy 600 and/or the associated Alloy 600 weld materials, even with proper primary water chemistry. Cracks have been detected in the stub runner with depths typically about 0.08 inches (EPRI 3002002850).*

   All but one of these instances of cracking has been detected in divider plate assemblies that are approximately 1.3 inches in thickness. For the cracks in the 1.3- inch thick divider plate assemblies, the cracks tend to be parallel to the divider-plate- to-stub-runner weld (i.e., run horizontally in parallel to the lower surface of the tubesheet). For the one instance of cracking in a divider plate assembly with a thickness greater than 1.3 inches, the cracking occurred in a divider plate assembly with a thickness of approximately 2.4 inches near manufacturing marks on the upper end of the stub runner used for locating tubesheet holes. These flaws were estimated to be approximately 0.08-inch deep.

   Although these instances indicate that the water chemistry program may not be sufficient to manage cracking due to PWSCC in SG divider plate assemblies, analyses by the industry indicate that PWSCC in the divider plate assembly does not pose a structural integrity concern for other steam generator components (e.g., tubesheet and tube-to-tubesheet welds) and does not adversely affect other safety analyses (e.g., analyses supporting tube plugging and repairs, tube repair criteria, and design basis accidents). In addition, the industry analyses indicate that flaws in the divider plate assembly will not adversely affect the heat transfer function (as a result of bypass flow) during normal forced flow operation, during natural circulation conditions (assessed in the analyses of various design basis accidents), or in the event of a loss-of-coolant accident (LOCA).

   Furthermore, additional industry analyses indicate that PWSCC in the divider plate assembly is unlikely to adversely impact adjacent items, such as the tubesheet cladding, tube-to-tubesheet welds, and channel head. Therefore,
   - *For units with divider plate assemblies fabricated of Alloy 690 and Alloy 690 type weld materials, a plant-specific AMP is not necessary.*
   - *For units with divider plate assemblies fabricated of Alloy 600 or Alloy 600 type weld materials, if the analyses performed by the industry (EPRI 3002002850) are applicable and bounding for the unit, a plant-specific AMP is not necessary.*
   - *For units with divider plate assemblies fabricated of Alloy 600 or Alloy 600 type weld materials, if the industry analyses (EPRI 3002002850) are not bounding for the applicant's unit, a plant-specific AMP is necessary or a rationale is necessary for why such a program is not needed. A plant-specific AMP (one beyond the primary water chemistry and the steam generator programs) may include a one-time inspection that is capable of detecting cracking to verify the effectiveness of the water chemistry and steam generator programs and the absence of PWSCC in the divider plate assemblies.*

   The existing programs rely on control of reactor water chemistry to mitigate cracking due to PWSCC and general visual inspections of the channel head interior surfaces (included as part *of the steam generator program). The GALL-SLR Report recommends further evaluation for a plant-specific AMP to confirm the effectiveness of the primary water chemistry and steam generator programs as described in this section. Acceptance criteria for a plant-specific AMP are described in BTP RLSB-1 (Appendix A.1 of this SRP SLR). In place of a plant-specific AMP, the applicant may provide a rationale to justify why a plant-specific AMP is not necessary.*

<u>Table 3.1.1 Item Number 3.1-1, 025:</u> This item is applicable to PWRs only, and therefore is not used for BFN.

2. *Cracking due to PWSCC could occur in SG nickel alloy tube-to-tubesheet welds exposed to reactor coolant. The acceptance criteria for this review are:*
    - *For units with Alloy 600 SG tubes for which an alternate repair criterion such as C*, F*, H*, or W* has been permanently approved for both the hot- and cold-leg side of the steam generator, the weld is no longer part of the reactor coolant pressure boundary and a plant-specific AMP is not necessary;*
    - *For units with Alloy 600 steam generator tubes, if there is no permanently approved alternate repair criteria such as C*, F*, H*, or W*, or permanent approval applies to only either the hot- or cold-leg side of the steam generator, a plant-specific AMP is necessary;*
    - *For units with thermally treated Alloy 690 SG tubes and with tubesheet cladding using Alloy 690 type material, a plant-specific AMP is not necessary;*
    - *For units with thermally treated Alloy 690 SG tubes and with tubesheet cladding using Alloy 600 type material, a plant-specific AMP is necessary unless the applicant confirms that the industry's analyses for tube-to-tubesheet weld cracking (e.g., chromium content for the tube-to-tubesheet welds is approximately 22 percent and the tubesheet primary face is in compression as discussed in EPRI 3002002850) are applicable and bounding for the unit, and the applicant will perform general visual inspections of the tubesheet region looking for evidence of cracking (e.g., rust stains on the tubesheet cladding) as part of the steam generator program. In lieu of a plant-specific AMP, the applicant may provide a rationale for why a plant-specific AMP is not necessary.*

The existing programs rely on control of reactor water chemistry to mitigate cracking due to PWSCC and visual inspections of the steam generator head interior surfaces. Along with the primary water chemistry and steam generator programs, a plant- specific AMP should be evaluated to confirm the effectiveness of the primary water chemistry and steam generator programs in certain circumstances. A plant-specific AMP may include a one-time inspection that is capable of detecting cracking to confirm the absence of PWSCC in the tube-to-tubesheet welds. Acceptance criteria for a plant-specific AMP are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR). In place of a plant-specific AMP, the applicant may provide a rationale to justify why a plant-specific AMP is not necessary.

<u>Table 3.1.1 Item Number 3.1-1, 025:</u> This item is applicable to PWRs only, and therefore is not used for BFN.

3.1.2.2.12 Cracking Due to Irradiation-Assisted Stress Corrosion Cracking

GALL-SLR Report AMP XI.M9, "BWR Vessel Internals," manages aging degradation of nickel alloy and SS, including associated welds, which are used in BWR vessel internal components. When exposed to the BWR vessel environment, these materials can experience cracking due to IASCC. The existing Boiling Water Reactor Vessel and Internals Project (BWRVIP) examination guidelines are mainly based on aging evaluation of BWR vessel internals for operation up to 60 years. However, increases in neutron fluence during the SLR term may need to be assessed for supplemental inspections of BWR vessel internals to adequately manage cracking due to IASCC. Therefore, the applicant should perform an evaluation to determine whether supplemental inspections are necessary in addition to those recommended in the existing BWRVIP examination guidelines. If the applicant determines that supplemental inspections are not necessary, the applicant should provide adequate technical justification for the determination. If supplemental inspections are determined necessary for BWR vessel internals, the applicant identifies the components to be inspected and performs supplemental inspections to adequately manage IASCC. In addition, the applicant should confirm the adequacy of any necessary supplemental inspections and enhancements to the BWR Vessel Internals Program.

<u>Table 3.1.1 Item Number 3.1-1, 029, Item Number 3.1-1, 041, and Item Number 3.1-1, 103:</u>
These items evaluate cracking including irradiated assisted stress corrosion cracking (IASCC) in stainless steel and nickel alloy reactor vessel internal components exposed to reactor coolant with neutron flux. Due to the increase in neutron fluence during the subsequent period of extended operation, an evaluation was performed to determine if supplemental inspections are necessary in addition to those recommended in the existing BWRVIP guidelines.

BFN Units 1, 2 and 3 will utilize the BWR Vessel Internals aging management program to manage age-related degradation of stainless steel and nickel alloy reactor vessel internal components and welds that are susceptible to cracking due to IASCC. The BFN BWR Vessel Internals program (B.2.1.7) is based on the recommendations provided in GALL-SLR AMP XI.M9, BWR Vessel Internals, and implements the referenced BWRVIP guidelines, as applicable. Supplemental inspections to manage IASCC beyond the current BWRVIP guidance are not necessary based on the following evaluation.

The aging mechanism of IASCC is dependent on accumulated neutron irradiation fluence. IASCC degradation of stainless steel or nickel alloys, including welds is not considered to be plausible until an accumulated neutron irradiation fluence threshold has been exceeded. A threshold fluence level for IASCC of 5.0×10^{20} n/cm^2 (E>1 MeV) has been generally accepted and is specified in BWRVIP guidance such as BWRVIP-26-A: BWR Vessel and Internals Project BWR Top Guide Inspection and Flaw Evaluation Guidelines. BWRVIP guidance addresses IASCC through 1) periodic inspection requirements for components using techniques capable of detecting cracking due to SCC and 2) flaw tolerance guidance that considers the effect of neutron fluence on material properties and SCC growth rates.

Although a generic threshold neutron irradiation fluence of 5×10^{20} n/cm^2 (E>1 MeV) has been generally accepted for onset of IASCC and used as a screening threshold for IASCC applicability, there is little evidence that accumulation of neutron irradiation fluence beyond this threshold results in increased stress corrosion cracking (SCC) occurrence. Periodic examinations of BWR internals subject to neutron irradiation fluence much greater than the threshold (i.e., core shrouds and top guide assemblies) have been performed for many years. To date, these inspections have not identified clear evidence of SCC initiation associated with increased neutron irradiation fluence. In most cases, newly identified cracking is attributed to application of new or more sensitive Non-Destructive Examination (NDE) technologies or implementation of NDE systems that permit probe delivery to locations previously not accessible.

However, during scheduled Enhanced Visual Testing (EVT-1) visual examinations of five Top Guide Grid Beam locations performed during BFN Unit 1 Refueling Outage 14 (U1R14), a relevant indication was observed at the northeast slotted notch of Cell Location 22-47. The indication traveled from the upper tip of the slotted notch diagonally upward and to the west along the grid beam for approximately 0.5". The indication had a horizontal component of 0.497" and a vertical component of 0.138". The most probable cause of the indication was postulated to be IASCC.

In accordance with EPRI Document BWRVIP-183-A, “Top Guide Grid Beam Inspection and Flaw Evaluation Guidelines,” Section 8.2, no scope expansion was required during U1R14 due to the identification of the indication since complete severance of the grid beam had not occurred. However, per Note 2 of Table 8-2 of BWRVIP-183-A, a plant-specific evaluation was performed for this flaw to determine a critical flaw size for the grid beam which was then used to determine if inspection scope expansion would be required during the following Unit 1 Refueling Outage 15 (U1R15). The evaluation concluded that the indication emanating from the northeast slotted notch of Cell Location 22-47 was below 75% of the beam height and would remain so throughout the next operating cycle. Therefore, the flaw was determined to be acceptable without repair per BWRVIP-183-A, since the flaw was verified by plant specific evaluation to be less than a critical flaw size that would result in failure. However, follow-up examination was added to the scope of future Unit 1 Refueling Outages 15 and 16 (U1R15 in the Fall of 2024 and U1R16 in the Fall of 2026) to evaluate the stability of the flaw as defined in Section 8.4 of BWRVIP 183-A with no further scope expansion required in future outages.

Regardless of operating experience trends, component locations potentially susceptible to IASCC are in all cases evaluated for significance of failure and if determined necessary, are subject to periodic inspection in accordance with the BWRVIP guideline applicable to the component. BWRVIP inspection requirements are conservatively established based considerations that include fleet performance, flaw tolerance, and redundancy. Inspection methods determined to be adequate to detect tight SCC remain adequate to detect IASCC in regions of increased neutron irradiation fluence.

The primary impact of increased neutron irradiation associated with operation beyond 60 years, is the effect on flaw tolerance evaluations. Flaw tolerance evaluation inputs include material fracture toughness and SCC crack growth rate, both of which can be affected by neutron fluence. Although these evaluation inputs can be affected by accumulated neutron fluence, the methods recommended within existing BWRVIP guidance remain adequate for use by licensees to determine the proper re-inspection interval. The application of fracture mechanics tools for the management of vessel internals is not limited by any specific time period. Further, although increased neutron fluences may potentially affect the re-inspection interval allowed, the tools remain valid for use at any fluence anticipated for boiling water reactors.

The following BFN Units 1, 2 and Unit 3 reactor vessel internal components are projected to exceed a neutron irradiation fluence of $5x10^{20}$ n/cm^2 (E>1 MeV) prior to the end of the subsequent period of extended operation; top guide, core shroud, core plate, in-core monitor dry tubes, in-core monitor housings, control rod guide tube housings (upper portion only) and orificed fuel supports. The evaluations to determine whether supplemental inspections are necessary in addition to those recommended in the existing BWRVIP examination guidelines are provided below.

Top Guide - Current inspection recommendations for the top guide are provided in BWRVIP-26-A, “BWR Vessel and Internals Project, BWR Top Guide Inspection and Flaw Evaluation Guidelines” and BWRVIP-183-A, “BWR Vessel and Internals Project, Top Guide Grid Beam Inspection and Flaw Evaluation Guidelines.” Both BWRVIP-26-A and BWRVIP-183-A consider IASCC an applicable aging mechanism in the determination of the inspection recommendations. Therefore, supplemental inspections in addition to the existing recommended inspections, which will continue through the subsequent period of extended operation,are not necessary.

Core Shroud - Current inspection recommendations for the core shroud are provided in BWRVIP-76-R1-A, “BWR Vessel and Internals Project, BWR Core Shroud Inspection and Flaw Evaluation Guidelines.” IASCC is identified as one of the observed mechanisms associated with cracking of core shrouds in the industry. The inspection recommendations provided in BWRVIP-76-R1-A are based on inspection results and flaw tolerance evaluations that appropriately consider the effects of neutron fluence on material fracture toughness and SCC crack growth rate correlations. Therefore, the higher neutron fluence achieved during the subsequent period of extended operation is addressed as part of the current guidance provided in BWRVIP-76-R1-A. Since the core shroud inspections are based on previous inspection results and flaw tolerance evaluations that consider the effects of neutron fluence, supplemental inspections in addition to the currently recommended inspection guidance, which will continue to be applicable through the subsequent period of extended operation, are not necessary.

Core Plate - Current inspection recommendations for the core plate are provided in BWRVIP-25 Revision 1-A, “BWR Vessel and Internals Project, BWR Core Plate Inspection and Flaw Evaluation Guidelines.” Structural evaluations conducted as part of developing BWRVIP-25 Revision 1-A concluded that no examinations are required for the core plate since postulated cracking cannot have an adverse effect on the capability of the core plate to perform its intended function. Supplemental inspections in addition to the guidance provided in BWRVIP-25 Revision 1-A are not necessary since cracking of the core plate will not prevent the core plate from performing its intended function.

For many core plate weld locations, there are no safety consequences from degradation. Elsewhere, the location is redundant to the core plate bolts and, as a result, inspection is not required. Significant SCC crack growth is not anticipated for locations fully protected by Hydrogen Water Chemistry (HWC), Noble Metal Chemistry Addition (NMCA), or Online Noble Metal Chemistry (OLNC) (as are the vessel internals at BFN). The location of most significance, in addition to the core plate bolts, are the aligner pin assemblies, which are redundant to the core plate bolts. These pins are located in a low fluence region of the core plate; in a region where neutron fluence exceeding the $5x10^{20}$ n/cm^2 (E > 1.0 MeV) threshold for IASCC is not considered to be plausible, regardless of service life.

For the core plate welded structure, there are no factors associated with extended operation that would indicate a change to these conclusions. Although some additional cracking could be postulated during extended operation, there are no data supporting any adverse trend for locations protected by HWC, NMCA, or OLNC, even when neutron fluence approaches or exceeds the IASCC threshold fluence of $5x10^{20}$ n/cm^2 (E > 1.0 MeV). Finally, there is no direct time dependency associated with the safety assessment conclusions documented in BWRVIP-25, Revision 1-A that form the basis for the current aging management approach.

In-core Monitor Dry Tubes - Current inspection recommendations for the in-core monitor dry tubes are provided in BWRVIP-47-A, "BWR Vessel and Internals Project, BWR Lower Plenum Inspection and Flaw Evaluation Guidelines." BWRVIP-47-A considered IASCC an applicable aging mechanism in the determination of the inspection recommendations, therefore supplemental inspections in addition to the existing recommended inspections are not necessary.

In-core Monitor Housing - Current inspection recommendations for the in-core monitor housings are provided in BWRVIP-47-A, "BWR Vessel and Internals Project, BWR Lower Plenum Inspection and Flaw Evaluation Guidelines." No inspections of the in-core monitor housings are recommended by BWRVIP-47-A. This recommendation is based on the determination that a failure of an in-core monitor housing does not impair the safe shutdown of the plant and the failure of an in-core monitor for any reason would be detectable by loss of monitor indication. The inclusion of IASCC to the applicable aging effects does not change the current conclusions of BWRVIP-47-A, therefore supplemental inspections or enhancements to the BWRVIP guidance are not necessary.

Control Rod Guide Tube Housing - Current inspection recommendations for the control rod guide tube housing are provided in BWRVIP-47-A, "BWR Vessel and Internals Project, BWR Lower Plenum Inspection and Flaw Evaluation Guidelines." BWRVIP-47-A recommends performing baseline inspections of the Control Rod Guide Tube (CRGT) to alignment lug weld (CRGT-1) and the guide tube circumferential welds (CRGT-2 and CRGT-3). These baseline inspections were performed at BFN during the 2004 to 2011 timeframe and no recordable indications were observed.

The BWRVIP-47-A recommended baseline inspection of the CRGT-1 welds consisted of a VT-3 visual inspection or verification of the alignment lug during removal and installation of the orificed fuel support. Although re-inspection of CRGT-1 welds is not currently required, the orificed fuel supports are removed and installed during control rod blade replacement activities which occur routinely. Also, the failure of the CRGT-1 weld was determined to have no safety consequence as evaluated in BWRVIP-47-A and BWRVIP-06 Revision 1-A. Based on the verification of the alignment lug during control rod blade replacement activities and no safety consequences associated with a failed alignment lug, supplemental inspections or enhancements to the current BWRVIP guidance for CRGT-1 welds are not necessary.

The BWRVIP-47-A recommended baseline inspection of the CRGT-2 and CRGT-3 welds consisted of an EVT-1 visual inspection. All U.S. BWRs have performed a baseline inspection of 10% of the CRGTs. As previously noted, these baseline inspections were performed at BFN during the 2004 to 2011 timeframe and no recordable indications were observed. Out of these inspections, very few relevant indications have been reported in the fleet, including only one short indication associated with a CRGT-2 weld and a small number of loose fuel alignment pins. As discussed in BWRVIP-06 Revision 1-A during normal plant operation the control rod guide tube and the CRGT welds are under compression and a failure is not expected to prevent control rod movement unless horizontal displacement or buckling was to occur. Significant horizontal displacement or buckling which would prevent control rod movement is not expected unless an event such as a LOCA or seismic event occurs when an undetected weld failure is present. Multiple control rod guide tube failures, which are considered to be a very low probability, would be required to prevent safe shutdown of the plant. Re-inspection of the CRGT-2 and CRGT-3 welds is not currently required, however control rod guide tubes are visually inspected for cleanliness and foreign material during control rod blade replacement activities which occur routinely. Any gross failure of the CRGT-2 or CRGT-3 welds could be detected during this activity.

With regard to IASCC / irradiation embrittlement, the upper end of the CRGT assemblies, in the area of the core plate and including welds CRGT-1 and CRGT-2, are projected to accumulate fluence exceeding the IASCC threshold fluence prior to the end of the subsequent period of extended operation. However, the CRGT-1 alignment lug function is redundant to that provided by the orificed fuel support casting alignment slot. As such, cracking in this location will not result in a critical failure. At the CRGT-2 weld location, the accumulated fluence is significantly lower, but it still may be potentially near the IASCC threshold fluence for welded components. However, there is no evidence that fluence near $5x10^{20}$ n/cm^2 (E > 1.0 MeV) will result in new SCC initiations. As such, there is presently no basis for any near-term concern at this location.

The results of the BWR fleet baseline inspections have been very favorable, and application of HWC technologies will likely prevent any future SCC occurrences. However, some nominal potential for SCC may be possible. Different than other BWRVIP guidelines, BWRVIP-47-A does not include periodic inspection requirements. As such, an evaluation is therefore appropriate to assess the periodic inspection needs to ensure adequate aging management. To address this need, the BWRVIP has initiated a project to review relevant data associated with CRGTs and CRD housings and perform associated engineering evaluations with the intent of determining if the inspection recommendations in BWRVIP-47-A are adequate or in need of Revision, and establishing appropriate future guidance for managing these components if appropriate.

Based on no indications being identified during the initial baseline inspections, the CRGT welds being under compression during normal plant operation, the low probability of multiple CRGT welds being failed concurrent with a LOCA or seismic event, control rod guide tubes are visually inspected for cleanliness and foreign material during control rod blade replacement activities, supplemental inspections or enhancements to the current BWRVIP guidance are not necessary in the near term. Nonetheless, as noted above, the BWRVIP intends to address re-inspection needs for CRGTs and CRD housings in a future Revision to BWRVIP-47-A. Evaluations supporting a Revision to BWRVIP-47-A will include consideration of the fluence accumulated for operation beyond 60 years and ensure that the conclusions reached are applicable to extended operations. Any new or revised inspection recommendations are required to be implemented at BFN by TVA in accordance with BWRVIP-94-R3-NP, “BWR Vessel and Internals Project, Program Implementation Guide” and Nuclear Energy Institute (NEI) guideline NEI 03-08, “Guideline for the Management of Material Issues.”

Orificed Fuel Support - Current inspection recommendations for the orificed fuel supports are provided in BWRVIP-47-A, “BWR Vessel and Internals Project, BWR Lower Plenum Inspection and Flaw Evaluation Guidelines.” No inspections of the orificed fuel supports are recommended by BWRVIP-47-A. This recommendation is based on assessments in BWRVIP-47-A and BWRVIP-06 Revision 1-A: BWR Vessel and Internals Project, Safety Assessment of BWR Reactor Internals, which concludes that the orificed fuel support castings are highly resistant to impairment by cracking due to the one-piece fabrication, the fact that cracking has not been observed, and that shutdown could be achieved even if a local failure did occur. The inclusion of IASCC to the applicable aging effects does not change the current conclusions of BWRVIP-47-A and BWRVIP-06 Revision 1-A, therefore supplemental inspections or enhancements to the BWRVIP guidance are not necessary.

As discussed above, specifying supplemental inspections beyond the inspections recommended by the current BWRVIP guidelines is not necessary. The BWRVIP is chartered to review and trend operating experience from the BWR fleet relative to implementation of recommended inspections and revise the recommendations as appropriate in accordance with BWRVIP-94-R3-NP and NEI 03-08. As new or revised inspection recommendations are recommended by the BWRVIP, the recommendations are required to be implemented in accordance with BWRVIP-94-R3-NP and NEI 03-08.

3.1.2.2.13 Loss of Fracture Toughness Due to Neutron Irradiation or Thermal Aging Embrittlement

GALL-SLR Report AMP XI.M9 manages aging degradation of nickel alloy and SS, including associated welds, which are used in BWR vessel internal components. When exposed to the BWR vessel environment, these materials can experience loss of fracture toughness due to neutron irradiation embrittlement. In addition, CASS, precipitation- hardened (PH) martensitic SS (e.g., 15-5 and 17-4 PH steel) and martensitic SS (e.g., 403, 410, 431 steel) can experience loss of fracture toughness due to neutron irradiation or thermal aging embrittlement.

The existing BWRVIP examination guidelines are mainly based on aging evaluation of BWR vessel internals for operation up to 60 years. Increases in neutron fluence and thermal embrittlement during the SLR term may need to be assessed for supplemental inspections of BWR vessel internals to adequately manage loss of fracture toughness due to neutron irradiation or thermal aging embrittlement. Therefore, the applicant should perform an evaluation to determine whether supplemental inspections are necessary in addition to those recommended in the existing BWRVIP examination guidelines. If the applicant determines that supplemental inspections are not necessary, the applicant should provide adequate technical justification for the determination. If supplemental inspections are determined necessary for BWR vessel internals, the applicant should identify the components to be inspected and perform supplemental inspections to adequately manage loss of fracture toughness. In addition, the applicant should confirm the adequacy of any necessary supplemental inspections and enhancements to the BWR Vessel Internals Program.

<u>Table 3.1.1 Item Number 3.1-1, 099:</u> This item evaluates loss of fracture toughness due to neutron irradiation or thermal aging embrittlement in stainless steel (including cast austenitic stainless steel (CASS), martensitic stainless steel, and precipitation-hardened (PH) martensitic stainless steel) and nickel alloy (including X-750 alloy) reactor vessel internal components exposed to reactor coolant with neutron flux. Due to the increase in neutron fluence during the subsequent period of extended operation, an evaluation was performed to determine if supplemental inspections are necessary in addition to those recommended in the existing BWRVIP guidelines.

The materials used to construct the BFN Units 1, 2, and 3 reactor vessel internals consist of CASS, wrought austenitic stainless steel, and nickel alloys (including alloy 600 and X- 750). Precipitation-hardened (PH) martensitic SS (e.g., 15-5 and 17-4 PH steel) and martensitic SS (e.g., 403, 410, 431 steel) were not used in fabrication of any reactor vessel internal component or repair component for BFN Units 1, 2 and 3.

The CASS reactor vessel internal components consist of the following; jet pump assembly (transition piece including elbow, inlet mixer, and diffuser collar), jet pump restrainer bracket, core spray sparger elbows, control rod guide tube base, and orificed fuel support castings. The aging effect of loss of fracture toughness due to thermal aging embrittlement and neutron irradiation embrittlement on these CASS components was specifically evaluated in BWRVIP-234, “BWR Vessel and Internals Project, Thermal Aging and Neutron Embrittlement Evaluation of Cast

Austenitic Stainless Steels for BWR Internals." The BWRVIP-234 evaluation determined that no supplemental (augmented) inspections, beyond those recommendations within the current BWRVIP reports were needed for these components to manage the aging effect of loss of fracture toughness due to thermal aging embrittlement and neutron irradiation embrittlement. The NRC accepted this recommendation, as adequately managing loss of fracture toughness due to thermal embrittlement and irradiation embrittlement and any possible combined effects of the two, for components that do not exceed $6x10^{20}$ n/cm^2 (1 dpa) as documented in Final Safety Evaluation of the BWRVIP-234, "Thermal Aging Embrittlement Evaluation of Cast Austenitic Stainless Steel for BWR Internals," dated June 22, 2016 (ADAMS Accession No. ML16096A002). For BFN Units 1, 2 and 3, the only CASS components that are projected to exceed a fluence greater than $6x10^{20}$ n/cm^2 (E>1 MeV) prior to the end of the subsequent period of extended operation are the orificed fuel support castings. Therefore, supplemental inspections or enhancements to the BWRVIP guidance are not necessary for the jet pump assembly (transition piece including elbow, inlet mixer, and diffuser collar), jet pump restrainer bracket, core spray sparger elbows, and control rod guide tube base.

The orificed fuel support castings were determined to be not susceptible to loss of fracture toughness due to thermal aging embrittlement based on being statically cast using CF-8 low molybdenum material and a delta ferrite content of less than 20 percent. However, the orificed fuel support castings in high fluence areas are projected to exceed the threshold of $6x10^{20}$ n/cm^2 (E>1 MeV) for loss of fracture toughness due to neutron irradiation embrittlement. For loss of fracture toughness to have an effect on a component's intended function there must be a mechanism for crack initiation and propagation. During normal plant operation, the orificed fuel support castings are in compression due to the weight of the fuel assemblies they support, therefore tensile stresses to initiate cracking are not present. The orificed fuel support castings are cast from ferritic - austenitic duplex stainless steel which is highly resistant to intergranular stress corrosion cracking (IGSCC). In addition, hydrogen water chemistry treatment is used to mitigate the potential for IGSCC. An assessment documented in BWRVIP-06 Revision 1-A, "Safety Assessment of BWR Reactor Internals," concluded that the orificed fuel support castings are highly resistant to impairment by cracking due to one-piece fabrication. Based on the fact that cracking has not been observed and that shutdown could be achieved even if a local failure did occur, no short-term (or long-term) action is required. Based on the above, supplemental inspections or enhancements to the BWRVIP guidance are not necessary to manage loss of fracture toughness due to thermal aging embrittlement or neutron irradiation embrittlement for the orificed fuel support castings.

Wrought austenitic stainless steel and nickel alloy can experience loss of fracture toughness due to neutron embrittlement when exposure to high neutron fluence. Per MRP-175, Materials Reliability Program, "PWR Internals Material Aging Degradation Mechanism Screening and Threshold Values," the aging effect of loss of fracture toughness due to neutron irradiation embrittlement is applicable for components if the fluence exceeds $1x10^{21}$ n/cm^2 (E>1 MeV) for wrought austenitic stainless steel and $6.7x10^{20}$ n/cm^2 (E>1 MeV) for welded austenitic stainless steel. MRP-175 also specifies that the austenitic stainless steel criterion should be used to nickel alloys. Although this criterion was developed for PWRs, it is considered applicable for boiling water reactors. However, the impact of loss of fracture toughness is only significant if cracking occurs. Conservatively, the threshold for irradiation-assisted stress corrosion cracking (IASCC) of $5x10^{20}$ n/cm^2 (E>1 MeV) is applied as a reasonable lower bound fluence for consideration of loss of fracture toughness due to irradiation embrittlement. The wrought austenitic stainless steel reactor internal components and welds that are projected to exceed the fluence threshold for susceptibility to loss of fracture toughness due to neutron irradiation embrittlement ($5x10^{20}$ n/cm^2 (E>1 MeV)) are the top guide, core shroud, core plate, in-core monitor dry tubes, in-core monitor housing, and control rod guide tube housing.

Top Guide - The top guide is currently inspected periodically for cracking. Therefore, the aging effect of loss of fracture toughness due to neutron embrittlement can be indirectly managed by identifying aging degradation, implementing early corrective actions, and monitoring and trending age-related degradation. Current inspection recommendations for the top guide are provided in BWRVIP-26-A, “BWR Vessel and Internals Project, Top Guide Inspection and Flaw Evaluation Guidelines,” and BWR-183-A, “BWR Vessel and Internals Project, Top Guide Grid Beam Inspection and Flaw Evaluation Guidelines.” The inspection recommendations provided in BWRVIP-26-A and BWRVIP-183-A are based on inspection results and flaw tolerance evaluations that appropriately consider the effects of neutron fluence on material toughness and crack growth rate correlations. Since the top guide inspections are based on previous inspection results and flaw tolerance evaluations that consider the effects of neutron fluence, supplemental inspections in addition to the current recommended inspection guidance are not necessary since the higher neutron fluence achieved during the subsequent period of extended operation is addressed as part of the current guidance provide in BWRVIP-26-A and BWRVIP-183-A.

Core Shroud - The core shroud is currently inspected periodically for cracking. Therefore, the aging effect of loss of fracture toughness due to neutron embrittlement can be indirectly managed by identifying aging degradation, implementing early corrective actions, and monitoring and trending age-related degradation. Current inspection recommendations for the core shroud are provided in BWRVIP-76-R1-A, “BWR Vessel and Internals Project, BWR Core Shroud Inspection and Flaw Evaluation Guidelines.” The inspection recommendations provided in BWRVIP-76-R1-A are based on inspection results and flaw tolerance evaluations that appropriately consider the effects of neutron fluence on material toughness and crack growth rate correlations. Since the core shroud inspections are based on previous inspection results and flaw tolerance evaluations that consider the effects of neutron fluence, supplemental inspections in addition to the current recommended inspection guidance are not necessary since the higher neutron fluence achieved during the subsequent period of extended operation is addressed as part of the current guidance provide in BWRVIP-76-R1-A.

Core Plate - Current inspection recommendations for the core plate are provided in BWRVIP-25 Revision 1-A, “BWR Vessel and Internals Project, BWR Core Plate Inspection and Flaw Evaluation Guidelines.” Structural evaluations conducted as part of developing BWRVIP- 25 Revision 1-A, concluded that no examinations are required for the core plate since postulated cracking cannot have an adverse effect on the capability of the core plate to perform its intended function. Supplemental inspections in addition to the guidance provided in BWRVIP-25 Revision 1-A are not necessary since cracking of the core plate does not prevent the core plate from performing its intended function.

In-core Monitor Dry Tubes - Current inspection recommendations for the in-core monitor dry tubes are provided in BWRVIP-47-A, “BWR Vessel and Internals Project, BWR Lower Plenum Inspection and Flaw Evaluation Guidelines.” No inspections of the in-core monitor dry tubes are recommended by BWRVIP-47-A. This recommendation is based on the determination that a failure of a dry tube does not impair the safe shutdown of the plant and the failure of an in-core monitor for any reason would be detectable by loss of monitor indication. The inclusion of loss of fracture toughness to the applicable aging effects does not change the current conclusions of

BWRVIP-47-A, therefore supplemental inspections or enhancements to the BWRVIP guidance are not necessary.

In-core Monitor Housing - Current inspection recommendations for the in-core monitor housings are provided in BWRVIP-47-A, “BWR Vessel and Internals Project, BWR Lower Plenum Inspection and Flaw Evaluation Guidelines. No inspections of the in-core monitor housings are recommended by BWRVIP-47-A.” This recommendation is based on the determination that a failure of an in-core monitor housing does not impair the safe shutdown of the plant and the failure of an in-core monitor for any reason would be detectable by loss of monitor indication. The inclusion of loss of fracture toughness to the applicable aging effects does not change the current conclusions of BWRVIP-47-A, therefore supplemental inspections or enhancements to the BWRVIP guidance are not necessary.

Control Rod Guide Tube Housing - Current inspection recommendations for the control rod guide tube housing are provided in BWRVIP-47-A, “BWR Vessel and Internals Project, BWR Lower Plenum Inspection and Flaw Evaluation Guidelines.” BWRVIP-47-A recommends performing baseline inspections of the guide tube to alignment lug weld (CRGT-1) and the guide tube circumferential welds (CRGT-2 and CRGT-3). These baseline inspections were performed at BFN during the 2004 to 2011 timeframe and no recordable indications were observed.

The upper portions of the control rod guide tube housing, in the area of the core plate, are projected to exceed the fluence threshold for neutron embrittlement. These portions include welds CRGT-1 and CRGT-2 in high fluence areas.

The BWRVIP-47-A recommended baseline inspection of the CRGT-1 welds consisted of a VT-3 visual inspection or verification of the alignment lug during removal and installation of the orificed fuel support. Although re-inspection of CRGT-1 welds is not currently required, the orificed fuel supports are removed and installed during control rod blade replacement activities which occur routinely. Also, the failure of the CRGT-1 weld was determined to have no safety consequence as evaluated in BWRVIP-47-A and BWRVIP- 06-R1-A. Based on the verification of the alignment lug during control rod blade replacement activities and no safety consequences associated with a failed alignment lug, supplemental inspections or enhancements to the current BWRVIP guidance are not necessary.

The BWRVIP-47-A recommended baseline inspection of the CRGT-2 and CRGT-3 welds consists of an EVT-1 visual inspection. All U.S. BWRs have performed a baseline inspection of 10% of the CRGTs. Out of these inspections, very few relevant indications have been reported in the fleet, including only one short indication associated with a CRGT-2 weld and a small number of loose fuel alignment pins. As discussed in BWRVIP-06 Revision 1-A during normal plant operation the control rod guide tube and CRGT-2 welds are under compression and a failure is not expected to prevent control rod movement unless horizontal displacement or buckling was to occur. Significant horizontal displacement or buckling which would prevent control rod movement is not expected unless an event such as a LOCA or seismic event occurs when an undetected weld failure is present. Multiple control rod guide tube failures, which are considered to be a very low probability, would be required to prevent safe shutdown of the plant. Re-inspection of CRGT-2 and CRGT-3 welds is not currently required, however control rod guide tubes are visually inspected for cleanliness and foreign material during control rod blade replacement activities which occur routinely. Any gross failure of the CRGT-2 or CRGT-3 welds could be detected during this activity.

The results of the BWR fleet baseline inspections have been very favorable, and application of HWC technologies will likely prevent any future SCC occurrences. However, some nominal potential for SCC may be possible. Different than other BWRVIP guidelines, BWRVIP-47-A does not include periodic inspection requirements. As such, an evaluation is therefore appropriate to assess the periodic inspection needs to ensure adequate aging management. To address this need, the BWRVIP has initiated a project to review relevant data associated with CRGTs and CRD housings and perform associated engineering evaluations with the intent of determining if the inspection recommendations in BWRVIP-47-A are adequate or in need of Revision, and establishing appropriate future guidance for managing these components if appropriate.

Based on no indications being identified during the initial baseline inspections, the CRGT welds being under compression during normal plant operation, the low probability of multiple CRGT welds being failed concurrent with a LOCA or seismic event, control rod guide tubes are visually inspected for cleanliness and foreign material during control rod blade replacement activities, supplemental inspections or enhancements to the current BWRVIP guidance are not necessary in the near term. Nonetheless, as noted above, the BWRVIP intends to address re-inspection needs for CRGTs and CRD housings in a future Revision to BWRVIP-47-A. Evaluations supporting a Revision to BWRVIP-47-A will include consideration of the fluence accumulated for operation beyond 60 years and ensure that the conclusions reached are applicable to extended operations. Any new or revised inspection recommendations are required to be implemented at BFN by TVA in accordance with BWRVIP-94-R4, “BWR Vessel and Internals Project, Program Implementation Guide,” and NEI 03-08, “Guideline for the Management of Material Issues.”

The nickel alloy reactor vessel internal components consist of the following; core shroud support assembly, core shroud access hole covers and bolting, jet pump hold-down beams, jet pump repair hardware (e.g., auxiliary spring wedges and slip joint clamps) and core spray repair hardware (e.g., clamps). The reactor vessel internal components fabricated from nickel alloy are located in relatively low fluence areas or were installed later in plant life (i.e., repair hardware). The projected fluence of the nickel alloy components at the end of the subsequent period of extended operation is less than $5x10^{20}$ n/cm^2, therefore loss of fracture toughness due to neutron irradiation embrittlement is not considered an applicable aging effect, therefore supplemental inspections or enhancements to the BWRVIP guidance are not necessary.

As discussed above, specifying supplemental inspections beyond the inspections recommended by the current BWRVIP guidelines are not necessary. The BWRVIP is chartered to review and trend operating experience from the BWR fleet relative to implementation of recommended inspections and revise the recommendations as appropriate in accordance with BWRVIP-94-R4 and NEI 03-08. As new or revised inspection recommendations are recommended by the BWRVIP, they are required to be implemented in accordance with BWRVIP-94-R4 and NEI 03-08.

3.1.2.2.14 Loss of Preload Due to Thermal or Irradiation-Enhanced Stress Relaxation

GALL-SLR Report AMP XI.M9 manages loss of preload due to thermal or irradiation- enhanced stress relaxation in BWR core plate rim holddown bolts. The issue is applicable to BWR-designed light water reactors that employ rim holddown bolts as the means for protecting the reactor's core plate from the consequences of lateral movement. The potential for such movement, if left unmanaged, could impact the ability of the reactor to be brought to a safe *shutdown condition during an anticipated transient occurrence or during a postulated design-basis accident or seismic event. This issue is not applicable to BWR reactor designs that use wedges as the means of precluding lateral movement of the core plate because the wedges are fixed in place and are not subject to this type of aging effect and mechanism combination.*

GALL-SLR Report AMP XI.M9 indicates that the inspections in the BWRVIP topical report, "BWR Vessel and Internals Project, BWR Core Plate Inspection and Flaw Evaluation Guidelines (BWRVIP-25)," are used to manage loss of preload due to thermal or irradiation-enhanced stress relaxation in BWR designs with core plate rim holddown bolts. However, in previous license renewal applications (LRAs), some applicants have identified that the inspection bases for managing loss of preload in BWRVIP-25 may not be capable of gaining access to the rim holddown bolts or are not sufficient to detect loss of preload on the components. For applicants that have identified this issue in their past LRAs, the applicants either committed to modifying the plant design to install wedges in the core plate designs or to submit an inspection plan, with a supporting core plate rim holddown bolt preload analysis for NRC approval at least 2 years prior to entering into the initial period of extended operation for the facility.

If an existing NRC-approved analysis for the bolts exists in the CLB and conforms to the definition of a TLAA, the applicant should identify the analysis as a TLAA for the SLRA and demonstrate how the analysis is acceptable in accordance with either 10 CFR 54.21(c)(1)(i), (ii), or (iii). Otherwise, if a new analysis will be performed to support an updated augmented inspection basis for the bolts for the subsequent period of extended operation, the NRC staff recommends that a license renewal commitment be placed in the FSAR Supplement for the applicant to submit both the inspection plan and the supporting loss of preload analysis to the NRC staff for approval at least 2 years prior to entering into the subsequent period of extended operation for the facility. If loss of preload in the bolts is managed with an AMP that correlates to GALL-SLR Report AMP XI.M9, the inspection basis in the applicable BWRVIP report is reviewed for continued validity, or else augmented as appropriate.

<u>Table 3.1.1 Item Number 3.1-1, 120:</u> This item evaluates loss of preload due to thermal or irradiation-enhanced stress relaxation in stainless steel core plate rim hold-down bolts exposed to reactor coolant with neutron flux. BFN does not currently contain core plate wedges.

The core plate rim hold-down bolts connect the core plate to the core shroud. Each of the BFN reactors has 34 core plate rim hold-down bolts. These bolts are preloaded during initial installation but are subject to stress relaxation (loss of preload) due to thermal and irradiation effects. This relaxation of preload could lead to lateral movement or sliding of the core plate under all operating conditions. The potential for such movement, if left unmanaged, could impact the ability of the reactor to be brought to a safe shutdown condition during an anticipated transient occurrence or during a postulated design-basis accident or seismic event.

The BWR Vessel Internals program (B.2.1.7) manages loss of preload due to thermal or irradiation-enhanced stress relaxation in BWR core plate rim hold-down bolts. The BWR Vessel Internals aging management program indicates that the inspections in the BWRVIP topical report, "BWR Vessel and Internals Project, BWR Core Plate Inspection and Flaw Evaluation Guidelines (BWRVIP-25)," are used to manage loss of preload due to thermal or irradiation-enhanced stress relaxation in BWR designs with core plate rim hold-down bolts. Additionally, as described in the NRC Safety Evaluation Report to BWRVIP-25, plants must consider relaxation of the core plate rim hold-down bolts as a TLAA issue.

BWRVIP-25, Revision 0 required an EVT-1 examination from below the core plate, or UT from above the core plate, of 50% (17) of the hold-down bolts. If cracking was detected, the remaining 50% of the bolts were to be inspected. Unit 1 performed an EVT-1 examination from below the core plate of 50% of the rim hold-down bolts during recovery from it's extended shutdown since access below the core plate was available, but visual exams performed since the Unit 1 restart from it's extended shutdown were extremely difficult to perform because of poor accessibility and high radiation conditions with fuel in an operating reactor vessel. Visual inspections are also problematic. An EVT-1 inspection may be able to examine the unthreaded shank of a bolt. However, the threaded portion, which is theoretically more susceptible to IGSCC, is surrounded by the core plate and the core plate support ring and is hidden from view. Thus, meaningful EVT-1 exams could not be performed and, in hindsight, perhaps should not have been recommended in BWRVIP-25. Additionally, UT had significant limitations due to bolt geometry. The only feasible location for delivering acoustic energy to the bolt is through its upper end, and access to the upper end is restricted by the presence of a keeper that is fillet welded to the top of the bolt. The resulting geometry did not allow for effective wave transmission, and consequently, a Ultrasonic Test inspection was not possible.

The BWRVIP set out to generically address this issue and to develop revised guidance, which was ultimately issued in the form of BWRVIP-25 Revision 1-A , Appendix I. Until this guidance was developed and approved by the NRC, a VT-3 examination of 100% of the hold-down bolts from above the core plate was performed by TVA, in accordance with a generic deviation disposition developed by the BWRVIP and submitted by TVA to the NRC for application at BFN in the initial License Renewal Application, in order to verify that the core plate rim hold-down bolts were still performing their design function.

The stress state of these bolts was evaluated as part of the analysis performed by General Electric Hitachi (GEH) in support of EPRI's preparation of BWRVIP-25 Revision 0. The analysis determined that a 5 percent to 19 percent reduction in core plate bolt preload due to thermal and irradiation effects should be expected over the 40-year life of a plant. A subsequent generic reevaluation performed by GEH determined that the maximum relaxation value of 20% is applicable to an average fluence level of 8.0×10^{19} n/cm^2 over the length of the bolt, determined at the peak azimuthal fluence location. Since this analysis evaluated irradiation effects expected to occur in 40 years, this analysis was identified as a TLAA that required evaluation for the period of extended operation (PEO).

The evaluation of core plate bolt loss of preload was projected for 60 years of plant life, as discussed in Section 4.7.7 of the NRC Safety Evaluation Report to the BFN License Renewal Application. A plant-specific evaluation performed in support of Extended Power Uprate determined an average bolt stress relaxation of 15%, based on a fast fluence of 5×10^{19} n/cm^2 for a 60-year (54-EFPY) plant life. The plant-specific stress relaxation of 15% is bounded by the bounding value of 20% that was provided in the generic analysis in BWRVIP-25. As noted in the BFN License Renewal Application Safety Evaluation Report in response to NRC Requests for Additional Information (RAIs) and follow-up correspondence between TVA and the NRC regarding Open Item OI-4.7.7, TVA made commitments to (1) perform an additional plant-specific analysis consistent with BWRVIP-25 to demonstrate that the core plate hold-down bolts can withstand required loads, considering the effects of stress relaxation until the end of the period of extended operation, and (2) submit the analysis for NRC review two years prior to entering the period of extended operation. The evaluation was completed and documented in GEH Nuclear Energy report NEDC-33632P, Revision 0, “Browns Ferry (Units 1-3) Core Plate Bolt Analysis Stress Analysis Report,” December 2010, and was submitted to the NRC on June 15, 2011. Subsequently, the NRC issued an additional RAI letter, NRC Letter to TVA, “Browns Ferry Nuclear Plant, Units 1, 2, and 3, Request for Additional Information Related to Core Plate Bolt Stress Analysis (TAC NOS. ME6615, ME6616, and ME6617),” dated June 28, 2012. TVA and GEH responded via a letter from TVA to NRC, “Response to Request for Additional Information Regarding BWRVIP-25 Core Plate Bolt Stress Analysis for BFN Units 1, 2, and 3,” dated October 25, 2012, which included attached report NEDC-33779P Revision 1, “RAI Response Support for Core Plate Hold Down Bolt Stress Analysis Performed to Address License Renewal Commitment for Tennessee Valley Authority Browns Ferry Nuclear Plant, Units 1, 2, and 3,” dated October 2012. Also attached to this letter, in response to one of the NRC questions in their RAI letter, was the previously mentioned plant specific deviation disposition from the inspection recommendations of BWRVIP-25 Revision 0, based on the generic deviation disposition developed by the BWRVIP, “Browns Ferry Nuclear Plant Deviation Disposition Number DD-2011-01 For Deviation Disposition for Variance from BWRVIP-25 Guidance for Inspection of Core Plate Bolts.” This deviation disposition justified the performance of a VT-3 examination of 100% of the hold-down bolts from above the core plate each refueling outage, rather than performing the EVT-1 or UT exams originally recommended in BWRVIP-25 Revision 0.

On March 23, 2020, the BWRVIP received the final NRC SER for BWRVIP-25, Revision 1. BWRVIP Letter 2020-021 was distributed to the EPRI BWRVIP members on April 2, 2020, and served as notification that BWRVIP- 25, Revision 1 could be implemented subject to the requirements stated in the report, the final NRC Safety Evaluation Report, and plant-specific licensing requirements. The major difference in Revision 1 from Revision 0 is to provide a comprehensive evaluation providing justification for the elimination of periodic core plate hold-down bolt inspections, which is contained in Appendix I of the report. Upon issuance of the Safety Evaluation Report, TVA contracted Structural Integrity Associates (SIA) to prepare a Core Plate Bolt Evaluation in accordance with BWRVIP-25, Revision 1, and this evaluation provides justification for not examining the core plate bolts at BFN Units 1, 2, and 3 and closing the generic deviation disposition. BWRVIP-25, Revision 1-A was issued in September 2020, and incorporates all changes to BWRVIP-25, Revision 1 that were requested by the final NRC Safety Evaluation Report. Elimination of the requirement to perform core plate rim hold-down bolt inspections has subsequently been incorporated into the current BFN BWR Vessel Internals aging management program and the unit specific Reactor Pressure Vessel Internals Inspection (RPVII) technical instructions.

For SLR, the plant-specific core support plate rim hold-down bolt loss of preload TLAA, performed consistent with BWRVIP-25 Revision 1-A, as well as the justification for elimination of the inspection of core plate rim hold-down bolts in accordance with BWRVIP-25 Revision 1-A Appendix I has been updated (Section 4.2.9) to account for the 80 year fluence projections to the end of the subsequent period of extended operation, and shows that the generic bolt stress analysis in BWRVIP-25 Revision 1-A remains bounding for the subsequent period of extended operation and that core plate rim hold-down bolt inspections are not required for the subsequent period of extended operation because of the IGSCC resistance of the bolts, excellent BWR industry field experience, and a margin assessment on the number of bolts required to meet allowable limits.

The Peach Bottom SLRA was supplemented via Supplement 9, dated October 9, 2019, to revise Enhancement 1 to their BWR Vessel Internals Program to add specific actions to be taken for

SLR with respect to the core plate rim hold-down bolts by using BWRVIP-25, Revision 1 guidance. As noted above, the guidance provided in NRC reviewed and approved BWRVIP-25, Revision 1-A is already incorporated in the current BFN BWR Vessel Internals Program aging management program, and will continue to be followed during the subsequent period of extended operation. Therefore, the intent of Peach Bottom Supplement 9 to their SLRA is addressed in the BFN SLRA by the BFN BWR Vessel Internals program (B.2.1.7).

3.1.2.2.15 Loss of Material Due to General, Crevice or Pitting Corrosion and Cracking Due to Stress Corrosion Cracking

Loss of material due to general (steel only), crevice, or pitting corrosion and cracking due to SCC (SS only) can occur in steel and SS piping and piping components exposed to concrete. Concrete provides a high alkalinity environment that can mitigate the effects of loss of material for steel piping, thereby significantly reducing the corrosion rate. However, if water intrudes through the concrete, the pH can be reduced and ions that promote loss of material such as chlorides, which can penetrate the protective oxide layer created in the high alkalinity environment, can reach the surface of the metal. Carbonation can reduce the pH within concrete. The rate of carbonation is reduced by using concrete with a low water-to-cement ratio and low permeability. Concrete with low permeability also reduces the potential for the penetration of water. Adequate air entrainment improves the ability of the concrete to resist freezing and thawing cycles and therefore reduces the potential for cracking and intrusion of water. Cracking due to SCC, as well as pitting and crevice corrosion can occur due to halides present in the water that penetrates to the surface of the metal.

If the following conditions are met, loss of material is not considered to be an applicable aging effect for steel: (a) attributes of the concrete are consistent with American Concrete Institute (ACI) 318 or ACI 349 (low water-to-cement ratio, low permeability, and adequate air entrainment) as cited in NUREG-1557; (b) plant-specific OE indicates no degradation of the concrete that could lead to penetration of water to the metal surface; and (c) the piping is not potentially exposed to groundwater. For SS components loss of material and cracking due to SCC are not considered to be applicable aging effects as long as the piping is not potentially exposed to groundwater. Where these conditions are not met, loss of material due to general (steel only), crevice or pitting corrosion and cracking due to SCC (SS only) are identified as applicable aging effects. GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," describes an acceptable program to manage these aging effects.

Table 3.1.1 Item Number 3.1-1, 105: This item evaluates steel piping, piping components exposed to concrete. There are no steel piping, piping components exposed to concrete in the Reactor Vessel, the Reactor Vessel Internals System, the Reactor Vessel Vents and Drains System, or the Reactor Recirculation System.

Table 3.1.1 Item Number 3.1-1, 115: This item evaluates stainless steel piping, piping components exposed to concrete. There are no stainless steel piping, piping components exposed to concrete in the Reactor Vessel, the Reactor Vessel Internals System, the Reactor Vessel Vents and Drains System, or the Reactor Recirculation System.

3.1.2.2.16 Loss of Material Due to Pitting and Crevice Corrosion in Stainless Steel and Nickel Alloys

Loss of material due to pitting and crevice corrosion could occur in indoor or outdoor SS and nickel alloy piping, piping components, and tanks exposed to any air, condensation, or *underground environment when the component is: (a) uninsulated; (b) insulated; (c) in the vicinity of insulated components; or (d) in the vicinity of potentially transportable halogens. Loss of material due to pitting and crevice corrosion can occur on SS and nickel alloys in environments containing sufficient halides (e.g., chlorides) in the presence of moisture.*

Insulated SS and nickel alloy components exposed to air, condensation, or underground environments are susceptible to loss of material due to pitting or crevice corrosion if the insulation contains certain contaminants. Leakage of fluids through mechanical connections such as bolted flanges and valve packing can result in contaminants leaching onto the component surface or the surfaces of other components below the component. For outdoor insulated SS and nickel alloy components, rain and changing weather conditions can result in moisture intrusion into the insulation.

Plant-specific OE and the condition of SS and nickel alloy components are evaluated to determine if prolonged exposure to the plant-specific environments has resulted in pitting or crevice corrosion. Loss of material due to pitting and crevice corrosion is not an aging effect requiring management for SS and nickel alloy components if (a) plant-specific OE does not reveal a history of loss of material due to pitting or crevice corrosion; and (b) a one-time inspection demonstrates that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the subsequent period of extended operation. The applicant documents the results of the plant-specific OE review in the SLRA.

In the environment of air-indoor controlled, pitting and crevice corrosion is only expected to occur as the result of a source of moisture and halides. Inspections focus on the most susceptible locations.

The GALL-SLR Report recommends further evaluation of SS and nickel alloy piping and piping components exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of loss of material due to pitting and crevice corrosion. GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that loss of material due to pitting and crevice corrosion is not occurring at a rate that will affect the intended function of the components. If loss of material due to pitting or crevice corrosion has occurred and is sufficient to potentially affect the intended function of an SSC, GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," describes an acceptable program to manage loss of material due to pitting or crevice corrosion. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in AMP XI.M32.

The applicant may establish that loss of material due to pitting and crevice corrosion is not an aging effect requiring management by demonstrating that a barrier coating isolates the component from aggressive environments. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating.

Table 3.1.1 Item Number 3.1-1, 136: This item evaluates the loss of material due to pitting and crevice corrosion in stainless steel and nickel alloy piping, piping components exposed to air and condensation. Plant-specific OE associated with stainless steel and nickel alloy piping, piping components in the Reactor Vessel, the Reactor Vessel Vents and Drains System, the Reactor recirculation System, the Reactor Core Isolation Cooling System, the High Pressure Coolant Injection System, the Residual Heat Removal System, the Core Spray System, the Standby Liquid Control System, the Sampling and Water Quality System, the Reactor Water Cleanup System, the Main Steam System, and the Reactor Feedwater System has been evaluated to determine if prolonged exposure to air-indoor uncontrolled or condensation has resulted in loss of material due to pitting or crevice corrosion. Loss of material has not been identified as an aging effect at BFN for the stainless steel and nickel alloy components in these environments, or as a result of transportable halogens, indicating that these environments do not contain sufficient halides (e.g., chlorides) in the presence of moisture to result in loss of material sufficient to potentially affect the intended function of an SSC.

The BFN-specific OE review revealed only one previously written Condition Report (CR) in the Corrective Action Program with the potential to represent an aging effect requiring management. This CR documented several areas on the Unit 1 reactor vessel head and flange in 2014, where pitting was found that exceeded General Electric (GE) criteria, and repairs were performed which included welding and honing. Hence, there does not appear to be an ongoing aging effect at BFN that would potentially affect the intended function of these components. Accordingly, the One-Time Inspection program (B.2.1.20) will be implemented to demonstrate that the aging effect of loss of material is not occurring in the nickel alloy and stainless steel reactor vessel penetrations, nozzles, safe ends, and welds, piping, piping components, and valve bodies exposed to air - indoor uncontrolled in the Reactor Vessel, the stainless steel and nickel alloy piping, piping components (including Reactor Coolant Pressure Boundary), hoses, heat exchanger components and valve bodies exposed to air or condensation in the Reactor Vessel Vents and Drains System, and the Reactor Recirculation System. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program.

Consistent with NUREG-2191, the One-Time Inspection program (B.2.1.20) will also be used to manage loss of material due to pitting, crevice corrosion of the stainless steel and carbon and low alloy steel piping and piping components (including Reactor Coolant Pressure Boundary), hoses, heat exchanger components and valve bodies exposed to air - indoor uncontrolled in the Reactor Core Isolation Cooling System, the High Pressure Coolant Injection System, the Residual Heat Removal System, the Core Spray System, the Standby Liquid Control System, the Sampling and Water Quality System, the Reactor Water Cleanup System, the Main Steam System, and the Reactor Feedwater System.

3.1.2.2.17 Quality Assurance for Aging Management of Nonsafety-Related Components

Quality Assurance (QA) provisions applicable to Subsequent License Renewal are discussed in Appendix A, Section A.1.4, and Appendix B, Section B.1.3.

3.1.2.2.18 Ongoing Review of Operating Experience

Ongoing review of operating experience is addressed in Appendix A, Section A.1.5, and Appendix B, Section B.1.4.

3.1.2.3 Time-Limited Aging Analysis

The time-limited aging analyses identified below are associated with the Reactor Vessel, Internals, and Reactor Coolant System components:

- Section 4.2, Reactor Vessel and Internals Neutron Embrittlement Analyses

- Section 4.2.1.1, Reactor Vessel Neutron Fluence Analyses
- Section 4.2.1.2, Reactor Vessel Internals Neutron Fluences Analyses
- Section 4.2.2, Reactor Vessel Upper-Shelf Energy (USE) Analyses

3.1.3 Conclusion

The Reactor Vessel, Internals, and Reactor Coolant System components that are subject to aging management review have been identified in accordance with the requirements of 10 CFR 54.4. The aging management programs selected to manage aging effects for the

Reactor Vessel, Internals, and Reactor Coolant System components are identified in the summaries in Section 3.1.2.1 above.

A description of these aging management programs is provided in Appendix B, along with the demonstration that the identified aging effects will be managed for the subsequent period of extended operation.

Therefore, based on the conclusions provided in Appendix B, the effects of aging associated with the Reactor Vessel, Internals, and Reactor Coolant System components will be adequately managed so that there is reasonable assurance that the intended functions are maintained consistent with the current licensing basis during the subsequent period of extended operation.

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 001	Steel reactor vessel closure flange assembly components exposed to air-indoor uncontrolled	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 "Metal Fatigue"	Yes	Fatigue and cyclic loading are TLAAs which apply to the Reactor Vessel ; further evaluation is documented in Subsection 3.1.2.2.1.
3.1-1, 002	PWR Only				
3.1-1, 003	Stainless steel, nickel alloy reactor vessel internal components exposed to reactor coolant, neutron flux	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 "Metal Fatigue"	Yes	Fatigue and cyclic loading are TLAAs which apply to the Reactor Vessel Internals system; further evaluation is documented in Subsection 3.1.2.2.1.
3.1-1, 004	Steel pressure vessel support skirt and attachment welds	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 "Metal Fatigue"	Yes	Fatigue and cyclic loading are TLAAs which apply to the Reactor Vessel; further evaluation is documented in Subsection 3.1.2.2.1.
3.1-1, 005	PWR Only				
3.1-1, 006	Stainless steel, steel (with or without nickel alloy or stainless steel cladding), nickel alloy reactor coolant pressure boundary components: piping, piping components; other pressure retaining components exposed toreactor coolant	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 "Metal Fatigue"	Yes	Fatigue and cyclic loading are TLAAs which apply to the Reactor Vessel, Reactor Recirculation, Reactor Vents and Drains, Core Spray, Residual Heat Removal, High Pressure Coolant Injection, Reactor Core Isolation Cooling, Main Steam, and Reactor Feedwater systems; further evaluation is documented in Subsection 3.1.2.2.1.

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 007	Stainless steel, steel (with or without nickel alloy or stainless steel cladding), nickel alloy reactor vessel components: nozzles; penetrations; safe ends; thermal sleeves; vessel shells, heads and welds exposed to reactor coolant	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 “Metal Fatigue”	Yes	Fatigue and cyclic loading are TLAAs, which apply to the Reactor Vessel and Reactor Vessel Internals systems; further evaluation is documented in Subsection 3.1.2.2.1.
3.1-1, 008	PWR Only				
3.1-1, 009	PWR Only				
3.1-1, 010	PWR Only				
3.1-1, 011	Steel or stainless steel pump and valve closure bolting exposed to high temperatures and thermal cycles	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	TLAA, SRP-SLR Section 4.3 “Metal Fatigue”	Yes	Fatigue and cyclic loading are TLAAs, , which apply to the Reactor Vessel, Reactor Recirculation, Reactor Vessel Vents and Drains, High Pressure Coolant Injection, Reactor Core Isolation Cooling, Main Steam, and Reactor Feedwater systems; further evaluation is documented in Subsection 3.1.2.2.1.
3.1-1, 012	PWR Only				
3.1-1, 013	Steel (with or without stainless steel or nickel alloy cladding) reactor vessel beltline shell, nozzle, and weld components exposed toreactor coolant and neutron flux	Loss of fracture toughness due to neutron irradiation embrittlement	TLAA, SRP-SLR Section 4.2 “Reactor Pressure Vessel Neutron Embrittlement”	Yes	Loss of fracture toughness due to neutron embrittlement is a TLAA which applies to the Reactor Vessel; further evaluation is documented in Subsection 3.1.2.2.3.1.

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 014	Steel (with or without cladding) reactor vessel beltline shell, nozzle, and weld components; exposed to reactor coolant and neutron flux	Loss of fracture toughness due to neutron irradiation embrittlement	AMP XI.M31, “Reactor Vessel Material Surveillance,” and AMP X.M2, “Neutron Fluence Monitoring”	Yes	Consistent with NUREG-2191. The Neutron Fluence Monitoring program (B.3.1.2) and Reactor Vessel Material Surveillance program (B.2.1.19) will be used to manage loss of fracture toughness of the carbon or low alloy steel with stainless steel cladding reactor vessel shell and welds within the beltline that are exposed to reactor coolant and neutron flux in the Reactor Vessel. See Subsection 3.1.2.2.3.2.
3.1-1, 015	PWR Only				
3.1-1, 016	Stainless steel or nickel alloy reactor vessel top head enclosure flange leakage detection line exposed to air-indoor uncontrolled, reactor coolant leakage	Cracking due to SCC, IGSCC	AMP XI.M32, “One-Time Inspection,” or AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage cracking of the stainless steel reactor vessel flange leak detection line, reactor vessel penetrations, nozzles, safe ends and welds, and piping, piping components, and valves exposed to air - indoor uncontrolled in the Reactor Vessel. See Subsection 3.1.2.2.4.1.
3.1-1, 017	Stainless steel isolation condenser components exposed to reactor coolant	Cracking due to SCC, IGSCC	AMP XI.M1, “ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD,” and AMP XI.M2, “Water Chemistry”	Yes	Not Applicable. The BFN BWR design does not include an isolation condenser. See Subsection 3.1.2.2.4.2.
3.1-1, 018	PWR Only				
3.1-1, 019	PWR Only				
3.1-1, 020	PWR Only				

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 021	Steel and stainless steel isolation condenser components exposed to reactor coolant	Cracking due to cyclic loading	AMP XI.M1, “ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD”	Yes	Not Applicable. The BFN BWR design does not include an isolation condenser. See Subsection 3.1.2.2.7.
3.1-1, 022	PWR Only				
3.1-1, 023	This Item Number is not used in NUREG-2192.				
3.1-1, 024	This Item Number is not used in NUREG-2192.				
3.1-1, 025	PWR Only				
3.1-1, 026	This Item Number is not used in NUREG-2192.				
3.1-1, 027	This Item Number is not used in NUREG-2192.				
3.1-1, 028	PWR Only				
3.1-1, 029	Nickel alloy core shroudand core plate access hole cover (welded covers) exposed to reactor coolant	Cracking due to SCC, IGSCC, irradiation-assisted SCC	AMP XI.M9, “BWR Vessel Internals,” and AMP XI.M2, “Water Chemistry”	Yes	Consistent with NUREG-2191 with exceptions. The BWR Vessel Internals program (B.2.1.7) and Water Chemistry program (B.2.1.2) will be used to manage cracking of the nickel alloy core shroud and welded core plate access hole covers (two welded covers remain in Unit 3) exposed to reactor coolant and neutron flux in the Reactor Vessel Internals System, until such time as permanent bolted replacement covers are installed in Unit 3. Units 1 and 2 have bolted core plate access hole covers. See Subsection 3.1.2.2.12. Exceptions apply to the NUREG-2191 recommendations for BWR Vessel Internals program (B.2.1.7) implementation.

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)					
Item Number	**Component**	**Aging Effect/ Mechanism**	**Aging Management Programs**	**Further Evaluation Recommended**	**Discussion**
3.1-1, 030	Stainless steel, nickel alloy penetration: drain line exposed to reactor coolant	Cracking due to SCC, IGSCC, cyclic loading	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD," and AMP XI.M2, "Water Chemistry" (SCC, IGSCC mechanisms only)	No	Consistent with NUREG-2191. The ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD program (B.2.1.1) and Water Chemistry (B.2.1.2) program will be used to manage cracking of the carbon or low alloy steel with nickel alloy cladding, carbon or low alloy steel with stainless steel cladding, nickel alloy, and stainless steel penetrations, nozzles, safe ends, welds, and vessel shell components exposed to reactor coolant and reactor coolant and neutron flux in the Reactor Vessel. The reactor vessel drain line penetration is carbon steel, therefore cracking is addressed by Item Number 3.1-1, 007.
3.1-1, 031	Steel and stainless steel isolation condenser components exposed to reactor coolant	Loss of material due to general (steel only), pitting, crevice corrosion, wear	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD," and AMP XI.M2, "Water Chemistry"	No	Not Applicable. The BFN BWR design does not include an isolation condenser.

3.1-1, 033	PWR Only				
3.1-1, 034	PWR Only				
3.1-1, 035	PWR Only				
3.1-1, 036	PWR Only				
3.1-1, 037	PWR Only				

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 038	Cast austenitic stainless steel Class 1 valve bodies and bonnets exposed to reactor coolant >250 °C (>482 °F)	Loss of fracture toughness due to thermal aging embrittlement	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD"	No	Consistent with NUREG-2191. The ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1) program will be used to manage loss of fracture toughness of the cast austenitic stainless steel Class 1 valve bodies and bonnets exposed to treated water in the Reactor Vessel Vents and Drains System and treated water >482 F in the Reactor Recirculation System, the Reactor Water Cleanup System, the Residual Heat Removal System, the Core Spray System, the Sampling and Water Quality System, the Main Steam System and the Reactor Feedwater System.
3.1-1, 039	Stainless steel, steel (with or without nickel alloy or stainless steel cladding), nickel alloy Class 1 piping, fittings and branch connections < NPS 4 exposed to reactor coolant	Cracking due to SCC (for stainless steel or nickel alloy surfaces exposed to reactor coolant only), IGSCC(for stainless steel or nickel alloy surfaces exposed to reactor coolant only), or thermal, mechanical,or vibratory loading	AMP XI.M1, "ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD," AMP XI.M2, "Water Chemistry," and XI.M35,"ASME Code Class 1 Small-Bore Piping"	No	Consistent with NUREG-2191. The ASME Code Class 1 Small-Bore Piping program (B.2.1.22), ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD program (B.2.1.1), and Water Chemistry program (B.2.1.2) will be used to manage cracking of the steel (with or without nickel alloy or stainless steel cladding), carbon steel and stainless steel Class 1 piping, fittings, and branch connections less than 4" NPS and greater than or equal to 1" NPS exposed to reactor coolant, steam, treated water, and treated water > 140 F in the Reactor Vessel, the Reactor Recirculation System, the Reactor Core Isolation Cooling System, the High Pressure Coolant Injection System, the Residual Heat Removal System, the Core Spray System, the Standby Liquid Control System, the Reactor Water Cleanup System, the Main Steam System, and the Reactor Feedwater System.
3.1-1, 040	PWR Only				
3.1-1, 040a	PWR Only				

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 041	Nickel alloy core shroudand core plate access hole cover (mechanical covers) exposed to reactor coolant	Cracking due to SCC, IGSCC, irradiation-assisted SCC	AMP XI.M9, “BWR Vessel Internals,” and AMP XI.M2, “Water Chemistry”	Yes	Consistent with NUREG-2191 with exceptions. The BWR Vessel Internals program (B.2.1.7) and the Water Chemistry program (B.2.1.2) will be used to manage cracking of the nickel alloy core shroud and the X-750 alloy core plate access hole covers (mechanical) exposed to reactor coolant in the Reactor Vessel Internals System. Units 1 and 2 have bolted core plate access hole covers. There are plans to install permanent bolted replacement covers on both core plate access holes in Unit 3 during a future refueling outage. See Subsection 3.1.2.2.12. Exceptions apply to the NUREG-2191 recommendations for BWR Vessel Internals program (B.2.1.7) implementation.
3.1-1, 042	PWR Only				
3.1-1, 043	Stainless steel and nickel alloy reactor vessel internals exposed to reactor coolant	Loss of material due to pitting, crevice corrosion	AMP XI.M1, “ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD,” and AMP XI.M2, “Water Chemistry”	No	The BWR Vessel Internals program (B.2.1.7) has been substituted for the ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD program (B.2.1.1), and will be used with the Water Chemistry program (B.2.1.2) to manage loss of material of Stainless Steel, Stainless Steel bolting, Nickel alloy, X-750 alloy, and CASS reactor vessel internal components exposed to reactor coolant, and reactor coolant and neutron flux in the Reactor Vessel Internals System. Exceptions apply to the NUREG-2191 recommendations for BWR Vessel Internals program (B.2.1.7) implementation.

3.1-1, 059c	PWR Only				
3.1-1, 060	Steel piping, piping components exposed to reactor coolant	Wall thinning due to flow-accelerated corrosion	AMP XI.M17, “Flow-Accelerated Corrosion”	No	Consistent with NUREG-2191. The Flow-Accelerated Corrosion program (B.2.1.9) will be used to manage wall thinning of the carbon steel piping, piping components exposed to reactor coolant, and treated water in the Reactor Vessel, the Reactor Recirculation System, the Reactor Core Isolation Cooling System, the High Pressure Coolant Injection System, The Reactor Water Cleanup System, the Main Steam System, and the Reactor Feedwater System.
3.1-1, 061	PWR Only				

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 062	High-strength steel, stainless steel closure bolting; stainless steel control rod drive head penetration flange boltingexposed to air-indoor uncontrolled	Cracking due to SCC	AMP XI.M18, "Bolting Integrity"	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage cracking of the high strength steel, carbon and low allow steel, and stainless steel closure bolting exposed to air - indoor uncontrolled in the Reactor Vessel, the Reactor Vessel Vents and Drains System, the Reactor Recirculation System, the Main Steam System, and the Reactor Feedwater System.
3.1-1, 063	Steel or stainless steel closure bolting exposed to air – indoor uncontrolled	Loss of material due to general (steel only), pitting, crevicecorrosion, wear	AMP XI.M18, "Bolting Integrity"	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage loss of material of the steel, stainless steel, carbon and low alloy steel, and high strength low alloy steel, closure bolting exposed to air - indoor uncontrolled in the Reactor Vessel, the Reactor Vessel Vents and Drains System, the Reactor Recirculation System, the Reactor Core Isolation Cooling System, the Main Steam System, and the Reactor Feedwater System.

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 084	Steel top head enclosure (without cladding): top head, top head nozzles (vent, top head spray, RCIC, spare) exposed to reactor coolant	Loss of material due to general, pitting, crevice corrosion	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage loss of material due to general, pitting, crevice corrosion of carbon steel reactor vessel upper head, reactor vessel nozzles, safe-ends, welds, and vessel internal attached components exposed to reactor coolant in the Reactor Pressure Vessel and Reactor Vessel Internals Systems.
3.1-1, 085	Stainless steel, nickel alloy, and steel with nickel alloy or stainless steel cladding reactor vessel flanges, nozzles, penetrations, safe ends, vessel shells, heads and welds exposed to reactor coolant	Loss of material due to pitting, crevice corrosion	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage loss of material due to pitting, crevice corrosion of the carbon or low alloy steel with nickel alloy cladding, carbon or low alloy steel with stainless steel cladding, nickel alloy, and stainless steel reactor vessel flanges, nozzles, safe ends, vessel shells, heads, vessel internal attached components, and welds exposed to reactor coolant and reactor coolant with neutron flux in the Reactor Pressure Vessel and Reactor Vessel Internals Systems.
3.1-1, 086	PWR Only				
3.1-1, 087	PWR Only				
3.1-1, 088	PWR Only				
3.1-1, 089	PWR Only				
3.1-1, 090	PWR Only				

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)					
Item Number	**Component**	**Aging Effect/ Mechanism**	**Aging Management Programs**	**Further Evaluation Recommended**	**Discussion**
3.1-1, 091	Steel (including high-strength steel) reactor vessel closure flange assembly components (including flanges, nut,studs, and washers) exposed to air-indoor uncontrolled	Cracking due to SCC; loss of material due to general, pitting, crevice corrosion, wear	AMP XI.M3, “Reactor Head Closure Stud Bolting”	No	Consistent with NUREG-2191 with exceptions. The Reactor Head Closure Stud Bolting program (B.2.1.3) will be used to manage cracking due to SCC and loss of material due to general, pitting, crevice corrosion, and wear of the high strength low alloy steel bolting with yield strength of 150 ksi or greater reactor vessel closure flange assembly components exposed to air - indoor uncontrolled in the Reactor Vessel. Exceptions apply to the NUREG-2191 recommendations for Reactor Head Closure Stud Bolting program (B.2.1.3) implementation.
3.1-1, 092	PWR Only				
3.1-1, 093	PWR Only				
3.1-1, 094	Stainless steel and nickel alloy vessel shell attachment welds exposed to reactor coolant	Cracking due to SCC, IGSCC, cyclic loading	AMP XI.M4, “BWR Vessel ID Attachment Welds,” and AMP XI.M2,“Water Chemistry” (SCC,IGSCC mechanisms only)	No	Consistent with NUREG-2191 with exceptions. The BWR Vessel ID Attachment Welds program (B.2.1.4) and Water Chemistry program (B.2.1.2) will be used to manage cracking due to SCC, IGSCC, cyclic loading of the stainless steel reactor vessel internal attachedcomponents exposed to reactor coolant, and reactor coolant and neutron flux in the Reactor Vessel and Internals System. Exceptions apply to the NUREG-2191 recommendations for BWR Vessel ID Attachment Welds program (B.2.1.4) implementation.

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 095	Steel (with or without stainless steel or nickel alloy cladding) feedwater nozzles exposed to reactor coolant	Cracking due to cyclic loading	AMP XI.M1, “ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD”	No	Consistent with NUREG-2191. The ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD program (B.2.1.1) will be used to manage cracking due to cyclic loading of the carbon steel reactor vessel feedwater nozzles exposed to reactor coolant and the carbon or low alloy steel with stainless steel cladding reactor vessel shell and welds exposed to reactor coolant and neutron flux in the Reactor Vessel.
3.1-1, 096	Steel (with or without stainless steel cladding) control rod drive return line nozzles and their nozzle-to-vessel welds exposed to reactor coolant in BWR-3, BWR-4, BWR-5, and BWR-6 designs	Cracking due to SCC, IGSCC, cyclic loading	AMP XI.M1, “ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD”	No	Consistent with NUREG-2191. The ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD program (B.2.1.1) will be used to manage cracking of the capped carbon or low alloy steel with stainless steel cladding reactor vessel control rod drive return line nozzle exposed to reactor coolant in the Reactor Vessel.

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 097	Stainless steel and nickel alloy piping, piping components greater than or equal to 4 NPS; nozzle safe ends and associated welds; control rod drive return line nozzle cap and associated cap-to- nozzle weld or cap-to- safe end weld in BWR-3, BWR 4, BWR 5, and BWR-6 designs	Cracking due to SCC, IGSCC	AMP XI.M7, “BWR Stress Corrosion Cracking,” and AMP XI.M2, “Water Chemistry”	No	Consistent with NUREG-2191 with exceptions. The BWR Stress Corrosion Cracking program (B.2.1.5) and Water Chemistry program (B.2.1.2) will be used to manage cracking due to SCC, IGSCC of the Class 1 stainless steel piping and piping components exposed to treated water, stainless steel piping, piping components greater than or equal to 4 inches NPS exposed to treated water >93°C [>200°F] (Internal) and reactor coolant, and reactor vessel CRD return line nozzle safe ends, cap and associated welds exposed to reactor coolant in the Reactor Vessel, the Reactor Vessel Vents and Drains System, the Reactor Recirculation System, the Reactor Core Isolation Cooling System, the Residual Heat Removal System, the Core Spray System, the Reactor Water Cleanup System, the Sampling and Water Quality System, the Main Steam System, and the Reactor Feedwater System. Exceptions apply to the NUREG-2191 recommendations for BWR Stress Corrosion Cracking program (B.2.1.5) implementation.

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 098	Stainless steel, nickel alloy penetrations: instrumentation and standby liquid control exposed to reactor coolant	Cracking due to SCC, IGSCC, cyclic loading	AMP XI.M8, “BWR Penetrations,” and AMP XI.M2, “Water Chemistry” (SCC, IGSCC mechanisms only)	No	Consistent with NUREG-2191 with exceptions. The BWR Penetrations program (B.2.1.6) and Water Chemistry program (B.2.1.2) will be used to manage cracking due to SCC, IGSCC, cyclic loading of the carbon or low alloy steel with stainless steel cladding, nickel alloy, and stainless steel core plate d/p and SLC nozzle, and reactor vessel instrumentation penetrations and nozzles, and penetrations for control rod drive stub tubes, in core monitor housings, jet pump instruments standby liquid control, and neutron flux monitors exposed to reactor coolant and reactor coolant and neutron flux in the Reactor Vessel. Exceptions apply to the NUREG-2191 recommendations for BWR Penetrations program (B.2.1.6) implementation.
3.1-1, 099	Stainless steel (including cast austenitic stainless steel; PH martensitic stainless steel; martensitic stainless steel); nickel alloy (including X-750 alloy) reactor internal components exposed to reactor coolant and neutron flux	Loss of fracture toughness due to thermal aging, neutron irradiationembrittlement	AMP XI.M9, “BWR Vessel Internals”	Yes	Consistent with NUREG-2191 with exceptions. The BWR Vessel Internals program (B.2.1.7) will be used to manage loss of fracture toughness due to thermal aging, neutron irradiation embrittlement of the cast austenitic stainless steel, nickel alloy, and stainless steel reactor vessel internal components exposed to reactor coolant and neutron flux in the Reactor Vessel and Reactor Vessel Internals Systems. See Subsection 3.1.2.2.13. Exceptions apply to the NUREG-2191 recommendations for BWR Vessel Internals program (B.2.1.7) implementation.

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)					
Item Number	**Component**	**Aging Effect/ Mechanism**	**Aging Management Programs**	**Further Evaluation Recommended**	**Discussion**
3.1-1, 100	Stainless steel reactor vessel internals components (jet pump wedge surface) exposed to reactor coolant	Loss of material due to wear	AMP XI.M9, "BWR Vessel Internals"	No	Consistent with NUREG-2191 with exceptions. The BWR Vessel Internals program (B.2.1.7) will be used to manage loss of material due to wear of the stainless steel jet pump assemblies: thermal sleeve, inlet header, riser brace arm, hold- down beams, and wedges exposed to reactor coolant and neutron flux in the Reactor Vessel Internals System. Exceptions apply to the NUREG-2191 recommendations for BWR Vessel Internals program (B.2.1.7) implementation.
3.1-1, 101	Stainless steel steam dryers exposed to reactor coolant	Cracking due to flow-induced vibration, SCC, IGSCC; loss of material due to wear	AMP XI.M9, "BWR Vessel Internals"	No	Consistent with NUREG-2191 with exceptions. The BWR Vessel Internals program (B.2.1.7) will be used to manage cracking due to flow-induced vibration, SCC, IGSCC and loss of material due to wear of the stainless steel reactor vessel internals components: steam dryers exposed to reactor coolant in the Reactor Vessel Internals System. Exceptions apply to the NUREG-2191 recommendations for BWR Vessel Internals program (B.2.1.7) implementation.

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 102	Stainless steel fuel supports and control rod drive assemblies control rod drive housing exposed to reactor coolant	Cracking due to SCC, IGSCC	AMP XI.M9, "BWR Vessel Internals," and AMP XI.M2, "Water Chemistry"	No	Consistent with NUREG-2191 with exceptions. The BWR Vessel Internals program (B.2.1.7) and Water Chemistry program (B.2.1.2) will be used to manage cracking due to SCC, IGSCC of the stainless steel CRD Housings exposed to reactor coolant, CASS and stainless steel fuel supports and control rod drive assemblies exposed to reactor coolant and neutron flux in the Reactor Vessel Internals System. Exceptions apply to the NUREG-2191 recommendations for BWR Vessel Internals program (B.2.1.7) implementation.
3.1-1, 103	Stainless steel, nickel alloy reactor internal components exposed to reactor coolant and neutron flux	Cracking due to SCC, IGSCC, irradiation-assisted SCC	AMP XI.M9, "BWR Vessel Internals," and AMP XI.M2, "Water Chemistry"	Yes	Consistent with NUREG-2191 with exceptions. The BWR Vessel Internals program (B.2.1.7) and Water Chemistry program (B.2.1.2) will be used to manage cracking due to SCC, IGSCC, and irradiation-assisted SCC of the stainless steel bolting, nickel alloy, X-750 alloy, CASS, and stainless steel reactor vessel nozzle components and reactor vessel internal components exposed to reactor coolant and reactor coolant and neutron flux in the Reactor Vessel and Reactor Vessel Internals Systems. See Subsection 3.1.2.2.12. Exceptions apply to the NUREG-2191 recommendations for BWR Vessel Internals program (B.2.1.7) implementation.

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 104	Nickel alloy reactor vessel internal components exposed to reactor coolant and neutron flux	Cracking due to IGSCC	AMP XI.M9, “BWR Vessel Internals,” and AMP XI.M2, “Water Chemistry”	No	Consistent with NUREG-2191 with exceptions. The BWR Vessel Internals program (B.2.1.7) and Water Chemistry program (B.2.1.2) will be used to manage cracking due to IGSCC of the nickel alloy and X-750 alloy reactor vessel internals components exposed to reactor coolant and neutron flux in the Reactor Vessel Internals System. Exceptions apply to the NUREG-2191 recommendations for BWR Vessel Internals program (B.2.1.7) implementation.
3.1-1, 105	Steel piping, piping components exposed to concrete	None	None	Yes	Not Applicable. There are no steel piping, piping components exposed to concrete in the Reactor Vessel, Reactor Vessel Internals, Reactor Vessel Vents and Drains, and Reactor Recirculation Systems. See Subsection 3.1.2.2.15.
3.1-1, 106	Nickel alloy piping, piping components exposed to air with borated water leakage	None	None	No	Not Applicable. There are no nickel alloy piping, piping components exposed to air with borated water leakage in the Reactor Vessel, Reactor Vessel Internals, Reactor Vessel Vents and Drains, and Reactor Recirculation Systems.
3.1-1, 107	Stainless steel piping, piping components exposed to gas, air with borated water leakage	None	None	No	Consistent with NUREG-2191.
3.1-1, 108	This Item Number is not used in NUREG-2192.				

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 109	This Item Number is not used in NUREG-2192.				
3.1-1, 110	Metallic piping, piping components exposed to reactor coolant	Wall thinning due to erosion	AMP XI.M17, “Flow-Accelerated Corrosion”	No	Consistent with NUREG-2191. The Flow-Accelerated Corrosion program (B.2.1.9) will be used to manage wall thinning due to erosion of the steel and stainless steel exposed to reactor coolant in the High Pressure Coolant Injection System, the Main Steam System, the Reactor Feedwater System, and the carbon and low alloy steel Class 1 piping, piping components, and valve bodies exposed to treated water in the Reactor Vessel Vents and Drains System.
3.1-1, 111	PWR Only				
3.1-1, 112	This Item Number is not used in NUREG-2192.				
3.1-1, 113	Steel reactor vessel external attachments exposed to indoor, uncontrolled air	Loss of material due to general, pitting, crevice corrosion, wear	AMP XI.M1, “ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD”	No	Consistent with NUREG-2191. The ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD program (B.2.1.1) will be used to manage loss of material due to general, pitting, crevice corrosion, and wear of the carbon steel reactor vessel external attachments, support skirt, and welds exposed to air - indoor uncontrolled in the Reactor Vessel.

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 114	Reactor coolant system components defined as ASME Section XI Code Class components (ASME Code Class 1 reactor coolant pressure boundary components or core support structure components, or ASME Class 2 or 3 components - including ASME defined appurtenances, component supports, and associated pressure boundary welds, or components subject to plant-specific equivalent classifications for these ASME code classes)	Cracking due to SCC, IGSCC (stainless steel, nickel alloy components only), cyclic loading; loss of material due to general corrosion (steel only), pitting corrosion, crevice corrosion, wear	AMP XI.M1, “ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD,” and AMP XI.M2, “Water Chemistry” (water chemistry-related or corrosion-related aging effect mechanisms only)	No	Consistent with NUREG-2191. The ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD program (B.2.1.1) and Water Chemistry program (B.2.1.2) will be used to manage cracking and loss of material of the steel. Stainless steel, carbon or low alloy steel with nickel alloy cladding, carbon or low alloy steel with stainless steel cladding, CASS, and stainless steel reactor coolant components defined as ASME Section XI Code Class components exposed to air, condensation, reactor coolant, threated water, or treated water > 140 F in the Reactor Vessel, the Reactor Recirculation System, the Reactor Core Isolation Cooling System, the High Pressure Coolant Injection System, the Residual Heat Removal System, the Core Spray System, the Sampling and Water Quality System, the Main Steam System, and the Reactor Feedwater System.
3.1-1, 115	Stainless steel piping, piping components exposed to concrete	None	None	Yes	Not Applicable. There are no stainless steel piping, piping components exposed to concrete in the Reactor Vessel, Reactor Vessel Internals, Reactor Vessel Vents and Drains, and Reactor Recirculation Systems. See Subsection 3.1.2.2.15.
3.1-1, 116	PWR Only				
3.1-1, 117	PWR Only				
3.1-1, 118	PWR Only				
3.1-1, 119	PWR Only				

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 120	Stainless steel core plate rim holddown bolts exposed to reactor coolant and neutron flux	Loss of preload due to thermal or irradiation-enhanced stress relaxation	AMP XI.M9, “BWR Vessel Internals,” and TLAA SRP-SLR 4.7 “Other Plant-Specific TLAAs” [if an analysis is performed as part of the aging management basis and conforms to the definition of a TLAA in 10 CFR 54.3(a)]	Yes	Consistent with NUREG-2191 with exceptions. The BWR Vessel Internals program (B.2.1.7) and TLAA will be used to manage loss of preload due to thermal or irradiation-enhanced stress relaxation of the stainless steel core plate rim holddown bolts exposed to reactor coolant and neutron flux in the Reactor Vessel Internals System. Exceptions apply to the NUREG-2191 recommendations for BWR Vessel Internals program (B.2.1.7) implementation. Loss of preload is a TLAA; further evaluation is documented in Subsection 3.1.2.2.14.
3.1-1, 121	Stainless steel jet pump assembly holddown beam bolts exposed to reactor coolant and neutron flux	Loss of preload due to thermal or irradiation-enhanced stress relaxation	AMP XI.M9, “BWR Vessel Internals”	No	Consistent with NUREG-2191 with exceptions. The BWR Vessel Internals program (B.2.1.7) will be used to manage loss of preload due to thermal or irradiation-enhanced stress relaxation of the stainless steel jet pump assembly holddown beam bolts exposed to reactor coolant and neutron flux in the Reactor Vessel Internals System. Exceptions apply to the NUREG-2191 recommendations for BWR Vessel Internals program (B.2.1.7) implementation.
3.1-1, 122	This Item Number is not used in NUREG-2192.				
3.1-1, 123	This Item Number is not used in NUREG-2192.				

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 124	Steel piping, piping components exposed to air-indoor uncontrolled, air-outdoor, condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage loss of material due to general, pitting, and crevice corrosion of the steel, carbon steel, stainless steel, CASS, and carbon and low alloy steel piping, piping components, and valve bodies exposed to air - indoor uncontrolled in the Reactor Water Cleanup System, the Reactor Vessel and Reactor Vessel Vents and Drains System, the Reactor Recirculation System, the Reactor Core Isolation Cooling System, the High Pressure Coolant Injection System, the Residual Heat Removal System, the Core Spray System, the Reactor Feedwater System, and the Main Steam System. The aging effect of loss of material due to general corrosion does not apply to the carbon steel external surfaces of reactor vessel, nozzle, and safe end components exposed to air - indoor uncontrolled in the Reactor Vessel. During power operation the insulated reactor vessel, nozzles, and safe end components have an external temperature greater than 212 °F and are at a higher temperature than the air - indoor uncontrolled environment. During plant shutdown the reactor vessel components and containment atmosphere temperatures are normally above the dewpoint temperature. Therefore, wetting due to condensation and moisture accumulation will not occur during power operation or plant shutdown and loss of material due to general, pitting, or crevice corrosion does not apply.

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 125	PWR Only				
3.1-1, 126	This Item Number is not used in NUREG-2192.				
3.1-1, 127	PWR Only				
3.1-1, 128	Stainless steel, nickel alloy nozzles safe ends and welds: high pressurecore spray; low pressure core spray; recirculating water, low pressure coolant injection or RHR injection mode exposed to reactor coolant	Cracking due to SCC, IGSCC	AMP XI.M7, “BWR Stress Corrosion Cracking,” and AMP XI.M2, “Water Chemistry”	No	Consistent with NUREG-2191 with exceptions. The BWR Stress Corrosion Cracking program (B.2.1.5) and Water Chemistry program (B.2.1.2) will be used to manage cracking due to SCC, or IGSCC of the nickel alloy and stainless steel reactor vessel nozzle safe ends and welds exposed to reactor coolant in the Reactor Vessel. Exceptions apply to the NUREG-2191 recommendations for BWR Stress Corrosion Cracking program (B.2.1.5) implementation.
3.1-1, 129	Steel and stainless steel piping, piping components exposed to reactor coolant: welded connections between the re-routed control rod drive return line and the inlet piping system that delivers return line flow to the reactor pressure vessel exposed to reactor coolant	Cracking due to cyclic loading	AMP XI.M1, “ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD”	No	Not Applicable. The BFN design does not include re-routed control rod drive returnlines to the reactor vessel. The original control rod drive return lines have been capped at the reactor vessel nozzle. Control rod drive flow is returned to the reactor vessel though the control rod drive cooling water lines.
3.1-1, 130	This Item Number is not used in NUREG-2192.				
3.1-1, 131	This Item Number is not used in NUREG-2192.				
3.1-1, 132	This Item Number is not used in NUREG-2192.				

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 133	Steel components exposed to treated water	Long-term loss of material due to general corrosion	AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage long-term loss of material due to general corrosion of the carbon steel reactor vessel upper head, reactor vessel nozzles, safe ends, and welds, piping, piping components, valve bodies, and reactor vessel internal components exposed to reactor coolant and treated water, in the Reactor Vessel, Reactor Vessel Internals, and Reactor Recirculation Systems, as well as carbon and low alloy steel, CASS, and stainless steel piping, piping components, and valve bodies exposed to treated water in the Reactor Vessel Vents and Drains System, and steel piping and piping components exposed to treated water in the Reactor Core Isolation Cooling, High Pressure Coolant Injection, Residual Heat Removal, Core Spray, Main Steam, and Reactor Feedwater Systems.
3.1-1, 134	Non-metallic thermal insulation exposed to air, condensation	Reduced thermal insulation resistance due to moisture intrusion	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage reduced thermal insulation resistance due to moisture intrusion for non-metallic thermal insulation exposed to air – indoor uncontrolled, as shown in Table 3.5.2-36, Structural Commodities (Thermal Insulation), in the Main Steam System and the Reactor Feedwater System.
3.1-1, 135	This Item Number is not used in NUREG-2192.				

Table 3.1.1, Summary of Aging Management Evaluations for the Reactor Vessel, Internals, and Reactor Coolant System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.1-1, 136	Stainless steel, nickel alloy piping, piping components exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191, the One-Time Inspection program (B.2.1.20) will be used to manage loss of material due to pitting, crevice corrosion of the nickel alloy and stainless steel reactor vessel penetrations, nozzles, safe ends, and welds, piping, piping components, and valve bodies exposed to air - indoor uncontrolled in the Reactor Vessel. Consistent with NUREG-2191, the One-Time Inspection program (B.2.1.20) will be used to manage loss of material due to pitting, crevice corrosion of the stainless steel and carbon and low alloy steel piping and piping components (including Reactor Coolant Pressure Boundary), hoses, heat exchanger components and valve bodies exposed to air - indoor uncontrolled in the Reactor Vessel Vents and Drains System, the Reactor Recirculation System, the Reactor Core Isolation Cooling System, the High Pressure Coolant Injection System, the Residual Heat Removal System, the Core Spray System, the Standby Liquid Control System, the Sampling and Water Quality System, the Reactor Water Cleanup System, the Main Steam System, and the Reactor Feedwater System. See Subsection 3.1.2.2.16.
3.1-1, 137	Copper alloy piping, piping components exposed to air, condensation, gas	None	None	No	Consistent with NUREG-2191 for the Reactor Recirculation and Reactor Feedwater systems.
3.1-1, 138	This Item Number is not used in NUREG-2192.				
3.1-1, 139	PWR Only				

Table 3.1.2-1, Reactor Vessel - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes

Table 3.1.2-1 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. The BWR Vessel Internals program is substituted to manage the aging effect(s) applicable to this component type, material, and environment combination.
2. During power operation the insulated reactor vessel, nozzles, and safe end components have an external temperature greater than 212 degrees F and are at a higher temperature than the air-indoor (uncontrolled) environment. During plant shutdown the reactor vessel components and containment atmosphere temperatures are normally above the dewpoint temperature. Therefore, wetting due to condensation and moisture accumulation will not occur during power operation or plant shutdown and loss of material due to general, pitting, or crevice corrosion does not apply.
3. Component includes shell and nozzle components (including associated welds in the beltline region of the vessel).

Table 3.1.2-2 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. The BWR Vessel Internals program is substituted to manage the aging effect(s) applicable to this component type, material, and environment combination.
2. The BWR Vessel Internals program is used to manage loss of material due to wear of nickel alloy jet pump wedges.
3. Aging effects identified for this material/environment combination are consistent with industry guidance (BWRVIP-47-A, BWRVIP-06 Revision 1-A, BWRVIP-315).

Table 3.1.2-4 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. Applicable environment has Closed-Cycle Cooling Water above 60 °C [>140 °F] which exceeds the threshold for SS SCC.

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.

B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.

C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.

D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.

E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.

F. Material not in NUREG-2191 for this component.

G. Environment not in NUREG-2191 for this component and material.

H. Aging effect not in NUREG-2191 for this component, material and environment combination.

I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.

J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. Fuel Assemblies are subject to replacement in accordance with the Core Reload Process. As such, they are short-lived components and not subject to aging management.

3.2 AGING MANAGEMENT OF ENGINEERED SAFETY FEATURES AND REACTOR CORE ISOLATION COOLING SYSTEM

3.2.1 Introduction

This section provides the results of the aging management review for those components identified in Section 2.3.2, Engineered Safety Features and Reactor Core Isolation Cooling System, as being subject to aging management review. The systems, or portions of systems, which are addressed in this section are described in the indicated sections.

- Containment System (2.3.2.1)
- Standby Gas Treatment System (2.3.2.2)
- Reactor Core Isolation Cooling System (2.3.2.3)
- High Pressure Coolant Injection System (2.3.2.4)
- Residual Heat Removal System (2.3.2.5)
- Core Spray System (2.3.2.6)
- Containment Atmosphere Dilution System (2.3.2.7)

3.2.2 Results

The following tables summarize the results of the aging management review for Engineered Safety Features and Reactor Core Isolation Cooling System.

- Table 3.2.2-1 Containment System - Summary of Aging Management Evaluation
- Table 3.2.2-2 Standby Gas Treatment System - Summary of Aging Management Evaluation
- Table 3.2.2-3 Reactor Core Isolation System - Summary of Aging Management Evaluation
- Table 3.2.2-4 High Pressure Coolant Injection System - Summary of Aging Management Evaluation
- Table 3.2.2-5 Residual Heat Removal System - Summary of Aging Management Evaluation
- Table 3.2.2-6 Core Spray System - Summary of Aging Management Evaluation
- Table 3.2.2-7 Containment Atmosphere Dilution System - Summary of Aging Management Evaluation

3.2.2.1 Materials, Environments, Aging Effects Requiring Management And Aging Management Programs

3.2.2.1.1 Containment System

Materials

The materials of construction for the Containment System components are:

- Aluminum
- Copper alloy
- Elastomer
- Galvanized Steel
- High-strength Steel

- Glass
- Nickel alloy
- Polymeric
- Stainless Steel
- Steel

Environments

The Containment System components are exposed to the following environments:

- Air
- Air indoor uncontrolled
- Concrete
- Outdoor air
- Soil
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the Containment System components require management:

- Cracking
- Hardening or loss of strength
- Flow blockage due to fouling
- Loss of material
- Selective leaching
- Loss of preload
- Reduction of heat transfer
- Wall thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Containment System components:

- Bolting Integrity (B.2.1.10)
- Buried and Underground Piping and Tanks (B.2.1.27)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Fire Protection (B.2.1.15)
- Flow-Accelerated Corrosion (B.2.1.9)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- Water Chemistry (B.2.1.2)

3.2.2.1.2 Standby Gas Treatment System

Materials

The materials of construction for the Standby Gas Treatment System components are:

- Aluminum
- Steel
- Copper alloy
- Elastomer
- Polymeric
- Stainless steel

Environments

The Standby Gas Treatment System components are exposed to the following environments:

- Air
- Air indoor controlled
- Air indoor uncontrolled
- Gas
- Soil

Aging Effects Requiring Management

The following aging effects associated with the Standby Gas Treatment System components require management:

- Cracking
- Flow blockage due to fouling
- Hardening or loss of strength
- Loss of preload
- Loss of material

Aging Management Programs

The following aging management programs manage the aging effects for the Standby Gas Treatment System components:

- Bolting Integrity (B.2.1.10)
- Buried and Underground Piping and Tanks (B.2.1.27)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)

3.2.2.1.3 Reactor Core Isolation Cooling System

Materials

The materials of construction for the Reactor Core Isolation Cooling System components are:

- Aluminum
- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- Glass
- Gray cast iron
- Steel
- Stainless steel

Environments

The Reactor Core Isolation Cooling System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Gas
- Lubricating oil
- Reactor coolant
- System temperature up to 288°C (550°F)
- Treated water
- Treated water >60°C (>140°F)

Aging Effects Requiring Management

The following aging effects associated with the Reactor Core Isolation Cooling System components require management:

- Cracking
- Cumulative fatigue damage
- Loss of material
- Selective leaching
- Loss of preload
- Reduction of heat transfer due to fouling
- Wall thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Reactor Core Isolation Cooling System components:

- ASME Code Class 1 Small-Bore Piping (B.2.1.22)
- ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1)
- Bolting Integrity (B.2.1.10)

- BWR Stress Corrosion Cracking (B.2.1.5)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Flow-Accelerated Corrosion (B.2.1.9)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Lubricating Oil Analysis (B.2.1.25)
- Selective Leaching (B.2.1.21)
- One-Time Inspection (B.2.1.20)
- Water Chemistry (B.2.1.2)
- Fatigue Monitoring (B.3.1.1)
- TLAA (Section 4.3)

3.2.2.1.4 High Pressure Coolant Injection System

Materials

The materials of construction for the High Pressure Coolant Injection System components are:

- Steel
- Copper Alloy
- Copper alloy (>15% Zn or >8% Al)
- Glass
- Gray Cast Iron
- High-strength Steel
- Nickel alloy
- Polymeric
- Stainless Steel

Environments

The High Pressure Coolant Injection System components are exposed to the following environments:

- Air
- Air - Indoor Uncontrolled
- Closed-cycle cooling water
- Condensation
- Lubricating Oil
- Reactor coolant
- Steam
- System temperature up to 288°C (550°F)
- Treated Water
- Treated Water >60°C (>140°F)

Aging Effects Requiring Management

The following aging effects associated with the High Pressure Coolant Injection System components require management:

- Cracking
- Cumulative fatigue damage
- Hardening or loss of strength
- Long-term loss of material
- Loss of material
- Loss of preload
- Loss of material due to selective leaching
- Reduction of heat transfer
- Wall thinning due to flow-accelerated corrosion

Aging Management Programs

The following aging management programs manage the aging effects for the High Pressure Coolant Injection System components:

- ASME Code Class 1 Small-Bore Piping (B.2.1.22)
- ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1)
- Bolting Integrity (B.2.1.10)
- Closed Treated Water Systems (B.2.1.12)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Flow- Accelerated Corrosion (B.2.1.9)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Lubricating Oil Analysis (B.2.1.25)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- Water Chemistry (B.2.1.2)
- TLAA (Section 4.3)

3.2.2.1.5 Residual Heat Removal System

Materials

The materials of construction for the Residual Heat Removal System components are:

- Aluminum
- Cast austenitic stainless steel
- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- Gray cast iron
- High-strength Steel
- Metallic

- Stainless steel
- Steel

Environments

The Residual Heat Removal System components are exposed to the following environments:
- Air
- Air - indoor uncontrolled
- Air - outdoor
- Closed-cycle cooling water >60°C (>140°F)
- Lubricating Oil
- Reactor coolant
- Treated water
- Treated water >60°C (>140°F)

Aging Effects Requiring Management

The following aging effects associated with the Residual Heat Removal System components require management:
- Cracking
- Cumulative fatigue damage
- Long-term loss of material
- Loss of fracture toughness
- Loss of material
- Loss of preload
- Flow blockage due to fouling
- Selective leaching
- Reduction of heat transfer due to fouling
- Wall thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Residual Heat Removal System components:
- ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1)
- ASME Code Class 1 Small-Bore Piping (B.2.1.22)
- Bolting Integrity (B.2.1.10)
- BWR Stress Corrosion Cracking (B.2.1.5)
- Closed Treated Water Systems (B.2.1.12)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Flow-Accelerated Corrosion (B.2.1.9)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B.2.1.28)

- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- Water Chemistry (B.2.1.2)
- Lubricating Oil Analysis (B.2.1.25)
- TLAA (Section 4.3)

3.2.2.1.6 Core Spray System

Materials

The materials of construction for the Core Spray System components are:

- Aluminum
- Cast austenitic stainless steel
- Gray cast iron
- High-strength steel
- Polymeric
- Stainless steel
- Steel
- Steel (with or without nickel alloy or stainless steel cladding)

Environments

The Core Spray System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Gas
- Lubricating Oil
- Reactor coolant
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the Core Spray System components require management:

- Cracking
- Cumulative fatigue damage
- Flow blockage due to fouling
- Hardening or loss of strength
- Long-term loss of material
- Loss of fracture toughness
- Loss of material
- Loss of preload
- Selective leaching
- Wall thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Core Spray System components:

- ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1)
- ASME Code Class 1 Small-Bore Piping (B.2.1.22)
- Bolting Integrity (B.2.1.10)
- BWR Stress Corrosion Cracking (B.2.1.5)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- Water Chemistry (B.2.1.2)
- Flow-Accelerated Corrosion (B.2.1.9)
- Lubricating Oil Analysis (B.2.1.25)
- TLAA (Section 4.3)

3.2.2.1.7 Containment Atmosphere Dilution System

Materials

The materials of construction for the Containment Atmosphere Dilution System components are:

- Aluminum
- Copper alloy
- High-strength steel
- Stainless steel
- Steel

Environments

The Containment Atmosphere Dilution System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Gas
- Soil, concrete

Aging Effects Requiring Management

The following aging effects associated with the Containment Atmosphere Dilution System components require management:

- Cracking
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Containment Atmosphere Dilution System components:

- Bolting Integrity (B.2.1.10)
- Buried and Underground Piping and Tanks (B.2.1.27)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- One-Time Inspection (B.2.1.20)

3.2.2.2 AMR Results for Which Further Evaluation is Recommended by the GALL-SLR Report

NUREG-2191 provides the basis for identifying those programs that warrant further evaluation by the reviewer in the subsequent license renewal application. For the Engineered Safety Features and Reactor Core Isolation Cooling System, those programs are addressed in the following subsections.

3.2.2.2.1 Cumulative Fatigue Damage

Evaluations involving time-dependent fatigue or cyclical loading parameters may be time-limited aging analyses (TLAAs), as defined in 10 CFR 54.3. TLAAs are required to be evaluated in accordance with 10 CFR 54.21(c)(1). This TLAA is addressed separately in Section 4.3, "Metal Fatigue," or Section 4.7, "Other Plant-Specific Time-Limited Aging Analyses," of this SRP-SLR. For plant-specific cumulative usage factor calculations that are based on stress-based input methods, the methods are to be appropriately defined and discussed in the applicable TLAAs.

Table 3.2.1 Item Number 3.2-1, 001: This item evaluates stainless steel and steel piping, piping components exposed to any environment for cumulative fatigue damage due to fatigue. Cumulative fatigue damage of steel and stainless steel piping, piping components is evaluated and dispositioned as a TLAA for the High Pressure Coolant Injection System, Reactor Core Isolation Cooling System, and Residual Heat Removal System as discussed in Section 4.3.

3.2.2.2.2 Loss of Material Due to Pitting and Crevice Corrosion in Stainless Steel and Nickel Alloys

Loss of material due to pitting and crevice corrosion could occur in indoor or outdoor stainless steel (SS) and nickel alloy piping, piping components, and tanks exposed to any air, condensation, or underground environment when the component is: (a) uninsulated; (b) insulated; (c) in the vicinity of insulated components; or (d) in the vicinity of potentially transportable halogens. Loss of material due to pitting and crevice corrosion can occur on SS and nickel alloys in environments containing sufficient halides (e.g., chlorides) in the presence of moisture.

Insulated SS and nickel alloy components exposed to air, condensation, or underground environments are susceptible to loss of material due to pitting or crevice corrosion if the insulation contains certain contaminants. Leakage of fluids through mechanical connections such as bolted flanges and valve packing can result in contaminants leaching onto the component surface or the surfaces of other components below the component. For outdoor insulated SS and *nickel alloy components, rain and changing weather conditions can result in moisture intrusion into the insulation.*

Plant-specific operating experience (OE) and the condition of SS and nickel alloy components are evaluated to determine if prolonged exposure to the plant-specific environments has resulted in pitting or crevice corrosion. Loss of material due to pitting and crevice corrosion is not an aging effect requiring management for SS and nickel alloy components if (a) plant-specific OE does not reveal a history of loss of material due to pitting or crevice corrosion, and (b) a one-time inspection demonstrates that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the subsequent period of extended operation. The applicant documents the results of the plant-specific OE review in the SLRA.

In the environment of air-indoor controlled, pitting and crevice corrosion is only expected to occur as the result of a source of moisture and halides. Inspections focus on the most susceptible locations.

The GALL-SLR Report recommends further evaluation of SS and nickel alloy piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of loss of material due to pitting and crevice corrosion. The GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that loss of material due to pitting and crevice corrosion is not occurring at a rate that affects the intended function of the components. If loss of material due to pitting or crevice corrosion has occurred and is sufficient to potentially affect the intended function of systems, structures, and components (SSCs), the following AMPs describe acceptable programs to manage loss of material due to pitting or crevice corrosion: (a) the GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," for tanks; (b) the GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," for external surfaces of piping and piping components; (c) the GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," for underground piping, piping components and tanks; and (d) the GALL-SLR Report AMP XI.M38, 'Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, a one-time inspection would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in AMP XI.M32.

The applicant may establish that loss of material due to pitting and crevice corrosion is not an aging effect requiring management by demonstrating that a barrier coating isolates the component from aggressive environments. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating.

<u>Table 3.2.1 Item Numbers 3.2-1, 004 and 3.2-1, 048:</u> These items evaluate loss of material due to pitting and crevice corrosion in stainless steel and nickel alloy piping, piping components, and tanks exposed to air or condensation environments. There are stainless steel or nickel alloy piping, piping components, or tanks exposed to the air-outdoor or air-indoor controlled environments in the ESF and RCIC Systems. There are no nickel alloy tanks in the ESF and RCIC Systems. Plant-specific operating experience (OE) associated with stainless steel and

nickel alloy components in the ESF and RCIC Systems has been evaluated to determine if prolonged exposure to the air-outdoor or air-indoor uncontrolled and condensation environments has resulted in loss of material due to pitting and crevice corrosion. Loss of material has not been identified as an aging effect at BFN for stainless steel or nickel alloy components in these environments, or as a result of transportable halogens, indicating that these environments do not contain sufficient halides (e.g., chlorides) in the presence of moisture to result in loss of material. Accordingly, the One-Time Inspection program (B.2.1.20) will be implemented to demonstrate that the aging effect of loss of material is not occurring in stainless steel piping, piping components, and tanks exposed to the air-outdoor or air-indoor uncontrolled and condensation environments. The One-Time Inspection program will also be implemented to demonstrate that the aging effect of loss of material is not occurring in nickel alloy piping and piping components exposed to the air-outdoor or air- indoor uncontrolled and condensation environments. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

Table 3.2.1 Item Number 3.2-1, 099: Not applicable. There are no stainless steel or nickel alloy tanks exposed to air or condensation in the ESF and RCIC Systems.

Table 3.2.1 Item Number 3.2-1, 106: Not applicable. There are no stainless steel or nickel alloy tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) in the ESF and RCIC Systems.

Table 3.2.1 Item Number 3.2-1, 107: Not applicable. There are no insulated stainless steel, nickel alloy piping, piping components, tanks exposed to air, condensation in the ESF and RCIC Systems.

Table 3.2.1 Item Number 3.2-1, 112: Not applicable. There are no stainless steel or nickel alloy underground piping, piping components, or tanks in the ESF and RCIC Systems.

3.2.2.2.3 Loss of Material Due to General Corrosion and Flow Blockage Due to Fouling

Loss of material due to general corrosion (as applicable) and flow blockage due to fouling for all materials can occur in the spray nozzles and flow orifices in the drywell and suppression chamber spray system exposed to air-indoor uncontrolled. This aging effect and mechanism will apply since the carbon steel piping upstream of the spray nozzles and flow orifices is occasionally wetted, even though the majority of the time this system is in standby. The wetting and drying of these components can accelerate corrosion in the system and lead to flow blockage from an accumulation of corrosion products. Aging effects sufficient to result in a loss of intended function are not anticipated if: (a) the applicant identifies those portions of the system that are normally dry but subject to periodic wetting; (b) plant-specific procedures exist to drain the normally dry portions that have been wetted during normal plant operation or inadvertently; (c) the plant-specific configuration of the drains and piping allow sufficient draining to empty the normally dry pipe; (d) plant-specific OE has not revealed loss of material or flow blockage due to fouling; and (e) a one-time inspection is conducted to verify that loss of material or flow blockage due to fouling has not occurred. The GALL-SLR Report AMP XI.M32, “One-Time Inspection,” describes an acceptable program to conduct the one-time inspections. The GALL-SLR Report AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” describes an acceptable program to manage loss of material due to general corrosion and flow blockage due to fouling when the above conditions are not met.

Table 3.2.1 Item Number 3.2-1, 006: This item evaluates loss of material due to general, pitting, and crevice corrosion and flow blockage due to fouling of metallic drywell and suppression chamber spray nozzles exposed to air-indoor uncontrolled and condensation environments. The BFN Units 1, 2, and 3 drywell and suppression chamber spray nozzles within the Residual Heat Removal System are copper alloy with greater than 15 percent zinc and are exposed to a condensation internal environment. The Residual Heat Removal System carbon steel piping sections downstream of the inboard primary containment motor operated isolation valves up to the drywell and suppression chamber spray nozzles are normally dry and subject to wetting, but are periodically wetted only during transient or accident conditions that require drywell or suppression chamber spray operation. Loss of material is not an aging effect for copper alloys in a condensation environment. Since the upstream piping is carbon steel, flow blockage due to fouling is an applicable aging effect for the spray nozzles.

When the piping between the drywell spray inboard and outboard primary containment isolation valves is filled with water to support inservice testing of valves, that piping is drained prior to opening the inboard isolation valve to preclude water flow into the downstream piping towards the spray header, and to maintain the piping between the isolation valves and the downstream piping to the spray header dry. During inservice testing of the primary containment isolation valves associated with the suppression chamber spray, the piping configuration and sequence of valve testing precludes the piping downstream of the inboard primary containment isolation valve from being wetted. When the piping between suppression chamber spray inboard and outboard primary containment isolation valves is filled with water to support inservice testing of pumps and valves, any leakage past the inboard primary containment isolation valve during testing drains to the suppression chamber via the spray nozzles due to the piping configuration to maintain the piping downstream of the inboard isolation valve dry.

Plant-specific OE has revealed corrosion on the carbon steel nipple between the header and a BFN Unit 2 torus spray copper alloy nozzle. The corrosion was attributed to leakage in the upstream valves that created a prolonged wetted condition. This leakage created a non-typical environment for the nozzle and piping. The corrective actions were to repair the upstream valves to eliminate the leakage. An engineering evaluation determined there was no degradation to the carbon steel nipple and no blockage resulting from the corrosion. The BFN surveillance procedure for the torus (suppression pool) nozzle test was successfully performed after discovery of the condition which validated no flow blockage existed at this nozzle. A verification of air or water flow through each drywell and suppression chamber spray nozzle is also performed periodically to satisfy Technical Specification surveillance requirements. Based on confirmation of no flow blockage after discovery and the repair to the leaking valve bringing the environment into conformance with the GALL/SRP item, the One-Time Inspection program (B.2.1.20) is sufficient and will be implemented to manage the aging effects of flow blockage due to fouling for the drywell and suppression chamber spray nozzles. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

3.2.2.2.4 Cracking Due to Stress Corrosion Cracking in Stainless Steel Alloys

Cracking due to stress corrosion cracking (SCC) could occur in indoor or outdoor SS piping, piping components, and tanks exposed to any air, condensation, or underground environment when the component is: (a) uninsulated; (b) insulated; (c) in the vicinity of insulated components, or (d) in the vicinity of potentially transportable halogens. Cracking can occur in environments containing sufficient halides (e.g., chlorides) in the presence of moisture.

Insulated SS components exposed to indoor air, outdoor air, condensation, or underground environments are susceptible to SCC if the insulation contains certain contaminants. Leakage of fluids through bolted connections (e.g., flanges, valve packing) can result in contaminants present in the insulation leaching onto the component surface or the surfaces of other components below the component. For outdoor insulated SS components, rain and changing weather conditions can result in moisture intrusion into the insulation.

Plant-specific OE and the condition of SS components are evaluated to determine if prolonged exposure to the plant-specific environments has resulted in SCC. SCC in SS components is not an aging effect requiring management if (a) plant-specific OE does not reveal a history of SCC and (b) a one-time inspection demonstrates that the aging effect is not occurring.

In the environment of air-indoor controlled, SCC is only expected to occur as the result of a source of moisture and halides. Inspections focus on the most susceptible locations. The applicant documents the results of the plant-specific OE review in the SLRA.

The GALL-SLR Report recommends further evaluation of SS piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of SCC. The GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that SCC is not occurring. If SCC is applicable, the following AMPs describe acceptable programs to manage loss of material due to SCC: (a) the GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," for tanks; (b) the GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," for external surfaces of piping and piping components; (c) the GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," for underground piping, piping components and tanks; and (d) the GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in AMP XI.M32.

The applicant may establish that SCC is not an aging effect requiring management for all components, by demonstrating that a barrier coating isolates the component from aggressive environments. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. The GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating.

Table 3.2.1 Item Number 3.2-1, 007: This item evaluates cracking due to SCC in stainless steel piping, piping components, and tanks exposed to air and condensation environments. There are stainless steel piping, piping components, or tanks exposed to the air-indoor controlled or air-outdoor environments in the ESF and RCIC Systems. Plant-specific OE associated with stainless steel components in the ESF and RCIC Systems has been evaluated to determine if prolonged exposure to the air-indoor uncontrolled or air-outdoor and condensation environments has resulted in cracking due to SCC. Cracking has not been identified as an aging effect at BFN for stainless steel components in these environments, or as a result of transportable halogens, indicating that the environments do not contain sufficient halides (e.g., chlorides) in the presence of moisture to result in SCC. Accordingly, the One-Time Inspection program (B.2.1.20) will be implemented to demonstrate that the aging effect of cracking is not occurring in stainless steel piping, piping components, and tanks exposed to air-indoor uncontrolled and condensation. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

Table 3.2.1 Item Number 3.2-1, 080: Not applicable. There are no stainless steel underground piping, piping components, or tanks in the ESF and RCIC Systems.

Table 3.2.1 Item Number 3.2-1, 103: Not applicable. There are no stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) in the ESF and RCIC Systems.

Table 3.2.1 Item Number 3.2-1, 108: Not applicable. There are no insulated stainless steel piping, piping components, tanks exposed to air, condensation in the ESF and RCIC Systems.

3.2.2.2.5 Quality Assurance for Aging Management of Nonsafety-Related Components

QA provisions applicable to Subsequent License Renewal are discussed in Appendix A, Section A.1.4, and Appendix B, Section B.1.3.

3.2.2.2.6 Ongoing Review of Operating Experience

Ongoing review of operating experience is addressed in Appendix A, Section A.1.5, and Appendix B, Section B.1.4.

3.2.2.2.7 Loss of Material Due to Recurring Internal Corrosion

Recurring internal corrosion can result in the need to augment AMPs beyond the recommendations in the GALL-SLR Report. During the search of plant-specific OE conducted during the SLRA development, recurring internal corrosion can be identified by the number of occurrences of aging effects and the extent of degradation at each localized corrosion site. This further evaluation item is applicable if the search of plant-specific OE reveals repetitive occurrences. The criteria for recurrence is (a) a 10-year search of plant-specific OE reveals the aging effect has occurred in three or more refueling outage cycles; or (b) a 5-year search of plant-specific OE reveals the aging effect has occurred in two or more refueling outage cycles and resulted in the component either not meeting plant-specific acceptance criteria or experiencing a reduction in wall thickness greater than 50 percent (regardless of the minimum wall thickness).

The GALL-SLR Report recommends that the GALL-SLR Report AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” be evaluated for inclusion of augmented requirements to ensure the adequate management of any recurring aging effect(s). Alternatively, a plant-specific AMP may be proposed. Potential augmented requirements include: alternative examination methods (e.g., volumetric versus external visual), augmented inspections (e.g., a greater number of locations, additional locations based on risk insights based on susceptibility to aging effect and consequences of failure, a greater frequency of inspections), and additional trending parameters and decision points where increased inspections would be implemented.

The applicant states: (a) why the program's examination methods will be sufficient to detect the recurring aging effect before affecting the ability of a component to perform its intended function, (b) the basis for the adequacy of augmented or lack of augmented inspections, (c) what *parameters will be trended as well as the decision points where increased inspections would be implemented (e.g., the extent of degradation at individual corrosion sites, the rate of degradation change), (d) how inspections of components that are not easily accessed (i.e., buried, underground) will be conducted, and (e) how leaks in any involved buried or underground components will be identified.*

Plant-specific OE examples should be evaluated to determine if the chosen AMP should be augmented even if the thresholds for significance of aging effect or frequency of occurrence of aging effect have not been exceeded. For example, during a 10-year search of plant-specific OE, two instances of a 360 degree 30 percent wall loss occurred at copper alloy to steel joints. Neither the significance of the aging effect nor the frequency of occurrence of aging effect threshold has been exceeded. Nevertheless, the OE should be evaluated to determine if the AMP that is proposed to manage the aging effect is sufficient (e.g., method of inspection, frequency of inspection, number of inspections) to provide reasonable assurance that the current licensing basis (CLB) intended functions of the component will be met throughout the subsequent period of extended operation. While recurring internal corrosion is not as likely in other environments as raw water and waste water (e.g., treated water), the aging effect should be addressed in a similar manner.

<u>Table 3.2.1 Item Number 3.2-1, 066:</u> This item evaluates loss of material due to recurring internal corrosion of metallic piping, piping components, and tanks exposed to raw water and waste water. There are no components exposed to raw water in the ESF and RCIC Systems. The cooling water side of the RHR Heat Exchanger is exposed to raw water and is addressed in the subsection 3.3.2.2.7.

3.2.2.2.8 Cracking Due to Stress Corrosion Cracking in Aluminum Alloys

SCC is a form of environmentally assisted cracking which is known to occur in high and moderate strength aluminum alloys. The three conditions necessary for SCC to occur in a component are a sustained tensile stress, aggressive environment, and material with a susceptible microstructure. Cracking due to SCC can be mitigated by eliminating one of the three necessary conditions. For the purposes of subsequent license renewal (SLR), acceptance criteria for this further evaluation are being provided for demonstrating that the specific material is not susceptible to SCC or an aggressive environment is not present. Cracking due to SCC is an aging effect requiring management unless it is demonstrated by the applicant that one of the two necessary conditions discussed below is absent.

<u>Susceptible Material:</u> If the material is not susceptible to SCC, then cracking is not an aging effect requiring management. The microstructure of an aluminum alloy, of which alloy composition is only one factor, is what determines if the alloy is susceptible to SCC. Therefore, determining susceptibility based on alloy composition alone is not adequate to conclude whether a particular material is susceptible to SCC. The temper, condition, and product form of the alloy is considered when assessing if a material is susceptible to SCC. Aluminum alloys that are susceptible to SCC include:

- *2xxx series alloys in the F, W, Ox, T3x, T4x, or T6x temper*
- *5xxx series alloys with a magnesium content of 3.5 weight percent or greater*
- *6xxx series alloys in the F temper*
- *7xxx series alloys in the F, T5x, or T6x temper*
- *2xx.x and 7xx.x series alloys*

- *3xx.x series alloys that contain copper*
- *5xx.x series alloys with a magnesium content of greater than 8 weight percent*

The material is evaluated to verify that it is not susceptible to SCC and that the basis used to make the determination is technically substantiated. Tempers have been specifically developed to improve the SCC resistance for some aluminum alloys. Aluminum alloy and temper combination which are not susceptible to SCC when used in piping, piping component, and tank applications include 1xxx series, 3xxx series, 6061-T6x, and 5454-x. If it is determined that a material is not susceptible to SCC, the SLRA provides the components/locations where it is used, alloy composition, temper or condition, product form, and for tempers not addressed above, the basis used to determine the alloy is not susceptible and technical information substantiating the basis.

<u>Aggressive Environment:</u> If the environment to which an aluminum alloy is exposed is not aggressive, such as dry gas or treated water, then cracking due to SCC will not occur and it is not an aging effect requiring management. Aggressive environments that are known to result in cracking due to SCC of susceptible aluminum alloys are aqueous solutions, air, condensation, and underground locations that contain halides (e.g., chloride). Halide concentrations should be considered high enough to facilitate SCC of aluminum alloys in uncontrolled or untreated aqueous solutions and air, such as raw water, waste water, condensation, underground locations, and outdoor air, unless demonstrated otherwise.

Halides could be present on the surface of the aluminum material if the component is encapsulated in a material such as insulation or concrete. In a controlled or uncontrolled indoor air, condensation, or underground environment, sufficient halide concentrations to cause SCC could be present due to secondary sources such as leakage from nearby components (e.g., leakage from insulated flanged connections or valve packing). If an aluminum component is exposed to a halide-free indoor air environment, not encapsulated in materials containing halides, and the exposure to secondary sources of moisture or halides is precluded, cracking due to SCC is not expected to occur. The plant-specific configuration can be used to demonstrate that exposure to halides will not occur. If it is determined that SCC will not occur because the environment is not aggressive, the SLRA provides the components and locations exposed to the environment, a description of the environment, basis used to determine the environment is not aggressive, and technical information substantiating the basis. The GALL-SLR Report AMP XI.M32, "One-Time Inspection," and a review of plant-specific OE describe an acceptable means to confirm the absence of moisture or halides within the proximity of the aluminum component.

If the environment potentially contains halides, the GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," describes an acceptable program to manage cracking due to SCC of aluminum tanks. The GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," describes an acceptable program to manage cracking due to SCC of aluminum piping and piping components. The GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," describes an acceptable program to manage cracking due to SCC of aluminum piping and tanks, which are buried or underground. The GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," describes an acceptable program to manage cracking due to SCC of aluminum components that are not included in other AMPs.

An alternative strategy to demonstrating that an aggressive environment is not present is to isolate the aluminum alloy from the environment using a barrier to prevent SCC. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to *aqueous solutions and air that contain halides. The GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating for internal or external coatings.*

Table 3.2.1 Item Number 3.2-1, 100: This item evaluates cracking due to SCC in aluminum piping, piping components, tanks exposed to air, condensation (internal), raw water and waste water. There are aluminum piping, piping components, tanks exposed to the air-indoor controlled or air-outdoor environments in the ESF and RCIC Systems. There are no aluminum piping, piping components, tanks with internal coatings/linings exposed to the air-indoor controlled or air-outdoor environments in the ESF and RCIC Systems. Plant-specific OE associated with aluminum components in the ESF and RCIC Systems has been evaluated to determine if prolonged exposure to the air, condensation, raw water, and waste water environments has resulted in cracking due to SCC. Cracking has not been identified as an aging effect at BFN for aluminum components in these environments, or as a result of transportable halogens, indicating that the environments do not contain sufficient halides (e.g., chlorides) in the presence of moisture to result in SCC. Accordingly, the One-Time Inspection program (B.2.1.20) will be implemented to demonstrate that the aging effect of cracking is not occurring in aluminum piping, piping components, tanks exposed to air, condensation (internal), raw water and waste water. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

Table 3.2.1 Item Number 3.2-1, 101: This item evaluates cracking due to SCC in aluminum piping, piping components and tanks exposed to air, condensation (external). There are aluminum piping, piping components, tanks exposed to the air-indoor controlled or air-outdoor environments in the ESF and RCIC Systems. There are no aluminum piping, piping components, tanks with internal coatings/linings exposed to the air-indoor controlled or air-outdoor environments in the ESF and RCIC Systems. Plant-specific OE associated with aluminum components in the ESF and RCIC Systems has been evaluated to determine if prolonged exposure to the air condensation environments has resulted in cracking due to SCC. Cracking has not been identified as an aging effect at BFN for aluminum components in these environments, or as a result of transportable halogens, indicating that the environments do not contain sufficient halides (e.g., chlorides) in the presence of moisture to result in SCC. Accordingly, the One-Time Inspection program (B.2.1.20) will be implemented to demonstrate that the aging effect of cracking is not occurring in aluminum piping, piping components, tanks exposed to air and condensation (external). Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

Table 3.2.1 Item Number 3.2-1, 102: Not applicable. There are no aluminum alloy tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") in the ESF and RCIC Systems.

Table 3.2.1 Item Number 3.2-1, 109: Not applicable. There are no insulated aluminum alloy piping, piping components, or tanks in the ESF and RCIC Systems.

Table 3.2.1 Item Number 3.2-1, 110: Not applicable. There are no aluminum alloy underground piping, piping components, or tanks in the ESF and RCIC Systems.

3.2.2.2.9 Loss of Material Due to General, Crevice or Pitting Corrosion and Cracking Due to Stress Corrosion Cracking

Loss of material due to general (steel only), crevice, or pitting corrosion and cracking due to SCC (SS only) can occur in steel and SS piping and piping components exposed to concrete. Concrete provides a high alkalinity environment that can mitigate the effects of loss of material for steel piping, thereby significantly reducing the corrosion rate. However, if water intrudes through the concrete, the pH can be reduced and ions that promote loss of material such as chlorides, which can penetrate the protective oxide layer created in the high alkalinity environment, can reach the surface of the metal. Carbonation can reduce the pH within concrete. The rate of carbonation is reduced by using concrete with a low water-to-cement ratio and low permeability. Concrete with low permeability also reduces the potential for the penetration of water. Adequate air entrainment improves the ability of the concrete to resist freezing and thawing cycles and therefore reduces the potential for cracking and intrusion of water. Cracking due to SCC, as well as pitting and crevice corrosion can occur due to halides present in the water that penetrates to the surface of the metal.

If the following conditions are met, loss of material is not considered to be an applicable aging effect for steel: (a) attributes of the concrete are consistent with American Concrete Institute (ACI) 318 or ACI 349 (low water-to-cement ratio, low permeability, and adequate air entrainment) as cited in NUREG-1557; (b) plant-specific OE indicates no degradation of the concrete that could lead to penetration of water to the metal surface; and (c) the piping is not potentially exposed to groundwater. For SS components loss of material and cracking due to SCC are not considered to be applicable aging effects as long as the piping is not potentially exposed to groundwater. Where these conditions are not met, loss of material due to general (steel only), crevice or pitting corrosion and cracking due to SCC (SS only) are identified as applicable aging effects. The GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," describes an acceptable program to manage these aging effects.

Table 3.2.1 Item Numbers 3.2-1, 055: Carbon steel piping, piping components exposed to concrete in the Standby Gas Treatment System and Containment System is potentially exposed to groundwater, therefore loss of material is considered to be an applicable aging effect. Loss of material is managed by the Buried and Underground Piping and Tanks program (B.2.1.27) and is addressed by Item Number 3.2.1, 052.

Table 3.2.1 Item Number 3.2-1, 091: Not applicable. There are no stainless steel piping or piping components exposed to concrete in the ESF and RCIC Systems.

3.2.2.2.10 Loss of Material Due to Pitting and Crevice Corrosion in Aluminum Alloys

Loss of material due to pitting and crevice corrosion could occur in aluminum piping, piping components, and tanks exposed to an air, condensation, underground, raw water, or waste water environment for a sufficient duration of time. Environments that can result in pitting and/or crevice corrosion of aluminum alloys are those that contain halides (e.g., chloride) in the presence of moisture. The moisture level and halide concentration in atmospheric and uncontrolled air are greatly dependent on geographical location and site-specific conditions. Moisture level and halide concentration should be considered high enough to facilitate pitting and/or crevice corrosion of aluminum alloys in atmospheric and uncontrolled air, unless demonstrated otherwise. The periodic introduction of moisture or halides into an environment from secondary sources should also be considered. Leakage of fluids from mechanical connections (e.g., insulated bolted flanges and valve packing); onto a component in indoor controlled air is an *example of a secondary source that should be considered. Halide concentrations should be considered high enough to facilitate loss of material of aluminum alloys in untreated aqueous solutions, unless demonstrated otherwise. Plant-specific OE and the condition of aluminum alloy components are evaluated to determine if prolonged exposure to the plant-specific air, condensation, underground, or water environments has resulted in pitting or crevice corrosion. Loss of material due to pitting and crevice corrosion is not an aging effect requiring management for aluminum alloys if (a) plant-specific OE does not reveal a history of loss of material due to pitting or crevice corrosion and (b) a one-time inspection demonstrates that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components. The applicant documents the results of the plant-specific OE review in the SLRA.*

In the environment of air-indoor controlled, pitting and crevice corrosion is only expected to occur as the result of a source of moisture and halides. Alloy susceptibility may be considered when reviewing OE and interpreting inspection results. Inspections focus on the most susceptible alloys and locations.

The GALL-SLR Report recommends the further evaluation of aluminum piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of loss of material due to pitting and crevice corrosion. GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that the aging effect of loss of material due to pitting and crevice corrosion is not occurring at a rate that will affect the intended function of the components. If loss of material due to pitting or crevice corrosion has occurred and is sufficient to potentially affect the intended function of an SSC, the following AMPs describe acceptable programs to manage loss of material due to pitting and crevice corrosion: (i) the GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," for tanks; (ii) the GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components,' for external surfaces of piping and piping components; (iii) the GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," for underground piping, piping components and tanks; and (iv) the GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components" for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in AMP XI.M32.

An alternative strategy to demonstrating that an aggressive environment is not present is to isolate the aluminum alloy from the environment using a barrier to prevent loss of material due to pitting and crevice corrosion. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. The GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," or equivalent program, describes an acceptable program to manage the integrity of a barrier coating.

<u>Table 3.2.1 Item Number 3.2-1, 042:</u> This item evaluates loss of material due to pitting and crevice corrosion in aluminum alloy piping, piping components, and tanks exposed to air or condensation external environments. There are no aluminum alloy tanks in the ESF and RCIC Systems. There are aluminum alloy piping or piping components exposed to the air-indoor controlled, air-outdoor, or condensation external environments in the ESF and RCIC Systems. Plant-specific OE associated with aluminum alloy components in the ESF and RCIC Systems has been evaluated to determine if prolonged exposure to air-indoor uncontrolled environment

has resulted in loss of material due to pitting and crevice corrosion. Loss of material has not been identified as an aging effect at BFN for aluminum alloy components in this environment, or as a result of transportable halogens, indicating that this environment does not contain sufficient halides (e.g., chlorides) in the presence of moisture to result in loss of material. Accordingly, the One-Time Inspection program (B.2.1.20) will be implemented to demonstrate that the aging effect of loss of material is not occurring in aluminum piping, piping components exposed to air-indoor uncontrolled. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

Table 3.2.1 Item Number 3.2-1, 056: This item evaluates loss of material due to pitting, crevice corrosion in aluminum piping, piping components, tanks exposed to air, condensation (internal). There are aluminum alloy piping, piping components, or tanks exposed to internal air or condensation environments in the ESF and RCIC Systems. Plant-specific OE associated with aluminum alloy components in the ESF and RCIC Systems has been evaluated to determine if prolonged exposure to air-indoor uncontrolled environment has resulted in loss of material due to pitting and crevice corrosion. Loss of material has not been identified as an aging effect at BFN for aluminum alloy components in this environment, or as a result of transportable halogens, indicating that this environment does not contain sufficient halides (e.g., chlorides) in the presence of moisture to result in loss of material. Accordingly, the One-Time Inspection program (B.2.1.20) will be implemented to demonstrate that the aging effect of loss of material is not occurring in aluminum piping, piping components exposed to air-indoor uncontrolled. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

Table 3.2.1 Item Number 3.2-1, 105: Not applicable. There are no aluminum alloy tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) in the ESF and RCIC Systems.

Table 3.2.1 Item Number 3.2-1, 111: Not applicable. There are no aluminum alloy underground piping, piping components, or tanks in the ESF and RCIC Systems.

Table 3.2.1 Item Number 3.2-1, 119: Not applicable. There are no insulated aluminum piping, piping components, tanks exposed to air, condensation in the ESF and RCIC Systems.

Table 3.2.1 Item Number 3.2-1, 121: Not applicable. There are no aluminum alloy piping, piping components, or tanks exposed to raw water or waste water in the ESF and RCIC Systems.

3.2.2.3 Time-Limited Aging Analysis

The time-limited aging analyses identified below are associated with the Engineered Safety Features and Reactor Core Isolation Cooling System components:

- Section 4.3, Metal Fatigue Analyses
  - Section 4.3.2, Metal Fatigue of Class 1 Components
  - Section 4.3.4, Metal Fatigue of Non-Class 1 Components
  - Section 4.3.5, Environmental Fatigue Analyses for Reactor Vessel and Class 1 Piping
- Section 4.6, Primary Containment Fatigue Analyses
  - Section 4.6.1, Suppression Chambers, Vents and Downcomers

- Section 4.6.2, Torus Attached Piping and Safety Relief Valve Discharge Lines
- Section 4.6.3, Containment Vent Lines and Process Penetration Bellows

3.2.3 Conclusion

The Engineered Safety Features components that are subject to aging management review have been identified in accordance with the requirements of 10 CFR 54.4. The aging management programs selected to manage aging effects for the Engineered Safety Features and Reactor Core Isolation Cooling System components are identified in the summaries in Section 3.2.2.1 above.

A description of these aging management programs is provided in Appendix B, along with the demonstration that the identified aging effects will be managed for the subsequent period of extended operation.

Therefore, based on the conclusions provided in Appendix B, the effects of aging associated with the Engineered Safety Features and Reactor Core Isolation Cooling components will be adequately managed so that there is reasonable assurance that the intended functions are maintained consistent with the current licensing basis during the subsequent period of extended operation.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 001	Stainless steel, steel piping, piping components exposed to any environment	Cumulative fatigue damage due to fatigue	TLAA, SRP-SLR Section 4.3 “Metal Fatigue”	Yes	Fatigue is a TLAA; further evaluation is documented in Section 4.3.
3.2-1, 002	This Item Number is not used in NUREG-2192.				
3.2-1, 003	This Item Number is not used in NUREG-2192.				
3.2-1, 004	Stainless steel, nickel alloy piping, piping components exposed to air, condensation (external)	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage loss of material of the nickel alloy and stainless steel piping, piping components, and tanks exposed to air - indoor uncontrolled and condensation in the Containment Atmosphere Dilution System, Core Spray System, High Pressure Coolant Injection System, Containment System, Reactor Core Isolation Cooling System, Residual Heat Removal System and Standby Gas Treatment System. See Subsection 3.2.2.2.2.
3.2-1, 005	PWR Only				

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 006	Metallic drywell and suppression chamber spray system (internal surfaces): flow orifice; spray nozzles exposed to air– indoor uncontrolled, condensation	Loss of material due to general, pitting, crevice corrosion; flow blockage due to fouling	AMP XI.M32, “One-Time Inspection,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will beused to manage loss of material due to general, pitting, crevice corrosion; flow blockage due tofouling of the copper alloy spray nozzles exposed to condensation in the Residual Heat Removal System. Plant-specific OE has revealed corrosion in the carbon steel nipple between the header and a BFN Unit 2 torus spray copper alloy nozzle. The corrosion was attributed to leakage in the upstream valves that created a prolonged wetted condition. An engineering evaluation determined there was no degradation to the carbon steel nipple and no blockage resulting from the corrosion. The BFN surveillance procedure for the torus (suppression pool) nozzle test was successfully performed after discovery of the condition which validated no flow blockage existed at this nozzle. Therefore, the One-Time Inspection (B.2.1.20) program will be implemented to manage Loss of material due to general, pitting, crevice corrosion; flow blockage due to fouling. See Subsection 3.2.2.2.3.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 007	Stainless steel piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M32, "One Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage cracking of the stainless steel heat exchanger components, piping, piping components, and tanks exposed to air - indoor uncontrolled and condensation in the Containment Atmosphere Dilution System, Core Spray System, High Pressure Coolant Injection System, Containment System, Reactor Core Isolation Cooling System, Residual Heat Removal System, Standby Gas Treatment System, Reactor Vessel and Reactor Recirculation System. See Subsection 3.2.2.2.4.
3.2-1, 008	PWR Only				
3.2-1, 009	PWR Only				
3.2-1, 010	Cast austenitic stainless steel piping, piping components exposed to treated borated water >250°C (>482°F), treated water >250°C (>482°F)	Loss of fracture toughness due to thermal aging embrittlement	AMP XI.M12, "Thermal Aging Embrittlement of Cast Austenitic Stainless Steel (CASS)"	No	Consistent with NUREG-2191. The Thermal Aging Embrittlement of Cast Austenitic Stainless Steel (CASS) program (B.2.1.8) will be used to manage loss of fracture toughness of cast austenitic stainless steel piping, piping components exposed to treated water > 482 F in the Reactor Recirculation System.
3.2-1, 011	Steel piping, piping components exposed to steam, treated water	Wall thinning due to flow-accelerated corrosion	AMP XI.M17, "Flow-Accelerated Corrosion"	No	Consistent with NUREG-2191. The Flow-Accelerated Corrosion program (B.2.1.9) will be used to manage wall thinning of the carbon steel piping, piping components exposed to steam and treated water in the Core Spray System, High Pressure Coolant Injection System, Reactor Core Isolation Cooling System and Residual Heat Removal System.

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 012	High-strength steel closure bolting exposed to air, soil, underground	Cracking due to SCC; cyclic loading	AMP XI.M18, "Bolting Integrity"	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage Cracking due to SCC; cyclic loading of the high-strength steel closure bolting exposed to air, soil, underground in the Containment Atmosphere Dilution System, Core Spray System, High Pressure Coolant Injection System, Containment System, Standby Gas Treatment System, Reactor Core Isolation Cooling System, Residual Heat Removal System.
3.2-1, 013	This Item Number is not used in NUREG-2192.				
3.2-1, 014	Stainless steel, steel, nickel alloy closure bolting exposed to air- indoor uncontrolled, air-outdoor, condensation	Loss of material due to general (steel only), pitting, crevice corrosion	AMP XI.M18, "Bolting Integrity"	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage loss of material of the carbon and low alloy steel and stainless steel closure bolting exposedto air - indoor uncontrolled and air - outdoor in the Containment Atmosphere Dilution System, Core Spray System, High Pressure Coolant Injection System, Containment System, Standby Gas Treatment System, Reactor Core Isolation Cooling System, Residual Heat Removal System.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 015	Metallic closure bolting exposed to any environment, soil underground	Loss of preload due to thermal effects, gasket creep, self- loosening	AMP XI.M18, “Bolting Integrity“	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage loss of preload of the carbon and low alloy steel and stainless steel closure bolting exposed to air - indoor uncontrolled, air - outdoor, and treated water in the Containment Atmosphere Dilution System, Core Spray System, High Pressure CoolantInjection System, Containment System, Standby Gas Treatment System, Reactor Core Isolation Cooling System and Residual Heat Removal System.
3.2-1, 016	Steel piping, piping components exposed to treated water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage loss of material of the carbon steel and gray cast iron heat exchanger components, piping, piping components, and tanks exposed to reactor coolant, steam, and treated water in the Core Spray System, High Pressure Coolant Injection System, Containment System, Reactor Core Isolation Cooling System, Residual Heat Removal System, Reactor Vessel and Reactor Recirculation system.
3.2-1, 017	Aluminum piping, piping components exposed to treated water, treated borated water	Loss of material due to pitting, crevice corrosion	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage loss of material of the aluminum piping, piping components exposed to treated water in the Core Spray System, Reactor Core Isolation Cooling System, Residual Heat Removal System.
3.2-1, 018	This Item Number is not used in NUREG-2192.				

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 019	Stainless steel heat exchanger tubes exposed to treated water, treated borated water	Reduction of heat transfer due to fouling	AMP XI.M2, “Water Chemistry” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage reduction of heat transfer of the stainless steel heat exchanger components exposed to treated water in the Residual Heat Removal System.
3.2-1, 020	PWR Only				
3.2-1, 021	This Item Number is not used in NUREG-2192.				
3.2-1, 022	Nickel alloy, stainless steel heat exchanger components, piping, piping components, tanks exposed to treated water, treated borated water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage loss of material of the stainless steel heat exchanger components and piping, piping components exposed to steam and treated water in the Core Spray System, High Pressure Coolant Injection System, Containment System, Reactor Core Isolation Cooling System, Residual Heat Removal System and Reactor Recirculation System.
3.2-1, 023	Steel heat exchanger components, piping, piping components exposed to raw water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Not Applicable. There are no stainless steel heat exchanger components, piping, piping components exposed to raw water in the ESF and RCIC Systems.
3.2-1, 024	PWR Only				

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 025	Stainless steel heat exchanger components exposed to raw water	Loss of material due to pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Not Applicable. There are no stainless steel heat exchanger components exposed to raw water in the ESF and RCIC Systems.
3.2-1, 026	This Item Number is not used in NUREG-2192.				
3.2-1, 027	Stainless steel, steel heat exchanger tubes exposed to raw water	Reduction of heat transfer due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Not Applicable. There are no stainless steel heat exchanger tubes exposed to raw water in the ESF and RCIC Systems.
3.2-1, 028	Stainless steel piping, piping components exposed to closed-cycle cooling water >60°C (>140°F)	Cracking due to SCC	AMP XI.M21A, “Closed Treated Water Systems”	No	Consistent with NUREG-2191. The Closed Treated Water Systems program (B.2.1.12) will be used to manage cracking of the stainless steel piping, piping components exposed to closed cycle cooling water in the Residual Heat Removal System and Core Spray System.
3.2-1, 029	Steel piping, piping components exposed to closed-cycle cooling water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no steel piping, piping components exposed to closed-cycle cooling water in ESF Systems or RCIC System
3.2-1, 030	Steel heat exchanger components exposed to closed-cycle cooling water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no steel heat exchanger components exposed to closed cycle cooling water in ESF Systems or RCIC System.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 031	Stainless steel heat exchanger components, piping, piping components exposed to closed-cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M21A, “Closed Treated Water Systems”	No	Consistent with NUREG-2191. The Closed Treated Water Systems program (B.2.1.12) will be used to manage loss of material of the stainless steel heat exchanger components exposed to closed cycle cooling water in the High Pressure Coolant Injection System and Reactor Recirculation System.
3.2-1, 032	Copper alloy heat exchanger components, piping, piping components exposed to closed-cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no copper alloy heat exchanger components or piping, piping components exposed to closed cycle cooling water in ESF Systems or RCIC System.
3.2-1, 033	Copper alloy, stainless steel heat exchanger tubes exposed to closed-cycle cooling water	Reduction of heat transfer due to fouling	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no copper alloy or stainless steel heat exchanger tubes exposed to closed cycle cooling water in ESF Systems or RCIC System.
3.2-1, 034	Copper alloy (>15% Zn or >8% Al) piping, piping components, heat exchanger components exposed to closed-cycle cooling water, treated water	Loss of material due to selective leaching	AMP XI.M33, “Selective Leaching”	No	Consistent with NUREG-2191. The Selective Leaching program (B.2.1.21) will be used to manage loss of material of the copper alloy with greater than 15% zinc heat exchanger components exposed to treated water in the High Pressure Coolant Injection System, Residual Heat Removal System, Reactor Core Isolation Cooling System and Reactor Recirculation System.

3.2-1, 042	Aluminum piping, piping components, tanks exposed to air, condensation (external)	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage loss of material of aluminum alloy piping, piping components exposed to air - indoor uncontrolled in the Reactor Coolant Core Isolation Cooling System and Containment Atmosphere Dilution System. See Subsection 3.2.2.2.10.
3.2-1, 043	Elastomer piping, piping components, seals exposed to air, condensation	Hardening or loss of strength due to elastomer degradation	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage hardening and loss of strength of elastomer ducting and components exposed to condensation in the Standby Gas Treatment System.
3.2-1, 044	Steel piping, piping components, ducting, ducting components exposed to air – indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material of the steel piping, piping components, ducting, ducting components exposed to air in the Containment Atmosphere Dilution System, Core Spray System, High Pressure Coolant Injection System, Containment System, Reactor Core Isolation Cooling System, Residual Heat Removal System and Standby Gas Treatment System.
3.2-1, 045	PWR Only				

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 046	Steel piping, piping components exposed to condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material of the carbon steel, galvanized steel, and gray cast iron ducting and components, heat exchanger components, piping, piping components, and tanks exposed to condensation in the High Pressure Coolant Injection System.
3.2-1, 047	PWR Only				
3.2-1, 048	Stainless steel, nickel alloy piping, piping components, tanks exposed to air, condensation (internal)	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage loss of material of the stainless steel piping, piping components, and tanks exposed to condensation in the High Pressure Coolant Injection System, Reactor Core Isolation Cooling System, Core Spray System and Residual Heat Removal System. See Subsection 3.2.2.2.2.
3.2-1, 049	Steel piping, piping components exposed to lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Lubricating Oil Analysis program (B.2.1.25) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material of the carbon steel, ductile iron, and gray cast iron piping, piping components, and tanks exposed to lubricating oil in the High Pressure Coolant Injection System, Reactor Core Isolation Cooling System, Core Spray System and Reactor Recirculation System.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 050	Copper alloy, stainless steel piping, piping components exposed to lubricating oil	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Lubricating Oil Analysis program (B.2.1.25) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material of the copper alloy and stainless steel piping, piping components exposed to lubricating oil in the Reactor Recirculation System.
3.2-1, 051	Steel, copper alloy, stainless steel heat exchanger tubes exposed to lubricating oil	Reduction of heat transfer due to fouling	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Lubricating Oil Analysis program (B.2.1.25) and One-Time Inspection program (B.2.1.20) will be used to manage reduction of heat transfer of the copper alloy and stainless steel heat exchanger components exposed to lubricating oil in the High Pressure Coolant Injection System, and Reactor Core Isolation Cooling System.
3.2-1, 052	Steel piping, piping components exposed to soil, concrete, underground	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Consistent with NUREG-2191 with exceptions. The Buried and Underground Piping and Tanks program (B.2.1.27) will be used to manage loss of material of the carbon steel piping, piping components exposed to concrete and soil in the Standby Gas Treatment System and Containment System. Exceptions apply to the NUREG-2191 recommendations for Buried and Underground Piping and Tanks program (B.2.1.27) implementation.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 053	Stainless steel, nickel alloy piping, piping components, tanks, exposed to soil, concrete	Loss of material due to pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Consistent with NUREG-2191 with exceptions. The Buried and Underground Piping and Tanks program (B.2.1.27) will be used to manage loss of material of the stainless steel, nickel alloy piping, piping components, tanks, exposed to soil, concrete in the Containment Atmosphere Dilution System. Exceptions apply to the NUREG-2191 recommendations for Buried and Underground Piping and Tanks program (B.2.1.27) implementation.
3.2-1, 053a	This Item Number is not used in NUREG-2192.				
3.2-1, 054	Stainless steel, nickel alloy piping, piping components greater than or equal to 4 NPS exposed to treated water >93°C (>200°F)	Cracking due to SCC, IGSCC	AMP XI.M7, “BWR Stress Corrosion Cracking,” and AMP XI.M2, “Water Chemistry”	No	Cracking due to SCC in stainless steel piping, piping components greater than or equal to 4 NPS exposed to treated water >200 F in the Core Spray System, Reactor Core Isolation Cooling System, and Residual Heat Removal System is addressed by Item Number 3.1-1, 097.
3.2-1, 055	Steel piping, piping components exposed to concrete	None	None	Yes	Carbon steel piping, piping components exposed to concrete in the Standby GasTreatment System and Containment System is addressed by Item Number 3.2-1, 052. Consistent with NUREG-2191, there is no Aging Management Program required for the steel piping components exposed to concrete in the Containment System. See Subsection 3.2.2.2.9.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 056	Aluminum piping, piping components, tanks exposed to air, condensation (internal)	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP-XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage loss of material of the aluminum piping, piping components, and tanks exposed to air in the Containment System. See Subsection 3.2.2.2.10.
3.2-1, 057	Copper alloy piping, piping components exposed to air, condensation, gas	None	None	No	Consistent with NUREG-2191, no Aging Management Program is required for copper alloy piping, piping components exposed to air, condensation or gas in the Containment Atmosphere Dilution System, Containment System, High Pressure Coolant Injection System, Reactor Core Isolation Cooling System, Residual Heat Removal System and Standby Gas Treatment System.
3.2-1, 058	PWR Only				
3.2-1, 059	Galvanized steel ducting, ducting components, piping, piping components exposed to air – indoor controlled	None	None	No	Consistent with NUREG-2191, no Aging Management Program is required for galvanized steel ducting, ducting components exposed to air in the Containment System and EHPM System.
3.2-1, 060	Glass piping elements exposed to air, underground, lubricating oil, raw water, treated water, treated borated water, air with borated water leakage, condensation, gas, closed-cycle cooling water	None	None	No	Consistent with NUREG-2191, there are no Aging Management Programs required for glass piping elements exposed to air, lubricating oil, or treated water for the Containment System, High Pressure Coolant Injection System, Reactor Core Isolation Colling System and Reactor Recirculation System.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 061	This Item Number is not used in NUREG-2192.				
3.2-1, 062	Nickel alloy piping, piping components exposed to air with borated water leakage	None	None	No	Not Applicable. There are no nickel alloy piping, piping components exposed to air with borated water leakage in ESF Systems or RCIC System.
3.2-1, 063	Stainless steel piping, piping components exposed to air with borated water leakage, gas	None	None	No	Consistent with NUREG-2191, there are no Aging Management Programs required for stainless steel piping, piping components exposed to gas in the Containment Atmosphere Dilution System, Core Spray System, Reactor Core Isolation Cooling System and Standby Gas Treatment System.
3.2-1, 064	Steel piping, piping components exposed to air– indoor controlled, gas	None	None	No	Consistent with NUREG-2191, there are no Aging Management Programs required for steel piping, piping components exposed to gas in the Containment Atmosphere Dilution System and Standby Gas Treatment System.
3.2-1, 065	Metallic piping, piping components exposed to treated water, treated borated water	Wall thinning due to erosion	AMP XI.M17, "Flow-Accelerated Corrosion"	No	Consistent with NUREG-2191. The Flow-Accelerated Corrosion program (B.2.1.9) will be used to manage wall thinning of thecarbon steel and stainless steel piping, piping components exposed to steam and treated water in the High Pressure Coolant Injection System, Reactor Core Isolation Cooling System, and Residual Heat Removal System.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 066	Metallic piping, piping components, tanks exposed to raw water, waste water	Loss of material due to recurring internal corrosion	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	Yes	Not applicable. There are no metallic piping, piping components, tanks exposed to raw water, waste water in the ESF Systems or RCIC Systems. For BFN mechanical components are screened with the system in which they were scoped. For heat exchangers, the process side of the heat exchanger are evaluated with the process side system for aging management review. Likewise, the cooling water side of the heat exchanger is evaluated with the cooling waterside system for aging management review. Mechanical components exposed to raw water are addressed within the Section 3.3. See Subsection 3.2.2.2.7.
3.2-1, 067	Stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not Applicable. There are no stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil or concrete in ESF Systems or RCIC System.
3.2-1, 068	Steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete, air, condensation	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not Applicable. There are no steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete, air, condensation for steel tanks in ESF Systems or RCIC System.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 069	Insulated steel piping, piping components, tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components” or AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage loss of material exposed to air, condensation for insulated steel piping, piping components and tanks in the Standby Gas Treatment System, High Pressure Coolant Injection System, Reactor Core Isolation Cooling System, and Residual Heat Removal System.
3.2-1, 070	Steel, stainless steel, aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to treated water, treated borated water	Loss of material due to general (steel only), pitting, crevice corrosion, MIC (steel,stainless steel only)	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not Applicable. There are no steel, stainless steel, or aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to treated water or treated borated water in ESF Systems or RCIC System.
3.2-1, 071	Insulated copper alloy (>15% Zn or >8% Al) piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Not Applicable. There are no insulated copper alloy (>15% Zn or >8% Al) piping, piping components, or tanks exposed to air or condensation in ESF Systems or RCIC System.
3.2-1, 072	Any material piping, piping components, heat exchangers, tanks with internal coatings/linings exposed to closed-cycle cooling water, raw water, treated water, treated borated water, lubrication oil, condensation	Loss of coating or lining integrity due to blistering, cracking, flaking, peeling, delamination, rusting, or physical damage; loss of material or cracking for cementitious coatings/ linings	AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	No	Not Applicable. There are no piping, piping components, heat exchangers, or tanks with internal coatings/ linings exposed to closed cycle cooling water, raw water, treated water, or treated borated water in ESF Systems or RCIC System.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 073	Any material piping, piping components, heat exchangers, tanks with internal coatings/linings exposed to closed-cycle cooling water, raw water, treated water, treated borated water, lubricating oil, condensation	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	No	Not Applicable. There are no piping, piping components, heat exchangers, tanks with internal coatings/linings exposed to closed-cycle cooling water, raw water, treated water, treated borated water, lubricating oil, condensation in ESF Systems or RCIC System.
3.2-1, 074	Gray cast iron, ductile iron piping, piping components with internal coatings/linings exposed to closed-cycle cooling water, raw water, treated water, treated borated water, waste water	Loss of material due to selective leaching	AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	No	Not Applicable. There are no gray cast iron or ductile iron piping, piping components with internal coatings/linings exposed to closed cycle cooling water, raw water, treated water, treated borated water, or waste water in ESF Systems or RCIC System.
3.2-1, 075	This Item Number is not used in NUREG-2192.				
3.2-1, 076	Stainless steel, steel, nickel alloy, copper alloy closure bolting exposed to treated water, treated borated water, raw water, waste water, lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC (steel, copper alloy in raw water, waste water only)	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage loss of material of the stainless steel closure bolting exposed to treated water in the Residual Heat Removal System.
3.2-1, 077	This Item Number is not used in NUREG-2192.				
3.2-1, 078	Stainless steel, steel, aluminum piping, piping components, tanks exposed to soil, concrete	Cracking due to SCC (steel in carbonate/ bicarbonate environment only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Carbon steel piping, piping components exposed to concrete and soil in the Standby Gas Treatment System and Containment System is addressed by Item Number 3.2-1, 052.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 079	Stainless steel closure bolting exposed to air, soil, concrete, underground	Cracking due to SCC	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage cracking of the stainless steel closure bolting exposed to air - indoor uncontrolled in the Containment System and Residual Heat Removal System.
3.2-1, 080	Stainless steel underground piping, piping components, tanks	Cracking due to SCC	AMP XI.M32, “One Time Inspection,” AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.4.
3.2-1, 081	Stainless steel, steel, aluminum, copper alloy, titanium heat exchanger tubes exposed to air, condensation	Reduction of heat transfer due to fouling	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage reduction of heat transfer due to fouling of the stainless steel, steel, aluminum copper alloy heat exchanger tubes exposed to air, condensation in the Reactor Core Isolation Cooling System, Containment System.
3.2-1, 082	This Item Number is not used in NUREG-2192.				
3.2-1, 083	This Item Number is not used in NUREG-2192.				
3.2-1, 084	This Item Number is not used in NUREG-2192.				
3.2-1, 085	This Item Number is not used in NUREG-2192.				
3.2-1, 086	This Item Number is not used in NUREG-2192.				

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 087	Non-metallic thermal insulation exposed to air, condensation	Reduced thermal insulation resistance due to moisture intrusion	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components (B.2.1.23) program will be used to manage reduced thermal insulation resistance due to moisture intrusion of non-metallic thermal insulation, as shown in Table 3.5.2-36 Structural Commodities (Thermal Insulation), in the High Pressure Coolant Injection System, Reactor Core Isolation Cooling System, Standby Gas Treatment System and Residual Heat Removal System.
3.2-1, 088	This Item Number is not used in NUREG-2192.				
3.2-1, 089	This Item Number is not used in NUREG-2192.				
3.2-1, 090	Steel components exposed to treated water, treated borated water, raw water	Long-term loss of material due to general corrosion	AMP XI.M32, "One Time Inspection"	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage long-term loss of material of the carbon steel and gray cast iron heat exchanger components, piping, piping components, and tanks exposed to treated water in the Core Spray System, High Pressure Coolant Injection System, Reactor Core Isolation Cooling System and Residual Heat Removal System,
3.2-1, 091	Stainless steel piping, piping components exposed to concrete	None	None	Yes	Not Applicable. See Subsection 3.2.2.2.9.
3.2-1, 092	This Item Number is not used in NUREG-2192.				
3.2-1, 093	This Item Number is not used in NUREG-2192.				
3.2-1, 094	This Item Number is not used in NUREG-2192.				
3.2-1, 095	This Item Number is not used in NUREG-2192.				

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 096	Steel, stainless steel piping, piping components exposed to raw water (for components not covered by NRC GL 89-13)	Loss of material due to general (steel only), pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no steel or stainless steel piping, piping components exposed to raw water (for components not covered by NRC Generic Letter (GL) 89-13) in ESF Systems or RCIC System.
3.2-1, 097	This Item Number is not used in NUREG-2192.				
3.2-1, 098	Copper alloy (>15% Zn or >8% Al) piping, piping components exposed tosoil	Loss of material due to selective leaching	AMP XI.M33, “Selective Leaching”	No	Not Applicable. There are no copper alloy (>15% Zn or >8% Al) piping, piping components exposed to soil in ESF Systems or RCIC System.
3.2-1, 099	Stainless steel, nickel alloy tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One Time Inspection,” AMP XI.M36, ‘External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.2.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 100	Aluminum piping, piping components, tanks exposed to air, condensation (internal), raw water, waste water	Cracking due to SCC	AMP XI.M32, “One Time Inspection,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage cracking of the aluminum alloy piping, piping components exposed to air - indoor uncontrolled in the Standby Gas Treatment System. See Subsection 3.2.2.2.8.
3.2-1, 101	Aluminum piping, piping components, tanks exposed to air, condensation (external)	Cracking due to SCC	AMP XI.M32, “One Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage cracking of the aluminum alloy piping, piping components exposed to air - indoor uncontrolled in the Containment Atmosphere Dilution System Standby Gas Treatment System and Residual Heat Removal System. See Subsection 3.2.2.2.8.
3.2-1, 102	Aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation, soil, concrete, raw water, waste water	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings/Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.8.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 103	Stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings/Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.4.
3.2-1, 104	Aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not Applicable. There are no aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil or concrete in ESF Systems or RCIC System.
3.2-1, 105	Aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings/Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.10.
3.2-1, 106	Stainless steel, nickel alloy tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings/Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.2.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 107	Insulated stainless steel, nickel alloy piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.2.
3.2-1, 108	Insulated stainless steel piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.4.
3.2-1, 109	Insulated aluminum piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.8.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 110	Aluminum underground piping, piping components, tanks	Cracking due to SCC	AMP XI.M32, “One-Time Inspection,” AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.8.
3.2-1, 111	Aluminum underground piping, piping components, tanks	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.10.
3.2-1, 112	Stainless steel, nickel alloy underground piping, piping components, tanks	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.2.
3.2-1, 113	This Item Number is not used in NUREG-2192.				
3.2-1, 114	Stainless steel, nickel alloy piping, piping components exposed to treated water >60°C (>140°F)	Cracking due to SCC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage cracking of the stainless steel piping, piping components exposed to steam and treated water >140 F in the Reactor Coolant Isolation Cooling System, High Pressure Coolant Injection System, Residual Heat Removal System and, Reactor Recirculation System.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 115	Titanium heat exchanger tubes exposed to treated water	Cracking due to SCC, reduction of heat transfer due to fouling	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not Applicable. There are no titanium heat exchanger tubes exposed to treated water in ESF Systems or RCIC System.
3.2-1, 116	Titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to treated water	None	None	No	Not Applicable. There are no titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes or piping, piping components exposed to treated water in ESF Systems or RCIC System.
3.2-1, 117	Titanium heat exchanger tubes exposed to closed-cycle cooling water	Cracking due to SCC, reduction of heat transfer due to fouling	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no titanium heat exchanger tubes exposed to closed cycle cooling water in ESF Systems or RCIC System.
3.2-1, 118	Titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to closed-cycle cooling water	None	None	No	Not Applicable. There are no titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, or piping, piping components exposed to closed cycle cooling water in ESF Systems or RCIC System.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 119	Insulated aluminum piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.10.
3.2-1, 120	Aluminum piping, piping components, tanks exposed to soil, concrete	Loss of material due to pitting, crevice corrosion	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There are no aluminum piping, piping components, or tanks exposed to soil or concrete in ESF Systems or RCIC System.
3.2-1, 121	Aluminum piping, piping components, tanks exposed to raw water, waste water	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. See Subsection 3.2.2.2.10.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 122	Elastomer piping, piping components, seals exposed to air	Loss of material due to wear	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage loss of material of elastomer ducting components exposed to air - indoor uncontrolled in the Standby Gas Treatment System.
3.2-1, 123	Elastomer piping, piping components, seals exposed to air	Loss of material due to wear	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no elastomer piping, piping components, seals exposed to air in the ESF Systems or RCIC System.
3.2-1, 124	Aluminum piping, piping components, tanks exposed to air with borated water leakage	None	None	No	Not Applicable. There are no aluminum piping, piping components, or tanks exposed to air with borated water leakage in ESF Systems or RCIC System.
3.2-1, 125	Steel closure bolting exposed to soil, concrete, underground	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There are no steel closure bolting exposed to soil, concrete, or underground in ESF Systems or RCIC System.
3.2-1, 126	Titanium, super austenitic piping, piping components, tanks, closure bolting exposed to soil, concrete, underground	Loss of material due to pitting, crevice corrosion, MIC (except for titanium; soil environment only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There are no titanium, super austenitic piping, piping components, tanks, or closure bolting exposed to soil, concrete, or underground in ESF Systems or RCIC System.
3.2-1, 127	Copper alloy piping, piping components exposed to concrete	None	None	No	Not Applicable. There are no copper alloy piping, piping components exposed to concrete in ESF Systems or RCIC System.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 128	Copper alloy piping, piping components exposed to soil, underground	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There are no copper alloy piping, piping components exposed to soil or underground in ESF Systems or RCIC System.
3.2-1, 129	Stainless steel tanks exposed to soil, concrete	Loss of material due to pitting, crevice corrosion, MIC (soil only)	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not Applicable. There are no stainless steel tanks exposed to soil or concrete in ESF Systems or RCIC System.
3.2-1, 130	Steel heat exchanger components exposed to lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Lubricating Oil Analysis program (B.2.1.25) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material of the carbon steel and gray cast iron heat exchanger components exposed to lubricating oil in the High Pressure Coolant Injection System.
3.2-1, 131	Aluminum piping, piping components exposed to raw water	Flow blockage due to fouling	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no aluminum piping, piping components exposed to raw water in ESF Systems or RCIC System.
3.2-1, 132	Titanium (ASTM Grades 3, 4, or 5) heat exchanger tubes exposed to raw water	Cracking due to SCC	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Not Applicable. There are no titanium (ASTM Grades 3, 4, or 5) heat exchanger tubes exposed to raw water in ESF Systems or RCIC System.

Table 3.2.1, Summary of Aging Management Evaluations for the Engineered Safety Features Systems and Reactor Core Isolation Cooling System (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.2-1, 133	Titanium piping, piping components, heat exchanger components exposed to raw water	Cracking due to SCC, flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Not Applicable. There are no titanium piping, piping components, heat exchanger components exposed to raw water in the ESF Systems or RCIC System.
3.2-1, 134	Polymeric piping, piping components, ducting, ducting components, seals exposed to air, condensation, raw water, raw water (potable), treated water, waste water, underground, concrete, soil	Hardening or loss of strength due to polymeric degradation; loss of material due to peeling, delamination, wear; cracking or blistering due to exposure to ultraviolet light, ozone, radiation,or chemical attack; flow blockage due to fouling	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) and the Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material of elastomer ducting components exposed to air - indoor uncontrolled in the Containment System, Standby Gas Treatment System, Core Spray System, High Pressure Coolant Injection System and Containment System

Table 3.2.2-1, Containment System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	V.E.E-03	3.2-1, 012	A
Closure bolting	Mechanical Closure	Nickel alloy	Air - indoor uncontrolled, air	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	V.E.E-02	3.2-1, 014	A
Closure bolting	Mechanical Closure	Stainless steel	Air - outdoor	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	V.E.E-02	3.2-1, 014	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	V.E.E-02	3.2-1, 014	A
Closure bolting	Mechanical Closure	Stainless steel, Steel, Nickel alloy	Air	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	V.E.EP-116	3.2-1, 015	A
Closure bolting	Mechanical Closure	Stainless steel	Air	Cracking due to SCC	Bolting Integrity (B.2.1.10)	V.E.E-421	3.2-1, 079	A
Ducting, ducting components	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	V.B.E-25	3.2-1, 044	A
Ducting, ducting components	Pressure Boundary	Galvanized steel	Air - indoor controlled	None	None	V.F.EP-14	3.2-1, 059	A
Ducting, ducting components	Pressure Boundary	Stainless steel	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.F3.AP-99a	3.3-1, 094	A
Ducting, ducting components	Pressure Boundary	Stainless steel	Air	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VII.F3.A-781a	3.3-1, 094a	A
Ducting, ducting components	Pressure Boundary	Aluminum	Air	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VII.F3.A-451a	3.3-1, 189	C

Table 3.2.2-1, Containment System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Ducting, ducting components	Pressure Boundary	Aluminum	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.F3.A-763a	3.3-1, 234	C
External surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled, air - outdoor, condensation	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	V.E.E-44	3.2-1, 040	A
Fire damper assemblies	Fire Barrier	Steel	Air	Loss of material due to general, pitting, crevice corrosion	Fire Protection (B.2.1.15)	VII.G.A-789	3.3-1, 255	A
Heat exchanger components	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	V.D2.E-29	3.2-1, 044	C
Heat exchanger components	Pressure Boundary	Aluminum	Air, condensation (internal)	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	V.D2.EP-3b	3.2-1, 056	C
Heat exchanger components	Pressure Boundary	Copper alloy	Air	None	None	V.F.EP-10	3.2-1, 057	C
Heat exchanger tubes	Pressure Boundary	Aluminum	Air, condensation	Reduction of heat transfer due to fouling	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	V.E.E-424	3.2-1, 081	A
Piping, piping components	Pressure Boundary	Nickel alloy	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	V.C.EP-107a	3.2-1, 004	A
Piping, piping components	Pressure Boundary	Stainless steel	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	V.C.EP-107a	3.2-1, 004	A
Piping, piping components	Pressure Boundary	Stainless steel	Air	Cracking due to SCC	One-Time Inspection (B.2.1.20)	V.C.EP-103b	3.2-1, 007	A
Piping, piping components	Pressure Boundary	Stainless steel	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	V.C.EP-103b	3.2-1, 007	A

Table 3.2.2-1, Containment System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Steel	Treated water	Wall thinning due to flow-accelerated corrosion	Flow-Accelerated Corrosion (B.2.1.9)	V.C.E-09	3.2-1, 011	A
Piping, piping components	Pressure Boundary	Steel	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	V.C.EP-62	3.2-1, 016	A
Piping, piping components	Pressure Boundary	Stainless steel	Treated water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	V.C.EP-63	3.2-1, 022	A
Piping, piping components	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	V.D2.E-29	3.2-1, 044	A
Piping, piping components	Pressure Boundary	Steel	Soil, concrete	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	Buried and Underground Piping and Tanks (B.2.1.27)	V.E.EP-111	3.2-1, 052	B
Piping, piping components	Pressure Boundary	Steel	Concrete	None	None	V.F.EP-112	3.2-1, 055	A
Piping, piping components	Pressure Boundary	Copper alloy	Air	None	None	V.F.EP-10	3.2-1, 057	A
Piping elements	Pressure Boundary	Glass	Air	None	None	V.F.EP-15	3.2-1, 060	A
Piping elements	Pressure Boundary	Glass	Treated water	None	None	V.F.EP-29	3.2-1, 060	A

Table 3.2.2-1 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

None.

Table 3.2.2-2, Standby Gas Treatment System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	V.E.E-03	3.2-1, 012	A
Closure bolting	Mechanical Closure	Stainless steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	V.E.E-02	3.2-1, 014	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	V.E.E-02	3.2-1, 014	A
Closure bolting	Mechanical Closure	Stainless Steel, Steel, Copper Alloy	Air	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	V.E.EP-116	3.2-1, 015	A
Ducting, ducting components	Pressure Boundary	Stainless steel	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.F3.AP-99aa	3.3-1, 094	A
Ducting, ducting components	Pressure Boundary	Stainless steel	Air	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VII.F3.A-781a	3.3-1, 094a	A
Ducting, ducting components	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	V.B.E-25	3.2-1, 044	A
Insulated ducting, ducting components	Pressure Boundary	Steel	Air, condensation	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	V.E.E-403a	3.2-1, 069	C
Ducting, ducting components	Pressure Boundary	Aluminum	Air (external)	Cracking due to SCC	One-Time Inspection (B.2.1.20)	V.E.E-444b	3.2-1, 101	C, 1

I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. Component type for Piping and piping components substituted for Ducting and ducting components with regard to Steel, Aluminum, Zinc, and Elastomer materials.

Table 3.2.2-3, Reactor Core Isolation Cooling System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Pump and valve closure bolting	Mechanical Closure	Steel	System temperature up to 288°C (550°F)	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	Section 4.3 “Metal Fatigue”	IV.C1.RP-44	3.1-1, 011	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion, wear	Bolting Integrity (B.2.1.10)	IV.C1.RP-42	3.1-1, 063	A
Closure bolting	Mechanical Closure	Stainless steel, steel	Air - indoor uncontrolled	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	V.E.EP-116	3.2-1, 015	A
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	V.E.E-03	3.2-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	V.E.E-02	3.2-1, 014	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	V.E.EP-116	3.2-1, 015	A
External surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	V.E.E-44	3.2-1, 040	A
Heat exchanger components	Pressure Boundary	Steel	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	V.D2.EP-60	3.2-1, 016	C
Heat exchanger components	Pressure Boundary	Copper alloy (>15% Zn or >8% Al)	Treated water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	V.D2.EP-37	3.2-1, 034	A

Table 3.2.2-3, Reactor Core Isolation Cooling System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Heat exchanger tubes	Pressure Boundary	Copper alloy	Lubricating oil	Reduction of heat transfer due to fouling	Lubricating Oil Analysis (B.2.1.25) and One-Time Inspection (B.2.1.20)	V.D2.EP-78	3.2-1, 051	A
Heat exchanger tubes	Pressure Boundary	Stainless steel	Lubricating oil	Reduction of heat transfer due to fouling	Lubricating Oil Analysis (B.2.1.25) and One-Time Inspection (B.2.1.20)	V.D2.EP-79	3.2-1, 051	A
Heat exchanger tubes	Pressure Boundary	Copper alloy	Air	Reduction of heat transfer due to fouling	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	V.E.E-424	3.2-1, 081	A
Heat exchanger tubes	Pressure Boundary	Copper alloy	Treated water	Reduction of heat transfer due to fouling	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.E.SP-100	3.4-1, 018	A
Insulated piping, piping components	Pressure Boundary	Steel	Air, condensation	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	V.E.E-403a	3.2-1, 069	A
Reactor coolant pressure boundary components: piping, piping components; other pressure retaining components with fatigue analyses	Pressure Boundary	Stainless steel	Reactor coolant	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	Section 4.3 “Metal Fatigue”	IV.C1.R-220	3.1-1, 006	A
Reactor coolant pressure boundary components: piping, piping components; other pressure retaining components with fatigue analyses	Pressure Boundary	Steel (with or without nickel alloy or stainless steel cladding)	Reactor coolant	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	Section 4.3 “Metal Fatigue”	IV.C1.R-220	3.1-1, 006	A

Table 3.2.2-3, Reactor Core Isolation Cooling System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Class 1 piping, fittings and branch connections < NPS 4	Pressure Boundary	Stainless steel Steel (with or without nickel alloy or stainless steel cladding)	Reactor coolant	Cracking due to SCC (for stainless steel or nickel alloy surfaces exposed to reactor coolant only), IGSCC (for stainless steel or nickel alloy surfaces exposed to reactor coolant only), thermal, mechanical, vibratory loading	ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1), Water Chemistry (B.2.1.2) and ASME Code Class 1 Small-bore Piping (B.2.1.22)	IV.C1.RP-230	3.1-1, 039	A
Piping, piping components	Pressure Boundary	Aluminum	Air, condensation (external)	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	V.E.EP-114b	3.2-1, 042	A
Piping, piping components	Pressure Boundary	Steel	Reactor coolant	Wall thinning due to flow-accelerated corrosion	Flow-Accelerated Corrosion (B.2.1.9)	IV.C1.R-23	3.1-1, 060	A
Reactor coolant pressure boundary components	Pressure Boundary	Stainless steel	Reactor coolant	Loss of material due to pitting, crevice corrosion	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	IV.C1.RP-158	3.1-1, 079	A
Piping, piping components greater than or equal to 4 NPS	Pressure Boundary	Stainless steel	Reactor coolant	Cracking due to SCC, IGSCC	BWR Stress Corrosion Cracking (B.2.1.5) and Water Chemistry (B.2.1.2)	IV.C1.R-20	3.1-1, 097	B

Table 3.2.2-3, Reactor Core Isolation Cooling System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Reactor coolant system components: Components defined as ASME Section XI components (e.g., reactor coolant pressure boundary components, core support structure components, ASME Class 2 or 3 components, including associated pressure-retaining welds) not managed by other AMR line items in GALL-SLR Chapter IV	Pressure Boundary	Steel	Air - indoor uncontrolled	Cracking due to SCC, IGSCC (stainless steel or nickel alloy components only), cyclic loading; loss of material due to general corrosion (steel only), pitting corrosion, crevice corrosion, wear	ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1) and Water Chemistry (B.2.1.2) (water chemistry-related or corrosion-related aging effect mechanisms only)	IV.E.R-444	3.1-1, 114	A
Piping, piping components	Pressure Boundary	Steel	Air - indoor uncontrolled, air - outdoor, condensation	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	IV.C1.R-431	3.1-1, 124	A
Piping, piping components - RCPB	Pressure Boundary	Steel	Treated water	Long-term loss of material due to general corrosion	One-Time Inspection (B.2.1.20)	IV.C1.R-448	3.1-1, 133	A
Piping, piping components	Pressure Boundary	Stainless steel	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	IV.C1.R-452a	3.1-1, 136	A
Piping, piping components	Pressure Boundary	Steel	Treated water	Cumulative fatigue damage due to fatigue	Section 4.3 “Metal Fatigue”	V.D2.E-10	3.2-1, 001	A
Piping, piping components	Pressure Boundary	Stainless steel	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	V.D2.EP-107a	3.2-1, 004	A
Piping, piping components	Pressure Boundary	Stainless steel	Air	Cracking due to SCC	One-Time Inspection (B.2.1.20)	V.D2.EP-103b	3.2-1, 007	A

Table 3.2.2-3 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

None.

Table 3.2.2-4, High Pressure Coolant Injection System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Pump and valve closure bolting	Mechanical Closure	Steel	System temperature up to 288°C (550°F)	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	Section 4.3 “Metal Fatigue”	IV.C1.RP-44	3.1-1, 011	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled (external)	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	IV.C1.RP-43	3.1-1, 067	A
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	V.E.E-03	3.2-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	V.E.E-02	3.2-1, 014	A
Closure bolting	Mechanical Closure	Steel	Any	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	V.E.EP-116	3.2-1, 015	A
External surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	V.E.E-44	3.2-1, 040	A
External surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	V.E.E-44	3.2-1, 040	A
Heat exchanger components	Pressure Boundary	Steel	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	V.D2.EP-60	3.2-1, 016	C
Heat exchanger components	Pressure Boundary	Copper alloy (>15% Zn or >8% Al)	Treated water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	V.D2.EP-37	3.2-1, 034	A

Table 3.2.2-6 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

None.

3.3 AGING MANAGEMENT OF AUXILIARY SYSTEMS

3.3.1 Introduction

This section provides the results of the aging management review for those components identified in Section 2.3.3, Auxiliary Systems, as being subject to aging management review. The systems, or portions of systems, which are addressed in this section are described in the indicated sections.

- Emergency High Pressure Makeup System (2.3.3.1)
- Auxiliary Boiler System (2.3.3.2)
- Fuel Oil System (2.3.3.3)
- Residual Heat Removal Service Water System (2.3.3.4)
- Raw Cooling Water System (2.3.3.5)
- Raw Service Water System (2.3.3.6)
- High Pressure Fire Protection (Diesel Driven Pump) System (2.3.3.7)
- Potable Water System (2.3.3.8)
- Normal Ventilation System, includes Turbine Building Ventilation System, Radwaste Ventilation System, and Diesel Generator Room Ventilation System (2.3.3.9)
- Air Conditioning System (2.3.3.10)
- Control Air System (2.3.3.11)
- Service Air System (2.3.3.12)
- CO_2 Storage, Fire Protection/Purge System (2.3.3.13)
- Station Drainage System (2.3.3.14)
- Sampling and Water Quality System (2.3.3.15)
- Building Heating System (2.3.3.16)
- Hypochlorite System (2.3.3.17)
- Demineralizer Backwash Air System (2.3.3.18)
- Standby Liquid Control System (2.3.3.19)
- Off-Gas System (2.3.3.20)
- Emergency Equipment Cooling Water System (2.3.3.21)
- Reactor Water Cleanup System (2.3.3.22)
- Reactor Building Closed Cooling Water System (2.3.3.23)
- Auxiliary Decay Heat Removal System (2.3.3.24)
- Containment Inerting System (2.3.3.25)
- Radwaste System (2.3.3.26)
- Spent Fuel Pool Cooling/Cleanup System (2.3.3.27)
- Fuel Handling and Storage System (2.3.3.28)
- Standby Diesel Generators (2.3.3.29)
- Supplemental Diesel Generator System (2.3.3.30)
- Control Rod Drive System (2.3.3.31)
- Diesel Generator Starting Air System (2.3.3.32)
- Cranes and Hoists (2.3.3.33)
- Sewage System (2.3.3.34)

- Diverse and Flexible Coping Strategies (FLEX) System (2.3.3.35)
- Security System (2.3.3.36)
- Radiation Monitoring System (2.3.3.37)
- Hardened Containment Venting System (2.3.3.38)

3.3.2 Results

The following tables summarize the results of the aging management review for Auxiliary Systems.

3.3.2.1 Materials, Environments, Aging Effects Requiring Management And Aging Management Programs

3.3.2.1.1 Emergency High Pressure Makeup System

Materials

The materials of construction for the Emergency High Pressure Makeup System components are:

-
- High-strength steel
- Galvanized steel
- Metallic
- Stainless steel
- Steel

Environments

The Emergency High Pressure Makeup System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air, condensation

- Lubricating Oil
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the Emergency High Pressure Makeup System components require management:

- Cracking
- Cumulative fatigue damage
- Long-term loss of material
- Loss of material
- Loss of preload
- Wall thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Emergency High Pressure Makeup System components:

- Water Chemistry (B.2.1.2)
- Flow-Accelerated Corrosion (B.2.1.9)
- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Lubricating Oil Analysis (B.2.1.25)
- TLAA (Section 4.3)

3.3.2.1.2 Auxiliary Boiler System

Materials

The materials of construction for the Auxiliary Boiler System components are:

- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- High-strength steel
- Stainless steel
- Steel

Environments

The Auxiliary Boiler System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air, condensation
- Steam
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the Auxiliary Boiler System components require management:

- Cracking due to SCC
- Cumulative fatigue damage
- Long-term loss of material
- Loss of material
- Loss of preload due to thermal effects, gasket creep, self-loosening
- Wall Thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Auxiliary Boiler System components:

- Water Chemistry (B.2.1.2)
- Flow-Accelerated Corrosion (B.2.1.9)
- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- TLAA (Section 4.3)

3.3.2.1.3 Fuel Oil System

Materials

The materials of construction for the Fuel Oil System components are:

- Aluminum
- Copper alloy
- Elastomer
- High-strength steel
- Stainless steel
- Steel

Environments

The Fuel Oil System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air, condensate
- Concrete
- Fuel oil

Aging Effects Requiring Management

The following aging effects associated with the Fuel Oil System components require management:

- Cracking
- Hardening or loss of strength
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Fuel Oil System components:

- Bolting Integrity (B.2.1.10)
- Fuel Oil Chemistry (B.2.1.18)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)

3.3.2.1.4 Residual Heat Removal Service Water System

Materials

The materials of construction for the Residual Heat Removal Service Water System components are:

- Aluminum
- Copper alloy
- Gray cast iron, ductile iron
- High-strength steel
- Polymeric
- Stainless steel
- Steel
- Steel with internal coatings/linings

Environments

The Residual Heat Removal Service Water System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air, condensate
- Concrete
- Lubricating oil
- Raw water

- Soil
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the Residual Heat Removal Service Water System components require management:

- Cracking
- Cumulative fatigue damage
- Hardening or loss of strength
- Loss of coating or lining integrity
- Loss of material
- Loss of preload
- Reduction of heat transfer due to fouling
- Wall thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Residual Heat Removal Service Water System components:

- Water Chemistry (B.2.1.2)
- Bolting Integrity (B.2.1.10)
- Open-Cycle Cooling Water System (B.2.1.11)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Lubricating Oil Analysis (B.2.1.25)
- Buried and Underground Piping and Tanks (B.2.1.27)
- Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B.2.1.28)
- TLAA (Section 4.3)

3.3.2.1.5 Raw Cooling Water System

Materials

The materials of construction for the Raw Cooling Water System components are:

- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- Elastomer
- Gray cast iron, ductile iron
- High-strength steel
- Polymeric

- Stainless steel
- Steel

Environments

The Raw Cooling Water System components are exposed to the following environments:
- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air, condensation
- Lubricating oil
- Raw water
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the Raw Cooling Water System components require management:
- Cracking
- Hardening or loss of strength
- Loss of material
- Loss of preload
- Wall thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Raw Cooling Water System components:
- Water Chemistry (B.2.1.2)
- Flow-Accelerated Corrosion (B.2.1.9)
- Bolting Integrity (B.2.1.10)
- Open-Cycle Cooling Water System (B.2.1.11)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Lubricating Oil Analysis (B.2.1.25)

3.3.2.1.6 Raw Service Water System

Materials

The materials of construction for the Raw Service Water System components are:
- Copper Alloy
- Copper alloy (>15% Zn or >8% Al)

- Gray cast iron, ductile iron
- High-strength steel
- Stainless steel
- Steel

Environments

The Raw Service Water System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air, condensation
- Raw water
- Soil

Aging Effects Requiring Management

The following aging effects associated with the Raw Service Water System components require management:

- Cracking
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Raw Service Water System components:

- Bolting Integrity (B.2.1.10)
- Open-Cycle Cooling Water System (B.2.1.11)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Buried and Underground Piping and Tanks (B.2.1.27)

3.3.2.1.7 High Pressure Fire Protection (Diesel Driven Pump) System

Materials

The materials of construction for the High Pressure Fire Protection (Diesel Driven Pump) System components are:

- Aluminum
- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- Elastomer
- Glass
- Gray cast iron

- Gray cast iron, ductile iron
- High-strength steel
- Metallic
- Stainless steel
- Steel

Environments

The High Pressure Fire Protection (Diesel Driven Pump) System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air - condensate
- Any
- Closed-cycle cooling water
- Concrete
- Fuel Oil
- Gas
- Lubricating oil
- Raw water
- Soil
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the High Pressure Fire Protection (Diesel Driven Pump) System components require management:

- Cracking
- Cumulative fatigue damage
- Flow blockage due to fouling
- Hardening or loss of strength
- Long term loss of material
- Loss of coating or lining integrity
- Loss of material
- Loss of preload
- Reduction of heat transfer

Aging Management Programs

The following aging management programs manage the aging effects for the High Pressure Fire Protection (Diesel Driven Pump) System components:

- Bolting Integrity (B.2.1.10)
- Open-Cycle Cooling Water System (B.2.1.11)

- Closed Treated Water Systems (B.2.1.12)
- Fire Protection (B.2.1.15)
- Fire Water System (B.2.1.16)
- Fuel Oil Chemistry (B.2.1.18)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Lubricating Oil Analysis (B.2.1.25)
- Buried and Underground Piping and Tanks (B.2.1.27)
- Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B.2.1.27)
- TLAA (Section 4.3)

3.3.2.1.8 Potable Water System

Materials

The materials of construction for the Potable Water System components are:

- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- High-strength steel
- Stainless steel
- Steel

Environments

The Potable Water System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air, Condensation
- Raw water (potable)

Aging Effects Requiring Management

The following aging effects associated with the Potable Water System components require management:

- Cracking
- Loss of coating or lining integrity
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Potable Water System components:

- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)

3.3.2.1.9 Normal Ventilation System

Materials

The materials of construction for the Normal Ventilation System components are:

- Elastomer
- High-strength steel
- Metallic
- Stainless steel
- Steel

Environments

The Normal Ventilation System components are exposed to the following environments:

- Air
- Air - outdoor
- Air - indoor uncontrolled
- Air, condensation
- Condensation

Aging Effects Requiring Management

The following aging effects associated with the Normal Ventilation System components require management:

- Cracking
- Hardening or loss of strength
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Normal Ventilation System components:

- Bolting Integrity (B.2.1.10)
- Fire Protection (B.2.1.15)
- One-Time Inspection (B.2.1.20)

- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)

3.3.2.1.10 Air Conditioning System

Materials

The materials of construction for the Air Conditioning System components are:

- Aluminum
- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- Elastomer
- Glass
- Gray cast iron, ductile iron
- High-strength steel
- Polymeric
- Stainless steel
- Steel

Environments

The Air Conditioning System components are exposed to the following environments:

- Air
- Air, condensation
- Air - indoor controlled
- Air - indoor uncontrolled
- Air - outdoor
- Closed-cycle cooling water
- Condensation
- Gas
- Lubricating oil
- Raw water (potable)

Aging Effects Requiring Management

The following aging effects associated with the Air Conditioning System components require management:

- Cracking
- Hardening or loss of strength
- Loss of material
- Loss of preload
- Reduction of heat transfer

Aging Management Programs

The following aging management programs manage the aging effects for the Air Conditioning System components:

- Bolting Integrity (B.2.1.10)
- Closed Treated Water Systems (B.2.1.12)
- Fire Protection (B.2.1.15)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Lubricating Oil Analysis (B.2.1.25)

3.3.2.1.11 Control Air System

Materials

The materials of construction for the Control Air System components are:

- Aluminum
- Copper alloy
- High-strength steel
- Metallic
- Nickel Alloy
- Stainless steel
- Steel
- Steel with internal coatings/linings

Environments

The Control Air System components are exposed to the following environments:

- Air
- Air-Dry
- Air - indoor uncontrolled
- Air, Condensation
- Condensation

Aging Effects Requiring Management

The following aging effects associated with the Control Air System components require management:

- Cracking
- Loss of coating or lining integrity
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Control Air System components:

- Bolting Integrity (B.2.1.10)
- Compressed Air Monitoring (B.2.1.14)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B.2.1.28)

3.3.2.1.12 Service Air System

Materials

The materials of construction for the Service Air System components are:

- Copper alloy
- High-strength steel
- Stainless steel
- Steel
- Steel with internal coatings/linings

Environments

The Service Air System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air-dry
- Air, condensation
- Condensation

Aging Effects Requiring Management

The following aging effects associated with the Service Air System components require management:

- Cracking
- Loss of coating or lining integrity
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Service Air System components:

- Bolting Integrity (B.2.1.10)

- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B.2.1.28)

3.3.2.1.13 CO_2 Storage, Fire Protection/Purge System

Materials

The materials of construction for the CO_2 Storage, Fire Protection/Purge System components are:

- Aluminum
- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- Elastomer
- Glass
- High-strength steel
- Nickel Alloy
- Stainless steel
- Steel

Environments

The CO_2 Storage, Fire Protection/Purge System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air, condensation
- Any
- Condensation
- Gas

Aging Effects Requiring Management

The following aging effects associated with the CO_2 Storage, Fire Protection/Purge System components require management:

- Cracking
- Flow blockage
- Hardening or loss of strength
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the CO_2 Storage, Fire Protection/Purge System components:

- Bolting Integrity (B.2.1.10)
- Fire Protection (B.2.1.15)
- Fire Water System (B.2.1.16)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- TLAA (Section 4.3)

3.3.2.1.14 Station Drainage System

Materials

The materials of construction for the Station Drainage System components are:

- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- Gray cast iron, ductile iron
- High-strength steel
- Stainless steel
- Steel

Environments

The Station Drainage System components are exposed to the following environments:

- Air
- Air - outdoor
- Air - indoor uncontrolled
- Air, condensation
- Waste water

Aging Effects Requiring Management

The following aging effects associated with the Station Drainage System components require management:

- Cracking
- Long-term loss of material
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Station Drainage System components:

- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)

3.3.2.1.15 Sampling and Water Quality System

Materials

The materials of construction for the Sampling and Water Quality System components are:

- Cast austenitic stainless steel
- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- Glass
- Gray cast iron, ductile iron
- High-strength steel
- Nickel alloy
- Polymeric
- Stainless steel
- Steel

Environments

The Sampling and Water Quality System components are exposed to the following environments:

- Air
- Air - indoor controlled
- Air - indoor uncontrolled
- Air - outdoor
- Air, condensation
- Any
- Condensation
- Gas
- Raw Water
- Reactor coolant
- Reactor coolant >250°C (>482°F)
- Treated water
- Treated water >60°C (>140°F)

Aging Effects Requiring Management

The following aging effects associated with the Sampling and Water Quality System components require management:

- Cracking
- Hardening or loss of strength
- Flow blockage
- Loss of fracture toughness
- Loss of material
- Loss of preload
- Reduction of heat transfer

Aging Management Programs

The following aging management programs manage the aging effects for the Sampling and Water Quality System components:

- ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1)
- Water Chemistry (B.2.1.2)
- Bolting Integrity (B.2.1.10)
- Open-Cycle Cooling Water System (B.2.1.11)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- TLAA (Section 4.3)

3.3.2.1.16 Building Heating System

Materials

The materials of construction for the Building Heating System components are:

- Copper Alloy
- High-strength steel
- Steel

Environments

The Building Heating System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air, condensation
- Any
- Closed-cycle cooling water
- Treated Water

Aging Effects Requiring Management

The following aging effects associated with the Building Heating System components require management:

- Cracking
- Loss of material
- Loss of preload
- Reduction of heat transfer

Aging Management Programs

The following aging management programs manage the aging effects for the Building Heating System components:

- Bolting Integrity (B.2.1.10)
- Closed Treated Water Systems (B.2.1.12)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)

3.3.2.1.17 Hypochlorite System

Materials

The materials of construction for the Hypochlorite System components are:

- High-strength steel
- Nickel Alloy
- Polymeric
- Stainless Steel
- Steel

Environments

The Hypochlorite System components are exposed to the following environments:

- Air
- Air - outdoor
- Condensation
- Raw Water

Aging Effects Requiring Management

The following aging effects associated with the Hypochlorite System components require management:

- Cracking
- Hardening or loss of strength
- Long-term loss of material
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Hypochlorite System components:

- Bolting Integrity (B.2.1.10)
- Closed Treated Water Systems (B.2.1.12)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)

3.3.2.1.18 Demineralizer Backwash Air System

Materials

The materials of construction for the Demineralizer Backwash Air System components are:

- Cast Iron
- Copper Alloy
- High-strength steel
- Steel

Environments

The Demineralizer Backwash Air System components are exposed to the following environments:

- Air
- Air - dry
- Air - indoor uncontrolled
- Air, condensation
- Condensation

Aging Effects Requiring Management

The following aging effects associated with the Demineralizer Backwash Air System components require management:

- Cracking
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Demineralizer Backwash Air System components:

- Bolting Integrity (B.2.1.10)
- Compressed Air Monitoring (B.2.1.14)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)

3.3.2.1.19 Standby Liquid Control System

Materials

The materials of construction for the Standby Liquid Control System components are:

- Aluminum
- Copper alloy
- High-strength steel
- Stainless steel
- Steel

Environments

The Standby Liquid Control System components are exposed to the following environments:

- Air
- Air - indoor controlled
- Air - indoor uncontrolled
- Air, condensation
- Lubricating oil
- Reactor coolant
- Sodium pentaborate solution
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the Standby Liquid Control System components require management:

- Cracking due to SCC
- Cumulative fatigue damage
- Long-term loss of material
- Loss of material
- Loss of preload
- Wall thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Standby Liquid Control System components:

- ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1)
- Water Chemistry (B.2.1.2)
- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- ASME Code Class 1 Small-bore Piping (B.2.1.22)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)

- Lubricating Oil Analysis (B.2.1.25)
- TLAA (Section 4.3)

3.3.2.1.20 Off-Gas System

Materials

The materials of construction for the Off-Gas System components are:
- Copper Alloy
- High-strength steel
- Stainless steel
- Steel

Environments

The Off-Gas System components are exposed to the following environments:
- Air
- Air - indoor uncontrolled
- Air, Condensation
- Condensation

Aging Effects Requiring Management

The following aging effects associated with the Off-Gas System components require management:
- Cracking
- Cumulative fatigue damage
- Loss of Material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Off-Gas System components:
- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- TLAA (Section 4.3)

3.3.2.1.21 Emergency Equipment Cooling Water System

Materials

The materials of construction for the Emergency Equipment Cooling Water System components are:

- Aluminum
- Copper Alloy
- Copper alloy (>15% Zn or >8% Al)
- Gray cast iron, ductile iron
- High-strength steel
- Stainless steel
- Steel

Environments

The Emergency Equipment Cooling Water Systemm components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air, condensation
- Concrete
- Gas
- Raw Water
- Soil

Aging Effects Requiring Management

The following aging effects associated with the Emergency Equipment Cooling Water System components require management:

- Cracking due to SCC
- Cumulative fatigue damage
- Long-term loss of material
- Loss of material
- Loss of preload
- Reduction of heat transfer
- Wall thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Emergency Equipment Cooling Water System components:

- Bolting Integrity (B.2.1.10)
- Open-Cycle Cooling Water System (B.2.1.11)
- One-Time Inspection (B.2.1.20)

- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Buried and Underground Piping and Tanks (B.2.1.27)
- TLAA (Section 4.3)

3.3.2.1.22 Reactor Water Cleanup System

Materials

The materials of construction for the Reactor Water Cleanup System components are:

- Cast austenitic stainless steel
- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- Glass
- Gray cast iron, ductile iron
- High-strength steel
- Stainless Steel
- Steel

Environments

The Reactor Water Cleanup System components are exposed to the following environments:

- Air
- Air - indoor Controlled
- Air - indoor uncontrolled
- Air, condensation
- Condensation
- Gas
- Reactor coolant
- Reactor coolant >250°C (>482°F)
- Treated Water
- Treated water >60°C (>140°F)
- Treated water >93°C (>200°F)

Aging Effects Requiring Management

The following aging effects associated with the Reactor Water Cleanup System components require management:

- Cracking
- Cumulative fatigue damage
- Long-term loss of material
- Loss of fracture toughness
- Loss of material
- Loss of preload

- Reduction of heat transfer
- Wall thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Reactor Water Cleanup System components:

- ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1)
- Water Chemistry (B.2.1.2)
- BWR Stress Corrosion Cracking (B.2.1.5)
- Flow-Accelerated Corrosion (B.2.1.9)
- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- ASME Code Class 1 Small-bore Piping (B.2.1.22)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- TLAA (Section 4.3)

3.3.2.1.23 Reactor Building Closed Cooling Water System

Materials

The materials of construction for the Reactor Building Closed Cooling Water System components are:

- Aluminum
- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- High-strength steel
- Nickel Alloy
- Stainless steel
- Steel

Environments

The Reactor Building Closed Cooling Water System components are exposed to the following environments:

- Air
- Air - dry
- Air - indoor uncontrolled
- Air, Condensation
- Closed cooling (treated) water
- Closed-cycle cooling water

- Condensation
- Gas
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the Reactor Building Closed Cooling Water System components require management:

- Cracking
- Loss of material
- Loss of preload
- Wall thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Reactor Building Closed Cooling Water System components:

- Bolting Integrity (B.2.1.10)
- Closed Treated Water Systems (B.2.1.12)
- Compressed Air Monitoring (B.2.1.14)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)

3.3.2.1.24 Auxiliary Decay Heat Removal System

Materials

The materials of construction for the Auxiliary Decay Heat Removal System components are:

- High-strength steel
- Stainless steel
- Steel

Environments

The Auxiliary Decay Heat Removal System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air, Condensation
- Closed-cycle cooling water
- Gas

Aging Effects Requiring Management

The following aging effects associated with the Auxiliary Decay Heat Removal System components require management:

- Cracking
- Loss of material
- Loss of preload
- Reduction of heat transfer

Aging Management Programs

The following aging management programs manage the aging effects for the Auxiliary Decay Heat Removal System components:

- Bolting Integrity (B.2.1.10)
- Closed Treated Water Systems (B.2.1.12)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)

3.3.2.1.25 Containment Inerting System

Materials

The materials of construction for the Containment Inerting System components are:

- Aluminum
- Copper Alloy
- High-strength steel
- Nickel Alloy
- Stainless Steel
- Steel

Environments

The Containment Inerting System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air, condensation
- Condensation
- Gas

Aging Effects Requiring Management

The following aging effects associated with the Containment Inerting System components require management:

- Cracking

- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Containment Inerting System components:

- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)

3.3.2.1.26 Radwaste System

Materials

The materials of construction for the Radwaste System components are:

- Copper Alloy
- Copper alloy (>15% Zn or >8% Al)
- Elastomer
- High-strength steel
- Metallic
- Stainless steel
- Steel

Environments

The Radwaste System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air, Condensation
- Concrete
- Gas
- Lubricating oil
- Treated Water
- Treated water >60°C (>140°F)
- Waste water

Aging Effects Requiring Management

The following aging effects associated with the Readwaste System components require management:

- Cracking

- Hardening or loss of strength
- Long-term loss of material
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Radwaste System components:

- Water Chemistry (B.2.1.2)
- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Buried and Underground Piping and Tanks (B.2.1.27)

3.3.2.1.27 Spent Fuel Cooling/Cleanup System

Materials

The materials of construction for the Spent Fuel Cooling/Cleanup System components are:

- Aluminum
- Gray cast iron, ductile iron
- High-strength steel
- Stainless steel
- Steel

Environments

The Spent Fuel Cooling/Cleanup System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air, condensation
- Concrete
- Treated Water
- Waste water

Aging Effects Requiring Management

The following aging effects associated with the Spent Fuel Cooling/Cleanup System components require management:

- Cracking

- Long-term loss of material
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Spent Fuel Cooling/Cleanup System components:

- Water Chemistry (B.2.1.2)
- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)

3.3.2.1.28 Fuel Handling and Storage System

Materials

The materials of construction for the Fuel Handling and Storage System components are:

- Aluminum
- Boral®; boron steel, and other materials (excluding Boraflex)
- High-strength steel
- Stainless Steel
- Steel

Environments

The Fuel Handling and Storage System components are exposed to the following environments:

- Air
- Treated water
- Treated water >60°C (>140°F)

Aging Effects Requiring Management

The following aging effects associated with the Fuel Handling and Storage System components require management:

- Cracking
- Loss of material
- Loss of preload
- Reduction of neutron-absorbing capacity

Aging Management Programs

The following aging management programs manage the aging effects for the Fuel Handling and Storage System components:

- Water Chemistry (B.2.1.2)

- Inspection of Overhead Heavy Load and Light Load (Related to Refueling) Handling Systems (B.2.1.13)
- Monitoring of Neutron-Absorbing Materials other than Boraflex (B.2.1.26)

3.3.2.1.29 Standby Diesel Generators

Materials

The materials of construction for the Standby Diesel Generators components are:

- Aluminum
- Copper Alloy
- Copper alloy (>15% Zn or >8% Al)
- Elastomer
- Glass
- Gray cast iron, ductile iron
- High-strength steel
- Stainless Steel
- Steel

Environments

The Standby Diesel Generators components are exposed to the following environments:

- Air
- Air - indoor controlled
- Air - indoor uncontrolled
- Air - outdoor
- Closed-cycle cooling water
- Condensation
- Diesel exhaust
- Gas
- Lubricating oil
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the Standby Diesel Generators components require management:

- Cracking
- Cumulative fatigue damage
- Hardening or loss of strength
- Loss of material
- Loss of preload
- Reduction of heat transfer

Aging Management Programs

The following aging management programs manage the aging effects for the Standby Diesel Generators components:

- Bolting Integrity (B.2.1.10)
- Closed Treated Water Systems (B.2.1.12)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Lubricating Oil Analysis (B.2.1.25)
- TLAA (Section 4.3)

3.3.2.1.30 Supplemental Diesel Generator System

Materials

The materials of construction for the Supplemental Diesel Generator System components are:

- Aluminum
- Elastomer
- High-strength steel
- Stainless Steel
- Steel

Environments

The Supplemental Diesel Generator System System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air, Condensation
- Closed-cycle cooling water
- Diesel Exhaust
- Fuel Oil
- Lubrication Oil

Aging Effects Requiring Management

The following aging effects associated with the Supplemental Diesel Generator System System components require management:

- Cracking
- Hardening or loss of strength
- Loss of material

- Loss of preload
- Reduction of heat transfer

Aging Management Programs

The following aging management programs manage the aging effects for the Supplemental Diesel Generator System components:

- Bolting Integrity (B.2.1.10)
- Closed Treated Water Systems (B.2.1.12)
- Fuel Oil Chemistry (B.2.1.18)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Lubricating Oil Analysis (B.2.1.25)

3.3.2.1.31 Control Rod Drive System

Materials

The materials of construction for the Control Rod Drive System components are:

- Aluminum
- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- High-strength steel
- Stainless steel
- Steel

Environments

The Control Rod Drive System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air, Condensation
- Any
- Lubricating oil
- Treated Water

Aging Effects Requiring Management

The following aging effects associated with the Control Rod Drive System components require management:

- Cracking
- Long-term loss of material

- Loss of material
- Loss of preload
- Reduction of heat transfer

Aging Management Programs

The following aging management programs manage the aging effects for the Control Rod Drive System components:

- Water Chemistry (B.2.1.2)
- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Lubricating Oil Analysis (B.2.1.25)
- TLAA (Section 4.3)

3.3.2.1.32 Diesel Generator Starting Air System

Materials

The materials of construction for the Diesel Generator Starting Air System components are:

- Aluminum
- Copper Alloy
- Copper alloy (>15% Zn or >8% Al)
- Elastomer
- Glass
- High-strength steel
- Stainless Steel
- Steel

Environments

The Diesel Generator Starting Air System components are exposed to the following environments:

- Air
- Air-dry
- Air - indoor controlled
- Air - indoor uncontrolled
- Air - outdoor
- Condensation
- Lubricating Oil

Aging Effects Requiring Management

The following aging effects associated with the Diesel Generator Starting Air System components require management:

- Cracking due to SCC
- Hardening or loss of strength
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Diesel Generator Starting Air System components:

- Bolting Integrity (B.2.1.10)
- Compressed Air Monitoring (B.2.1.14)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Lubricating Oil Analysis (B.2.1.25)

3.3.2.1.33 Cranes and Hoists

Materials

The materials of construction for the Cranes and Hoists components are:

- High-strength steel
- Stainless Steel
- Steel

Environments

The Cranes and Hoists components are exposed to the following environments:

- Air

Aging Effects Requiring Management

The following aging effects associated with the Cranes and Hoists components require management:

- Cumulative fatigue damage
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Cranes and Hoists components:

- Inspection of Overhead Heavy Load and Light Load (Related to Refueling) Handling Systems (B.2.1.13)
- TLAA (Section 4.7)

3.3.2.1.34 Sewage System

Materials

The materials of construction for the Sewage System components are:

- Not Applicable

Environments

The Sewage System components are exposed to the following environments:

- Not Applicable

Aging Effects Requiring Management

The following aging effects associated with the Sewage System components require management:

- None

Aging Management Programs

The following aging management programs manage the aging effects for the Sewage System components:

- None

3.3.2.1.35 FLEX System

Materials

The materials of construction for the FLEX System components are:

- High-strength steel
- Stainless Steel
- Steel

Environments

The FLEX System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Air, Condensation
- Raw Water

Aging Effects Requiring Management

The following aging effects associated with the FLEX System components require management:

- Cracking
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the FLEX System components:

- Bolting Integrity (B.2.1.10)
- Open-Cycle Cooling Water System (B.2.1.11)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)

3.3.2.1.36 Security System

Materials

The materials of construction for the Security System components are:

- Not Applicable

Environments

The Security System components are exposed to the following environments:

- Not Applicable

Aging Effects Requiring Management

The following aging effects associated with the Security System components require management:

- None

Aging Management Programs

The following aging management programs manage the aging effects for the Security System components:

- None

3.3.2.1.37 Radiation Monitoring System

Materials

The materials of construction for the Radiation Monitoring System components are:

- Aluminum
- Copper alloy

- Copper alloy (>15% Zn or >8% Al)
- Glass
- High-strength steel
- Polymeric
- Stainless Steel
- Steel

Environments

The Radiation Monitoring System components are exposed to the following environments:

- Air
- Air- indoor controlled
- Air - indoor uncontrolled
- Air - outdoor
- Air, Condensation
- Any
- Closed-cycle cooling water >60°C (>140°F)
- Closed-cycle cooling water
- Gas
- Raw Water
- Treated Water

Aging Effects Requiring Management

The following aging effects associated with the Radiation Monitoring System components require management:

- Cracking
- Flow blockage
- Hardening or loss of strength
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Radiation Monitoring System components:

- Water Chemistry (B.2.1.2)
- Bolting Integrity (B.2.1.10)
- Open-Cycle Cooling Water System (B.2.1.11)
- Closed Treated Water Systems (B.2.1.12)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)

- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B.2.1.28)
- TLAA (Section 4.3)

3.3.2.1.38 Hardened Containment Venting System

Materials

The materials of construction for the Hardened Containment Venting System components are:
- Steel

Environments

The Hardened Containment Venting System components are exposed to the following environments:
- Air - indoor uncontrolled
- Air - outdoor
- Underground

Aging Effects Requiring Management

The following aging effects associated with the Hardened Containment Venting System components require management:
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Hardened Containment Venting System components:
- Bolting Integrity (B.2.1.10)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Buried and Underground Piping and Tanks (B.2.1.27)

3.3.2.2 AMR Results for Which Further Evaluation is Recommended by the GALL-SLR Report

NUREG-2191 provides the basis for identifying those programs that warrant further evaluation by the reviewer in the subsequent license renewal application. For the Auxiliary Systems, those programs are addressed in the following subsections.

3.3.2.2.1 Cumulative Fatigue Damage

Evaluations involving time-dependent fatigue or cyclical loading parameters may be time-limited aging analyses (TLAAs), as defined in 10 CFR 54.3. TLAAs are required to be evaluated in accordance with 10 CFR 54.21(c)(1). This TLAA is addressed separately in Section 4.3, “Metal Fatigue” or Section 4.7, “Other Plant-Specific Time-Limited Aging Analyses,” of this SRP-SLR.

For plant-specific cumulative usage factor calculations that are based on stress-based input methods, the methods are to be appropriately defined and discussed in the applicable TLAAs.

Table 3.3.1 Item Number 3.3-1, 001: This item evaluates steel cranes: rails, bridges, structural members, structural components exposed to the environments of air-indoor uncontrolled and air-outdoor for cumulative fatigue damage due to fatigue. Cumulative fatigue damage is evaluated and dispositioned as a TLAA for the Cranes and Hoists System as discussed in Section 4.7.

Table 3.3.1 Item Number 3.3-1, 002: This item evaluates piping, piping components exposed to the environments of diesel exhaust and treated water for cumulative fatigue damage due to fatigue. Cumulative fatigue damage is evaluated and dispositioned as a TLAA for the Emergency High Pressure Makeup, Auxiliary Boiler, High Pressure Fire Protection (Diesel Driven Pump), Off-Gas, Emergency Equipment Cooling Water, Standby Diesel Generator, Standby Liquid Control, Residual Heat Removal Service Water, CO_2 Storage Fire Protection/Purge, Control Rod Drive, Sampling and Water Quality, Radiation Monitoring, and Reactor Water Cleanup Systems, as discussed in Section 4.3.

3.3.2.2.2 Cracking Due to Stress Corrosion Cracking and Cyclic Loading

Cracking due to stress corrosion cracking (SCC) and cyclic loading could occur in stainless steel (SS) PWR nonregenerative heat exchanger tubing exposed to treated borated water greater than 60°C (Celsius) [140°F (Fahrenheit)] in the chemical and volume control system. The existing AMP for monitoring and control of primary water chemistry in PWRs (GALL-SLR Report AMP XI.M2, "Water Chemistry") manages the aging effects of cracking due to SCC. However, control of water chemistry does not preclude cracking due to SCC and cyclic loading. Therefore, the effectiveness of the water chemistry control program should be verified to ensure that cracking is not occurring. If a search of plant-specific operating experience (OE) does not reveal that cracking has occurred in nonregenerative heat exchanger tubing, this aging effect can be considered to be adequately managed by GALL-SLR Report AMP XI.M2. However, if cracking has occurred in nonregenerative heat exchanger tubing, the GALL-SLR Report recommends that AMP XI.M21A, "Closed Treated Water Systems," be evaluated for inclusion of augmented requirements to conduct temperature and radioactivity monitoring of the shell side water, and where component configuration permits, periodic eddy current testing of tubes.

Table 3.3.1 Item Numbers 3.3-1, 003 and 3.3-1, 003a: These Item Numbers are applicable to PWRs only and are not used for BFN.

3.3.2.2.3 Cracking Due to Stress Corrosion Cracking in Stainless Steel Alloys

Cracking due to SCC could occur in indoor or outdoor SS piping, piping components, and tanks exposed to any air, condensation, or underground environment when the component is: (a) uninsulated, (b) insulated, (c) in the vicinity of insulated components, or (d) in the vicinity of potentially transportable halogens. Cracking can occur in environments containing sufficient halides (e.g., chlorides) in the presence of moisture.

Insulated SS components exposed to indoor air, outdoor air, condensation, or underground environments are susceptible to SCC if the insulation contains certain contaminants. Leakage of fluids through bolted connections (e.g., flanges, valve packing) can result in contaminants present in the insulation leaching onto the component surface or the surfaces of other *components below the component. For outdoor insulated SS components, rain and changing weather conditions can result in moisture intrusion into the insulation.*

Plant-specific OE and the condition of SS components are evaluated to determine if prolonged exposure to the plant-specific environments has resulted in SCC. SCC in SS components is not an aging effect requiring management if (a) plant-specific OE does not reveal a history of SCC and (b) a one-time inspection demonstrates that the aging effect is not occurring.

In the environment of air-indoor controlled, SCC is only expected to occur as the result of a source of moisture and halides. Inspections focus on the most susceptible locations.

The applicant documents the results of the plant-specific OE review in the license renewal application (LRA).

The GALL-SLR Report recommends further evaluation of SS piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of SCC. The GALL-SLR Report AMP XI.M32, “One-Time Inspection,” describes an acceptable program to demonstrate that SCC is not occurring. If SCC is applicable, the following AMPs describe acceptable programs to manage loss of material due to SCC: (a) GALL-SLR Report AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” for tanks; (b) GALL-SLR Report AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” for external surfaces of piping and piping components; (c) GALL-SLR Report AMP XI.M41, “Buried and Underground Piping and Tanks,” for underground piping, piping components and tanks; and (d) GALL-SLR Report AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the “detection of aging effects” program element in GALL-SLR Report AMP XI.M32.

The applicant may establish that SCC is not an aging effect requiring management for all components, by demonstrating that a barrier coating isolates the component from aggressive environments. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. The GALL-SLR Report AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks,” describes an acceptable program to manage the integrity of a barrier coating.

<u>Table 3.3.1 Item Number 3.3-1, 004:</u> This item evaluates cracking due to SCC in stainless steel components exposed to air-indoor uncontrolled, air-outdoor, and condensation environments. There are stainless steel components exposed to an environment of air-indoor controlled in BFN Auxiliary Systems. Stainless steel components within the screened-in portions of the Auxiliary Systems are in the following systems: Emergency High Pressure Makeup, Auxiliary Boiler, Fuel Oil, Residual Heat Removal Service Water, Raw Cooling Water, Raw Service Water, High Pressure Fire Protection (Diesel Driven Pump), Potable Water, Air Conditioning, Service Air, Sampling and Water Quality, Hypochlorite, Reactor Building Closed Cooling Water, Reactor

Water Cleanup, Standby Diesel Generators, Radiation Monitoring, Diesel Generator Starting Air and the Diverse and Flexible Coping Strategies (FLEX) Systems.

BFN OE associated with stainless steel components in the Auxiliary Systems has been evaluated to determine if prolonged exposure to the environments of air-indoor uncontrolled, air-outdoor, and condensation has resulted in cracking due to SCC. Cracking has been identified as an aging effect at BFN for stainless steel in these environments, or as a result of transportable halogens, indicating that the environments do contain sufficient halides (e.g., chlorides) in the presence of moisture to result in SCC in the Diesel Generator Starting Air System. This is a conservative assumption based on a lack of information as to the apparent or root cause of the component failure. While there are no known widespread sources of halogens that are inherent to the design of the systems within the EDG building, the fact that the waterproof doors open to an outdoor environment during maintenance, creates the possibility of inadvertently introducing halogens through cross contamination of soil or even deicing salt with components inside the EDG building. Accordingly, BFN will implement the External Surfaces Monitoring of Mechanical Components program (B.2.1.23) to demonstrate that the aging effect of cracking is not occurring in piping, piping components, and tanks exposed to air-indoor uncontrolled, air-outdoor, and condensation for the Diesel Generator Starting Air System.

BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of cracking is not occurring in piping, piping components, and tanks exposed to air-indoor uncontrolled, air-outdoor, and condensation for the Emergency High Pressure Makeup, Auxiliary Boiler, Fuel Oil, Residual Heat Removal Service Water, Raw Cooling Water, Raw Service Water, High Pressure Fire Protection (Diesel Driven Pump), Potable Water, Air Conditioning, Service Air, Sampling and Water Quality, Hypochlorite, Reactor Building Closed Cooling Water, Reactor Water Cleanup, Standby Diesel Generators, Radiation Monitoring, and the Diverse and Flexible Coping Strategies (FLEX) Systems. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program.

<u>Table 3.3.1 Item Number 3.3-1, 094a:</u> This item evaluates cracking due to SCC in stainless steel ducting, ducting components exposed to air, condensation environments in the Air Conditioning, Normal Ventilation, Standby Gas Treatment, and Containment Systems. Plant OE associated with stainless steel ducting and ducting components in the Auxiliary Systems has been evaluated to determine if prolonged exposure to the environments of air and condensation has resulted in cracking due to SCC. Cracking has not been identified as an aging effect at BFN for stainless steel ducting and ducting components exposed to air, condensation environments. Accordingly, BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of cracking is not occurring in stainless steel ducting, ducting components in the Air Conditioning, Normal Ventilation, Standby Gas Treatment and Containment Systems exposed to air, condensation environments. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program.

<u>Table 3.3.1 Item Number 3.3-1, 146:</u> This item evaluates cracking due to SCC in underground stainless steel piping and piping components in the Spent Fuel Pool Cooling and Clean-up System. Plant OE associated with SCC in underground stainless steel piping and piping components has been evaluated in Spent Fuel Pool Cooling and Clean-up. SCC in underground stainless steel piping and piping components in the Spent Fuel Pool Cooling and Clean-up System has not been detected. Accordingly, BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of cracking is not occurring in underground stainless steel piping and piping components in the Spent Fuel Pool Cooling and Clean-up System. Deficiencies will be documented in accordance with 10 CFR Part 50,

Appendix B Corrective Action Program. The One-Time Inspection program is described in Appendix B.

Table 3.3.1 Item Number 3.3-1, 205: This item evaluates cracking due to SCC in tanks in the Sampling and Water Quality System exposed to air and condensation environments. Design specifications for thermal insulation impose limits on leachable concentrations for chlorides and fluorides for insulation used on stainless steel so that SCC is not promoted. Plant OE associated with insulated stainless steel components in the Auxiliary Systems has been evaluated to determine if prolonged exposure to the environments of air and condensation has resulted in cracking due to SCC. Cracking has not been identified as an aging effect at BFN for insulated stainless steel in these environments indicating that moisture intrusion into the insulation and leaching of contaminants present in the insulation onto component surfaces, or onto other components below the insulated component, resulting in SCC has not occurred. Accordingly, BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of cracking is not occurring in tanks in the Sampling and Water Quality System exposed to air and condensation environments. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program is described in Appendix B.

Table 3.3.1 Item Number 3.3-1, 231: Not applicable. There are no stainless steel tanks (within the scope of AMP XI.M29, Outdoor and Large Atmospheric Metallic Storage Tanks exposed to air, condensation in Auxiliary Systems.

3.3.2.2.4 Loss of Material Due to Pitting and Crevice Corrosion in Stainless Steel and Nickel Alloys

Loss of material due to pitting and crevice corrosion could occur in indoor or outdoor SS and nickel alloy piping, piping components, and tanks exposed to any air, condensation, or underground environment when the component is: (a) uninsulated; (b) insulated; (c) in the vicinity of insulated components; or (d) in the vicinity of potentially transportable halogens. Loss of material due to pitting and crevice corrosion can occur on SS and nickel alloys in environments containing sufficient halides (e.g., chlorides) in the presence of moisture.

Insulated SS and nickel alloy components exposed to air, condensation, or underground environments are susceptible to loss of material due to pitting or crevice corrosion if the insulation contains certain contaminants. Leakage of fluids through mechanical connections such as bolted flanges and valve packing can result in contaminants leaching onto the component surface or the surfaces of other components below the component. For outdoor insulated SS and nickel alloy components, rain and changing weather conditions can result in moisture intrusion into the insulation.

Plant-specific OE and the condition of SS and nickel alloy components are evaluated to determine if prolonged exposure to the plant-specific environments has resulted in pitting or crevice corrosion. Loss of material due to pitting and crevice corrosion is not an aging effect requiring management for SS and nickel alloy components if (a) plant-specific OE does not reveal a history of loss of material due to pitting or crevice corrosion; and (b) a one-time inspection demonstrates that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the subsequent period of extended operation. The applicant documents the results of the plant-specific OE review in the SLRA.

In the environment of air-indoor controlled, pitting and crevice corrosion is only expected to occur as the result of a source of moisture and halides. Inspections focus on the most susceptible locations.

The GALL-SLR Report recommends further evaluation of SS and nickel alloy piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of loss of material due to pitting and crevice corrosion. GALL-SLR Report AMP XI.M32, "One- Time Inspection," describes an acceptable program to demonstrate that loss of material due to pitting and crevice corrosion is not occurring at a rate that affects the intended function of the components. If loss of material due to pitting or crevice corrosion has occurred and is sufficient to potentially affect the intended function of an SSC, the following AMPs describe acceptable programs to manage loss of material due to pitting or crevice corrosion: (a) GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," for tanks; (b) GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," for external surfaces of piping and piping components; (c) GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," for underground piping, piping components and tanks; and (d) GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in GALL-SLR Report AMP XI.M32.

The applicant may establish that loss of material due to pitting and crevice corrosion is not an aging effect requiring management by demonstrating that a barrier coating isolates the component from aggressive environments. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating.

<u>Table 3.3.1 Item Number 3.3-1, 006:</u> This item evaluates loss of material due to pitting and crevice corrosion in stainless steel components exposed to air-indoor uncontrolled, air-outdoor, and condensation environments. There are stainless steel components exposed to an environment of air-indoor controlled in Auxiliary Systems. There are no nickel alloy components in the Auxiliary Systems. Stainless steel components within the screened-in portions of the Auxiliary Systems are in the following systems: Emergency High Pressure Makeup, Auxiliary Boiler, Fuel Oil, Raw Cooling Water, High Pressure Fire Protection (Diesel Driven Pump), Potable Water, Air Conditioning, Control Air, Carbon Dioxide, Sampling and Water Quality, Hypochlorite, Off-Gas, Standby Liquid Control, Emergency Equipment Cooling Water, Reactor Water Cleanup, Reactor Building Closed Cooling Water, Auxiliary Decay Heat Removal, Containment Inerting, Radiation Monitoring, Radwaste, Spent Fuel Pool Cooling/Cleanup, Supplemental Diesel Generator, Control Rod Drive, and Diverse and Flexible Coping Strategies (FLEX) Systems. Plant OE associated with stainless steel components in the Auxiliary Systems has been evaluated to determine if prolonged exposure to the environments of air-indoor uncontrolled, air-outdoor, and condensation has resulted in loss of material due to pitting and crevice corrosion. OE identified loss of material on stainless steel components in the following systems: Air Conditioning (AC), Emergency Equipment Cooling Water (EECW), Reactor Water

Cleanup (RWCU), Auxiliary Decay Heat Removal (ADHR) and Control Rod Drive (CRD) systems.

BFN will implement the Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) for the internal portions of these components in the Air Conditioning system. BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of loss of material is not occurring on the external surfaces in the Air Conditioning system. BFN will implement the External Surfaces Monitoring of Mechanical Components program (B.2.1.23) to demonstrate that the aging effect will be adequately managed for the EECW system. BFN will implement the External Surfaces Monitoring of Mechanical Components program (B.2.1.23) to demonstrate that the aging effect will be adequately managed for the RWCU system. BFN will implement the External Surfaces Monitoring of Mechanical Components program (B.2.1.23) and the Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) to demonstrate that the aging effect will be adequately managed for the CRD system.

BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of loss of material due to pitting and crevice corrosion in stainless steel components exposed to air-indoor uncontrolled, air-outdoor, and condensation environments for the Auxiliary Boiler, Fuel Oil, Raw Cooling Water, High Pressure Fire Protection (Diesel Driven Pump), Potable Water, Air Conditioning, Control Air, Carbon Dioxide, Sampling, Hypochlorite, Off-Gas, Emergency Equipment Cooling Water, Reactor Building Closed Cooling Water, Auxiliary Decay Heat Removal, Containment Inerting, Radiation Monitoring, Radwaste, Spent Fuel Pool Cooling/ Cleanup, Supplemental Diesel Generator, and Diverse and Flexible Coping Strategies (FLEX) Systems. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program.

<u>Table 3.3.1 Item Number 3.3-1, 094:</u> This item evaluates loss of material due to pitting, crevice corrosion in stainless steel ducting, ducting components exposed to air, condensation environments in the Air Conditioning and Normal Ventilation systems. Plant OE associated with stainless steel ducting and ducting components in the Auxiliary Systems has been evaluated to determine if prolonged exposure to the environments of air and condensation has resulted in loss of material due to pitting, crevice corrosion. Loss of material due to pitting, crevice corrosion has not been identified as an aging effect at BFN for stainless steel ducting and ducting components exposed to air, condensation environments in the Air Conditioning, Normal Ventilation, and Standby Gas Treatment and Containment Systems. Accordingly, BFN will implement the One-Time Inspection program (B.2.1.20) program to demonstrate that the aging effect of evaluates loss of material due to pitting, crevice corrosion is not occurring in stainless steel ducting, ducting components in the Air Conditioning, Normal Ventilation, Standby Gas Treatment and Containment Systems exposed to air, condensation environments. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program.

<u>Table 3.3.1 Item Number 3.3-1, 222:</u> This item evaluates loss of material due to pitting and crevice corrosion in stainless steel tanks exposed to air-indoor uncontrolled and condensation environments. There are no stainless steel tanks exposed to an environment of air-indoor controlled in the Auxiliary Systems. There are no nickel alloy tanks in the Auxiliary Systems. Plant OE associated with stainless steel components in the Auxiliary Systems has been evaluated to determine if prolonged exposure to the environments of air-indoor uncontrolled and condensation has resulted in loss of material due to pitting and crevice corrosion. Loss of material has not been identified as an aging effect at BFN for stainless steel in these environments, or as a result of transportable halogens, indicating that these environments do not

contain sufficient halides (e.g., chlorides) in the presence of moisture to result in loss of material. Accordingly, BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of loss of material is not occurring in stainless steel components exposed to air- indoor uncontrolled and condensation. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program.

<u>Table 3.3.1 Item Number 3.3-1, 228:</u> Not applicable. There are no stainless steel, nickel alloy tanks (within the scope of AMP XI.M29, Outdoor and Large Atmospheric Metallic Storage Tanks) exposed to air, condensation in Auxiliary Systems.

<u>Table 3.3.1 Item Number 3.3-1, 232:</u> This item evaluates loss of material due to pitting and crevice corrosion in insulated stainless steel components exposed to air-outdoor and condensation environments in the Standby Liquid Control, Emergency Equipment Cooling Water, Reactor Water Cleanup, Containment Inerting, Spent Fuel Pool Cleaning/Cleanup and Control Rod Drive systems. Plant OE associated with insulated stainless steel components in the Auxiliary Systems has been evaluated to determine if prolonged exposure to the environments of air-outdoor and condensation has resulted in loss of material due to pitting and crevice corrosion. Loss of material has not been identified as an aging effect at BFN for insulated stainless steel in these environments indicating that moisture intrusion into the insulation and leaching of contaminants present in the insulation onto component surfaces, or onto other components below the insulated component, resulting in loss of material has not occurred. Accordingly, BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of loss of material is not occurring in insulated stainless steel piping and piping components exposed to air- outdoor and condensation. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program.

<u>Table 3.3.1 Item Number 3.3-1, 241:</u> This item evaluates loss of material due to pitting and crevice corrosion in stainless steel heat exchanger components exposed to an air- indoor uncontrolled environment in the Sampling and Water Quality, Auxiliary Decay Heat Removal, Containment Inerting, and Containment Atmosphere Dilution Systems. Plant OE associated with stainless steel components in the Auxiliary Systems has been evaluated to determine if prolonged exposure to the environment of air-indoor uncontrolled has resulted in loss of material due to pitting and crevice corrosion. Loss of material has not been identified as an aging effect at BFN for stainless steel in this environment, or as a result of transportable halogens, indicating that this environment does not contain sufficient halides (e.g., chlorides) in the presence of moisture to result in loss of material. Accordingly, BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of loss of material is not occurring in stainless steel heat exchanger components exposed to air-indoor uncontrolled in the Sampling and Water Quality, Auxiliary Decay Heat Removal, Containment Inerting, and Containment Atmosphere Dilution Systems. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program.

<u>Table 3.3.1 Item Number 3.3-1, 246:</u> This item evaluates loss of material due to pitting, crevice corrosion in underground stainless steel piping and piping components in the Spent Fuel Pool Cooling and Clean-up System. Plant OE associated with loss of material due to pitting, crevice corrosion in underground stainless steel piping and piping components has been evaluated in Spent Fuel Pool Cooling and Clean-up. Loss of material due to pitting, crevice corrosion in underground stainless steel piping and piping components in the Spent Fuel Pool Cooling and Clean-up System has not been detected. Accordingly, BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of loss of material is not occurring in underground stainless steel piping and piping components in the Spent Fuel Pool

Cooling and Clean-up System. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program.

3.3.2.2.5 Quality Assurance for Aging Management of Nonsafety-Related Components

QA provisions applicable to Subsequent License Renewal are discussed in Appendix A, Section A.1.4, and Appendix B, Section B.1.3.

3.3.2.2.6 Ongoing Review of Operating Experience

Ongoing review of operating experience is addressed in Appendix A, Section A.1.5, and Appendix B, Section B.1.4.

3.3.2.2.7 Loss of Material Due to Recurring Internal Corrosion

Recurring internal corrosion can result in the need to augment AMPs beyond the recommendations in the GALL-SLR Report. During the search of plant-specific OE conducted during the SLRA development, recurring internal corrosion can be identified by the number of occurrences of aging effects and the extent of degradation at each localized corrosion site. This further evaluation item is applicable if the search of plant specific OE reveals repetitive occurrences. The criteria for recurrence is (a) a 10 year search of plant specific OE reveals the aging effect has occurred in three or more refueling outage cycles; or (b) a 5 year search of plant specific OE reveals the aging effect has occurred in two or more refueling outage cycles and resulted in the component either not meeting plant specific acceptance criteria or experiencing a reduction in wall thickness greater than 50 percent (regardless of the minimum wall thickness).

The GALL-SLR Report recommends that GALL-SLR Report AMP XI.M20, “Open-Cycle Cooling Water System,” GALL-SLR Report AMP XI.M27, “Fire Water System,” or GALL- SLR Report AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” be evaluated for inclusion of augmented requirements to ensure the adequate management of any recurring aging effect(s). Alternatively, a plant-specific AMP may be proposed. Potential augmented requirements include: alternative examination methods (e.g., volumetric versus external visual), augmented inspections (e.g., a greater number of locations, additional locations based on risk insights based on susceptibility to aging effect and consequences of failure, a greater frequency of inspections), and additional trending parameters and decision points where increased inspections would be implemented.

The applicant states: (a) why the program's examination methods will be sufficient to detect the recurring aging effect before affecting the ability of a component to perform its intended function, (b) the basis for the adequacy of augmented or lack of augmented inspections, (c) what parameters will be trended as well as the decision points where increased inspections would be implemented (e.g., the extent of degradation at individual corrosion sites, the rate of degradation change), (d) how inspections of components that are not easily accessed (i.e., buried, underground) will be conducted, and (e) how leaks in any involved buried or underground components will be identified.

Plant-specific OE examples should be evaluated to determine if the chosen AMP should be augmented even if the thresholds for significance of aging effect or frequency of occurrence of aging effect have not been exceeded. For example, during a 10-year search of plant-specific OE, two instances of 360 degree 30 percent wall loss occurred at copper alloy to steel joints. Neither the significance of the aging effect nor the frequency of occurrence of aging effect threshold has been exceeded. Nevertheless, the OE should be evaluated to determine if the AMP that is *proposed to manage the aging effect is sufficient (e.g., method of inspection, frequency of inspection, number of inspections) to provide reasonable assurance that the current licensing basis (CLB) intended functions of the component will be met throughout the subsequent period of extended operation. While recurring internal corrosion is not as likely in other environments as raw water and waste water (e.g., treated water), the aging effect should be addressed in a similar manner.*

Table 3.3.1 Item Number 3.3-1, 127: The review of plant specific OE has identified no recurring internal corrosion in metallic piping, piping components, tanks exposed to raw water, raw water (potable), treated water, or waste water in the screened in portions of Raw Cooling Water, Raw Service Water, RHR Service Water, High Pressure Fire Protection, and Emergency Equipment Coolant Water Systems. However, since internal Operating Experience has shown that there have been significant numbers of piping through wall leaks and/or minimum wall thickness readings within the BFN raw water systems, recurring internal corrosion is assumed. Therefore, as described below, BFN will implement the Open-Cycle Cooling Water System program (B.2.1.11) to manage recurring internal corrosion in the piping, piping components, tanks exposed to raw water, raw water (potable), treated water, or waste water systems. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The Open-Cycle Cooling Water System program is described in Appendix B.

The Open Cycle Cooling Program is controlled by a BFN procedure for Raw Water Fouling and Corrosion Control. This procedure defines and implements responsibilities and requirements of TVA Nuclear Power Group Standard Programs and Process procedure for Raw Water Corrosion Program and the applicable BFN Generic Letter 89-13 actions required to mitigate raw water fouling and corrosion related degradation in RHRSW, EECW, and raw water systems. The details of responsible organizations, inspection and testing requirements, and chemical treatment are specified in BFN procedure. The BFN procedure utilizes visual inspections, nondestructive testing (i.e., ultrasonic testing, and eddy current testing), material for corrosion and deposit control, and heat exchanger and component cleaning on a periodic basis to measure surface conditions and the extent of wall thinning.

With regard to normally inaccessible piping, piping components (i.e., buried, underground), Opportunistic internal visual inspections are conducted to identify loss of material, fouling, and cracking prior to loss of intended function.

Heat transfer capabilities are verified through inspection and cleaning whenever a raw water system is opened. Preventive maintenance work orders direct the cleaning, maintenance, and testing of raw water systems and components. System engineering performs inspections on all GL 89-13 components, completes required evaluations, and along with the heat exchanger coordinator, performs damage assessment and corrective action determination for heat exchangers.

In addition to being covered by the Open Cycle Cooling Water System Program, as described below, BFN will implement the Fire Water System program (B.2.1.16) to manage the potential for recurring internal corrosion in the Fire Water System. The Fire Water System Program applies to water-based fire protection systems that consist of sprinklers, nozzles, fittings, valves, hydrants, hose stations, standpipes, water storage tanks, and aboveground and underground piping and components that are tested in accordance with the applicable National Fire Protection Association codes and standards. The Fire Water System tests are mandated by the BFN NFPA 805 Fire Protection Report, which is incorporated by reference into the BFN FSAR.

Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The Fire Water System program is described in Appendix B.

The continued implementation of the Open-Cycle Cooling Water System program (B.2.1.11) and Fire Water System program (B.2.1.16) provide reasonable assurance that the aging effects will be managed so that the systems and components within the scope of this program will continue to perform their intended functions consistent with the current licensing basis for the period of extended operation.

3.3.2.2.8 Cracking Due to Stress Corrosion Cracking in Aluminum Alloys

SCC is a form of environmentally assisted cracking which is known to occur in high and moderate strength aluminum alloys. The three conditions necessary for SCC to occur in a component are a sustained tensile stress, aggressive environment, and material with a susceptible microstructure. Cracking due to SCC can be mitigated by eliminating one of the three necessary conditions. For the purposes of SLR, acceptance criteria for this further evaluation is being provided for demonstrating that the specific material is not susceptible to SCC or an aggressive environment is not present. Cracking due to SCC is an aging effect requiring management unless it is demonstrated by the applicant that one of the two necessary conditions discussed below is absent.

<u>Susceptible Material:</u> *If the material is not susceptible to SCC then cracking is not an aging effect requiring management. The microstructure of an aluminum alloy, of which alloy composition is only one factor, is what determines if the alloy is susceptible to SCC. Therefore, determining susceptibility based on alloy composition alone is not adequate to conclude whether a particular material is susceptible to SCC. The temper, condition, and product form of the alloy is considered when assessing if a material is susceptible to SCC. Aluminum alloys that are susceptible to SCC include:*

- *2xxx series alloys in the F, W, Ox, T3x, T4x, or T6x temper*
- *5xxx series alloys with a magnesium content of 3.5 weight percent or greater*
- *6xxx series alloys in the F temper*
- *7xxx series alloys in the F, T5x, or T6x temper*
- *2xx.x and 7xx.x series alloys*
- *3xx.x series alloys that contain copper*
- *5xx.x series alloys with a magnesium content of greater than 8 weight percent*

The material is evaluated to verify that it is not susceptible to SCC and that the basis used to make the determination is technically substantiated. Tempers have been specifically developed to improve the SCC resistance for some aluminum alloys.

Aluminum alloy and temper combination which are not susceptible to SCC when used in piping, piping component, and tank applications include 1xxx series, 3xxx series, 6061-T6x, and 5454-x. If it is determined that a material is not susceptible to SCC, the SLRA provides the components/locations where it is used, alloy composition, temper or condition, product form, and for tempers not addressed above, the basis used to determine the alloy is not susceptible and technical information substantiating the basis.

<u>Aggressive Environment:</u> *If the environment to which an aluminum alloy is exposed is not aggressive, such as dry gas or treated water, then cracking due to SCC will not occur and it is not an aging effect requiring management. Aggressive environments that are known to result in*

cracking due to SCC of susceptible aluminum alloys are aqueous solutions, air, condensation, and underground locations that contain halides (e.g., chloride). Halide concentrations should be considered high enough to facilitate SCC of aluminum alloys in uncontrolled or untreated aqueous solutions and air, such as raw water, waste water, condensation, underground locations, and outdoor air, unless demonstrated otherwise.

Halides could be present on the surface of the aluminum material if the component is encapsulated in a material such as insulation or concrete. In a controlled or uncontrolled indoor air, condensation, or underground environment, sufficient halide concentrations to cause SCC could be present due to secondary sources such as leakage from nearby components (e.g., leakage from insulated flanged connections or valve packing). If an aluminum component is exposed to a halide-free indoor air environment, not encapsulated in materials containing halides, and the exposure to secondary sources of moisture or halides is precluded, cracking due to SCC is not expected to occur. The plant-specific configuration can be used to demonstrate that exposure to halides will not occur. If it is determined that SCC will not occur because the environment is not aggressive, the SLRA provides the components and locations exposed to the environment, a description of the environment, basis used to determine the environment is not aggressive, and technical information substantiating the basis. The GALL-SLR Report AMP XI.M32, "One-Time Inspection," and a review of plant-specific OE describe an acceptable means to confirm the absence of moisture or halides within the proximity of the aluminum component.

If the environment potentially contains halides, GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," describes an acceptable program to manage cracking due to SCC of aluminum tanks. GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," describes an acceptable program to manage cracking due to SCC of aluminum piping and piping components. GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," describes an acceptable program to manage cracking due to SCC of aluminum piping and tanks which are buried or underground. GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," describes an acceptable program to manage cracking due to SCC of aluminum components that are not included in other AMPs.

An alternative strategy to demonstrating that an aggressive environment is not present is to isolate the aluminum alloy from the environment using a barrier to prevent SCC. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating for internal or external coatings.

<u>Table 3.3.1 Item Number 3.3-1, 186:</u> Not applicable. There are no aluminum tanks (within the scope of AMP XI.M29, Outdoor and Large Atmospheric Metallic Storage Tanks) exposed to air, condensation, soil, concrete, raw water, waste water in screened in portions of BFN Auxiliary Systems.

<u>Table 3.3.1 Item Number 3.3-1, 189:</u> This item evaluates cracking due to SCC in aluminum piping, piping components, tanks exposed to air, condensation, raw water, raw water (potable), or waste water environments. There are aluminum alloy components exposed to these environments in screened in portions of BFN Auxiliary Systems. Aluminum piping, piping components, tanks exposed to air, condensation, raw water, raw water (potable), waste water within the screened-in portions of the Auxiliary Systems are located in the following systems:

Fuel Oil, CO_2 Storage Fire Protection/Purge, Containment, Standby Liquid Control, Reactor Building Closed Cooling Water and Radiation Monitoring Systems. The component types in the identified systems are exposed to air, condensation, raw water, raw water (potable) or waste water and are constructed of aluminum alloys that are susceptible to SCC, or assumed susceptible to SCC because the specific series of the aluminum alloy is unknown. Therefore, SCC is a predicted aging effect and aging management of these components for SCC is required. Plant OE associated with aluminum alloy components in the Auxiliary Systems has been evaluated to determine if prolonged exposure to the environment of air, condensation, raw water, raw water (potable) or waste water would result in cracking due to SCC from halide exposure. Cracking has not been identified as an aging effect at BFN for aluminum alloy in this environment, or as a result of exposure to secondary sources, confirming the absence of moisture or halides within the proximity of the aluminum alloy components. Accordingly, BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of cracking is not occurring in the aluminum alloy piping and piping components identified above that are susceptible to SCC and exposed to air, condensation, raw water, raw water (potable) or waste water. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program is described in Appendix B.

Table 3.3.1 Item Number 3.3-1, 192: Not applicable. There are no aluminum underground piping, piping components, and tanks in screened in portions of BFN Auxiliary Systems.

Table 3.3.1 Item Number 3.3-1, 233: There are insulated aluminum piping, piping components, and tanks exposed to air and condensation in screened in portions of the High Pressure Fire Protection System (Diesel water heater tank for the gate 2 diesel driven fire pump) for BFN Auxiliary Systems. Plant OE associated with insulated aluminum piping, piping components, and tanks in the screened in portions of BFN Auxiliary Systems has been evaluated to determine if prolonged exposure to air and condensation environment will result in cracking due to stress corrosion cracking (SCC). SCC has not been identified as an aging effect at BFN for insulated aluminum piping, piping components, and tanks in this environment. Accordingly, BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of cracking is not occurring in the insulated aluminum alloy piping and piping components and tanks identified above that are susceptible to SCC and exposed to air, condensation. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program is described in Appendix B.

Table 3.3.1 Item Number 3.3-1, 254: Not Applicable. There are no aluminum heat exchanger components exposed to air or condensation susceptible to cracking in screened in portions of the BFN Auxiliary Systems. A review of BFN OE and work orders for the coolers identified no instances where aluminum alloys in an air/gas environment had an aging related failure mechanism for any components in the screened in portions of BFN Auxiliary Systems. However, in Engineered Safety Features Systems, components have been aligned to this Item Number, and include the aluminum alloy for the Core Spray and RHR Room Cooler fins. These flat plate fins are constructed of an aluminum alloy for which the specific type was not determined. Pure aluminum is not susceptible to SCC, however, aluminum alloys containing more than 12% zinc or more than 6% magnesium are very susceptible to cracking under mild corrosive environments. Aluminum alloys are susceptible to SCC in air and water vapor environments as well as in corrosive environment containing chloride solutions and saltwater. Generally, a wetted condition is required to cause SCC. The air/gas environment for the Core Spray and RHR room coolers does not contain the level of moisture necessary to be considered a wetted environment nor does the environment have chloride solutions or saltwater. SCC is not a concern for aluminum and aluminum alloys related to BFN Auxiliary Systems.

3.3.2.2.9 Loss of Material Due to General, Crevice or Pitting Corrosion and Cracking Due to Stress Corrosion Cracking

Loss of material due to general (steel only), crevice, or pitting corrosion, and cracking due to SCC (SS only) can occur in steel and SS piping and piping components exposed to concrete. Concrete provides a high alkalinity environment that can mitigate the effects of loss of material for steel piping, thereby significantly reducing the corrosion rate. However, if water intrudes through the concrete, the pH can be reduced and ions that promote loss of material such as chlorides, which can penetrate the protective oxide layer created in the high alkalinity environment, can reach the surface of the metal. Carbonation can reduce the pH within concrete. The rate of carbonation is reduced by using concrete with a low water-to-cement ratio and low permeability. Concrete with low permeability also reduces the potential for the penetration of water. Adequate air entrainment improves the ability of the concrete to resist freezing and thawing cycles and therefore reduces the potential for cracking and intrusion of water. Cracking due to SCC, as well as pitting and crevice corrosion can occur due to halides present in the water that penetrates to the surface of the metal.

If the following conditions are met, loss of material is not considered to be an applicable aging effect for steel: (a) attributes of the concrete are consistent with American Concrete Institute (ACI) 318 or ACI 349 (low water-to-cement ratio, low permeability, and adequate air entrainment) as cited in NUREG-1557; (b) plant-specific OE indicates no degradation of the concrete that could lead to penetration of water to the metal surface; and (c) the piping is not potentially exposed to groundwater. For SS components, loss of material and cracking due to SCC are not considered to be applicable aging effects as long as the piping is not potentially exposed to groundwater. Where these conditions are not met, loss of material due to general (steel only), crevice, or pitting corrosion, and cracking due to SCC (SS only) are identified as applicable aging effects. GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," describes an acceptable program to manage these aging effects.

<u>Table 3.3.1 Item Number 3.3-1, 112:</u> Loss of material for steel piping and piping components with an external environment of concrete can occur for components in the Auxiliary Systems that are potentially exposed to groundwater at the soil-concrete interface. BFN will manage loss of material for steel piping and piping components exposed to concrete (and potentially exposed to groundwater) in the Auxiliary Systems with the Buried and Underground Piping and Tanks program (B.2.1.27). Steel components within the screened-in portions of the Auxiliary Systems are located in the following systems: Fuel Oil, Residual Heat Removal Service Water, High Pressure Fire Protection (Diesel Driven Pump), Emergency Equipment Cooling Water, Radwaste and Spent Fuel Pool Cooling/Cleanup Systems. The Auxiliary Systems includes steel piping and tanks exposed to concrete. A review of OE for BFN indicates there are occurrences of concrete degradation, in some systems, that could lead to the penetration of water to the metal surface; therefore, a loss of material due to general, pitting, and crevice corrosion of steel piping and tanks exposed to concrete is an aging effect that requires management. It should be noted that some systems within the Auxiliary Systems have steel components exposed to concrete (e.g., Fuel Oil and Spent Fuel Pool Cooling/Cleanup Systems) but are located indoors and shielded from an outdoor environment which would not require aging management. Consistent with the recommendation of GALL-SLR, the Buried and Underground Piping and Tanks program (B.2.1.27) is used to manage loss of material in steel piping and tanks exposed to concrete. This program provides for the management of aging effects. Any evidence of loss of material will be

evaluated for acceptability. Conditions will be documented in accordance with the 10 CFR Part 50, Appendix B Corrective Action Program. Loss of material aging effect is addressed is by Table 3.3-1 item 3.3-1, 109. These aging effects are managed by the Buried and Underground Piping and Tanks program, as described in Appendix B.

Table 3.3.1 Item Number 3.3-1, 202: Stainless steel piping, piping components exposed to concrete in the Spent Fuel Pool Cooling/Cleanup System components are indoor and not exposed to groundwater, therefore loss of material and cracking are considered to be not applicable aging effects. Loss of material for SS piping and piping components with an external environment of concrete can occur for components in the Auxiliary Systems that are potentially exposed to groundwater at the soil-concrete interface. BFN will manage loss of material for SS piping and piping components exposed to concrete (and potentially exposed to groundwater) in the Auxiliary Systems with the Buried and Underground Piping and Tanks program (B.2.1.27). The loss of material is addressed by Item Number 3.3-1, 107. Cracking is addressed by Item Number 3.3-1, 144. These aging effects are managed by the Buried and Underground Piping and Tanks program, as described in Appendix B

The Auxiliary Systems includes Stainless Steel piping and tanks exposed to concrete. A review of OE for BFN indicates there are occurrences of concrete degradation, in some systems, that could lead to the penetration of water to the metal surface; therefore, a loss of material due to general, pitting, and crevice corrosion of stainless-steel piping and tanks exposed to concrete is an aging effect that requires management. It should be noted that some systems within the Auxiliary Systems have SS and steel components exposed to concrete (e.g., Spent Fuel Pool Cooling/Cleanup System), but are located indoors and shielded from an outdoor environment which would not require aging management. The Buried and Underground Piping and Tanks program (B.2.3.27) is used to manage loss of material in steel piping and tanks exposed to concrete. This program provides for the management of aging effects. Any evidence of loss of material will be evaluated for acceptability. Conditions will be documented in accordance with the 10 CFR Part 50, Appendix B Corrective Action Program. The Buried and Underground Piping and Tanks program is described in Appendix B.

3.3.2.2.10 Loss of Material Due to Pitting and Crevice Corrosion in Aluminum Alloys

Loss of material due to pitting and crevice corrosion could occur in aluminum piping, piping components, and tanks exposed to an air, condensation, underground, raw water, or waste water environment for a sufficient duration of time. Environments that can result in pitting and/or crevice corrosion of aluminum alloys are those that contain halides (e.g., chloride) in the presence of moisture. The moisture level and halide concentration in atmospheric and uncontrolled air are greatly dependent on geographical location and site-specific conditions. Moisture level and halide concentration should be considered high enough to facilitate pitting and/or crevice corrosion of aluminum alloys in atmospheric and uncontrolled air, unless demonstrated otherwise. The periodic introduction of moisture or halides into an environment from secondary sources should also be considered. Leakage of fluids from mechanical connections (e.g., insulated bolted flanges and valve packing); onto a component in indoor controlled air is an example of a secondary source that should be considered. Halide concentrations should be considered high enough to facilitate loss of material of aluminum alloys in untreated aqueous solutions, unless demonstrated otherwise. Plant-specific OE and the condition of aluminum alloy components are evaluated to determine if prolonged exposure to the plant-specific air, condensation, underground, or water environments has resulted in pitting or crevice corrosion. Loss of material due to pitting and crevice corrosion is not an aging effect requiring management for aluminum alloys if (a) plant-specific OE does not reveal a history of loss of material due to *pitting or crevice corrosion and (b) a one-time inspection demonstrates that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components. The applicant documents the results of the plant-specific OE review in the SLRA.*

In the environment of air-indoor controlled, pitting and crevice corrosion is only expected to occur as the result of a source of moisture and halides. Alloy susceptibility may be considered when reviewing OE and interpreting inspection results. Inspections focus on the most susceptible alloys and locations.

The GALL-SLR Report recommends the further evaluation of aluminum piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of loss of material due to pitting and crevice corrosion. GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that the aging effect of loss of material due to pitting and crevice corrosion is not occurring at a rate that will affect the intended function of the components. If loss of material due to pitting or crevice corrosion has occurred and is sufficient to potentially affect the intended function of an SSC, the following AMPs describe acceptable programs to manage loss of material due to pitting and crevice corrosion: (i) GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," for tanks; (ii) GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," for external surfaces of piping and piping components; (iii) GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," for underground piping, piping components and tanks; and (iv) GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in GALL-SLR Report AMP XI.M32.

An alternative strategy to demonstrating that an aggressive environment is not present is to isolate the aluminum alloy from the environment using a barrier to prevent loss of material due to pitting and crevice corrosion. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. The GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," or equivalent program, describes an acceptable program to manage the integrity of a barrier coating.

Table 3.3.1 Item Number 3.3-1, 223: Not applicable. There are no aluminum underground piping, piping components, and tanks in screened in portions of BFN Auxiliary Systems. Plant OE associated with aluminum underground piping, piping components, and tanks in the screened in portions of BFN Auxiliary Systems has been evaluated to determine if prolonged exposure to an underground environment will result in loss of material due to pitting and crevice corrosion. Loss of material has not been identified as an aging effect at BFN for aluminum underground piping, piping components, and tanks in this environment.

Table 3.3.1 Item Number 3.3-1, 227: Not applicable. There are no aluminum tanks (within the scope of AMP XI.M29, Outdoor and Large Atmospheric Metallic Storage Tanks) exposed to air or condensation in screened in portions of BFN Auxiliary Systems.

Table 3.3.1 Item Number 3.3-1, 234: This item evaluates loss of material due to pitting and crevice corrosion in aluminum alloy components exposed to air-indoor uncontrolled and condensation environments. There are aluminum alloy components identified for screened in portions which are exposed to an environment of air-indoor controlled in Auxiliary Systems. All components aligned to this Item Number have been evaluated and assumed to be potentially susceptible to loss of material due to pitting and crevice corrosion as a result of exposure to halides (e.g., chlorides). Aluminum alloy components within the screened-in portions of the Auxiliary Systems are located in the following systems: Fuel Oil, Residual Heat Removal Service Water, High Pressure Fire Protection (Diesel Driven Pump), Air Conditioning, Control Air, Containment, Containment Inerting, Spent Fuel Pool Cooling/Cleanup, Control Rod Drive, Radiation Monitoring and Diesel Generator Starting Air Systems. Plant OE associated with aluminum alloy components in the Auxiliary Systems has been evaluated to determine if prolonged exposure to the environments of air-indoor uncontrolled and condensation will result in loss of material due to pitting and crevice corrosion. Loss of material has not been identified as an aging effect at BFN in the Fuel Oil, Residual Heat Removal Service Water, High Pressure Fire Protection (Diesel Driven Pump), Air Conditioning, Control Air, Containment, Containment Inerting, Spent Fuel Pool Cooling/Cleanup, Control Rod Drive and Diesel Generator Starting Air Systems for aluminum alloy in these environments, or as a result of exposure to secondary sources, indicating that the environments do not contain sufficient halides in the presence of moisture to result in loss of material. Accordingly, BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of loss of material is not occurring in aluminum alloy piping, piping components exposed to air- indoor uncontrolled and condensation. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program is described in Appendix B.

BFN OE review identified loss of material on aluminum alloy components in the Radiation Monitoring System. Accordingly, BFN will implement the Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) for the internal portions of these components in the Radiation Monitoring System. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program is described in Appendix B.

Table 3.3.1 Item Number 3.3-1, 240: Not applicable. There are no aluminum heat exchanger components exposed to waste water identified in screened in portions of BFN Auxiliary Systems.

Table 3.3.1 Item Number 3.3-1, 242: This item evaluates loss of material due to pitting and crevice corrosion in aluminum alloy heat exchanger components exposed to a condensation environment. There are aluminum alloy heat exchanger components identified for screened in portions of Air Conditioning, Emergency Equipment Core Cooling, and Standby Diesel Generators of Auxiliary Systems which are exposed to the environments of air-indoor uncontrolled or air-indoor controlled in BFN Auxiliary Systems. All components aligned to this Item Number have been evaluated and assumed to be potentially susceptible to loss of material due to pitting and crevice corrosion as a result of exposure to halides (e.g., chlorides). Plant OE associated with aluminum alloy components in the Auxiliary Systems has been evaluated to determine if prolonged exposure to the environment of condensation will result in loss of material due to pitting and crevice corrosion. Loss of material has not been identified as an aging effect at BFN for aluminum alloy heat exchanger components in this environment, or as a result of exposure to secondary sources, indicating that this environment does not contain sufficient halides in the presence of moisture to result in loss of material. Accordingly, BFN will implement the One-Time Inspection program (B.2.1.20) to demonstrate that the aging effect of loss of material is not occurring in aluminum alloy heat exchanger components exposed to condensation. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program is described in Appendix B.

Table 3.3.1 Item Number 3.3-1, 245: Not applicable. There are no insulated aluminum piping, piping components, and tanks exposed to air and condensation identified in screened in portions of BFN Auxiliary Systems.

Table 3.3.1 Item Number 3.3-1, 247: Not Applicable. There are no aluminum piping, piping components, tanks exposed to raw water, waste water identified in screened in portions of BFN Auxiliary Systems.

3.3.2.3 Time-Limited Aging Analysis

The time-limited aging analyses identified below are associated with the Auxiliary Systems components:

- Section 4.3, Metal Fatigue Analyses
  - Section 4.3.2, Metal Fatigue of Class 1 Components
  - Section 4.3.4, Metal Fatigue of Non-Class 1 Components
  - Section 4.3.7, Emergency Equipment Cooling Water Weld Flaws Evaluation
- Section 4.7, Other Plant-Specific Analyses
  - Section 4.7.1, Reactor Building Crane Cyclic Loading

3.3.3 Conclusion

The Auxiliary Systems components that are subject to aging management review have been identified in accordance with the requirements of 10 CFR 54.4. The aging management programs selected to manage aging effects for the Auxiliary Systems components are identified in the summaries in Section 3.3.2.1 above.

A description of these aging management programs is provided in Appendix B, along with the demonstration that the identified aging effects will be managed for the subsequent period of extended operation.

Therefore, based on the conclusions provided in Appendix B, the effects of aging associated with the Auxiliary Systems components will be adequately managed so that there is reasonable assurance that the intended functions are maintained consistent with the current licensing basis during the subsequent period of extended operation.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 001	Steel cranes: bridges, structural members, structural components exposed to any environment	Cumulative fatigue damage due to fatigue	TLAA, SRP-SLR Section 4.7 “Other Plant-Specific TLAAs”	Yes	Consistent with NUREG-2191. Fatigue is a TLAA; further evaluation is documented in Subsection 3.3.2.2.1.
3.3-1, 002	Stainless steel, steel heat exchanger components and tubes, piping, piping components exposed to any environment	Cumulative fatigue damage due to fatigue	TLAA, SRP-SLR Section 4.3 “Metal Fatigue”	Yes	Consistent with NUREG-2191. Fatigue is a TLAA; further evaluation is documented in Subsection 3.3.2.2.1.
3.3-1, 003	PWR Only				
3.3-1, 003a	PWR Only				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 004	Stainless steel piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks””	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage cracking of stainless steel piping, piping components, and tanks exposed to air- indoor uncontrolled, air-outdoor, and condensation program will be used to manage cracking of stainless steel heat exchanger components, piping, piping components, and tanks exposed to air and condensation. Impacted systems include, Emergency High Pressure Makeup, Auxiliary Boiler, Fuel Oil, Residual Heat Removal Service Water, Raw Cooling Water, Raw Service Water, High Pressure Fire Protection (Diesel Driven Pump), Potable Water, Air Conditioning, Service Air, Sampling and Water Quality, Hypochlorite, Radiation Monitoring, Reactor Building Closed Cooling Water, Reactor Water Cleanup, Standby Diesel Generators and FLEX Systems. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage cracking of stainless steel piping, piping components, and tanks exposed to air and condensation. Impacted systems include the Diesel Generator Starting Air System. See Subsection 3.3.2.2.3.
3.3-1, 005	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 006	Stainless steel, nickel alloy piping, piping components exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage loss of material in stainless steel piping, piping components, and tanks exposed to air-indoor uncontrolled, air and condensation. Impacted systems include, Emergency High Pressure Makeup, Auxiliary Boiler, Fuel Oil, Raw Cooling Water, High Pressure Fire Protection (Diesel Driven Pump), Potable Water, Air Conditioning (external surfaces), Control Air, CO_2 Storage Fire Protection/ Purge, Emergency Equipment Cooling Water, Sampling and Water Quality, Hypochlorite, Off-Gas, Reactor Building Closed Cooling Water, Auxiliary Decay Heat Removal, Containment Inerting, Radiation Monitoring, Radwaste, Spent Fuel Pool Cooling/Cleanup, Supplemental Diesel Generator, Standby Liquid Control, FLEX Systems. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage loss of material in stainless steel piping, piping components exposed to air and condensation for the Emergency Equipment Cooling Water, Reactor Water Cleanup and Control Rod Drive Systems. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material in stainless steel piping, piping components exposed to air and condensation in the Air Conditioning and Control Rod Drive Systems. See Subsection 3.3.2.2.4.
3.3-1, 007	PWR Only				
3.3-1, 008	PWR Only				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 009	PWR Only				
3.3-1, 010	High-strength steel closure bolting exposed to air, soil, underground	Cracking due to SCC; cyclic loading	AMP XI.M18, "Bolting Integrity"	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage cracking due to SCC, cyclic loading of high-strength steel closure bolting exposed to air, soil, underground within the screened-in portions of the Emergency High Pressure Makeup, Auxiliary Boiler, Fuel Oil, Residual Heat Removal Service Water, Raw Cooling Water, Raw Service Water, High Pressure Fire Protection (Diesel Driven Pump), Potable Water, Normal Ventilation, Air Conditioning, Control Air, Service Air, CO_2 Storage Fire Protection/Purge, Station Drainage, Sampling and Water Quality, Building Heating, Hypochlorite, Demineralizer Backwash Air, Standby Liquid Control, Off-Gas, Emergency Equipment Cooling Water, Radiation Monitoring, Reactor Water Cleanup, Reactor Building Closed Cooling Water, Auxiliary Decay Heat Removal, Containment Inerting, Radwaste, Spent Fuel Pool Cooling/Cleanup, Standby Diesel Generators, Supplemental Diesel Generator, Control Rod Drive, Diesel Generator Starting Air and FLEX Systems.
3.3-1, 011	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 012	Steel; stainless steel, nickel alloy closure bolting exposed to air – indoor uncontrolled, air –outdoor, condensation	Loss of material due to general (steel only), pitting, crevice corrosion	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage loss of material of carbon and low alloy steel and stainless steel closure bolting exposed to air-indoor uncontrolled, air-outdoor, and condensation in the Emergency High Pressure Makeup, Auxiliary Boiler, Fuel Oil, Radiation Monitoring, Residual Heat Removal Service Water, Raw Cooling Water, Raw Service Water, High Pressure Fire Protection (Diesel Driven Pump), Potable Water, Normal Ventilation, Air Conditioning, Control Air, Service Air, CO_2 Storage Fire Protection/Purge, Station Drainage, Sampling and Water Quality, Building Heating, Hypochlorite, Demineralizer Backwash Air, Standby Liquid Control, Off-Gas, Emergency Equipment Cooling Water, Reactor Water Cleanup, Reactor Building Closed Cooling Water, Auxiliary Decay Heat Removal, Containment Inerting, Radwaste, Spent Fuel Pool Cooling/Cleanup, Standby Diesel Generators, Supplemental Diesel Generator, Control Rod Drive, Diesel Generator Starting Air, Hardened Containment Venting, and FLEX Systems.
3.3-1, 013	This Item Number is not used in NUREG-2192.				
3.3-1, 014	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 015	Metallic closure bolting exposed to any environment, soil, underground	Loss of preload due to thermal effects, gasket creep, self- loosening	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage loss of preload of carbon and low alloy steel and stainless steel closure bolting exposed to any environment, soil, underground in screened in portions of Emergency High Pressure Makeup, Auxiliary Boiler, Fuel Oil, Residual Heat Removal Service Water, Raw Cooling Water, Raw Service Water, High Pressure Fire Protection (Diesel Driven Pump), Potable Water, Normal Ventilation, Air Conditioning, Control Air, Service Air, CO_2 Storage Fire Protection/ Purge, Station Drainage, Sampling and Water Quality, Building Heating, Hypochlorite, Demineralizer Backwash Air, Standby Liquid Control, Off-Gas, Emergency Equipment Cooling Water, Reactor Water Cleanup, Reactor Building Closed Cooling Water, Auxiliary Decay Heat Removal, Containment Inerting, Radiation Monitoring, Radwaste, Spent Fuel Pool Cooling/ Cleanup, Standby Diesel Generators, Supplemental Diesel Generator, Control Rod Drive, Diesel Generator Starting Air, Hardened Containment Venting, and FLEX Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 016	Stainless steel piping, piping components outboard the second containment isolation valves with a diameter ≥4 inches nominal pipe size exposed to treated water >93°C (>200°F)	Cracking due to SCC, IGSCC	AMP XI.M2, “Water Chemistry,” and AMP XI.M25, “BWR Reactor Water Cleanup System”	No	Consistent with NUREG-2191. BFN will use the Water Chemistry program (B.2.1.2) to monitor and manage the aging effects of cracking due to SCC, IGSCC on stainless steel piping, piping components outboard the second containment isolation valves with a diameter ≥4 inches nominal pipe size exposed to treated water >93°C (>200°F) in screened in portion of Reactor Water Cleanup System. BFN has satisfactorily completed all actions requested in NRC Generic Letter 88-01 for the Reactor Water Cleanup System on Units 1, 2 and 3. BFN Units 1, 2 and 3 have replaced the Reactor Water Cleanup piping with piping made of material that is resistant to IGSCC (316NG) stainless steel. The BFN Chemistry Control Program is in accordance with EPRI TR1016579 (2008 revision) BWR Water Chemistry Guidelines, which maintains a high water purity thereby reducing susceptibility to SCC. Since the piping in the Reactor Water Cleanup System is made of material that is resistant to IGSCC has been implemented, no IGSCC inspections are required.
3.3-1, 017	Stainless steel heat exchanger tubes exposed to treated water,treated borated water	Reduction of heat transfer due to fouling	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not Applicable. There are no stainless steel heat exchanger tubes exposed to treated water or treated borated water with an aging effect of reduction of heat transfer in screened in portions of Auxiliary Systems.
3.3-1, 018	Stainless steel high-pressure pump casing, piping, piping components, tanks exposed to treated borated water >60°C (>140°F), sodium pentaborate solution >60°C (>140°F)	Cracking due to SCC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not Applicable. There are no stainless steel high-pressure pump casing, piping, piping components, and tanks exposed to treated borated water >60°C (>140°F) or sodium pentaborate solution >60°C (>140°F) in Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 019	Stainless steel regenerative heat exchanger components exposed to treated water >60°C (>140°F)	Cracking due to SCC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. BFN will use the Water Chemistry program (B.2.1.2) to monitor and manage the aging effects of cracking due to SCC, IGSCC on stainless steel piping, piping components outboard the second containment isolation valves with a diameter ≥4 inches nominal pipe size exposed to treated water >93°C (>200°F) in screened in portion of Reactor Water Cleanup System. BFN has satisfactorily completed all actions requested in NRC Generic Letter 88-01 for the Reactor Water Cleanup System on Units 1, 2 and 3. BFN Units 1, 2 and 3 have replaced the Reactor Water Cleanup piping with piping made of material that is resistant to IGSCC (316NG) stainless steel. The BFN Chemistry Control Program is in accordance with EPRI TR1016579 (2008 revision) BWR Water Chemistry Guidelines, which maintains a high water purity thereby reducing susceptibility to SCC. Since the piping in the Reactor Water Cleanup System is made of material that is resistant to IGSCC has been implemented, no IGSCC inspections are required.
3.3-1, 020	Stainless steel, steel with stainless steel cladding heat exchanger components exposed to treated borated water >60°C (>140°F), treatedwater >60°C (>140°F)	Cracking due to SCC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage cracking of carbon or low alloy steel with stainless steel cladding and stainless steel heat exchanger components exposed to treated water > 140 F in the Sampling and Water Quality, Reactor Water Cleanup, Radwaste, Reactor Feedwater, Condensate/Demineralized Water and Residual Heat Removal Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 021	Steel piping, piping components exposed to treated water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage loss of material due to general, pitting, crevice corrosion, MIC in steel piping, piping components exposed to treated water in the Emergency High Pressure Makeup, Residual Heat Removal Service Water, Sampling and Water Quality, Reactor Water Cleanup, Radwaste, Control Rod Drive Systems.
3.3-1, 022	Copper alloy piping, piping components exposed to treated water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage loss of material of the copper alloy heat exchanger components, piping, piping components exposed to treated water in the Auxiliary Boiler, Reactor Core Isolation Cooling, High Pressure Coolant Injection, Reactor Water Cleanup, Residual Heat Removal, Radwaste, and Sampling and Water Quality Systems.
3.3-1, 023	This Item Number is not used in NUREG-2192.				
3.3-1, 024	This Item Number is not used in NUREG-2192.				
3.3-1, 025	Aluminum piping, piping components exposed to treated water, treated borated water	Loss of material due to pitting, crevice corrosion	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage loss of material of the aluminum piping, piping components exposed to treated water, treated borated water in the Residual Heat Removal Service Water, Standby Liquid Control, Spent Fuel Pool Cooling/Cleanup, Control Rod Drive Systems and Reactor Buildings.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 026	Steel (with stainless steel cladding) piping, piping components exposed to treated water	Loss of material due to general (only after cladding degradation), pitting,crevice corrosion, MIC	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Not Applicable. This component, material, environment, and aging effect combination is addressed by Item Number 3.3-1, 203.
3.3-1, 027	Stainless steel heat exchanger tubes exposed to treated water	Reduction of heat transfer due to fouling	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One Time Inspection"	No	Not Applicable. There are no stainless steel heat exchanger tubes exposed to treated water with an aging effect / mechanism of reduction of heat transfer due to fouling in screened in portions of Auxiliary Systems.
3.3-1, 028	PWR Only				
3.3-1, 029	This Item Number is not used in NUREG-2192.				
3.3-1, 030	Concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to raw water	Cracking due to chemical reaction, weathering, settlement, or corrosion of reinforcement (reinforced concrete only); loss of material due to delamination, exfoliation, spalling, popout, scaling, or cavitation; flow blockage due to fouling	AMP XI.M20, "Open-Cycle Cooling Water System"	No	Not Applicable. There are no concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to raw water with an aging effect / mechanism of cracking due to chemical reaction, weathering, settlement, or corrosion of reinforcement (reinforced concrete only); loss of material due to delamination, exfoliation, spalling, popout, scaling, or cavitation; flow blockage due to fouling in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 030a	Fiberglass, HDPE piping, piping components exposed to raw water	Cracking, blistering, loss of material due to exposure to ultraviolet light, ozone, radiation, temperature, or moisture; flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Not Applicable. There are no fiberglass, HDPE piping, piping components exposed to raw water in screened in portions of Auxiliary Systems.
3.3-1, 031	This Item Number is not used in NUREG-2192.				
3.3-1, 032	This Item Number is not used in NUREG-2192.				
3.3-1, 032a	This Item Number is not used in NUREG-2192.				
3.3-1, 033	This Item Number is not used in NUREG-2192.				
3.3-1, 034	Nickel alloy, copper alloy piping, piping components exposed to raw water	Loss of material due to general (copper alloy only), pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Consistent with NUREG-2191. The Open-Cycle Cooling Water System program (B.2.1.11) will be used to manage flow blockage and loss of material of the copper alloy piping, piping components in the Radiation Monitoring, Residual Heat Removal Service Water, Raw Cooling Water, Raw Service Water, Hypochlorite, Emergency Equipment Cooling Water Systems.
3.3-1, 035	This Item Number is not used in NUREG-2192.				
3.3-1, 036	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 037	Steel piping, piping components exposed to raw water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Consistent with NUREG-2191. The Open-Cycle Cooling Water System program (B.2.1.11) will be used to manage flow blockage and loss of material of the carbon steel, ductile iron, and gray cast iron heat exchanger components, piping, piping components exposed to raw water in the Residual Heat Removal Service Water, Raw Cooling Water, Raw Service Water, Sampling and Water Quality, Hypochlorite, Emergency Equipment Cooling Water, and FLEX Systems.
3.3-1, 038	Copper alloy, steel heat exchanger components exposed to raw water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Consistent with NUREG-2191. The Open-Cycle Cooling Water System program (B.2.1.11) will be used to manage flow blockage and loss of material of the carbon steel and copper alloy heat exchanger components exposed to raw water in the High Pressure Fire Protection (Diesel Driven Pump), Raw Cooling Water and Emergency Equipment Cooling Water Systems
3.3-1, 039	This Item Number is not used in NUREG-2192.				
3.3-1, 040	Stainless steel piping, piping components exposed to raw water	Loss of material due to pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, “Open-Cycle CoolingWater System”	No	Consistent with NUREG-2191. The Open-Cycle Cooling Water System program (B.2.1.11) will be used to manage flow blockage and loss of material of the carbon or low alloy steel with stainless steel cladding and stainless steel heat exchanger components, piping, piping components, and tanks exposed to raw water in the Radiation Monitoring, Residual Heat Removal Service Water, Raw Cooling Water, Raw Service Water, Sampling and Water Quality, Hypochlorite, Emergency Equipment Cooling Water, and FLEX Systems.
3.3-1, 041	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 042	Copper alloy, titanium, stainless steel heat exchanger tubes exposed to raw water, raw water (potable), treated water	Cracking due to SCC (titanium only), reduction of heat transfer due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The Open-Cycle Cooling Water System program (B.2.1.11) will be used to manage reduction of heat transfer of the copper alloy and stainless steel heat exchanger tubes exposed to raw water in the Emergency Equipment Cooling Water, Raw Cooling Water, Raw Service Water and Residual Heat Removal Service Water Systems.
3.3-1, 043	Stainless steel piping, piping components exposed to closed-cycle cooling water >60°C (>140°F)	Cracking due to SCC	AMP XI.M21A, “Closed Treated Water Systems”	No	Consistent with NUREG-2191. The Closed Treated Water Systems program (B.2.1.12) will be used to manage aging of stainless steel piping, piping components exposed to closed-cycle cooling water >140°F in the screened-in portions of the Radiation Monitoring System.
3.3-1, 044	Stainless steel; steel with stainless steel cladding heat exchanger components exposed to closed-cycle cooling water >60°C (>140°F)	Cracking due to SCC	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no stainless steel; steel with stainless steel cladding heat exchanger components exposed to closed-cycle cooling water >60°C (>140°F) that are susceptible to cracking due to SCC in screened in portions of Auxiliary Systems.
3.3-1, 045	Steel piping, piping components, tanks exposed to closed-cycle cooling water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M21A, “Closed Treated Water Systems”	No	Consistent with NUREG-2191. The Closed Treated Water Systems program (B.2.1.12) will be used to manage loss of material of the carbon steel and gray cast iron heat exchanger components, piping, piping components, and tanks exposed to closed-cycle cooling water in the Air Conditioning, Building Heating, Reactor Building Closed Cooling Water, Standby Diesel Generators and Supplemental Diesel Generator Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 046	Steel, copper alloy heat exchanger components, piping, piping components exposed to closed-cycle cooling water	Loss of material due to general (steel only), pitting, crevice corrosion, MIC	AMP XI.M21A, “Closed Treated Water Systems”	No	Consistent with NUREG-2191. The Closed Treated Water Systems program (B.2.1.12) will be used to manage loss of material of the carbon steel, copper alloy, and gray cast iron heat exchanger components, piping, piping components exposed to closed-cycle cooling water in the High Pressure Fire Protection, Air Conditioning, Building Heatjng, Reactor Building Closed Cooling Water, Standby Diesel Generators and Supplemental Diesel Generator Systems.
3.3-1, 047	Stainless steel; steel with stainless steel cladding heat exchanger components exposed to closed-cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M21A, “Closed Treated Water Systems”	No	Consistent with NUREG-2191. The Closed Treated Water Systems program (B.2.1.12) will be used to manage loss of material of the stainless steel heat exchanger components exposed to closed-cycle cooling water in the Auxiliary Decay Heat Removal System.
3.3-1, 048	Aluminum piping, piping components exposed to closed-cycle cooling water	Loss of material due to pitting, crevice corrosion	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no aluminum piping, piping components exposed to closed-cycle cooling water >140°F in the screened-in portions of the Auxiliary Systems.
3.3-1, 049	Stainless steel piping, piping components exposed to closed-cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M21A, “Closed Treated Water Systems”	No	Consistent with NUREG-2191. The Closed Treated Water Systems program (B.2.1.12) will be used to manage loss of material of the stainless steel heat exchanger components, piping, piping components exposed to closed-cycle cooling water in the Auxiliary Decay Heat Removal, Air Conditioning, Radiation Monitoring and Standby Diesel Generators Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 050	Stainless steel, copper alloy, steel heat exchanger tubes exposed to closed-cycle cooling water	Reduction of heat transfer due to fouling	AMP XI.M21A, “Closed Treated Water Systems”	No	Consistent with NUREG-2191. The Closed Treated Water Systems program (B.2.1.12) will be used to manage reduction of heat transfer of the copper alloy heat exchanger tubes exposed to closed-cycle cooling water in the High Pressure Fire Protection (Diesel Driven Pump), Standby Diesel Generators, Building Heat and Supplemental Diesel Generator Systems.
3.3-1, 051	Boraflex spent fuel storage racks: neutron-absorbing sheets (PWR), spent fuel storage racks: neutron-absorbing sheets (BWR) exposed to treated borated water, treated water	Reduction of neutron-absorbing capacity due to boraflex degradation	AMP XI.M22, “Boraflex Monitoring”	No	Not Applicable. Boraflex is not used for neutron absorption in the BFN spent fuel storage pools. Also see Item Number 3.3-1, 102.
3.3-1, 052	Steel cranes: rails, bridges, structural members, structural components exposed to air	Loss of material due to general corrosion,wear, deformation, cracking	AMP XI.M23, “Inspection of Overhead Heavy Load and Light Load (Related to Refueling) Handling Systems”	No	Consistent with NUREG-2191. The Inspection of Overhead Heavy Load and Light Load (Related to Refueling) Handling Systems program (B.2.1.13) will be used to manage cracking, deformation, and loss of material of the carbon steel crane/hoist and cranes: rails, bridges, structural members, and structural components exposed to air in the Cranes and Hoists and Fuel Handling and Storage Systems.
3.3-1, 053	This Item Number is not used in NUREG-2192.				
3.3-1, 054	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 055	Steel piping, piping components, tanks exposed to condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material of the carbon steel, ductile iron, and gray cast iron piping, piping components, and tanks exposed to condensation in the Control Air, Service Air, Sampling and Water Quality, Demineralizer Backwash Air, Off-Gas, Reactor Water Cleanup, Reactor Building Closed Cooling Water, Containment Inerting, Standby Diesel Generators and Diesel Generator Starting Air Systems.
3.3-1, 056	This Item Number is not used in NUREG-2192.				
3.3-1, 057	Elastomer fire barrier penetration seals exposed to air, condensation	Hardening, loss of strength, shrinkage due to elastomer degradation	AMP XI.M26, “Fire Protection”	No	Consistent with NUREG-2191. The Fire Protection program (B.2.1.15) will be used to manage hardening and loss of strength, shrinkage due to elastomer degradation of the elastomer fire barriers exposed to air-indoor uncontrolled as shown in Table 3.5.2-36 of Structural Commodities (Hazard Barriers and Elastomers).
3.3-1, 058	Steel halon/carbon dioxide fire suppression system piping, piping components exposed to air – indoor uncontrolled,air – outdoor, condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M26, “Fire Protection”	No	Consistent with NUREG-2191. The Fire Protection program (B.2.1.15) will be used to manage loss of material of the carbon steel, ductile iron, galvanized steel, and gray cast iron fire barriers, piping, piping components, and tanks exposed to air- indoor uncontrolled, air-outdoor, and condensation in the High Pressure Fire Protection (Diesel Driven Pump), and CO_2 Storage Fire Protection/Purge Systems.
3.3-1, 059	Steel fire rated doors exposed to air	Loss of material due to wear	AMP XI.M26, “Fire Protection”	No	Consistent with NUREG-2191. The Fire Protection program (B.2.1.15) will be used to manage loss of material of the carbon steel fire barrier doors exposed to air-indoor uncontrolled and air-outdoor as shown in Table 3.5.2-36 of Structural Commodities (Hazard Barriers and Elastomers).

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 060	Reinforced concrete structural fire barriers: walls, ceilings and floors exposed to air	Cracking due to chemical reaction, weathering, settlement, or corrosion of reinforcement; loss of material due to delamination, exfoliation, spalling, popout, or scaling	AMP XI.M26, “Fire Protection,” and AMP XI.S6, “Structures Monitoring”	No	Consistent with NUREG-2191. The Fire Protection program (B.2.1.15) and Structures Monitoring program (B.2.1.33) will be used to manage cracking and loss ofmaterial of the concrete and grout fire barriers and concrete elements exposed to air-indoor uncontrolled and air-outdoor as shown in Table 3.5.2-36 of Structural Commodities (Hazard Barriers and Elastomers).
3.3-1, 061	This Item Number is not used in NUREG-2192.				
3.3-1, 062	This Item Number is not used in NUREG-2192.				
3.3-1, 063	Steel fire hydrants exposed to air – outdoor, raw water, raw water (potable), treated water	Loss of material due to general, pitting, crevice corrosion; flow blockage due to fouling (raw water, raw water (potable) only)	AMP XI.M27, “Fire Water System”	No	Consistent with NUREG-2191. The Fire Water System program (B.2.1.16) will be used to manage flow blockage and loss of material of the ductile iron and gray cast iron fire hydrants exposed to air-outdoor and raw water in the High Pressure Fire Protection (Diesel Driven Pump) System.
3.3-1, 064	Steel, copper alloy piping, piping components exposed to raw water, treated water, raw water (potable)	Loss of material due to general (steel; copper alloy in raw water and raw water (potable) only), pitting, crevice corrosion, MIC; flow blockage due to fouling (raw water; raw water (potable) for steel only)	AMP XI.M27, “Fire Water System”	No	Consistent with NUREG-2191. The Fire Water System program (B.2.1.16) will be used to manage loss of material due to general (steel; copper alloy in raw water and raw water (potable) only), pitting, crevice corrosion, MIC; flow blockage due to fouling (raw water; raw water (potable) for steel only) in steel, copper alloy piping, piping components exposed to raw water, treated water, raw water (potable) in screened in portions of the High Pressure Fire Protection (Diesel Driven Pump) System.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 065	Aluminum piping, piping components exposed to raw water, treated water,raw water (potable)	Loss of material due to pitting, crevice corrosion; flow blockage due to fouling (raw water only)	AMP XI.M27, “Fire Water System”	No	Consistent with NUREG-2191. The Fire Water System program (B.2.1.16) will be used to manage loss of material due to pitting, crevice corrosion; flow blockage due to fouling while exposed to raw water for aluminum piping, piping components exposed to raw water, treated water, raw water (potable) in screened in portions of the High Pressure Fire Protection (Diesel Driven Pump) System.
3.3-1, 066	Stainless steel piping, piping components exposed to raw water, treated water, raw water (potable)	Loss of material due to pitting, crevice corrosion, MIC; flow blockage due to fouling (raw water only)	AMP XI.M27, “Fire Water System”	No	Consistent with NUREG-2191. The Fire Water System program (B.2.1.16) will be used to manage flow blockage and loss of material of the stainless steel piping, piping components exposed to raw water in the High Pressure Fire Protection (Diesel Driven Pump) System.
3.3-1, 067	This Item Number is not used in NUREG-2192.				
3.3-1, 068	This Item Number is not used in NUREG-2192.				
3.3-1, 069	Copper alloy piping, piping components exposed to fuel oil	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M30, “Fuel Oil Chemistry,” and AMP XI.M32, “One-Time Inspection,” or AMP XI.M30, “Fuel Oil Chemistry”	No	Consistent with NUREG-2191 with exceptions. The Fuel Oil Chemistry program (B.2.1.18) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material of the copper alloy piping, piping components exposed to fuel oil in the Fuel Oil System. Exceptions apply to the NUREG-2191 recommendations for Fuel Oil Chemistry program (B.2.1.18) implementation.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 070	Steel piping, piping components, tanks exposed to fuel oil	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M30, “Fuel Oil Chemistry,” and AMP XI.M32, “One-Time Inspection,” or AMP XI.M30, “Fuel Oil Chemistry”	No	Consistent with NUREG-2191 with exceptions. The Fuel Oil Chemistry program (B.2.1.18) will be used to manage loss of material of the carbon steel and gray cast iron piping, piping components, and tanks exposed to fuel oil and in the Fuel Oil, High Pressure Fire Protection (Diesel Driven Pump) and Supplement Diesel Generator Systems. Exceptions apply to the NUREG-2191 recommendations for Fuel Oil Chemistry program (B.2.1.18) implementation.
3.3-1, 071	Stainless steel, aluminum, nickel alloy piping, piping components exposed to fuel oil	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M30, “Fuel Oil Chemistry,” and AMP XI.M32, “One-Time Inspection,” or AMP XI.M30, “Fuel Oil Chemistry”	No	Consistent with NUREG-2191 with exceptions. The Fuel Oil Chemistry program (B.2.1.18) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material of the aluminum alloy and stainless steel piping, piping components exposed to Fuel Oil System. Exceptions apply to the NUREG-2191 recommendations for Fuel Oil Chemistry program (B.2.1.18) implementation.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 072	Gray cast iron, ductile iron, copper alloy (>15% Zn or >8% Al) piping, piping components, heat exchanger components exposed to treated water, closed-cycle cooling water, soil, raw water, raw water (potable), waste water	Loss of material due to selective leaching	AMP XI.M33, "Selective Leaching"	No	Consistent with NUREG-2191. The Selective Leaching program (B.2.1.21) will be used to manage loss of material of the copper alloy with greater than 15% zinc, ductile iron, and gray cast iron heat exchanger components, and piping, piping components, exposed to closed cycle cooling water, raw water, soil, treated water, and waste water in the Auxiliary Boiler, Radiation Monitoring, Residual Heat Removal Service Water, Raw Cooling Water, Raw Service Water, High Pressure Fire Protection (Diesel Driven Pump), Potable Water, Air Conditioning, Station Drainage, Sampling and Water Quality, Emergency Equipment Cooling Water, Reactor Water Cleanup, Reactor Building Closed Cooling Water, Reactor Core Isolation Cooling, High Pressure Coolant Injection, Residual Heat Removal, Core Spray, Radwaste, Spent Fuel Pool Cooling/ Cleanup, Standby Diesel Generators, and Control Rod Drive Systems.
3.3-1, 073	Concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to air – outdoor	Cracking due to chemical reaction, weathering, or corrosion of reinforcement (reinforced concrete only); loss of material due to delamination, exfoliation, spalling, popout, or scaling	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Not Applicable. There are no concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to air – outdoor in screened in portions of Auxiliary Systems.
3.3-1, 074	This Item Number is not used in NUREG-2192.				
3.3-1, 075	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 076	Elastomer piping, piping components, ducting, ducting components, seals exposed to air, condensation	Hardening or loss of strength due to elastomer degradation	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage hardening and loss of strength of the elastomer piping, piping components, ducting, ducting components, seals exposed to air and condensation in the Fuel Oil, Raw Cooling Water, High Pressure Fire Protection (Diesel Driven Pump), Normal Ventilation, Containment, Radwaste, Standby Diesel Generators, Supplemental Diesel Generator, Diesel Generator Starting Air Systems, and Table 3.5.2-36: Structural Commodities (Hazard Barriers and Elastomers).
3.3-1, 077	This Item Number is not used in NUREG-2192.				
3.3-1, 078	Steel external surfaces exposed to air – indoor uncontrolled, air – outdoor, condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage loss of material of the carbon steel, ductile iron, galvanized steel, and gray cast iron ducting, ducting components, heat exchanger components, piping, piping components, and tanks exposed to air-indoor uncontrolled, air- outdoor, and condensation in the Emergency High Pressure Makeup, Fuel Oil, Potable Water, Normal Ventilation, Air Conditioning, CO_2 Storage Fire Protection/Purge, Building Heating, Demineralized Backwash Air, Off-Gas, Auxiliary Boiler, Containment Inerting, Raw Cooling Water, Standby Liquid Control, Station Drainage, Reactor Water Cleanup, Reactor Building Closed Cooling Water, Spent Fuel Pool Cooling/Cleanup, Standby Diesel Generators, Supplemental Diesel Generator, Control Rod Drive, Hardened Containment Venting and FLEX Systems.
3.3-1, 079	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 080	Steel heat exchanger components, piping, piping components exposed to air – indoor uncontrolled, air – outdoor	Loss of material due to general, pitting, crevice corrosion	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage loss of material of the carbon steel, ductile iron, and gray cast iron heat exchanger components, piping, piping components exposed to air-indoor uncontrolled and air-outdoor in the Emergency High Pressure Makeup, Fuel Oil, Residual Heat Removal Service Water Systems, Raw Cooling Water, Raw Service Water, High Pressure Fire Protection, Air Conditioning, Emergency Equipment Cooling Water, Control Rod Drive Systems.
3.3-1, 081	This Item Number is not used in NUREG-2192.				
3.3-1, 082	Elastomer, fiberglass piping, piping components, ducting, ducting components, seals exposed to air	Loss of material due to wear	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage loss of material of the elastomer piping, piping components exposed to air-indoor uncontrolled in the Fuel Oil, Raw Cooling Water, Containment, Standby Diesel Generators, CO_2 Storage Fire Protection/Purge and Diesel Generator Starting Air Systems.
3.3-1, 083	Stainless steel diesel engine exhaust piping, piping components exposed to diesel exhaust	Cracking due to SCC	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no stainless steel diesel engine exhaust piping, piping components exposed to diesel exhaust in the Standby Diesel Generators System at BFN. The exhaust piping is carbon steel alloy.
3.3-1, 084	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 085	Elastomer piping, piping components, seals exposed to air, condensation, closed-cycle cooling water, treated borated water, treated water, raw water,raw water (potable), waste water, gas, fuel oil, lubricating oil	Hardening or loss of strength due to elastomer degradation; flow blockage due to fouling (raw water, waste water only)	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage hardening and loss of strength of the elastomer ducting, ducting components, piping, piping components exposed to closed-cycle cooling water, condensation, fuel oil, lubricating oil, raw water, treated water, and waste water in the Fuel Oil, High Pressure Fire Protection (Diesel Driven Pump), Air Conditioning, CO_2 Storage Fire Protection/ Purge, Radwaste, Standby Diesel Generators and Supplemental Diesel Generator Systems.
3.3-1, 086	This Item Number is not used in NUREG-2192.				
3.3-1, 087	This Item Number is not used in NUREG-2192.				
3.3-1, 088	Steel; stainless steel piping, piping components, diesel engine exhaust exposed to raw water (potable), diesel exhaust	Loss of material due to general (steel only), pitting, crevice corrosion, flow blockage due to fouling (steel only for raw water (potable) environment)	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material of the carbon steel, gray cast iron, and stainless steel, piping, piping components, and tanks exposed to diesel exhaust and raw water inthe Potable Water, Air Conditioning, Standby Diesel Generator, and Supplemental Diesel Generator Systems.
3.3-1, 089	Steel piping, piping components exposed to condensation (internal)	Loss of material due to general, pitting, crevice corrosion	AMP XI.M27, “Fire Water System”	No	Not Applicable. There is no steel piping, piping components exposed to condensation (internal) in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 090	Steel ducting, ducting components (internal surfaces) exposed to condensation	Loss of material due to general, pitting, crevice corrosion, MIC (for drip pans and drain lines only)	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material of the carbon steel and galvanized steel ducting and ducting components exposed to condensation in the Normal Ventilation, Air Conditioning, CO_2 Storage Fire Protection/Purge, Emergency High Pressure Makeup, and Off-Gas Systems.
3.3-1, 091	Steel piping, piping components, heat exchanger components, tanks exposed to waste water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material of the carbon steel, ductile iron, galvanized steel, and gray cast iron heat exchanger components, piping, piping components, and tanks exposed to waste water in the Station Drainage and Radwaste Systems.
3.3-1, 092	This Item Number is not used in NUREG-2192.				
3.3-1, 093	Copper alloy piping, piping components exposed to raw water (potable)	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material of the copper alloy piping, piping components exposed to raw water in the Air Conditioning and Potable Water Systems.
3.3-1, 094	Stainless steel ducting, ducting components exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," or AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage loss of material of the stainless steel ducting,ducting components exposed to air, condensation in the Normal Ventilation, Air Conditioning, Standby Gas Treatment and Containment Systems. See Subsection 3.3.2.2.4.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 094a	Stainless steel ducting, ducting components exposed to air, condensation	Cracking due to SCC	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage cracking due to SCC of the stainless steel ducting, ducting components exposed to air, condensation in the Normal Ventilation, Standby Gas Treatment, Air Conditioning and Containment Systems. See Subsection 3.3.2.2.3.
3.3-1, 095	Copper alloy, stainless steel, nickel alloy piping, piping components, heat exchanger components, tanks exposed to waste water	Loss of material due to general (copper alloy only), pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material of the copper alloy and stainless steel piping, piping components, and tanks exposed to waste water in the Station Drainage and Radwaste Systems.
3.3-1, 096	Elastomer piping, piping components, seals exposed to air, raw water, raw water (potable), treated water, waste water	Loss of material due to wear; flow blockage due to fouling (raw water, waste water only)	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material of the elastomer piping, piping components exposed to air, raw water, raw water (potable), treated water,waste water in Raw Cooling Water, High Pressure Fire Protection, Normal Ventilation, Air Conditioning and CO_2 Storage Fire Protection/Purge Systems.
3.3-1, 096a	Steel, aluminum, copper alloy, stainless steel, titanium heat exchanger tubes internal to components exposed to air, condensation (external)	Reduction of heat transfer due to fouling	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no steel, aluminum, copper alloy, stainless steel, titanium heat exchanger tubes internal to components exposed toair, condensation (external) in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 096b	Steel heat exchanger components exposed to condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Not Applicable. There are no steel heat exchanger components exposed to condensation in screened in portions of Auxiliary Systems.
3.3-1, 097	Steel piping, piping components exposed to lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M39, "Lubricating Oil Analysis," and AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191. The Lubricating Oil Analysis program (B.2.1.25) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material of the carbon steel and gray cast iron piping, piping components, and tanks exposed to lubricating oil in the Emergency High Pressure Makeup, Residual Heat Removal Service Water, Raw Cooling Water, High Pressure Fire Protection (Diesel Driven Pump), Standby Liquid Control, Standby Diesel Generators, Supplemental Diesel Generator, Control Rod Drive and Diesel Generator Starting Air Systems.
3.3-1, 098	Steel heat exchanger components exposed to lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M39, "Lubricating Oil Analysis," and AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191. The Lubricating Oil Analysis program (B.2.1.25) and One-Time Inspection program (B.2.1.20) will be used to manage aging of steel heat exchanger components exposed to lubricating oil for loss of material due to general, pitting, crevice corrosion, MIC in the screened in portions of the Condensate/ Demineralized Water System. This component, material, environment, and aging effect combination is also addressed by Item Number 3.3-1, 257.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 099	Copper alloy, aluminum piping, piping components exposed to lubricating oil	Loss of material due to pitting, crevice corrosion, MIC (copper alloy only)	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Lubricating Oil Analysis program (B.2.1.25) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material of the aluminum alloy, copper alloy, and stainless steel heat exchanger components, piping, piping components exposed to lubricating oil in the Air Conditioning, Standby Diesel Generators, Control Rod Drive, and Diesel Generator Starting Air Systems.
3.3-1, 100	Stainless steel piping, piping components exposed to lubricating oil	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Lubricating Oil Analysis program (B.2.1.25) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material of the stainless steel heat exchanger components, piping, piping components, and tanks exposed to lubricating oil in the Reactor Core Isolation Cooling, High Pressure Coolant Injection, and Standby Diesel Generators Systems.
3.3-1, 101	Aluminum heat exchanger tubes exposed to lubricating oil	Reduction of heat transfer due to fouling	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Lubricating Oil Analysis program (B.2.1.25) and One-Time Inspection program (B.2.1.20) will be used to manage reduction of heat transfer due to fouling of the aluminum heat exchanger tubes exposed to lubricating oil in the Standby Diesel Generators System.
3.3-1, 102	Boral®; boron steel, and other materials (excluding Boraflex) spent fuel storage racks: neutron-absorbing sheets (PWR), spent fuel storage racks: neutron-absorbing sheets (BWR) exposed to treated borated water, treated water	Reduction of neutron-absorbing capacity; change in dimensions and loss of material due to effects of SFP environment	AMP XI.M40, “Monitoring of Neutron-Absorbing Materials Other Than Boraflex”	No	Consistent with NUREG-2191. The Monitoring of Neutron-Absorbing Materials Other Than Boraflex program (B.2.1.26) will be used to manage reduction of neutron absorbing capacity; change in dimensions and loss of material of the boral neutron absorbing sheets exposed to treated water in the spent fuel storage racks of the Fuel Handling and Storage System.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 103	Concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to soil, concrete	Cracking due to chemical reaction, weathering, or corrosion of reinforcement (reinforced concrete only); loss of material due to delamination, exfoliation, spalling, popout, or scaling	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There are no concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to soil or concrete in Auxiliary Systems.
3.3-1, 104	HDPE, fiberglass piping, piping components exposed to soil, concrete	Cracking, blistering, loss of material due to exposure to ultraviolet light, ozone, radiation, temperature, or moisture	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There are no HDPE, fiberglass piping, piping exposed to soil or concrete in screened in portions of Auxiliary Systems.
3.3-1, 105	This Item Number is not used in NUREG-2192.				
3.3-1, 106	This Item Number is not used in NUREG-2192.				
3.3-1, 107	Stainless steel, nickel alloy piping, piping components exposed to soil, concrete	Loss of material due to pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There is no stainless steel, nickel alloy piping, piping components exposed to soil, concrete in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 108	Titanium, super austenitic, copper alloy, stainless steel, nickel alloy piping, piping components, tanks, closure bolting exposed to soil, concrete, underground	Loss of material due to general (copper alloy only), pitting, crevice corrosion, MIC (super austenitic,copper alloy, stainless steel, nickel alloy; soil environment only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Consistent with NUREG-2191 with exceptions. The Buried and Underground Piping and Tanks program (B.2.1.27) will be used to manage loss of material due to general (copper alloy only), pitting, crevice corrosion, MIC (super austenitic, copper alloy, stainless steel, nickel alloy; soil environment only) in the Raw Service Water and High Pressure Fire Protection (Diesel Driven Pump) Systems. Exceptions apply to the NUREG-2191 recommendations for Buried and Underground Piping and Tanks program (B.2.1.27) implementation.
3.3-1, 109	Steel piping, piping components, closure bolting exposed to soil, concrete, underground	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Consistent with NUREG-2191 with exceptions. The Buried and Underground Piping and Tanks program (B.2.1.27) will be used to manage loss of material of the steel piping, piping components, closure bolting, exposed to soil, concrete, and underground in the Residual Heat Removal Service Water, High Pressure Fire Protection (Diesel Driven Pump), Radwaste, Hardened Containment Venting, and Emergency Equipment Cooling Water Systems. Exceptions apply to the NUREG-2191 recommendations for Buried and Underground Piping and Tanks program (B.2.1.27) implementation.
3.3-1, 109a	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 110	Stainless steel, nickel alloy piping, piping components greater than or equal to 4 NPS exposed to treated water >93°C (>200°F)	Cracking due to SCC, IGSCC	AMP XI.M7, “BWR Stress Corrosion Cracking,” and AMP XI.M2, “Water Chemistry”	No	Not Applicable. There is no nickel alloy piping, piping components greater than or equal to 4 NPS exposed to treated water >93°C (>200°F) in screened in portions of Auxiliary Systems. Cracking in stainless steel piping, piping components greater than or equal to 4 NPS exposed to treated water >93°C (>200°F) is addressed in Item Number 3.3-1, 016.
3.3-1, 111	Steel structural steel exposed to air-indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	AMP XI.S6, “Structures Monitoring”	No	Not Applicable. There is no steel structural steel exposed to air-indoor uncontrolled air that use the Structures Monitoring program (B.2.1.33) to manage aging in screened in portions of Auxiliary Systems.
3.3-1, 112	Steel piping, piping components exposed to concrete	None	None	Yes	Consistent with NUREG-2191. Steel piping, piping components exposed to concrete for this Item Number do not have an aging effect nor do they have an Aging Management Program assigned. Operating Experience was reviewed under the Further Evaluation (Subsection 3.3.2.2.9) and no Condition Reports were identified associated with the Fuel Oil, Residual Heat Removal Service Water, High Pressure Fire Protection (Diesel Driven Pump), Emergency Equipment Cooling Water, Radwaste and Spent Fuel Pool Cooling/Cleanup Systems. However, since Residual Heat Removal Service Water, High Pressure Fire Protection (Diesel Driven Pump), Radwaste and Emergency Equipment Cooling Water Systems are potentially exposed to ground water, and subject to aging management, they are addressed under the Buried and Underground Piping and Tanks program (B.2.1.27). See Item Number 3.3-1, 109 and Subsection 3.3.2.2.9.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 113	Aluminum piping, piping components exposed to gas	None	None	No	Consistent with NUREG-2191. Aluminum piping, piping components exposed to gas do not have an aging effect nor do they have an Aging Management Program assigned. This Item Number is applicable to Containment Atmosphere Dilution and Containment Inerting Systems.
3.3-1, 114	Copper alloy piping,piping components exposed to air, condensation, gas	None	None	No	Consistent with NUREG-2191. Copper alloy piping, piping components exposed to air, condensation, gas do not have an aging effect nor do they have an Aging Management Program assigned. This Item Number is applicable to Auxiliary Boiler, Fuel Oil, Radiation Monitoring, Residual Heat Removal Service Water, Raw Service Water, High Pressure Fire Protection (Diesel Driven Pump), Air Conditioning, Control Air, Service Air, CO_2 Storage Fire Protection/Purge, Station Drainage, Sampling and Water Quality, Demineralized Backwash Air, Standby Liquid Control, Off-Gas, Emergency Equipment Cooling Water, Reactor Water Cleanup, Reactor Building Closed-Cooling Water, Containment Inerting, Radwaste, Standby Diesel Generators, Control Rod Drive, Building Heating, and Diesel Generator Starting Air Systems.
3.3-1, 115	Copper alloy, copper alloy (>8% Al) piping, piping components exposed to air with borated water leakage	None	None	No	Not Applicable. There are no copper alloy, copper alloy (>8% Al) piping, piping components exposed to air with borated water leakage in screened in portions of Auxiliary Systems.
3.3-1, 116	Galvanized steel piping, piping components exposed to air – indoor uncontrolled	None	None	No	Not Applicable. There are no galvanized steel piping, piping components exposed to air – indoor uncontrolled in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 117	Glass piping elements exposed to air, lubricating oil, closed-cycle cooling water, fuel oil, raw water, treated water, treated borated water, air with borated water leakage, condensation, gas, underground	None	None	No	Consistent with NUREG-2191. Glass piping elements exposed to air, lubricating oil, closed-cycle cooling water, fuel oil, raw water, treated water, treated borated water, air with borated water leakage, condensation, gas, underground do not have an aging effect nor do they have an Aging Management Program assigned. This Item Number is applicable to High Pressure Fire Protection (Diesel Driven Pump), Air Conditioning, CO_2 Storage Fire Protection/Purge, Sampling and Water Quality, Radiation Monitoring, Reactor Water Cleanup, Standby Diesel Generators, Emergency Equipment Cooling Water and Diesel Generator Starting Air Systems.
3.3-1, 118	This Item Number is not used in NUREG-2192.				
3.3-1, 119	Nickel alloy, PVC, glass piping, piping components exposed to air with borated water leakage, air – indoor uncontrolled, condensation, waste water, raw water (potable)	None	None	No	Not Applicable. There is no nickel alloy, PVC, glass piping, piping components exposed to air with borated water leakage, air – indoor uncontrolled, condensation, waste water, raw water (potable) not previously addressed in screened in portions of Auxiliary Systems.
3.3-1, 120	Stainless steel piping, piping components exposed to air with borated water leakage, gas	None	None	No	Consistent with NUREG-2191. Stainless steel piping, piping components exposed to air with borated water leakage, gas does not have an aging effect nor does it have an AMP assigned. This SRP is applicable to Air Conditioning, CO_2 Storage Fire Protection/Purge, Reactor Water Cleanup, Reactor Building Closed Cooling Water, Auxiliary Decay Heat Removal, and Containment Inerting Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 121	Steel piping, piping components exposed to air – indoor controlled, gas	None	None	No	Consistent with NUREG-2191. Steel piping, piping components exposed to air – indoor controlled, gas do not have an aging effect nor do they have an aging Management Program assigned. This Item Number is applicable to Air Conditioning, CO_2 Storage Fire Protection/Purge, Sampling and Water Quality, Standby Liquid Control, Radiation Monitoring, Reactor Water Cleanup, Reactor Building Closed Cooling Water, Standby Diesel Generators, and Diesel Generator Starting Air Systems
3.3-1, 122	Titanium heat exchanger components, piping, piping components exposed to air – indoor uncontrolled, air – outdoor	None	None	No	Not Applicable. There are no titanium heat exchanger components, piping, piping components exposed to air – indoor uncontrolled, air – outdoor not previously addressed in screened in portions of Auxiliary Systems.
3.3-1, 123	Titanium heat exchanger components other than tubes, piping and piping components exposed to raw water	Cracking due to SCC, flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no titanium heat exchanger components other than tubes, piping and piping components exposed to raw water in screened in portions of Auxiliary Systems.
3.3-1, 124	Stainless steel, steel (with stainless steel or nickel alloy cladding) spent fuel storage racks (BWR), spent fuel storage racks (PWR), piping, piping components exposed to treated water >60°C (>140°F), treated borated water >60°C (>140°F)	Cracking due to SCC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage aging of stainless steel, steel (with stainless steel or nickel alloy cladding) for the spent fuel storage racks (BWR), piping, piping components exposed to treated water >60°C (>140°F) in Fuel Handling and Storage System.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 125	Stainless steel, steel (with stainless steel cladding), nickel alloy spent fuel storage racks (BWR), spent fuel storage racks (PWR), piping, piping components exposed to treated water, treated borated water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage loss of material of the stainless steel structural bolting, equipment storage racks(inside spent fuel pool and reactor well), fuel storage racks (spent fuel), and metal components exposed to treated water in Fuel Handling and Storage System.
3.3-1, 126	Metallic piping, piping components exposed to treated water, treated borated water, raw water	Wall thinning due to erosion	AMP XI.M17, “Flow-Accelerated Corrosion”	No	Consistent with NUREG-2191. The Flow-Accelerated Corrosion program (B.2.1.9) will be used to manage wall thinning of the carbon steel and stainless steel piping, piping components exposed to treated water and raw water in the Raw Cooling Water, Condensate/Demineralized Water, Emergency High Pressure Makeup, and Reactor Water Cleanup Systems.
3.3-1, 127	Metallic piping, piping components, tanks exposed to raw water, raw water (potable), treated water, waste water	Loss of material due to recurring internal corrosion	AMP XI.M20, “Open-Cycle Cooling Water System,” AMP XI.M27, “Fire Water System,” or AMP XI.M38 “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	Yes	Not Applicable. There are no metallic piping, piping components, tanks exposed to raw water,raw water (potable), treated water, waste water that have not been addressed by other more specific item numbers in screened in portions of Auxiliary Systems. See Subsection 3.3.2.2.7.
3.3-1, 128	Steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete, air, condensation, raw water	Loss of material due to general, pitting, crevice corrosion, MIC (soil, raw water only)	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not Applicable. There are no Steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete, air, condensation, raw water in screened in portions of Auxiliary Systems.
3.3-1, 129	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 130	Metallic sprinklers exposed to air, condensation, raw water, raw water (potable), treated water	Loss of material due to general (where applicable), pitting, crevice corrosion, MIC (except for aluminum, and in raw water, raw water (potable), treated water only); flow blockage due to fouling	AMP XI.M27, “Fire Water System”	No	Consistent with NUREG-2191. The Fire Water System program (B.2.1.16) will be used to manage Loss of material due to general (where applicable), pitting, crevice corrosion, MIC (except for aluminum, and in rawwater, raw water (potable), treated water only); flow blockage due to fouling on metallic sprinklers exposed to air, condensation, raw water, raw water (potable), treated water in the High Pressure Fire Protection System.
3.3-1, 131	Steel, stainless steel, copper alloy, aluminum piping, piping components exposed to air, condensation	Flow blockage due to fouling	AMP XI.M27, “Fire Water System”	No	Consistent with NUREG-2191. The Fire Water System program (B.2.1.16) will be used to manage flow blockage of the steel, stainless steel, copper alloy, aluminum piping, piping components, and spray nozzles exposed to air, condensation in the High Pressure Fire Protection (Diesel Driven Pump) and CO_2 Storage Fire Protection/Purge Systems.
3.3-1, 132	Insulated steel, copper alloy (>15% Zn or >8% Al), piping, piping components, tanks, tanks(within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Loss of material due to general (steel only), pitting, crevice corrosion; cracking due to SCC (copper alloy (>15% Zn or >8% Al) only)	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Consistent with NUREG-2191. The External Surfaces Monitoring of MechanicalComponents program (B.2.1.23) will be used to manage loss of material due to general (steel only), pitting, crevice corrosion; cracking due to SCC (copper alloy (>15% Zn or >8% Al) only) of the insulated steel, copper alloy (>15% Zn or >8% Al), piping, piping components exposed to air, condensation in the Emergency High Pressure Makeup, Auxiliary Boiler, Residual Heat Removal Service Water, Raw Cooling Water, High Pressure Fire Protection (Diesel Driven Pump), Potable Water, Air Conditioning, Service Air, CO_2 Storage Fire Protection/Purge, Station Drainage, Emergency Equipment Cooling Water, Reactor Water Cleanup, Reactor Building Closed Cooling Water, Radwaste, Spent Fuel Pool Cooling/ Cleanup, Supplemental Diesel Generators, Standby Diesel Generators, Control Rod Drive, and Diesel Generator Starting Air Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 133	HDPE underground piping, piping components	Cracking, blistering	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There are no HDPE underground piping, piping components in screened in portions of Auxiliary Systems.
3.3-1, 134	Steel, stainless steel, copper alloy piping, piping components, and heat exchanger components exposed to raw water (for components not covered by NRC GL 89-13)	Loss of material due to general (steel, copper alloy only), pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material of the carbon steel, copper alloy, and stainless steel piping, piping components, and traveling screens exposed to raw water in the Sampling and Water Quality and FLEX Systems.
3.3-1, 135	Steel, stainless steel pump casings exposed to waste water environment	Loss of material due to general (steel only), pitting, crevice corrosion, MIC	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Not Applicable. There are no steel, stainless steel pump casings exposed to waste water environment in screened in portions of Auxiliary Systems.
3.3-1, 136	Steel fire water storage tanks exposed to air, condensation, soil, concrete, raw water, raw water (potable), treated water	Loss of material due to general, pitting, crevice corrosion, MIC (raw water, raw water (potable), treated water, soil only)	AMP XI.M27, “Fire Water System”	No	Consistent with NUREG-2191. The Fire Water System program (B.2.1.16) will be used to manage loss of material of the steel fire water storage tanks exposed to air, condensation, soil, concrete, raw water, raw water (potable), treated water in the High Pressure Fire Protection (Diesel Driven Pump) System.
3.3-1, 137	Steel, stainless steel, aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to treated water, raw water, waste water	Loss of material due to general (steel only), pitting, crevice corrosion, MIC (steel, stainless steel only)	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not Applicable. There are no steel, stainless steel, aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to treated water, raw water, waste water in screened in portions of the Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 138	Any material piping, piping components, heat exchangers, tanks with internal coatings/linings exposed to closed-cycle cooling water, raw water, raw water (potable), treated water, treated borated water, fuel oil, lubricating oil, waste water, air-dry, air, condensation	Loss of coating or lining integrity due to blistering, cracking, flaking, peeling, delamination, rusting,or physical damage; loss of material or cracking for cementitious coatings/ linings	AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	No	Consistent with NUREG-2191. The Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks program (B.2.1.24) will be used to manage loss of coating or lining integrity of the carbon steel (with internal coating), ductile iron (with internal coating), galvanized steel, gray cast iron (with internal coating), and stainless steel (with internal coating) heat exchanger components, piping, piping components, and tanks exposed to lubricating oil, raw water, treated water, and waste water in the Residual Heat Removal Service Water, High Pressure Fire Protection (Diesel Driven Pump), Control Air and Service Air Systems.
3.3-1, 139	Any material piping, piping components, heat exchangers, tanks with internal coatings/linings exposed to closed-cycle cooling water, raw water, raw water (potable), treated water, treated borated water, fuel oil, lubricating oil, waste water, air-dry, air, condensation	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	No	Consistent with NUREG-2191. The Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks program (B.2.1.24) will be used to manage loss of material due to general, pitting, crevice corrosion, MIC on any material piping, piping components, heat exchangers, tanks with internal coatings/linings exposed to closed-cycle cooling water, raw water, raw water (potable), treated water, treated borated water, fuel oil, lubricating oil, waste water, air-dry, air, condensation in Residual Heat Removal Service Water, Control Air and Service Air Systems.
3.3-1, 140	Gray cast iron, ductile iron piping components with internal coatings/linings exposed to closed-cycle cooling water, raw water, raw water (potable), treated water, waste water	Loss of material due to selective leaching	AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	No	Consistent with NUREG-2191. The Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks program (B.2.1.24) will be used to manage loss of material of the ductile iron (with internal coating) and gray cast iron (with internal coating) piping, piping components exposed to raw water in the High Pressure Fire Protection (Diesel Driven Pump) and Potable Water Systems.
3.3-1, 141	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 142	Stainless steel, steel, nickel alloy, copper alloy closure bolting exposed to fuel oil, lubricating oil, treated water, treated borated water, raw water, waste water	Loss of material due to general (steel; copper alloy in raw water, waste water only), pitting, crevicecorrosion, MIC (raw water and waste water environments only)	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage loss of material of the carbon and low alloy steel and stainless steel closure bolting exposed to raw water and waste water in the Emergency High Pressure Makeup, Residual Heat Removal Service Water, High Pressure Fire Protection (Diesel Driven Pump), and Spent Fuel Pool Cooling/Cleanup Systems.
3.3-1, 143	This Item Number is not used in NUREG-2192.				
3.3-1, 144	Stainless steel, steel, aluminum piping, piping components, tanks exposed to soil, concrete	Cracking due to SCC (steel in carbonate / bicarbonate environment only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There is no stainless steel, steel, aluminum piping, piping components, tanks exposed to soil, concrete for which cracking due to SCC (steel in carbonate / bicarbonate environment only) exist in screened in portions of the Auxiliary Systems.
3.3-1, 145	Stainless steel closure bolting exposed to air, soil, concrete, underground, waste water	Cracking due to SCC	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage cracking ofstainless steel closure bolting exposed to air-indoor uncontrolled and air-outdoor in the Radiation Monitoring, Station Drainage, Sampling and Water Quality, Standby Liquid Control, and Reactor Water Cleanup Systems.
3.3-1, 146	Stainless steel underground piping, piping components, tanks	Cracking due to SCC	AMP XI.M32, “One-Time Inspection,” AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage aging for stainless steel underground piping, piping components, and tanks in screened in portions of Spent Fuel Pool Cooling/Cleanup System. See Subsection 3.3.2.2.3.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 147	Nickel alloy, nickel alloy cladding piping, piping components exposed to closed-cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M21A, "Closed Treated Water Systems"	No	Not Applicable. There is no nickel alloy, nickel alloy cladding piping, piping components exposed to closed-cycle cooling water in screened in portions of Auxiliary Systems.
3.3-1, 148	This Item Number is not used in NUREG-2192.				
3.3-1, 149	Fiberglass piping, piping components, ducting, ducting components exposed to air – outdoor	Cracking, blistering, loss of material due to exposure to ultraviolet light, ozone, radiation, temperature, or moisture	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Not Applicable. There is no fiberglass piping, piping components, ducting and ducting components exposed to air-outdoor in screened in portions of Auxiliary Systems.
3.3-1, 150	Fiberglass piping, piping components, ducting, ducting components exposed to air	Cracking, blistering, loss of material due to exposure to ultraviolet light, ozone, radiation, temperature, or moisture	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Not Applicable. There is no fiberglass piping, piping components, ducting, ducting components exposed to air in screened in portions of Auxiliary Systems.
3.3-1, 151	Stainless steel, steel, aluminum, copper alloy, titanium heat exchanger tubes exposed to air, condensation	Reduction of heat transfer due to fouling	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Consistent with NUREG-2191. External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage stainless steel, steel, aluminum, copper alloy, titanium heat exchanger tubes exposed to air, condensation in reduction of heat transfer due to fouling in the Air Conditioning, Sampling and Water Quality, Building Heating, Reactor Water Cleanup, Auxiliary Decay Heat Removal, Emergency Equipment Cooling Water, Supplemental Diesel Generator and Control Rod Drive Systems.
3.3-1, 152	This Item Number is not used in NUREG-2192.				
3.3-1, 153	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 154	This Item Number is not used in NUREG-2192.				
3.3-1, 155	Stainless steel piping, piping components, and tanks exposed to waste water >60°C (>140°F)	Cracking due to SCC	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no stainless steel piping, piping components, and tanks exposed to waste water >60°C (>140°F) in screened in portions of Auxiliary Systems.
3.3-1, 156	This Item Number is not used in NUREG-2192.				
3.3-1, 157	Steel piping, piping components, heat exchanger components exposed to air-outdoor	Loss of material due to general, pitting, crevice corrosion	AMP XI.M27, “Fire Water System,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping andDucting Components”	No	Consistent with NUREG-2191. The Fire Water System program (B.2.1.16) or Inspection of Internal Surfaces in Miscellaneous Piping andDucting Components program (B.2.1.24) will be used to manage loss of material of the steel piping, piping components exposed to air-outdoor in the High Pressure Fire Protection (Diesel Driven Pump), Normal Ventilation, Station Drainage, and Radiation Monitoring Systems.
3.3-1, 158	Nickel alloy piping, piping components heat exchanger components (for components not covered by NRC GL 89-13) exposed to raw water	Loss of material due to pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no nickel alloy piping, piping components heat exchanger components (for components not covered by NRC GL 89-13) exposed to raw water in screened in portions of Auxiliary Systems.
3.3-1, 159	Fiberglass piping, piping components, ducting, ducting components exposed to air	Loss of material due to wear	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There is no fiberglass piping, piping components, ducting, and ducting components exposed to air in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 160	Copper alloy (>15% Zn or >8% Al) piping, piping components, heat exchanger components exposed to closed-cycle cooling water, raw water, waste water	Cracking due to SCC	AMP XI.M20, "Open-Cycle Cooling Water System," AMP XI.M21A, "Closed Treated Water Systems," or AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191. The Open-Cycle Cooling Water System program (B.2.1.11) and Closed Treated Water Systems program (B.2.1.12) will be used to manage cracking of copper alloy with greater than 15% zinc heat exchanger components, piping, piping components exposed to raw water in the Raw Cooling Water, Raw Service Water, Emergency Equipment Cooling Water, High Pressure Fire Protection (Diesel Driven Pump), Air Conditioning and Reactor Building Closed Cooling Water Systems.
3.3-1, 161	Copper alloy heat exchanger tubes exposed to condensation	Reduction of heat transfer due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not Applicable. There are no copper alloy heat exchanger tubes exposed to condensation with a heat transfer intended function in screened in portions of Auxiliary Systems.
3.3-1, 162	This Item Number is not used in NUREG-2192.				
3.3-1, 163	This Item Number is not used in NUREG-2192.				
3.3-1, 164	This Item Number is not used in NUREG-2192.				
3.3-1, 165	This Item Number is not used in NUREG-2192.				
3.3-1, 166	Copper alloy piping, piping components exposed to concrete	None	None	No	Not Applicable. There is no copper alloy piping, piping components exposed to concrete in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 167	Zinc piping components exposed to air-indoor controlled, air - indoor uncontrolled	None	None	No	Consistent with NUREG-2191. There is no zinc piping components exposed to air-indoor controlled, air - indoor uncontrolled in screened in portions of Auxiliary Systems. However, it is applicable to Standby Gas Treatment System.
3.3-1, 168	This Item Number is not used in NUREG-2192.				
3.3-1, 169	Steel, copper alloy piping, piping components exposed to steam	Loss of material due to general (steel only), pitting, crevice corrosion	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Water Chemistry program (B.2.1.2) and the One-Time Inspection program (B.2.1.20) will be used to manage the loss of material due to general (steel only), pitting, crevice corrosion of steel, copper alloy piping, piping components exposed to steam in the Auxiliary Boiler System.
3.3-1, 170	Stainless steel piping, piping components exposed to steam	Loss of material due to pitting, crevice corrosion	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not Applicable. There are no stainless steel piping, piping components exposed to steam in screened in portions of Auxiliary Systems.
3.3-1, 171	This Item Number is not used in NUREG-2192.				
3.3-1, 172	PVC piping, piping components exposed to air-outdoor	Reduction in impact strength due to photolysis	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Not Applicable. There is no PVC piping, piping components exposed to air-outdoor in screened in portions of Auxiliary Systems.
3.3-1, 173	This Item Number is not used in NUREG-2192.				
3.3-1, 174	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 175	Fiberglass piping, piping components, tanks exposed to raw water (for components not covered by NRC GL 89-13), raw water (potable), treated water, waste water	Cracking, blistering, loss of material due to exposure to ultraviolet light, ozone, radiation, temperature, or moisture; flow blockage due to fouling (raw water, waste water only)	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not Applicable. There is no fiberglass piping, piping components, and tanks exposed to raw water (for components not covered by NRC GL 89-13), raw water (potable), treated water, or waste water in screened in portions of Auxiliary Systems.
3.3-1, 176	Fiberglass piping, piping components, tanks exposed to raw water environment (for components not covered by NRC GL 89-13), raw water (potable), treated water, waste water	Loss of material due to wear; flow blockage due to fouling (raw water, waste water only)	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not Applicable. There is no fiberglass piping, piping components, and tanks exposed to raw water environment (for components not covered by NRC GL 89-13), raw water (potable), treated water, or waste water in screened in portions of Auxiliary Systems.
3.3-1, 177	Fiberglass piping, piping components exposed to soil	Loss of material due to wear	AMP XI.M41, "Buried and Underground Piping and Tanks"	No	Not Applicable. There is no fiberglass piping, piping components exposed to soil in screened in portions of Auxiliary Systems.
3.3-1, 178	Fiberglass piping and piping components exposed to concrete	None	None	No	Not Applicable. There are no fiberglass piping and piping components exposed to concrete in screened in portions of Auxiliary Systems.
3.3-1, 179	Masonry walls: structural fire barriers exposed to air	Cracking due to restraint shrinkage, creep, aggressive environment; loss of material (spalling, scaling) and cracking due to freeze-thaw	AMP XI.M26, "Fire Protection," and AMP XI.S5, "Masonry Walls"	No	Consistent with NUREG-2191. The Fire Protection program (B.2.1.15) and Masonry Walls program (B.2.1.32) will be used to manage cracking due to restraint shrinkage, creep, aggressive environment; loss of material (spalling, scaling) and cracking due to freeze-thaw of masonry walls: structural fire barriers exposed to air in Table 3.5.2-36: Structural Commodities (Hazard Barriers and Elastomers).

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 180	This Item Number is not used in NUREG-2192.				
3.3-1, 181	Titanium piping, piping components exposed to condensation	None	None	No	Not Applicable. There is no titanium piping, piping components exposed to condensation in screened in portions of Auxiliary Systems.
3.3-1, 182	Non-metallic thermal insulation exposed to air, condensation	Reduced thermal insulation resistance due to moisture intrusion	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage reduced thermal insulation resistance of the aluminum, calcium silicate, caulking and lagging adhesive, cellular glass, fiberglass, foamed plastic, insulation cement and finishing cement, mineral fiber, plastic mastic jacketing, silicone, and stainless steel thermal insulation and thermal insulation jacketing exposed to air-indoor uncontrolled and air- outdoor as shown in Table 3.5.2-36: Structural Commodities (Thermal Insulation).
3.3-1, 183	This Item Number is not used in NUREG-2192.				
3.3-1, 184	PVC piping, piping components, tanks exposed to concrete	None	None	No	Not Applicable. There is no PVC piping, piping components, and tanks exposed to concrete in screened in portions of Auxiliary Systems.
3.3-1, 185	Aluminum fire water storage tanks exposed to air, condensation, soil, concrete, raw water, raw water (potable), treated water	Cracking due to SCC	AMP XI.M27, “Fire Water System”	No	Not Applicable. There are no aluminum fire water storage tanks exposed to air, condensation, soil, concrete, raw water, raw water (potable), treated water in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 186	Aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation, soil, concrete, raw water, waste water	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings/Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There are no aluminum tanks (within the scope of AMP XI.M29, “Outdoor and LargeAtmospheric Metallic Storage Tanks”) exposed to air, condensation, soil, concrete, raw water, or waste water in screened in portions of Auxiliary Systems. See Subsection 3.3.2.2.8.
3.3-1, 187	This Item Number is not used in NUREG-2192.				
3.3-1, 188	This Item Number is not used in NUREG-2192.				
3.3-1, 189	Aluminum piping, piping components, tanks exposed to air, condensation, raw water, raw water (potable), waste water	Cracking due to SCC	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage cracking of aluminum piping, piping components, tanks exposed to air, condensation, raw water, raw water (potable), waste water. Impacted systems include, Fuel Oil, CO_2 Storage Fire Protection/Purge, Standby Liquid Control, Containment, Radiation Monitoring and Reactor Building Closed Cooling Water Systems. See Subsection 3.3.2.2.8.
3.3-1, 190	This Item Number is not used in NUREG-2192.				
3.3-1, 191	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 192	Aluminum underground piping, piping components, tanks	Cracking due to SCC	AMP XI.M32, “One-Time Inspection,” AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There is no aluminum underground piping, piping components, and tanks in scoped in portions of Auxiliary Systems. See Subsection 3.3.2.2.8.
3.3-1, 193	Steel components exposed to treated water, raw water, raw water (potable), waste water	Long-term loss of material due to general corrosion	AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) program will be used to manage long-term loss of material of the carbon steel, ductile iron, galvanized steel, and gray cast iron heat exchanger components, piping, piping components, and tanks exposed to raw water, sodium pentaborate solution, treated water, and waste water in the Emergency High Pressure Makeup, Emergency Equipment Cooling Water, Auxiliary Boiler, High Pressure Fire Protection (Diesel Driven Pump), Station Drainage, Standby Liquid Control, Reactor Water Cleanup, Radwaste, Spent Fuel Pool Cooling/Cleanup and Control Rod Drive Systems.
3.3-1, 194	PVC piping, piping components, and tanks exposed to soil	Loss of material due to wear	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There is no PVC piping, piping components, and tanks exposed to soil in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 195	Concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to raw water, treated water, raw water (potable)	Cracking due to chemical reaction, weathering, settlement, or corrosion of reinforcement (reinforced concrete only); loss of material due to delamination, exfoliation, spalling, popout, scaling, or cavitation; flow blockage due to fouling (raw water only)	AMP XI.M27, “Fire Water System”	No	Not Applicable. There are no concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to raw water or treated water in screened in portions of Auxiliary Systems.
3.3-1, 196	HDPE piping, piping components exposed to raw water, treated water, raw water (potable)	Cracking, blistering; flow blockage due to fouling (raw water only)	AMP XI.M27, “Fire Water System”	No	Not Applicable. There are no HDPE piping, piping components exposed to raw water or treated water in screened in portions of Auxiliary Systems.
3.3-1, 197	Metallic fire water system piping, piping components, heat exchanger, heat exchanger components (any material) with only a Pressure Boundary (spatial) or structural integrity (attached) intended function exposed to any external environment except soil, concrete	Loss of material due to general (steel, copper alloy only), pitting, crevice corrosion	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Not Applicable. There is no metallic fire water system piping, piping components, heat exchanger, heat exchanger components (any material) with only a Pressure Boundary (spatial) or structural integrity (attached) intended function exposed to any external environment except soil, concrete in screened in portions of Auxiliary Systems that has not been addressed.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 198	Metallic fire water system piping, piping components, heat exchanger, heat exchanger components (any material) with only a Pressure Boundary (spatial) or structural integrity (attached) intended function	Loss of material dueto general (steel, copper alloy only), pitting, crevice corrosion, MIC (all metallic materials except aluminum; in liquid environments only)	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There is no metallic fire water system piping, piping components, heat exchanger, heat exchanger components (any material) with only a Pressure Boundary (spatial) or structural integrity (attached) intended function in screened in portions of Auxiliary Systems that has not been addressed.
3.3-1, 199	Cranes: steel structural bolting exposed to air	Loss of preload due to self-loosening; loss of material due to general corrosion; cracking	AMP XI.M23, “Inspection of Overhead Heavy Load and Light Load (Related to Refueling) Handling Systems”	No	Consistent with NUREG-2191. The Inspection of Overhead Heavy Load and Light Load (Related to Refueling) Handling Systems program (B.2.1.13) will be used to manage cracking, loss of material, and loss of preload of the carbon and low alloy steel structural bolting and high strength low alloy steel structural bolting with yield strength of 150 ksi or greater exposed to air-indoor uncontrolled the Fuel Handling and Storage and Cranes and Hoists Systems.
3.3-1, 200	This Item Number is not used in NUREG-2192.				
3.3-1, 201	This Item Number is not used in NUREG-2192.				
3.3-1, 202	Stainless steel piping, piping components exposed to concrete	None	None	Yes	Consistent with NUREG-2191. Stainless steel piping, piping components exposed to concrete do not have an aging effect nor do they have an Aging Management Program assigned. This Item Number is applicable to Spent Fuel Pool Cooling/Cleanup. See Subsection 3.3.2.2.9.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 203	Stainless steel; steel with stainless steel cladding, nickel alloy piping, piping components, heat exchanger components, tanks exposed to treated water, sodium pentaborate solution	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage loss of material of the carbon or low alloy steel with stainless steel cladding, and stainless steel heat exchanger components, piping, piping components, and tanks exposed to sodium pentaborate solution and treated water in the Emergency High Pressure Makeup, Radiation Monitoring, Residual Heat Removal Service Water, Raw Cooling Water, Sampling and Water Quality, Standby Liquid Control, Containment, Reactor Water Cleanup, Radwaste, Spent Fuel Pool Cooling/Cleanup, and Control Rod Drive Systems.
3.3-1, 204	This Item Number is not used in NUREG-2192.				
3.3-1, 205	Insulated stainless steel piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) program will be used to manage Cracking due to SCC for insulated stainless steel piping, piping components, tanks exposed to air, condensation in Sampling and Water Quality System. See Subsection 3.3.2.2.3.
3.3-1, 206	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 207	Stainless steel, copper alloy, titanium heat exchanger tubes exposed to raw water (forcomponents not covered by NRC GL 89-13)	Cracking due to SCC (titanium only), reduction of heat transfer due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage copper alloy heat exchanger tubes exposed to raw water (for components not covered by NRC GL 89-13) in screened in portions of Residual Heat Removal Service Water System.
3.3-1, 208	Concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to raw water (for components not covered by NRC GL 89-13)	Cracking due to chemical reaction, weathering, settlement, or corrosion of reinforcement (reinforced concrete only); loss of material due to delamination, exfoliation, spalling, popout, scaling, or cavitation; flow blockage due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not Applicable. There are no concrete, concrete cylinder piping, reinforced concrete, asbestos cement, cementitious piping, piping components exposed to raw water (for components not covered by NRC GL 89-13) in screened in portions of Auxiliary Systems.
3.3-1, 209	This Item Number is not used in NUREG-2192.				
3.3-1, 210	HDPE piping, piping components exposed to raw water (for components not covered by NRC GL 89-13)	Cracking, blistering; flow blockage due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not Applicable. There is no HDPE piping, piping components exposed to raw water (for components not covered by NRC GL 89-13) in screened in portions of Auxiliary Systems.
3.3-1, 211	This Item Number is not used in NUREG-2192.				
3.3-1, 212	This Item Number is not used in NUREG-2192.				
3.3-1, 213	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 214	Copper alloy (>15% Zn or >8% Al) piping, piping components exposed to soil	Loss of material due to selective leaching	AMP XI.M33, "Selective Leaching"	No	Consistent with NUREG-2191. Loss of material due to selective leaching for copper alloy (>15% Zn or >8% Al) piping, piping components exposed to soil will be managed by Selective Leaching program (B.2.1.21) in the High Pressure Fire Protection (Diesel Driven Pump) System.
3.3-1, 215	Aluminum fire water storage tanks exposed to air, condensation, soil, concrete, raw water, raw water (potable), treated water	Loss of material due to pitting, crevice corrosion	AMP XI.M27, "Fire Water System"	No	Not Applicable. There are no aluminum fire water storage tanks exposed to air, condensation, soil, concrete, raw water, raw water (potable), ortreated water in screened in portions of Auxiliary Systems.
3.3-1, 216	Stainless steel fire water storage tanks exposed to air, condensation, soil, concrete	Cracking due to SCC	AMP XI.M27, "Fire Water System"	No	Not Applicable. There are no stainless steel fire water storage tanks exposed to air, condensation, soil, or concrete in screened in portions of Auxiliary Systems.
3.3-1, 217	This Item Number is not used in NUREG-2192.				
3.3-1, 218	Stainless steel fire water storage tanks exposed to air, condensation, soil, concrete, raw water, raw water (potable), treated water	Loss of material due to pitting, crevice corrosion, MIC (water and soil environment only)	AMP XI.M27, "Fire Water System"	No	Not Applicable. There are no stainless steel fire water storage tanks exposed to air, condensation, soil, concrete, raw water, raw water (potable), treated water in screened in portions of Auxiliary Systems.
3.3-1, 219	Stainless steel piping, piping components exposed to steam	Cracking due to SCC	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191. Cracking due to SCC in stainless steel piping, piping components exposed to steam will be managed by the Water Chemistry program (B.2.1.2) and the One-Time Inspection program (B.2.1.20) for Auxiliary Boiler System.
3.3-1, 220	This Item Number is not used in NUREG-2192.				

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 221	This Item Number is not used in NUREG-2192.				
3.3-1, 222	Stainless steel, nickel alloy tanks exposed to air, condensation (internal/ external)	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There is no stainless steel, nickel alloy tanks exposed to air, condensation (internal/external) within the screened in portions of Auxiliary Systems. See Subsection 3.3.2.2.4.
3.3-1, 223	Aluminum underground piping, piping components, tanks	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There is no aluminum underground piping, piping components, and tanks in screened in portions of Auxiliary Systems. See Subsection 3.3.2.2.10.
3.3-1, 224	This Item Number is not used in NUREG-2192.				
3.3-1, 225	This Item Number is not used in NUREG-2192.				
3.3-1, 226	Aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not Applicable. There are no aluminum tanks (within the scope of AMP XI.M29, “Outdoor and LargeAtmospheric Metallic Storage Tanks”) exposed to soil or concrete in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 227	Aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings/Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There are no aluminum tanks (within the scope of AMP XI.M29, “Outdoor and LargeAtmospheric Metallic Storage Tanks”) exposed to air or condensation in screened in portions of Auxiliary Systems. See Subsection 3.3.2.2.10.
3.3-1, 228	Stainless steel, nickel alloy tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One Time Inspection,” or AMP XI.M42, “Internal Coatings/Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There are no stainless steel, nickel alloy tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air or condensation in screened in portions of Auxiliary Systems. See Subsection 3.3.2.2.4.
3.3-1, 229	Stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete	Loss of material due to pitting, crevice corrosion, MIC (soil only)	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not Applicable. There are no stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil or concrete in screened in portions of Auxiliary Systems.
3.3-1, 230	Stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not Applicable. There are no stainless steel tanks (withinthe scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil or concrete in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 231	Stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings/Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There are no stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air or condensation in screened in portions of Auxiliary Systems. See Subsection 3.3.2.2.3.
3.3-1, 232	Insulated stainless steel, nickel alloy piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage loss of material of the insulated stainless steel, nickel alloy piping, piping components, tanks exposed to air and condensation. Impacted systems include Standby Liquid Control, Emergency Equipment Cooling Water, Reactor Water Cleanup, Containment Inerting, Spent Fuel Pool Cooling/ Cleanup and Control Rod Drive Systems. See Subsection 3.3.2.2.4.
3.3-1, 233	Insulated aluminum piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage cracking due to SCC in insulated aluminum piping, piping components, tanks exposed to air, condensation for in- scope piping, piping components, heat exchangers, and tanks for High Pressure Fire Protection (Diesel Driven Pump) System. See Subsection 3.3.2.2.8.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 234	Aluminum piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage loss of material in aluminum piping, piping components, tanks exposed to air and condensation. Impacted systems include in the Fuel Oil, Residual Heat Removal Service Water, High Pressure Fire Protection (Diesel Driven Pump), Air Conditioning, Control Air, Containment, Containment Inerting, Spent Fuel Pool Cooling/Cleanup, Control Rod Drive, and Diesel Generator Starting Air Systems. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material in aluminum piping, piping components, tanks exposed to air and condensation in the Radiation Monitoring System. See Subsection 3.3.2.2.10.
3.3-1, 235	Metallic piping, piping components exposed to air-dry (internal)	Loss of material due to general (steel only), pitting, crevice corrosion	AMP XI.M24, “Compressed Air Monitoring”	No	Consistent with NUREG-2191. The Compressed Air Monitoring program (B.2.1.14) will be used to manage loss of material of the aluminum alloy, carbon steel, copper alloy, and stainless steel piping, piping components exposed to air-dry in the Control Air, Demineralizer Backwash Air, Main Steam, Reactor Building Closed Cooling Water and Diesel Generator Starting Air Systems.
3.3-1, 236	Titanium heat exchanger tubes exposed to treated water	Cracking due to SCC, reduction of heat transfer due to fouling	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not Applicable. There are no titanium heat exchanger tubes exposed to treated water in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 237	Titanium (ASTM Grades1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to treated water	None	None	No	.Not Applicable. There are no titanium (ASTM Grades1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to treated water in screened in portions of Auxiliary Systems.
3.3-1, 238	Titanium heat exchanger tubes exposed to closed-cycle cooling water	Cracking due to SCC, reduction of heat transfer due to fouling	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no titanium heat exchanger tubes exposed to closed-cycle cooling water in screened in portions of Auxiliary Systems.
3.3-1, 239	Titanium (ASTM Grades1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to closed-cycle cooling water	None	None	No	Not Applicable. There is no titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to closed-cycle cooling water in screened in portions of Auxiliary Systems.
3.3-1, 240	Aluminum heat exchanger components exposed to waste water	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There are no aluminum heat exchanger components exposed to waste water in screened in portions of Auxiliary Systems. See Subsection 3.3.2.2.10.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 241	Stainless steel, nickel alloy heat exchanger components exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage loss of material of stainless steel, nickel alloy heat exchanger components exposed to air and condensation. Impacted systems include, Sampling and Water Quality, Auxiliary Decay Heat Removal, Containment Inerting and Containment Atmosphere Dilution Systems. See Subsection 3.3.2.2.4.
3.3-1, 242	Aluminum heat exchanger components exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage loss of material in aluminum heat exchanger components exposed to air and condensation. Impacted systems include Air Conditioning, Emergency Equipment Cooling Water and Standby Diesel Generator Systems. See Subsection 3.3.2.2.10.
3.3-1, 243	This Item Number is not used in NUREG-2192.				
3.3-1, 244	Stainless steel, nickel alloy piping, piping components exposed to treated water >60°C (>140°F)	Cracking due to SCC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) and Water Chemistry program (B.2.1.2) will be used to manage cracking of cast austenitic stainless steel and stainless steel piping, piping components exposed to treated water > 140 F and treated water > 482 F in the Reactor Water Cleanup System.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 245	Insulated aluminum piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There are no Insulated aluminum piping, piping components, tanks exposed to air, condensation in screened in portions of Auxiliary Systems. See Subsection 3.3.2.2.10.
3.3-1, 246	Stainless steel, nickel alloy underground piping, piping components, tanks	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to manage aging for stainless steel underground piping, piping components, and tanks in screened in portions of Spent Fuel Pool Cooling/Cleanup System. See Subsection 3.3.2.2.4.
3.3-1, 247	Aluminum piping, piping components, tanks exposed to raw water, waste water	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There are no aluminum piping, piping components, and tanks exposed to raw water and waste water in screened in portions of Auxiliary Systems. See Subsection 3.3.2.2.10.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 248	Aluminum piping, piping components, tanks exposed to air with borated water leakage	None	None	No	Not Applicable. There are no aluminum piping, piping components, and tanks exposed to air with borated water leakage in screened in portions of Auxiliary Systems.
3.3-1, 249	Steel heat exchanger tubes internal to components exposed to air-outdoor, air-indoor uncontrolled, condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material of the carbon steel heat exchanger components exposed to condensation in the Reactor Building Closed Cooling Water Systems.
3.3-1, 250	Steel reactor coolant pump oil collection system tanks, piping, piping components exposed to lubricating oil (waste oil)	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) program will be used to manage loss of material due to general, pitting, crevice corrosion, MIC in piping, piping components exposed to lubricating oil (waste oil) in the Radwaste System.
3.3-1, 251	This Item Number is not used in NUREG-2192.				
3.3-1, 252	Aluminum piping, piping components exposed to soil, concrete	Loss of material due to pitting, crevice corrosion	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There is no aluminum piping, piping components exposed to soil or concrete in screened in portions of Auxiliary Systems.
3.3-1, 253	PVC piping, piping components exposed to raw water, raw water (potable), treated water, waste water	Loss of material due to wear; flow blockage due to fouling (raw water only)	AMP XI.M20, “Open-Cycle Cooling Water System,” AMP XI.M27, “Fire Water System,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There is no PVC piping, piping components exposed to raw water, raw water (potable), treated water, waste water in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 254	Aluminum heat exchanger components exposed to air, condensation	Cracking due to SCC	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not applicable. There are no aluminum heat exchanger components exposed to air, condensation in screened in portions of Auxiliary Systems. See Subsection 3.3.2.2.8.
3.3-1, 255	Any material fire damper assemblies exposed to air	Loss of material due to general, pitting, crevice corrosion; cracking due to SCC; hardening, loss of strength, shrinkage due to elastomer degradation	AMP XI.M26, “Fire Protection”	No	Consistent with NUREG-2191. The Fire Protection program (B.2.1.15) will be used to manage loss of material of the galvanized steel fire barriers exposed to air-indoor uncontrolled in the Normal Ventilation, Air Conditioning, CO_2 Storage Fire Protection/Purge, and Containment Systems.
3.3-1, 256	This Item Number is not used in NUREG-2192.				
3.3-1, 257	Steel, stainless steel, copper alloy heat exchanger tubes exposed to lubricating oil	Reduction of heat transfer due to fouling	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Lubricating Oil Analysis program (B.2.1.25) and One-Time Inspection program (B.2.1.20) program will be used to manage reduction of heat transfer of the copper alloy and stainless heat exchanger tubes exposed to lubricating oil in the Air Conditioning, Standby Diesel Generators, Condenser Circulating Water, and Control Rod Drive Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 258	Metallic, elastomer, fiberglass, HDPE piping, piping components exposed to waste water	Flow blockage due to fouling	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no metallic, elastomer, fiberglass, HDPE piping, piping components exposed to waste water with aflow rate or heat transfer function in screened in portions of Auxiliary Systems.
3.3-1, 259	Aluminum piping, piping components exposed to raw water	Flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The Open-Cycle Cooling Water System program (B.2.1.11) program will be used to manage flow blockage due to fouling of aluminum piping, piping components exposed to raw water in screened in portions of the Radiation Monitoring System.
3.3-1, 260	Metallic HVAC closure bolting exposed to air, condensation	Loss of material due to general (where applicable), pitting, crevice corrosion; cracking due to SCC, loss of preload	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191 The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage loss of material and loss of preload of the carbon and low alloy steel HVAC closure bolting exposed to air-indoor uncontrolled in the Emergency High Pressure Makeup, Normal Ventilation, and Air Conditioning Systems.
3.3-1, 261	Titanium (ASTM Grades 3, 4, or 5) heat exchanger tubes exposed to closed-cycle cooling water, raw water	Cracking due to SCC	AMP XI.M20, “Open-Cycle Cooling Water System,” or AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no titanium (ASTM Grades 3, 4,or 5) heat exchanger tubes exposed to closed-cycle cooling water or raw water in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 262	Titanium piping, piping components, heat exchanger components exposed to closed-cycle cooling water, treated water	Cracking due to SCC	AMP XI.M20, “Open-Cycle Cooling Water System,” or AMP XI.M21A, “Closed Treated Water Systems,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There is no titanium piping, piping components, and heat exchanger components exposed to closed-cycle cooling water in screened in portions of Auxiliary Systems.
3.3-1, 263	Polymeric piping, piping components, ducting, ducting components, seals exposed to air, condensation, raw water, raw water (potable), treated water, waste water, underground, concrete, soil	Hardening or loss of strength due to polymeric degradation; loss of material due to peeling, delamination, wear; cracking or blistering due to exposure to ultraviolet light, ozone, radiation,or chemical attack; flow blockage due to fouling	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191 the External Surfaces Monitoring of Mechanical Components program (B.2.1.23), or Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage hardening or loss of strength due to polymeric degradation; loss of material due to peeling, delamination, wear; cracking or blistering due to exposure to ultraviolet light, ozone, radiation, or chemical attack; flow blockage due to fouling in the Radiation Monitoring, Residual Heat Removal Service Water, Raw Cooling Water, Air Conditioning, Sampling and Water Quality, and Hypochlorite Systems.
3.3-1, 264	This Item Number is reserved and not currently used in NUREG-2192.				
3.3-1, 265	Steel heat exchanger tubes exposed to fuel oil	Reduction of heat transfer due to fouling	XI.M30, “Fuel Oil Chemistry,” and XI.M32, “One-Time Inspection”	No	Not Applicable. There are no steel heat exchanger tubes exposed to fuel oil in screened in portions of Auxiliary Systems.
3.3-1, 266	Steel heat exchanger tubes exposed to fuel oil	Reduction of heat transfer due to fouling	XI.M30, “Fuel Oil Chemistry”	No	Not Applicable. There are no steel heat exchanger tubes exposed to fuel oil in screened in portions of Auxiliary Systems.

Table 3.3.1, Summary of Aging Management Evaluations for the Auxiliary Systems (Continued)

Item Number	Component	Aging Effect/ Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.3-1, 267	Subliming compound fireproofing/fire barriers (Thermo- lag®, Darmatt™, 3M™ Interam™, and other similar materials) exposed to air	Loss of material due to abrasion, flaking, vibration; cracking/ delamination due to chemical reaction, settlement; change in material properties due to gamma irradiation exposure; separation	AMP XI.M26, “Fire Protection”	No	Consistent with NUREG-2191. There are no subliming compound fireproofing/fire barriers (Thermo- lag®, Darmatt™, 3M™ Interam™, and other similar materials) exposed to air addressed in screened in portions of Auxiliary Systems. However, this item is used in Table 3.5.2-36: Structural Commodities (Hazard Barriers and Elastomers).
3.3-1, 268	Cementitious coating fireproofing/fire barriers (Pyrocrete, BIO™ K-10 Mortar, Cafecote, and other similar materials) exposed to air	Loss of material due to abrasion, exfoliation, elevated temperature, flaking, spalling; cracking/delamination due to chemical reaction, elevated temperature, settlement, vibration; change in material properties due to elevated temperature, gamma irradiation exposure; separation	AMP XI.M26, “Fire Protection”	No	Consistent with NUREG-2191. There are no cementitious coating fireproofing/fire barriers (Pyrocrete, BIO™ K-10 Mortar, Cafecote, and other similar materials) exposed to air addressed in screened in portions of Auxiliary Systems. However, this item is used in Table 3.5.2-36: Structural Commodities (Hazard Barriers and Elastomers).
3.3-1, 269	Silicate fireproofing/fire barriers (Marinite®, Kaowool™, Cerafiber®, Cera® blanket, or other similar materials) exposed to air	Loss of material due to abrasion, flaking; cracking/delamination due to settlement; change in material properties due to gamma irradiation exposure; separation	AMP XI.M26, “Fire Protection”	No	Consistent with NUREG-2191. There are no silicate fireproofing/fire barriers (Marinite®, Kaowool™, Cerafiber®, Cera® blanket, or other similar materials) exposed to air addressed in screened in portions of Auxiliary Systems. However, this item is used in Table 3.5.2-36: Structural Commodities (Hazard Barriers and Elastomers).

Table 3.3.2-1, Emergency High Pressure Makeup System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Steel	Treated water	Long-term loss of material due to general corrosion	One-Time Inspection (B.2.1.20)	VII.C2.A-439	3.3-1, 193	A
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VII.I.A-04	3.3-1, 010	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Metallic	Air, condensation	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VII.I.AP-124	3.3-1, 015	A
Closure bolting	Mechanical Closure	Steel	treated water	Loss of material due to general (steel; copper alloy in raw water, waste water only), pitting, crevice corrosion, MIC (raw water, waste water environments only)	Bolting Integrity (B.2.1.10)	VII.I.A-423	3.3-1, 142	A, 1
Closure bolting HVAC	Mechanical Closure	Metallic	Air, condensation	Loss of material due to general (where applicable), pitting, crevice corrosion; cracking due to SCC, loss of preload	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.F2.A-794	3.3-1, 260	A
Ducting, ducting components,	Pressure Boundary	Galvanized Steel	Air - indoor controlled	None	None	V.F.EP-14	3.2-1, 059	A

Table 3.3.2-1, Emergency High Pressure Makeup System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Ducting, ducting components, (internal surfaces)	Pressure Boundary	Galvanized Steel	Condensation	Loss of material due to general, pitting, crevice corrosion, MIC (for drip pans and drain lines only)	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.F2.A-08	3.3-1, 090	A
External surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-77	3.3-1, 078	A
Insulated piping, piping components, tanks	Pressure Boundary	Steel	Air, condensation	Loss of material due to general, pitting, crevice corrosion (steel only); cracking due to SCC (copper alloy (>15% Zn or >8% Al) only)	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-405a	3.3-1, 132	A
Piping, piping components	Pressure Boundary	Steel	Air	Cumulative fatigue damage due to fatigue	Section 4.3, "Metal Fatigue"	VII.E3.A-34	3.3-1, 002	A
Piping, piping components	Pressure Boundary	Stainless steel	Air, condensation	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VII.C1.AP-209a	3.3-1, 004	A
Piping, piping components	Pressure Boundary	Stainless steel	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.C2.AP-221a	3.3-1, 006	A
Piping, piping components	Pressure Boundary	Steel	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.E3.AP-106	3.3-1, 021	A
Piping, piping components	Pressure Boundary	Steel	Air - outdoor	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-24	3.3-1, 080	A
Piping, piping components	Pressure Boundary	Steel	Lubricating oil	Loss of material due to pitting, crevice corrosion, MIC	Lubricating Oil Analysis (B.2.1.25) and One-Time Inspection (B.2.1.20)	VII.C1.AP-127	3.3-1, 097	A

Table 3.3.2-1, Emergency High Pressure Makeup System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Steel	Treated water	Wall thinning due to erosion	Flow-Accelerated Corrosion (B.2.1.9)	VII.E3.A-408	3.3-1, 126	A
Piping, piping components	Pressure Boundary	Stainless steel	Treated water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.E3.AP-110	3.3-1, 203	A

Table 3.3.2-1 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. This GALL-SLR item reflects consideration of leakage from a flanged connection. However, this system does not contain any submerged closure bolting.

Table 3.3.2-2, Auxiliary Boiler System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Steel	Treated water	Long-term loss of material due to general corrosion	One-Time Inspection (B.2.1.20)	VII.E3.A-439	3.3-1, 193	A
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VII.I.A-04	3.3-1, 010	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VII.I.AP-124	3.3-1, 015	A
External surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-77	3.3-1, 078	A
Insulated piping, piping components, tanks	Pressure Boundary	Copper alloy (>15% Zn or >8% Al)	Air, condensation	Loss of material due to general (steel only), pitting, crevice corrosion; cracking due to SCC (copper alloy (>15% Zn or >8% Al) only)	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-405a	3.3-1, 132	A
Insulated piping, piping components, tanks	Pressure Boundary	Steel	Air, condensation	Loss of material due to general (steel only), pitting, crevice corrosion; cracking due to SCC (copper alloy (>15% Zn or >8% Al) only)	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-405a	3.3-1, 132	A
Piping, piping components	Pressure Boundary	Steel	Air	Cumulative fatigue damage due to fatigue	Section 4.3, “Metal Fatigue”	VII.E3.A-34	3.3-1, 002	A

Closure bolting	Mechanical Closure	Stainless steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Stainless steel	Air - outdoor	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VII.I.AP-124	3.3-1, 015	A
Closure bolting	Mechanical Closure	Stainless steel	Raw Water	Loss of material due to general (steel; copper alloy in raw water, waste water only), pitting, crevice corrosion, MIC (raw water, waste water environments only)	Bolting Integrity (B.2.1.10)	VII.I.A-423	3.3-1, 142	A
Closure bolting	Mechanical Closure	Steel	Raw Water	Loss of material due to general (steel; copper alloy in raw water, waste water only), pitting, crevice corrosion, MIC (raw water, waste water environments only)	Bolting Integrity (B.2.1.10)	VII.I.A-423	3.3-1, 142	A

Table 3.3.2-4, Residual Heat Removal Service Water System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Heat exchanger components	Pressure Boundary	Steel	Raw water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	Open-Cycle Cooling Water System (B.2.1.11)	VII.C1.AP-183	3.3-1, 038	A
Heat exchanger tubes	Pressure Boundary, Heat Transfer	Stainless steel	Raw water	Cracking due to SCC (titanium only), reduction of heat transfer due to fouling	Open-Cycle Cooling Water System (B.2.1.11)	VII.C1.AP-187	3.3-1, 042	A
Heat exchanger tubes (for components not covered by NRC GL 89-13)	Pressure Boundary, Heat Transfer	Stainless steel	Raw water	Cracking due to SCC (titanium only), reduction of heat transfer due to fouling	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.C1.A-736	3.3-1, 207	A
Heat exchanger tubes	Pressure Boundary,, Heat Transfer	Stainless steel	Raw water	Reduction of heat transfer due to fouling	Open-Cycle Cooling Water System (B.2.1.11)	VIII.E.S-28	3.4-1, 022	A
Insulated piping, piping components, tanks	Pressure Boundary	Steel	Air, condensation	Loss of material due to general (steel only), pitting, crevice corrosion; cracking due to SCC (copper alloy (>15% Zn or >8% Al) only)	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-405a	3.3-1, 132	A
Piping, piping components	Pressure Boundary	Steel	Air	Cumulative fatigue damage due to fatigue	Section 4.3, “Metal Fatigue”	VII.E3.A-34	3.3-1, 002	A
Piping, piping components	Pressure Boundary	Stainless steel	Air, condensation	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VII.C1.AP-209a	3.3-1, 004	A
Piping, piping components	Pressure Boundary	Steel	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.E3.AP-106	3.3-1, 021	A

Table 3.3.2-4, Residual Heat Removal Service Water System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Aluminum	Treated water	Loss of material due to pitting, crevice corrosion	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.C2.AP-130	3.3-1, 025	A
Piping, piping components	Pressure Boundary	Copper alloy	Raw water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	Open-Cycle Cooling Water System (B.2.1.11)	VII.C1.AP-196	3.3-1, 034	A
Piping, piping components	Pressure Boundary	Steel	Raw water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	Open-Cycle Cooling Water System (B.2.1.11)	VII.C1.AP-194	3.3-1, 037	A
Piping, piping components	Pressure Boundary	Stainless steel	Raw water	Loss of material due to pitting, crevice corrosion, MIC; flow blockage due to fouling	Open-Cycle Cooling Water System (B.2.1.11)	VII.C1.A-54	3.3-1, 040	A
Piping, piping components	Pressure Boundary	Gray cast iron, ductile iron	Raw water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.C1.A-51	3.3-1, 072	A
Piping, piping components	Pressure Boundary	Steel	Air - outdoor	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-24	3.3-1, 080	A
Piping, piping components	Pressure Boundary	Steel	Lubricating oil	Loss of material due to pitting, crevice corrosion, MIC	Lubricating Oil Analysis (B.2.1.25) and One-Time Inspection (B.2.1.20)	VII.C1.AP-127	3.3-1, 097	A
Piping, piping components	Pressure Boundary	Steel	Soil	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	Buried and Underground Piping and Tanks (B.2.1.27)	VII.I.AP-198	3.3-1, 109	B
Piping, piping components	Pressure Boundary	Steel	Concrete	None	None	VII.J.AP-282	3.3-1, 112	A

Table 3.3.2-4, Residual Heat Removal Service Water System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Copper alloy	Air, condensation	None	None	VII.J.AP-144	3.3-1, 114	A
Piping, piping components, heat exchangers with internal coatings/linings	Pressure Boundary, Heat Transfer	Steelwith internal coatings/linings	Raw water	Loss of coating or lining integrity due to blistering, cracking, flaking, peeling, delamination, rusting, physical damage; loss of material or cracking for cementitious coatings/linings	Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B.2.1.28)	VII.G.A-416	3.3-1, 138	A
Piping, piping components	Pressure Boundary	Stainless steel	Treated water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.E3.AP-110	3.3-1, 203	A
Piping, piping components, tanks	Pressure Boundary	Aluminum	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.H1.A-763a	3.3-1, 234	A
Piping, piping components, ducting, ducting components, seals	Pressure Boundary	Polymeric	Treated water	Hardening or loss of strength due to polymeric degradation; loss of material due to peeling, delamination, wear; cracking or blistering due to exposure to ultraviolet light, ozone, radiation, or chemical attack; flow blockage due to fouling	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.C1.A-797b	3.3-1, 263	A

Piping, piping components, ducting, ducting components, seals	Pressure Boundary	Polymeric	Air	Hardening or loss of strength due to polymeric degradation; loss of material due to peeling, delamination, wear; cracking or blistering due to exposure to ultraviolet light, ozone, radiation, or chemical attack	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-797a	3.3-1, 263	A

Table 3.3.2-4 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

None.

Table 3.3.2-5, Raw Cooling Water System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VII.I.A-04	3.3-1, 010	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VII.I.AP-124	3.3-1, 015	A
External surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-77	3.3-1, 078	A
Heat exchanger tubes	Pressure Boundary, Heat Transfer	Steel	Raw water	Reduction of heat transfer due to fouling	Open-Cycle Cooling Water System (B.2.1.11)	V.D2.E-23	3.2-1, 027	A
Heat exchanger components	Pressure Boundary	Copper alloy	Raw water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	Open-Cycle Cooling Water System (B.2.1.11)	VII.C1.AP-179	3.3-1, 038	A
Heat exchanger components	Pressure Boundary	Steel	Raw water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	Open-Cycle Cooling Water System (B.2.1.11)	VII.C1.AP-183	3.3-1, 038	A
Heat exchanger tubes	Pressure Boundary, Heat Transfer	Stainless steel	Raw water	Cracking due to SCC (titanium only), reduction of heat transfer due to fouling	Open-Cycle Cooling Water System (B.2.1.11)	VII.C1.AP-187	3.3-1, 042	A
Heat exchanger components	Pressure Boundary	Copper alloy (>15% Zn or >8% Al)	Raw water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.C1.A-66	3.3-1, 072	A

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Copper alloy	Raw water	Loss of material due to general (raw water, raw water (potable) only), pitting, crevice corrosion, MIC; flow blockage due to fouling (raw water only)	Fire Water System (B.2.1.16)	VII.G.AP-197	3.3-1, 064	A
Piping, piping components	Pressure Boundary	Aluminum	Treated water	Loss of material due to pitting, crevice corrosion; flow blockage due to fouling (raw water only)	Fire Water System (B.2.1.16)	VII.G.AP-180	3.3-1, 065	A
Piping, piping components	Pressure Boundary	Stainless steel	Raw water	Loss of material due to pitting, crevice corrosion, MIC; flow blockage due to fouling (raw water only)	Fire Water System (B.2.1.16)	VII.G.A-55	3.3-1, 066	A
Piping, piping components, tanks	Pressure Boundary	Steel	Fuel oil	Loss of material due to general, pitting, crevice corrosion, MIC	Fuel Oil Chemistry (B.2.1.18)	VII.G.AP-234a	3.3-1, 070	B
Piping, piping components	Pressure Boundary	Gray cast iron, ductile iron	Soil	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.C1.A-02	3.3-1, 072	A
Piping, piping components	Pressure Boundary	Gray cast iron	Raw water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.C1.A-51	3.3-1, 072	A
Piping, piping components	Pressure Boundary	Gray cast iron, ductile iron	Soil	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.G.A-02	3.3-1, 072	A
Piping, piping components	Pressure Boundary	Copper alloy (>15% Zn or >8% Al)	Raw water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.G.A-47	3.3-1, 072	A
Piping, piping components	Pressure Boundary	Gray cast iron	Raw water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.G.A-51	3.3-1, 072	A

Table 3.3.2-7, High Pressure Fire Protection (Diesel Driven Pump) System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Gray cast iron	Treated water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.G.A-51	3.3-1, 072	A
Piping, piping components	Pressure Boundary	Gray cast iron	Treated water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.G.AP-31	3.3-1, 072	A
Piping, piping components, ducting, ducting components, seals	Pressure Boundary	Elastomer	Air, condensation	Hardening or loss of strength due to elastomer degradation	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.AP-102	3.3-1, 076	A
Piping, piping components	Pressure Boundary	Steel	Air - outdoor	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-24	3.3-1, 080	A
Piping, piping components, seals	Pressure Boundary	Elastomer	Treated water	Hardening or loss of strength due to elastomer degradation; flow blockage due to fouling (raw water only)	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.G.AP-75	3.3-1, 085	A
Piping, piping components, seals	Pressure Boundary	Elastomer	Fuel oil	Hardening or loss of strength due to elastomer degradation	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.H1.A-660	3.3-1, 085	A
Piping, piping components, seals	Pressure Boundary	Elastomer	Raw water	Loss of material due to wear; flow blockage due to fouling (raw water only)	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.G.AP-76	3.3-1, 096	A
Piping, piping components	Pressure Boundary	Steel	Lubricating oil	Loss of material due to pitting, crevice corrosion, MIC	Lubricating Oil Analysis (B.2.1.25) and One-Time Inspection (B.2.1.20)	VII.C1.AP-127	3.3-1, 097	A

Sprinklers	Pressure Boundary	Metallic	Air, condensation	Loss of material due to general (where applicable), pitting, crevice corrosion, MIC (except for aluminum, and in raw water, raw water (potable), treated water only), flow blockage due to fouling	Fire Water System (B.2.1.16)	VII.G.A-403	3.3-1, 130	A

Table 3.3.2-7 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

None.

Table 3.3.2-8, Potable Water System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VII.I.A-04	3.3-1, 010	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VII.I.AP-124	3.3-1, 015	A
External surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-77	3.3-1, 078	A
External surfaces	Pressure Boundary	Steel	Air - outdoor	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-77	3.3-1, 078	A
Insulated piping, piping components, tanks	Pressure Boundary	Copper alloy (>15% Zn or >8% Al)	Air, condensation	Loss of material due to general (steel only), pitting, crevice corrosion; cracking due to SCC (copper alloy (>15% Zn or >8% Al) only)	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-405a	3.3-1, 132	A
Insulated piping, piping components, tanks	Pressure Boundary	Steel	Air, condensation	Loss of material due to general (steel only), pitting, crevice corrosion; cracking due to SCC (copper alloy (>15% Zn or >8% Al) only)	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-405a	3.3-1, 132	A
Piping, piping components	Pressure Boundary	Stainless steel	Air, condensation	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VII.F2.AP-209a	3.3-1, 004	A

Table 3.3.2-8, Potable Water System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Stainless steel	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.F2.AP-221a	3.3-1, 006	A
Piping, piping components	Pressure Boundary	Copper alloy (>15% Zn or >8% Al)	Raw water (potable)	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.G.A-47	3.3-1, 072	A
Piping, piping components	Pressure Boundary	Stainless steel	Raw water (potable)	Loss of material due to general (steel only), pitting, crevice corrosion, flow blockage due to fouling (steel only)	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.E5.AP-270	3.3-1, 088	A
Piping, piping components	Pressure Boundary	Steel	Raw water (potable)	Loss of material due to general (steel only), pitting, crevice corrosion, flow blockage due to fouling (steel only)	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.E5.AP-270	3.3-1, 088	A
Piping, piping components	Pressure Boundary	Copper alloy	Raw water (potable)	Loss of material due to general, pitting, crevice corrosion, MIC	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.E5.AP-271	3.3-1, 093	A

Heat exchanger components	Pressure Boundary	Copper alloy	Closed-cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	Closed Treated Water Systems (B.2.1.12)	VII.F1.AP-203	3.3-1, 046	A
Heat exchanger components	Pressure Boundary	Steel	Air - outdoor	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.AP-40	3.3-1, 080	A
Heat exchanger components	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.AP-41	3.3-1, 080	A
Heat exchanger tubes	Pressure Boundary, Heat Transfer	Aluminum	Air, condensation	Reduction of heat transfer due to fouling	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-716	3.3-1, 151	A
Heat exchanger tubes	Pressure Boundary, Heat Transfer	Copper alloy	Air, condensation	Reduction of heat transfer due to fouling	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-716	3.3-1, 151	A

Table 3.3.2-10, Air Conditioning System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Heat exchanger tubes	Pressure Boundary, Heat Transfer	Steel	Air, condensation	Reduction of heat transfer due to fouling	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-716	3.3-1, 151	A
Heat exchanger components	Pressure Boundary	Aluminum	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.F1.A-771a	3.3-1, 242	A
Heat exchanger tubes	Pressure Boundary, Heat Transfer	Copper alloy	Lubricating oil	Reduction of heat transfer due to fouling	Lubricating Oil Analysis (B.2.1.25) and One-Time Inspection (B.2.1.20)	VII.F1.A-791	3.3-1, 257	A
Insulated piping, piping components, tanks	Pressure Boundary, Structural Support	Steel	Air, condensation	Loss of material due to general (steel only), pitting, crevice corrosion; cracking due to SCC (copper alloy (>15% Zn or >8% Al) only)	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-405a	3.3-1, 132	A
Piping, piping components	Pressure Boundary, Structural Support	Stainless steel	Air, condensation	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VII.F4.AP-209a	3.3-1, 004	A
Piping, piping components	Pressure Boundary, Structural Support	Stainless steel	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.F4.AP-221a	3.3-1, 006	A
Piping, piping components	Pressure Boundary, Structural Support	Stainless steel	Air	Loss of material due to pitting, crevice corrosion	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.F4.AP-221c	3.3-1, 006	A

Table 3.3.2-10, Air Conditioning System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components, tanks	Pressure Boundary, Structural Support	Steel	Closed-cycle cooling water	Loss of material due to general, pitting, crevice corrosion, MIC	Closed Treated Water Systems (B.2.1.12)	VII.C2.AP-202	3.3-1, 045	A
Piping, piping components, tanks	Pressure Boundary, Structural Support	Steel	Closed-cycle cooling water	Loss of material due to general, pitting, crevice corrosion, MIC	Closed Treated Water Systems (B.2.1.12)	VII.F4.AP-202	3.3-1, 045	A
Piping, piping components	Pressure Boundary, Structural Support	Copper alloy	Closed-cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	Closed Treated Water Systems (B.2.1.12)	VII.F1.AP-199	3.3-1, 046	A
Piping, piping components	Pressure Boundary, Structural Support	Stainless steel	Closed-cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	Closed Treated Water Systems (B.2.1.12)	VII.C2.A-52	3.3-1, 049	A
Piping, piping components	Pressure Boundary, Structural Support	Copper alloy (>15% Zn or >8% Al)	Closed-cycle cooling water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.A4.AP-43	3.3-1, 072	A
Piping, piping components	Pressure Boundary, Structural Support	Gray cast iron, ductile iron	Closed-cycle cooling water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.C2.A-50	3.3-1, 072	A
Piping, piping components, seals	Pressure Boundary	Elastomer	Air, condensation	Hardening or loss of strength due to elastomer degradation	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.F4.A-504	3.3-1, 085	A

Table 3.3.2-10, Air Conditioning System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary, Structural Support	Stainless steel	Raw water (potable)	Loss of material due to general (steel only), pitting, crevice corrosion, flow blockage due to fouling (steel only)	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.E5.AP-270	3.3-1, 088	A
Piping, piping components	Pressure Boundary, Structural Support	Steel	Raw water (potable)	Loss of material due to general (steel only), pitting, crevice corrosion, flow blockage due to fouling (steel only)	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.E5.AP-270	3.3-1, 088	A
Piping, piping components	Pressure Boundary, Structural Support	Copper alloy	Raw water (potable)	Loss of material due to general, pitting, crevice corrosion, MIC	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.E5.AP-271	3.3-1, 093	A
Piping, piping components, seals	Pressure Boundary	Elastomer	Air	Loss of material due to wear; flow blockage due to fouling (raw water, waste water only)	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.F4.AP-103	3.3-1, 096	A
Piping, piping components	Pressure Boundary, Structural Support	Copper alloy	Lubricating oil	Loss of material due to pitting, crevice corrosion, MIC	Lubricating Oil Analysis (B.2.1.25) and One-Time Inspection (B.2.1.20)	VII.C1.AP-133	3.3-1, 099	A
Piping, piping components	Pressure Boundary, Structural Support	Copper alloy	Air, condensation	None	None	VII.J.AP-144	3.3-1, 114	A
Piping, piping components	Pressure Boundary, Structural Support	Copper alloy	Gas	None	None	VII.J.AP-9	3.3-1, 114	A

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components, ducting, ducting components, seals	Pressure Boundary	Polymeric	Air	Hardening or loss of strength due to polymeric degradation; loss of material due to peeling, delamination, wear; cracking or blistering due to exposure to ultraviolet light, ozone, radiation, or chemical attack; flow blockage due to fouling	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.F4.A-797b	3.3-1, 263	A

Table 3.3.2-10 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

None.

Table 3.3.2-11, Control Air System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VII.I.A-04	3.3-1, 010	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VII.I.AP-124	3.3-1, 015	A
Heat exchanger components	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.AP-41	3.3-1, 080	A
Piping, piping components	Pressure Boundary, Structural Support	Nickel Alloy	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.D.AP-221a	3.3-1, 006	A
Piping, piping components	Pressure Boundary, Structural Support	Stainless steel	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.D.AP-221a	3.3-1, 006	A
Piping, piping components, tanks	Pressure Boundary, Structural Support	Steel	Condensation	Loss of material due to general, pitting, crevice corrosion	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.D.A-26	3.3-1, 055	A
Piping, piping components	Pressure Boundary, Structural Support	Copper alloy	Air, condensation	None	None	VII.J.AP-144	3.3-1, 114	A

Table 3.3.2-14, Station Drainage System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Steel	Air - outdoor	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-24	3.3-1, 080	A
Piping, piping components, heat exchanger components, tanks	Pressure Boundary	Steel	Waste water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.E5.AP-281	3.3-1, 091	A
Piping, piping components, heat exchanger components	Pressure Boundary	Copper alloy	Waste water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.E5.AP-272	3.3-1, 095	A
Piping, piping components	Pressure Boundary	Copper alloy	Air, condensation	None	None	VII.J.AP-144	3.3-1, 114	A
Piping, piping components, heat exchanger components	Pressure Boundary	Steel	Air - outdoor	Loss of material due to general, pitting, crevice corrosion	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.E5.A-722	3.3-1, 157	A

Table 3.3.2-14 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.

B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.

C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.

D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.

E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.

F. Material not in NUREG-2191 for this component.

G. Environment not in NUREG-2191 for this component and material.

H. Aging effect not in NUREG-2191 for this component, material and environment combination.

I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.

J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

None.

Table 3.3.2-15, Sampling and Water Quality System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Class 1 valve bodies and bonnets	Pressure Boundary	Cast austenitic stainless steel	Reactor coolant >250°C (>482°F)	Loss of fracture toughness due to thermal aging embrittlement	ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1)	IV.C1.R-08	3.1-1, 038	A
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VII.I.A-04	3.3-1, 010	A
Closure bolting	Mechanical Closure	Nickel Alloy	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Stainless steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VII.I.AP-124	3.3-1, 015	A
Closure bolting	Mechanical Closure	Stainless Steel	Air	Cracking due to SCC	Bolting Integrity (B.2.1.10)	VII.I.A-426	3.3-1, 145	A
Heat exchanger Components	Pressure Boundary	Stainless steel	Treated water >60°C (>140°F)	Cracking due to SCC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.E3.AP-112	3.3-1, 020	A
Heat exchanger components	Pressure Boundary	Copper alloy (>15% Zn or >8% Al)	Treated water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.F3.AP-65	3.3-1, 072	A
Heat exchanger tubes	Pressure Boundary, Heat Transfer	Copper alloy	Air, condensation	Reduction of heat transfer due to fouling	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-716	3.3-1, 151	A

Table 3.3.2-15, Sampling and Water Quality System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Heat exchanger tubes	Pressure Boundary, Heat Transfer	Stainless steel	Air, condensation	Reduction of heat transfer due to fouling	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-716	3.3-1, 151	A
Heat exchanger Components	Pressure Boundary	Nickel Alloy	Treated water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.A4.AP-111	3.3-1, 203	A
Heat exchanger components	Pressure Boundary	Stainless Steel	Treated water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.A4.AP-111	3.3-1, 203	A
Heat exchanger components	Pressure Boundary	Nickel Alloy	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.F3.A-770a	3.3-1, 241	A
Insulated piping, piping components, tanks	Pressure Boundary	Stainless Steel	Air, condensation	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VII.I.A-734b	3.3-1, 205	A
Piping, piping components	Pressure Boundary	Stainless Steel	Any	Cumulative fatigue damage due to fatigue	Section 4.3, “Metal Fatigue”	VII.E3.A-62	3.3-1, 002	A
Piping, piping components	Pressure Boundary	Steel	Any	Cumulative fatigue damage due to fatigue	Section 4.3, “Metal Fatigue	VII.E3.A-34	3.3-1, 002	A
Piping, piping components	Pressure Boundary	Stainless Steel	Air, condensation	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VII.C2.AP-209a	3.3-1, 004	A
Piping, piping components	Pressure Boundary	Nickel Alloy	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.C2.AP-221a	3.3-1, 006	A
Piping, piping components	Pressure Boundary	Stainless steel	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.C2.AP-221a	3.3-1, 006	A
Piping, piping components	Pressure Boundary	Steel	Treated Water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.E3.AP-106	3.3-1, 021	A
Piping, piping components	Pressure Boundary	Copper Alloy	Treated Water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.E3.AP-140	3.3-1, 022	A

B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

None.

Table 3.3.2-19, Standby Liquid Control System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Steel	Treated water	Long-term loss of material due to general corrosion	One-Time Inspection (B.2.1.20)	VII.E2.A-439	3.3-1, 193	A
Class 1 piping, fittings and branch connections < NPS 4	Pressure Boundary	Stainless steel	Reactor coolant	Cracking due to SCC (for stainless steel or nickel alloy surfaces exposed to reactor coolant only), IGSCC (for stainless steel or nickel alloy surfaces exposed to reactor coolant only), thermal, mechanical, vibratory loading	ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1) Water Chemistry (B.2.1.2) and ASME Code Class 1 Small-bore Piping (B.2.1.22)	IV.C1.RP-230	3.1-1, 039	A
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VII.I.A-04	3.3-1, 010	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VII.I.AP-124	3.3-1, 015	A
Closure bolting	Mechanical Closure	Stainless steel	Air	Cracking due to SCC	Bolting Integrity (B.2.1.10)	VII.I.A-426	3.3-1, 145	A
External surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-77	3.3-1, 078	A
Insulated piping, piping components, tanks	Pressure Boundary	Stainless steel	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.I.A-761b	3.3-1, 232	A

Table 3.3.2-19, Standby Liquid Control System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping Components	Pressure Boundary	Stainless Steel	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	IV.C1.R-452a	3.1-1, 136	A
Piping, piping components	Pressure Boundary	Stainless steel	Treated Water	Cumulative fatigue damage due to fatigue	Section 4.3, "Metal Fatigue"	VII.E3.A-62	3.3-1, 002	A
Piping, piping components	Pressure Boundary	Stainless steel	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.C2.AP-221a	3.3-1, 006	A
Piping, piping components	Pressure Boundary	Aluminum	Treated water	Loss of material due to pitting, crevice corrosion	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.E3.AP-130	3.3-1, 025	A
Piping, piping components	Pressure Boundary	Steel	Lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	Lubricating Oil Analysis (B.2.1.25) and One-Time Inspection (B.2.1.20)	VII.C2.AP-127	3.3-1, 097	A
Piping, piping components	Pressure Boundary	Copper alloy	Air, condensation	None	None	VII.J.AP-144	3.3-1, 114	A
Piping, piping components	Pressure Boundary	Steel	Air - indoor controlled	None	None	VII.J.AP-2	3.3-1, 121	A
Piping, piping components, tanks	Pressure Boundary	Aluminum	Air, condensation	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VII.E2.A-451a	3.3-1, 189	A
Piping, piping components, tanks	Pressure Boundary	Stainless steel	Sodium pentaborate solution	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.E2.AP-141	3.3-1, 203	A
Piping, piping components, tanks	Pressure Boundary	Steel	Sodium pentaborate solution	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.E2.AP-141	3.3-1, 203	F, 1
Reactor coolant pressure boundary components	Pressure Boundary	Stainless steel	Reactor coolant	Loss of material due to pitting, crevice corrosion	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	IV.C1.RP-158	3.1-1, 079	A

<u>Table 3.3.2-19 Notes</u>

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. The Water Chemistry program (B.2.1.2) (relating to Standby Liquid Control) is used to manage the aging effect(s) applicable to this component type, material and environment combination.

Table 3.3.2-20, Off-Gas System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VII.I.A-04	3.3-1, 010	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VII.I.AP-124	3.3-1, 015	A
Ducting, ducting components (Internal surfaces)	Pressure Boundary	Steel	Condensation	Loss of material due to general, pitting, crevice corrosion, MIC (for drip pans and drain lines only)	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.F3.A-08	3.3-1, 090	A
External Surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-77	3.3-1, 078	A
Piping, piping components	Pressure Boundary	Steel	Air	Cumulative fatigue damage due to fatigue	Section 4.3, “Metal Fatigue”	VII.E3.A-34	3.3-1, 002	A
Piping, piping components	Pressure Boundary	Stainless steel	Air, Condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.C2.AP-221a	3.3-1, 006	A
Piping, piping components	Pressure Boundary	Stainless steel	Air, Condensation	Loss of material due to pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.C2.AP-221b	3.3-1, 006	A
Piping, piping components, tanks	Pressure Boundary	Steel	Condensation	Loss of material due to general, pitting, crevice corrosion	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.D.A-26	3.3-1, 055	A

Piping, piping components	Pressure Boundary	Stainless Steel	Treated water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.E3.AP-110	3.3-1, 203	A
Piping, piping Components	Pressure Boundary	Stainless steel	Treated water >60°C (>140°F)	Cracking due to SCC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.E3.A-773	3.3-1, 244	A
Tanks	Pressure Boundary	Steel	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.E.SP-75	3.4-1, 012	A
Tanks	Pressure Boundary	Stainless steel	Treated water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.E.SP-162	3.4-1, 083	A

Table 3.3.2-22 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. The Selective Leaching program (B.2.1.21) program is used to manage the aging effect(s) applicable to this component type, material and environment combination.
2. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) is used to manage the aging effect(s) applicable to this component type, material and environment combination.
3. The Water Chemistry program (B.2.1.2) will be used to manage the aging effect(s) applicable to this component type, material and environment combination. The AMP XI.M25, BWR Reactor Water Cleanup System, will not be used since BFN Units 1, 2, and 3 have satisfactorily completed all actions requested in NRC GL 89-10 and NRC GL 88-01 for the Reactor Water Cleanup (RWCU) System. NRC has documented closeout of these GLs for BFN. In addition, the RWCU piping on each unit has been replaced with piping made of material that is resistant to IGSCC. Therefore, consistent with NRC guidance, no IGSCC inspections are required.

Table 3.3.2-26, Radwaste System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Steel	Concrete	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	Buried and Underground Piping and Tanks (B.2.1.27)	VII.I.AP-198	3.3-1, 109	B
Piping, piping components	Pressure Boundary	Steel	Concrete	None	None	VII.J.AP-282	3.3-1, 112	A
Piping, piping components	Pressure Boundary	Copper Alloy	Air, condensation	None	None	VII.J.AP-144	3.3-1, 114	A
Piping, piping components	Pressure Boundary	Copper Alloy	Gas	None	None	VII.J.AP-9	3.3-1, 114	A
Piping, piping components	Pressure Boundary	Stainless steel	Treated water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.E3.AP-110	3.3-1, 203	A
Piping, piping components	Pressure Boundary	Copper alloy	Lubricating oil (waste oil)	Loss of material due to general, pitting, crevice corrosion, MIC	One-Time Inspection (B.2.1.20)	VII.G.AP-117	3.3-1, 250	J, 1
Piping, piping components	Pressure Boundary	Steel	Lubricating oil (waste oil)	Loss of material due to general, pitting, crevice corrosion, MIC	One-Time Inspection (B.2.1.20)	VII.G.AP-117	3.3-1, 250	C, 1

Table 3.3.2-26 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.

B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.

C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.

D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.

E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.

F. Material not in NUREG-2191 for this component.

G. Environment not in NUREG-2191 for this component and material.

H. Aging effect not in NUREG-2191 for this component, material and environment combination.

I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.

J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. The One-Time Inspection program (B.2.1.20) is used to manage the aging effect(s) applicable to this component type, material and environment combination.

Table 3.3.2-27, Spent Fuel Pool Cooling/Cleanup System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Steel	Treated Water	Long-term loss of material due to general corrosion	One-Time Inspection (B.2.1.20)	VII.A4.A-439	3.3-1, 193	A
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VII.I.A-04	3.3-1, 010	A
Closure Bolting	Mechanical Closure	Stainless steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VII.I.AP-124	3.3-1, 015	A
Closure bolting	Mechanical Closure	Stainless steel	Treated Water	Loss of material due to general, (steel; copper alloy in raw water, waste water only), pitting, crevice corrosion, MIC (raw water, waste water environments only)	Bolting Integrity (B.2.1.10)	VII.I.A-423	3.3-1, 142	A, 1
Closure bolting	Mechanical Closure	Steel	Treated Water	Loss of material due to general (steel; copper alloy in raw water, waste water only), pitting, crevice corrosion, MIC (raw water, waste water environments only)	Bolting Integrity (B.2.1.10)	VII.I.A-423	3.3-1, 142	A, 1
External surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-77	3.3-1, 078	A

Table 3.3.2-27, Spent Fuel Pool Cooling/Cleanup System - Summary of Aging Management Evaluation (Continued)								
Component Type	**Intended Function**	**Material**	**Environment**	**Aging Effect Requiring Management**	**Aging Management Program**	**NUREG-2191 Item**	**NUREG-2192 Table 1 Item**	**Notes**
Heat exchanger components	Pressure Boundary	Steel	Air - indoor Uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.AP-41	3.3-1, 080	A
Insulated piping, piping components, tanks	Pressure Boundary	Steel	Air, condensation	Loss of material due to general, pitting, crevice corrosion (steel only); cracking due to SCC (copper alloy (>15% Zn or >8% Al) only)	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-405a	3.3-1, 132	A
Insulated piping, piping components, tanks	Pressure Boundary	Stainless steel	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.I.A-761b	3.3-1, 232	A
Piping, piping components	Pressure Boundary	Stainless steel	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.C2.AP-221a	3.3-1, 006	A
Piping, piping components	Pressure Boundary	Stainless steel	Air, condensation	Loss of material due to pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.C2.AP-221b	3.3-1, 006	A
Piping, piping components	Pressure Boundary	Aluminum	Treated Water	Loss of material due to pitting, crevice corrosion	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.A4.AP-130	3.3-1, 025	A
Piping, piping components	Pressure Boundary	Aluminum	Treated water	Loss of material due to pitting, crevice corrosion	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.C2.AP-130	3.3-1, 025	A
Piping, piping components	Pressure Boundary	Gray cast iron, ductile iron	Treated Water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VII.A4.AP-31	3.3-1, 072	A
Piping, piping components	Pressure Boundary	Steel	Air - outdoor	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-24	3.3-1, 080	A
Piping, piping components	Pressure Boundary	Steel	Concrete	None	None	VII.J.AP-282	3.3-1, 112	A

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components, tanks	Pressure Boundary	Stainless steel	Underground	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VII.I.A-714a	3.3-1, 146	A
Piping, piping components	Pressure Boundary	Stainless steel	Concrete	None	None	VII.J.AP-19	3.3-1, 202	A
Piping, piping components	Pressure Boundary	Stainless steel	Treated Water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VII.A4.AP-110	3.3-1, 203	A
Piping, piping components, tanks	Pressure Boundary	Aluminum	Air, Condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.A4.A-763a	3.3-1, 234	A
Piping, piping components, tanks	Pressure Boundary	Stainless steel	Underground	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.I.A-775a	3.3-1, 246	A
Tanks	Pressure Boundary	Stainless steel	Treated Water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.E.SP-162	3.4-1, 083	A

Table 3.3.2-27 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. This GALL-SLR item reflects consideration of leakage from a flanged connection. However, this system does not contain any submerged closure bolting.

Table 3.3.2-29 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

None.

Table 3.3.2-30, Supplemental Diesel Generator System - Summary of Aging Management Evaluation								
Component Type	**Intended Function**	**Material**	**Environment**	**Aging Effect Requiring Management**	**Aging Management Program**	**NUREG-2191 Item**	**NUREG-2192 Table 1 Item**	**Notes**
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VII.I.A-04	3.3-1, 010	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VII.I.AP-124	3.3-1, 015	A
External surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-77	3.3-1, 078	A
Heat exchanger components	Pressure Boundary	Steel	Closed-cycle cooling water	Loss of material due to general, pitting, crevice corrosion, MIC	Closed Treated Water Systems (B.2.1.12)	VII.C2.AP-189	3.3-1, 046	A
Heat exchanger tubes	Pressure Boundary, Heat Transfer	Aluminum	Closed-cycle cooling water	Reduction of heat transfer due to fouling	Closed Treated Water Systems (B.2.1.12)	VII.C2.AP-188	3.3-1, 050	F, 1
Heat exchanger components	Pressure Boundary	Steel	Air - outdoor	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.AP-40	3.3-1, 080	A
Heat exchanger tubes	Pressure Boundary, Heat Transfer	Aluminum	Air	Reduction of heat transfer due to fouling	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-716	3.3-1, 151	A

Table 3.3.2-30, Supplemental Diesel Generator System - Summary of Aging Management Evaluation (Continued)								
Component Type	**Intended Function**	**Material**	**Environment**	**Aging Effect Requiring Management**	**Aging Management Program**	**NUREG-2191 Item**	**NUREG-2192 Table 1 Item**	**Notes**
Insulated piping, piping components, tanks	Pressure Boundary	Steel	Air, Condensation	Loss of material due to general, pitting, crevice corrosion (steel only); cracking due to SCC (copper alloy (>15% Zn or >8% Al) only)	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-405a	3.3-1, 132	A
Piping, piping components	Pressure Boundary	Stainless Steel	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.H2.AP-221a	3.3-1, 006	A
Piping, piping components, tanks	Pressure Boundary	Steel	Closed-cycle cooling water	Loss of material due to general, pitting, crevice corrosion, MIC	Closed Treated Water Systems (B.2.1.12)	VII.H2.AP-202	3.3-1, 045	A
Piping, piping components, tanks	Pressure Boundary	Steel	Fuel Oil	Loss of material due to general, pitting, crevice corrosion, MIC	Fuel Oil Chemistry (B.2.1.18)	VII.H2.AP-105a	3.3-1, 070	B
Piping, piping components, ducting, ducting components, seals	Pressure Boundary	Elastomer	Air, condensation	Hardening or loss of strength due to elastomer degradation	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.AP-102	3.3-1, 076	A
Piping, piping components, seals	Pressure Boundary	Elastomer	Closed-cycle cooling water	Hardening or loss of strength due to elastomer degradation	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.C2.AP-259	3.3-1, 085	A
Piping, piping components, diesel engine exhaust	Pressure Boundary	Stainless Steel	Diesel Exhaust	Loss of material due to general (steel only), pitting, crevice corrosion	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.H2.AP-104	3.3-1, 088	A
Piping, piping components, diesel engine exhaust	Pressure Boundary	Steel	Diesel Exhaust	Loss of material due to general (steel only), pitting, crevice corrosion	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.H2.AP-104	3.3-1, 088	A

Piping, piping components	Pressure Boundary	Steel	Lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	Lubricating Oil Analysis (B.2.1.25) and One-Time Inspection (B.2.1.20)	VII.H2.AP-127	3.3-1, 097	A

Table 3.3.2-30 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. The Closed Treated Water Systems program (B.2.1.12) is used to manage the aging effect(s) applicable to this component type, material, and environment combination.

Table 3.3.2-31, Control Rod Drive System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Steel	Treated Water	Long-term loss of material due to general corrosion	One-Time Inspection (B.2.1.20)	VII.E3.A-439	3.3-1, 193	A
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VII.I.A-04	3.3-1, 010	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VII.I.AP-124	3.3-1, 015	A
External surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-77	3.3-1, 078	A
Heat exchanger components	Pressure Boundary	Steel	Air - indoor Uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.AP-41	3.3-1, 080	A
Heat exchanger Tubes	Pressure Boundary, Heat Transfer	Copper alloy	Air, condensation	Reduction of heat transfer due to fouling	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-716	3.3-1, 151	A
Heat exchanger tubes	Pressure Boundary, Heat Transfer	Copper alloy	Lubricating oil	Reduction of heat transfer due to fouling	Lubricating Oil Analysis (B.2.1.25) and One-Time Inspection (B.2.1.20)	VII.C1.A-791	3.3-1, 257	A
Heat exchanger tubes	Pressure Boundary, Heat Transfer	Steel	Lubricating oil	Reduction of heat transfer due to fouling	Lubricating Oil Analysis (B.2.1.25) and One-Time Inspection (B.2.1.20)	VII.C1.A-791	3.3-1, 257	A

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.

B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.

C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.

D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.

E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.

F. Material not in NUREG-2191 for this component.

G. Environment not in NUREG-2191 for this component and material.

H. Aging effect not in NUREG-2191 for this component, material and environment combination.

I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.

J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. Sewage System components are designed and required to load shed in order to meet NFPA 805 performance criteria.

Table 3.3.2-35, FLEX System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VII.I.A-04	3.3-1, 010	A
Closure bolting	Mechanical Closure	Steel	Air - outdoor	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VII.I.A-03	3.3-1, 012	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VII.I.AP-124	3.3-1, 015	A
External surfaces	Pressure Boundary	Steel	Air - outdoor	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VII.I.A-77	3.3-1, 078	A
Piping, piping components	Pressure Boundary	Stainless steel	Air, condensation	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VII.C1.AP-209a	3.3-1, 004	A
Piping, piping components	Pressure Boundary	Stainless steel	Air, condensation	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VII.C1.AP-221a	3.3-1, 006	A
Piping, piping components	Pressure Boundary	Steel	Raw Water	Loss of material due to general, pitting, crevice corrosion, MIC; flow blockage due to fouling	Open-Cycle Cooling Water System (B.2.1.11)	VII.C1.AP-194	3.3-1, 037	A
Piping, piping components	Pressure Boundary	Stainless Steel	Raw Water	Loss of material due to pitting, crevice corrosion, MIC; flow blockage due to fouling	Open-Cycle Cooling Water System (B.2.1.11)	VII.C1.A-54	3.3-1, 040	A
Piping, piping components, heat exchanger components (for components not covered by NRC GL 89-13)	Pressure Boundary	Steel	Raw water	Loss of material due to general (steel, copper alloy only), pitting, crevice corrosion, MIC; flow blockage due to fouling	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.C1.A-727	3.3-1, 134	A

Table 3.3.2-35 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

None.

Table 3.3.2-36 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.

B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.

C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.

D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.

E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.

F. Material not in NUREG-2191 for this component.

G. Environment not in NUREG-2191 for this component and material.

H. Aging effect not in NUREG-2191 for this component, material and environment combination.

I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.

J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. The Security System card readers and magnetic locks are active components, which facilitate access to locations for credited operator recovery actions.

3.4 AGING MANAGEMENT OF STEAM AND POWER CONVERSION SYSTEMS

3.4.1 Introduction

This section provides the results of the aging management review for those components identified in Section 2.3.4, Steam and Power Conversion Systems, as being subject to aging management review. The systems, or portions of systems, which are addressed in this section are described in the indicated sections.

- Main Steam System (2.3.4.1)
- Condensate/Demineralized Water System (2.3.4.2)
- Reactor Feedwater System (2.3.4.3)
- Heater Drains and Vents System (2.3.4.4)
- Miscellaneous Turbine Connections System (2.3.4.5)
- Condenser Circulating Water System (2.3.4.6)
- Gland Seal Water System (2.3.4.7)

3.4.2 Results

The following tables summarize the results of the aging management review for Steam and Power Conversion Systems.

- Table 3.4.2-1, Main Steam System - Summary of Aging Management Evaluation
- Table 3.4.2-2, Condensate/Demineralized Water System - Summary of Aging Management Evaluation
- Table 3.4.2-3, Reactor Feedwater System - Summary of Aging Management Evaluation
- Table 3.4.2-4, Heater Drains and Vents System - Summary of Aging Management Evaluation
- Table 3.4.2-5, Miscellaneous Turbine Connections System - Summary of Aging Management Evaluation
- Table 3.4.2-6, Condenser Circulating System - Summary of Aging Management Evaluation
- Table 3.4.2-7, Gland Seal Water System - Summary of Aging Management Evaluation

3.4.2.1 Materials, Environments, Aging Effects Requiring Management And Aging Management Programs

3.4.2.1.1 Main Steam System

Materials

The materials of construction for the Main Steam System components are:

- Aluminum
- Any
- Cast Austenitic Stainless Steel (CASS)
- High-strength steel
- Stainless Steel
- Steel

Environments

The Main Steam System components are exposed to the following environments:

- Air
- Air - dry
- Air - indoor uncontrolled
- Air - outdoor
- Any
- Reactor coolant
- Reactor coolant >250°C (>482°F)
- Steam
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the Main Steam System components require management:

- Cracking
- Cumulative Fatigue Damage
- Loss of Fracture Toughness
- Loss of Material
- Loss of Preload
- Reduced Thermal Insulation Resistance
- Wall Thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Main Steam System components:

- ASME Section XI Inservice Inspection, Subsections IWB, IWC and IWD (B.2.1.1)
- Water Chemistry (B.2.1.2)
- BWR Stress Corrosion Cracking (B.2.1.5)
- Thermal Aging Embrittlement of Cast Austenitic Stainless Steel (CASS) (B.2.1.8)
- Flow-Accelerated Corrosion (B.2.1.9)
- Bolting Integrity (B.2.1.10)
- Compressed Air Monitoring (B.2.1.14)
- One-Time Inspection (B.2.1.20)
- ASME Code Class 1 Small-Bore Piping (B.2.1.22)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- TLAA (Section 4.3)

3.4.2.1.2 Condensate/Demineralized Water System

Materials

The materials of construction for the Condensate/Demineralized Water System components are:

- Aluminum
- Any
- Cast Iron and Cast Iron Alloy
- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- Ductile iron
- Gray cast iron
- High-strength steel
- Metallic
- Polymeric
- PVC
- Stainless Steel
- Steel

Environments

The Condensate/Demineralized Water System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Any
- Concrete
- Lubricating oil
- Raw water
- Steam
- Treated water
- Treated water >60°C (>140°F)

Aging Effects Requiring Management

The following aging effects associated with the Condensate/Demineralized Water System components require management:

- Cracking
- Hardening or Loss of Strength
- Loss of coating or lining integrity
- Loss of Material
- Loss of Preload
- Reduced Thermal Insulation Resistance

- Reduction of heat transfer
- Wall Thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Condensate/ Demineralized Water System components:

- Water Chemistry (B.2.1.2)
- Flow-Accelerated Corrosion (B.2.1.9)
- Bolting Integrity (B.2.1.10)
- Outdoor and Large Atmospheric Metallic Storage Tanks (B.2.1.17)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Lubricating Oil Analysis (B.2.1.25)
- Buried and Underground Piping and Tanks (B.2.1.27)
- Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B.2.1.28)

3.4.2.1.3 Reactor Feedwater System

Materials

The materials of construction for the Reactor Feedwater System components are:

- Any
- Cast austenitic stainless steel (CASS)
- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- High-strength steel
- Nickel alloy
- Stainless steel
- Steel

Environments

The Reactor Feedwater System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Any
- Reactor coolant
- Reactor coolant >250°C (>482°F)

- Treated water
- Treated water >60°C (>140°F)

Aging Effects Requiring Management

The following aging effects associated with the Reactor Feedwater System components require management:

- Cracking
- Cumulative Fatigue Damage
- Loss of Fracture Toughness
- Loss of Material
- Loss of Preload
- Reduced Thermal Insulation Resistance
- Wall Thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Reactor Feedwater System components:

- ASME Section XI Inservice Inspection, Subsections IWB, IWC and IWD (B.2.1.1)
- Water Chemistry (B.2.1.2)
- BWR Stress Corrosion Cracking (B.2.1.5)
- Flow-Accelerated Corrosion (B.2.1.9)
- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- ASME Code Class 1 Small-Bore Piping (B.2.1.22)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- TLAA (Section 4.3)

3.4.2.1.4 Heater Drains and Vents System

Materials

The materials of construction for the Heater Drains and Vents System components are:

- Any
- Cast Iron
- Stainless steel
- Steel

Environments

The Heater Drains and Vents System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled

- Any
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the Heater Drains and Vents System components require management:

- Loss of Material
- Loss of Preload
- Reduced Thermal Insulation Resistance
- Wall Thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Heater Drains and Vents System components:

- Water Chemistry (B.2.1.2)
- Flow-Accelerated Corrosion (B.2.1.9)
- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)

3.4.2.1.5 Miscellaneous Turbine Connections System

Materials

The materials of construction for the Miscellaneous Turbine Connections System components are:

- Steel

Environments

The Miscellaneous Turbine Connections System components are exposed to the following environments:

- Air - indoor uncontrolled
- Any
- Steam
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the Miscellaneous Turbine Connections System components require management:

- Loss of Material
- Loss of Preload
- Wall Thinning

Aging Management Programs

The following aging management programs manage the aging effects for the Miscellaneous Turbine Connections System components:

- Water Chemistry (B.2.1.2)
- Flow-Accelerated Corrosion (B.2.1.9)
- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)

3.4.2.1.6 Condenser Circulating System

Materials

The materials of construction for the Condenser Circulating System components are:

- Cast Iron and Cast Iron Alloy
- Copper alloy
- Stainless steel
- Steel

Environments

The Condenser Circulating System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Any
- Concrete
- Condensation
- Raw water
- Soil

Aging Effects Requiring Management

The following aging effects associated with the Condenser Circulating System components require management:

- Cracking
- Loss of Material
- Loss of Preload

Aging Management Programs

The following aging management programs manage the aging effects for the Condenser Circulating System components:

- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)

- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)
- Buried and Underground Piping and Tanks (B.2.1.27)

3.4.2.1.7 Gland Seal Water System

Materials

The materials of construction for the Gland Seal Water System components are:

- Cast Iron and Cast Iron Alloy
- Copper alloy
- Copper alloy (>15% Zn or >8% Al)
- Glass
- Gray cast iron
- Steel

Environments

The Gland Seal Water System components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Any
- Treated water

Aging Effects Requiring Management

The following aging effects associated with the Gland Seal Water System components require management:

- Cracking
- Loss of Material
- Loss of Preload

Aging Management Programs

The following aging management programs manage the aging effects for the Gland Seal Water System components:

- Water Chemistry (B.2.1.2)
- Bolting Integrity (B.2.1.10)
- One-Time Inspection (B.2.1.20)
- Selective Leaching (B.2.1.21)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)

3.4.2.2 AMR Results for Which Further Evaluation is Recommended by the GALL-SLR Report

NUREG-2191 provides the basis for identifying those programs that warrant further evaluation by the reviewer in the subsequent license renewal application. For the Steam and Power Conversion Systems, those programs are addressed in the following subsections.

3.4.2.2.1 Cumulative Fatigue Damage

Evaluations involving time-dependent fatigue or cyclical loading parameters may be time- limited aging analyses (TLAAs), as defined in 10 CFR 54.3. TLAAs are required to be evaluated in accordance with 10 CFR 54.21(c)(1). This TLAA is addressed separately in Section 4.3, "Metal Fatigue," or Section 4.7, "Other Plant-Specific Time-Limited Aging Analyses," of this SRP-SLR. For plant-specific cumulative usage factor calculations that are based on stress-based input methods, the methods are to be appropriately defined and discussed in the applicable TLAAs.

<u>Table 3.4.1 Item Number 3.4-1, 001:</u> This item evaluates steel piping, piping components exposed to any environment for cumulative fatigue damage due to fatigue. Cumulative fatigue damage of steel piping, piping components is evaluated and dispositioned as a TLAA for the Main Steam System, Condensate/Demineralized Water System and Reactor Feedwater System as discussed in Section 4.3.

3.4.2.2.2 Cracking Due to Stress Corrosion Cracking in Stainless Steel Alloys

Cracking due to stress corrosion cracking (SCC) could occur in indoor or outdoor stainless steel (SS) piping, piping components, and tanks exposed to any air, condensation, or underground environment when the component is: (a) uninsulated; (b) insulated; (c) in the vicinity of insulated components, or (d) in the vicinity of potentially transportable halogens. Cracking can occur in environments containing sufficient halides (e.g., chlorides) in the presence of moisture.

Insulated SS components exposed to indoor air, outdoor air, condensation, or underground environments are susceptible to SCC if the insulation contains certain contaminants. Leakage of fluids through bolted connections (e.g., flanges, valve packing) can result in contaminants present in the insulation leaching onto the component surface or the surfaces of other components below the component. For outdoor insulated SS components, rain and changing weather conditions can result in moisture intrusion into the insulation.

Plant-specific operating experience (OE) and the condition of SS components are evaluated to determine if prolonged exposure to the plant-specific environments has resulted in SCC. SCC in SS components is not an aging effect requiring management if (a) plant-specific OE does not reveal a history of SCC and (b) a one-time inspection demonstrates that the aging effect is not occurring.

In the environment of air-indoor controlled, SCC is only expected to occur as the result of a source of moisture and halides. Inspections focus on the most susceptible locations. The applicant documents the results of the plant-specific OE review in the SLRA.

The GALL-SLR Report recommends further evaluation of SS piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of SCC. The GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that SCC is not occurring. If SCC is occurring, the following AMPs describe acceptable programs to manage loss *of material due to SCC: (a) GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," for tanks; (b) GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," for external surfaces of piping and piping components; (c) GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," for underground piping, piping components and tanks; and (d) GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in AMP XI.M32.*

The applicant may establish that SCC is not an aging effect requiring management for all components, by demonstrating that a barrier coating isolates the component from aggressive environments. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. The GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating.

<u>Table 3.4.1 Item Number 3.4-1, 002:</u> This item evaluates cracking due to SCC in stainless steel piping, piping components, and tanks exposed to air and condensation environments. There is only one stainless steel tank in the screened-in portions of the Steam and Power Conversion Systems, the Condensate Head Drain Tank. There are no stainless steel piping, piping components exposed to the air-indoor controlled environment in the screened-in portions of the Steam and Power Conversion Systems. Stainless steel components within the screened-in portions of the Steam and Power Conversion Systems are located in the following systems: Main Steam, Condensate/Demineralized Water, Reactor Feedwater, and Condenser Circulating Water. Plant-specific OE associated with stainless steel components in the screened-in portions of the Steam and Power Conversion Systems has been evaluated to determine if prolonged exposure to the air-indoor uncontrolled, air-outdoor, and condensation environments has resulted in cracking due to SCC. Cracking has not been identified as an aging effect at BFN for stainless steel screened-in components in these environments. Cracking has been identified as an aging effect at BFN for stainless steel components as a result of transportable halogens, indicating that the environments do contain sufficient halides (e.g., chlorides) in the presence of moisture to result in SCC (for the sample probes exposed to treated water) as described below.

- On May 25, 2023, a component failure of a sample probe upstream of the condensate booster pump was documented in a CR, where the failure has been attributed to SCC in stainless steel. This component (sample probe upstream of the Condensate Booster Pump) is screened-in for SLR.
- The component that failed was an original design sample probe. The sample probe which failed was located in the Condensate/Demineralized Water System piping upstream of the Reactor Feedwater Pumps. A total of 3 Condensate/Demineralized Water System sample probes are installed in the three BFN units (1 per unit). Each one of these three components will be permanently removed from the system prior to the subsequent period of extended operation.
- The CR extent of condition evaluation determined that the reported condition also applied to the sample probes in the Feedwater System. A total of 12 Feedwater sample probes are installed in the three BFN units (4 per unit). All of these components have been confirmed to have been replaced with an upgraded design, except for three of the four

Feedwater sample probes in Unit 2. These three BFN Unit 2 Feedwater System sample probes will be inspected to ensure the design is consistent with the upgraded design for these sample probes. If any of these probes cannot be confirmed as being consistent with the upgraded design, the probe(s) will be replaced with upgraded design sample probes prior to entry into the subsequent period of extended operation.

- A review of BFN-specific OE shows that BFN has not experienced any failures of the upgraded design sample probes. Therefore, the upgraded design Feedwater sample probes are included in the population of stainless steel piping and piping components with the potential to experience stress corrosion cracking (SCC) and will be managed by the One-Time Inspection program (B.2.1.20) to demonstrate that stainless steel SCC is not occurring and by the Water Chemistry program (B.2.1.2) to maintain reactor water chemistry parameters within acceptance limits.

Accordingly, the One-Time Inspection program (B.2.1.20) will be implemented to demonstrate the aging effect of cracking in stainless steel piping, piping components exposed to air-indoor uncontrolled, air-outdoor, and condensation is not occurring. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

Table 3.4.1 Item Number 3.4-1, 074: This item evaluates cracking due to SCC of stainless steel piping, piping components and tanks located in an underground environment. This item is restricted to only underground environments. There are no stainless steel underground piping, piping components or tanks in screened-in portions of the Steam and Power Conversion System.

Table 3.4.1 Item Number 3.4-1, 100: Not applicable. There are no stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air or condensation within the screened-in portions of the Steam and Power Conversion Systems.

Table 3.4.1 Item Number 3.4-1, 104: This item evaluates cracking due to SCC in insulated stainless steel piping, piping components, and tanks exposed to air and condensation environments. There are no insulated stainless steel tanks in the screened-in portions of the Steam and Power Conversion Systems. There are no insulated stainless steel piping or piping components exposed to the air-indoor controlled environment. The remaining components to be evaluated are insulated stainless steel piping and piping components exposed to air-indoor uncontrolled, air-outdoor, or condensation environments in the screened-in portions of the Steam and Power Conversion Systems. Insulated stainless steel piping and piping components within the screened-in portions of the Steam and Power Conversion Systems are located in the following systems: Main Steam, Condensate/Demineralized Water, and Reactor Feedwater. Plant-specific OE associated with insulated stainless steel piping and piping components exposed to air-indoor uncontrolled, air-outdoor, or condensation environments in the screened-in portions of the Steam and Power Conversion Systems has been evaluated to determine if prolonged exposure to these environments has resulted in cracking due to SCC. Cracking has not been identified as an aging effect at BFN for insulated stainless steel components in the air-indoor uncontrolled, air-outdoor, or condensation environments indicating that moisture intrusion into the insulation and leaching of contaminants present in the insulation onto component surfaces, or onto other components below the insulated component, resulting in SCC, has not occurred. Accordingly, the One-Time Inspection program (B.2.1.20) will be used to demonstrate that the cracking aging effect is not occurring in screened-in insulated stainless steel piping and piping components exposed to air-indoor uncontrolled, air-outdoor or condensation environments in the screened-in portions of the Steam and Power Conversion

Systems. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

3.4.2.2.3 Loss of Material Due to Pitting and Crevice Corrosion in Stainless Steel and Nickel Alloys

Loss of material due to pitting and crevice corrosion could occur in indoor or outdoor SS and nickel alloy piping, piping components, and tanks exposed to any air, condensation, or underground environment when the component is: (a) uninsulated; (b) insulated; (c) in the vicinity of insulated components; or (d) in the vicinity of potentially transportable halogens. Loss of material due to pitting and crevice corrosion can occur on SS and nickel alloys in environments containing sufficient halides (e.g., chlorides) in the presence of moisture.

Insulated SS and nickel alloy components exposed to air, condensation, or underground environments are susceptible to loss of material due to pitting or crevice corrosion if the insulation contains certain contaminants. Leakage of fluids through mechanical connections such as bolted flanges and valve packing can result in contaminants leaching onto the component surface or the surfaces of other components below the component. For outdoor insulated SS and nickel alloy components, rain, and changing weather conditions can result in moisture intrusion into the insulation.

Plant-specific OE and the condition of SS and nickel alloy components are evaluated to determine if prolonged exposure to the plant-specific environments has resulted in pitting or crevice corrosion. Loss of material due to pitting and crevice corrosion is not an aging effect requiring management for SS and nickel alloy components if (a) plant-specific OE does not reveal a history of loss of material due to pitting or crevice corrosion; and (b) a one-time inspection demonstrates that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components during the subsequent period of extended operation. The applicant documents the results of the plant-specific OE review in the SLRA.

In the environment of air-indoor controlled, pitting and crevice corrosion is only expected to occur as the result of a source of moisture and halides. Inspections focus on the most susceptible locations.

The GALL-SLR Report recommends further evaluation of SS and nickel alloy piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of loss of material due to pitting and crevice corrosion. GALL-SLR Report AMP XI.M32, "One- Time Inspection," describes an acceptable program to demonstrate that loss of material due to pitting and crevice corrosion is not occurring at a rate that affects the intended function of the components. If loss of material due to pitting or crevice corrosion has occurred and is sufficient to potentially affect the intended function of an SSC, the following AMPs describe acceptable programs to manage loss of material due to pitting or crevice corrosion: (a) GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," for tanks; (b) GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," for external surfaces of piping and piping components; (c) GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," for underground piping, piping components and tanks; and (d) GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant *during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in AMP XI.M32.*

The applicant may establish that loss of material due to pitting and crevice corrosion is not an aging effect requiring management by demonstrating that a barrier coating isolates the component from aggressive environments. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating.

<u>Table 3.4.1 Item Number 3.4-1, 003:</u> This item evaluates loss of material due to pitting and crevice corrosion in stainless steel and nickel alloy piping, piping components, and tanks exposed to air or condensation environments. There is one stainless steel tank, the Condensate Head Drain Tank, in the screened-in portion of the Steam and Power Conversion Systems. There are no nickel alloy tanks, or nickel alloy piping, piping components in the screened-in portions of the Steam and Power Conversion Systems. There are no stainless steel piping, piping components exposed to air-indoor controlled in the screened-in portions of the Steam and Power Conversion Systems. Stainless steel or nickel alloy components with the passive function Pressure Boundary within the screened-in portions of the Steam and Power Conversion Systems are located in the following systems: Main Steam, Condensate/Demineralized Water, Reactor Feedwater, and Condenser Circulating Water. Plant-specific operating experience (OE) associated with stainless steel components in the screened-in portions of the Steam and Power Conversion Systems has been evaluated to determine if prolonged exposure to air-indoor uncontrolled, air-outdoor, and condensation environments has resulted in loss of material due to pitting and crevice corrosion. Loss of material has not been identified as an aging effect in the screened-in portions of the Steam and Power Conversion Systems at BFN for stainless steel components in these environments, or as a result of transportable halogens, indicating that these environments do not contain sufficient halides (e.g., chlorides) in the presence of moisture to result in loss of material. Accordingly, the One-Time Inspection program (B.2.1.20) will be implemented to demonstrate that the aging effect of loss of material is not occurring in stainless steel piping, piping components exposed to air-indoor uncontrolled, air-outdoor, and condensation. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

<u>Table 3.4.1 Item Number 3.4-1, 095:</u> This item evaluates loss of material due to pitting, crevice corrosion of stainless steel and nickel alloy piping, piping components and tanks located in an underground environment. This item is restricted to only underground environments. There are no stainless steel and nickel alloy underground piping, piping components, or tanks within the screened-in portions of the Steam and Power Conversion Systems.

<u>Table 3.4.1 Item Number 3.4-1, 098:</u> Not applicable. There are no stainless steel or nickel alloy tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") in the screened-in portions of the Steam and Power Conversion Systems.

<u>Table 3.4.1 Item Number 3.4-1, 103:</u> This item evaluates loss of material due to pitting and crevice corrosion in insulated stainless steel or nickel alloy piping, piping components, and tanks exposed to air and condensation environments. There is one stainless steel tank, the Condensate Head Drain Tank, in the screened-in portion of the Steam and Power Conversion

Systems, however, this tank is not insulated. There are no insulated stainless steel or nickel alloy piping or piping components exposed to the air-indoor controlled environment in the screened-in portions of the Steam and Power Conversion Systems. Additionally, there are no insulated nickel alloy piping, piping components in the screened-in portions of the Steam and Power Conversion Systems. The remaining components to be evaluated are insulated stainless steel piping and piping components exposed to air-indoor uncontrolled, air-outdoor, or condensation environments within the screened-in portions of the Steam and Power Conversion Systems. Stainless steel or nickel alloy piping, piping components and tanks within the screened-in portions of the Steam and Power Conversion Systems are located in the following systems: Main Steam, Condensate/Demineralized Water, Reactor Feedwater, and Condenser Circulating Water. However, these components in the Condenser Circulating Water System are not insulated. Plant-specific OE associated with insulated stainless steel components in the screened-in portions of the Steam and Power Conversion Systems has been evaluated to determine if prolonged exposure to air-indoor uncontrolled, air-outdoor, or condensation environments has resulted in loss of material due to pitting or crevice corrosion. Loss of material has not been identified as an aging effect at BFN for screened-in insulated stainless steel components in these environments, indicating that moisture intrusion into the insulation and leaching of contaminants present in the insulation onto component surfaces, or onto other components below the insulated component, resulting in loss of material, has not occurred. Accordingly, the One-Time Inspection program (B.2.1.20) will be used to demonstrate that the aging effect of loss of material due to pitting or crevice corrosion is not occurring in insulated stainless steel piping and piping components exposed to air-indoor uncontrolled, air-outdoor, or condensation environments in the screened-in portions of the Steam and Power Conversion Systems. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

3.4.2.2.4 Quality Assurance for Aging Management of Nonsafety-Related Components

QA provisions applicable to Subsequent License Renewal are discussed in Appendix A, Section A.1.4, and Appendix B, Section B.1.3.

3.4.2.2.5 Ongoing Review of Operating Experience

Ongoing review of operating experience is addressed in Appendix A, Section A.1.5, and Appendix B, Section B.1.4.

3.4.2.2.6 Loss of Material Due to Recurring Internal Corrosion

Recurring internal corrosion can result in the need to augment AMPs beyond the recommendations in the GALL-SLR Report. During the search of plant-specific OE conducted during the SLRA development, recurring internal corrosion can be identified by the number of occurrences of aging effects and the extent of degradation at each localized corrosion site. This further evaluation item is applicable if the search of plant specific OE reveals repetitive occurrences. The criteria for recurrence is (a) a 10 year search of plant specific OE reveals the aging effect has occurred in three or more refueling outage cycles; or (b) a 5 year search of plant specific OE reveals the aging effect has occurred in two or more refueling outage cycles and resulted in the component either not meeting plant specific acceptance criteria or experiencing a reduction in wall thickness greater than 50 percent (regardless of the minimum wall thickness).

The GALL-SLR Report recommends that GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," be evaluated for inclusion of augmented requirements to ensure the adequate management of any recurring aging effect(s). Alternatively, a plant-specific AMP may be proposed. Potential augmented requirements include: (i) alternative examination methods (e.g., volumetric versus external visual); (ii) augmented inspections (e.g., a greater number of locations, additional locations based on risk insights based on susceptibility to aging effect and consequences of failure, a greater frequency of inspections), and (iii) additional trending parameters and decision points where increased inspections would be implemented.

The applicant states: (a) why the program's examination methods will be sufficient to detect the recurring aging effect before affecting the ability of a component to perform its intended function, (b) the basis for the adequacy of augmented or lack of augmented inspections, (c) what parameters will be trended as well as the decision points where increased inspections would be implemented (e.g., the extent of degradation at individual corrosion sites, the rate of degradation change), (d) how inspections of components that are not easily accessed (i.e., buried, underground) will be conducted, and (e) how leaks in any involved buried or underground components will be identified.

Plant-specific OE examples should be evaluated to determine if the chosen AMP should be augmented even if the thresholds for significance of aging effect or frequency of occurrence of aging effect have not been exceeded. For example, during a 10 year search of plant-specific OE, two instances of a 360 degree 30 percent wall loss occurred at copper alloy to steel joints. Neither the significance of the aging effect nor the frequency of occurrence of aging effect threshold has been exceeded. Nevertheless, the OE should be evaluated to determine if the AMP that is proposed to manage the aging effect is sufficient (e.g., method of inspection, frequency of inspection, number of inspections) to provide reasonable assurance that the current licensing basis (CLB) intended functions of the component will be met throughout the subsequent period of extended operation. While recurring internal corrosion is not as likely in other environments as raw water and waste water (e.g., treated water), the aging effect should be addressed in a similar manner.

<u>Table 3.4.1 Item Number 3.4-1, 061:</u> Not Applicable. This item evaluates loss of material due to recurring internal corrosion of metallic piping, piping components, and tanks exposed to raw water and waste water. There are no components exposed to waste water in the screened-in portions of the Steam and Power Conversion Systems. The Condenser Circulating Water System is the only Steam and Power Conversion System where the components are exposed to raw water. Plant-specific OE associated with loss of material of metallic components in the Steam and Power Conversion Systems has been evaluated over the period from 2011 to 2022 to identify instances of loss of material due to recurring internal corrosion in raw water and other internal environments. The OE review did not identify any components within the Steam and Power Conversion Systems where the frequency and severity for loss of material met the thresholds discussed above that would require augmenting the aging management recommendations in the GALL-SLR Report to manage loss of material due to recurring internal corrosion.

3.4.2.2.7 Cracking Due to Stress Corrosion Cracking in Aluminum Alloys

SCC is a form of environmentally assisted cracking which is known to occur in high and moderate strength aluminum alloys. The three conditions necessary for SCC to occur in a component are a sustained tensile stress, aggressive environment, and material with a *susceptible microstructure. Cracking due to SCC can be mitigated by eliminating one of the three necessary conditions. For the purposes of SLR, acceptance criteria for this further evaluation is being provided for demonstrating that the specific material is not susceptible to SCC or an aggressive environment is not present. Cracking due to SCC is an aging effect requiring management unless it is demonstrated by the applicant that one of the two necessary conditions discussed below is absent.*

<u>Susceptible Material:</u> If the material is not susceptible to SCC, then cracking is not an aging effect requiring management. The microstructure of an aluminum alloy, of which alloy composition is only one factor, is what determines whether the alloy is susceptible to SCC. Therefore, determining susceptibility based on alloy composition alone is not adequate to conclude whether a particular material is susceptible to SCC. The temper, condition, and product form of the alloy is considered when assessing if a material is susceptible to SCC. Aluminum alloys that are susceptible to SCC include:

- *2xxx series alloys in the F, W, Ox, T3x, T4x, or T6x temper*
- *5xxx series alloys with a magnesium content of 3.5 weight percent or greater*
- *6xxx series alloys in the F temper*
- *7xxx series alloys in the F, T5x, or T6x temper*
- *2xx.x and 7xx.x series alloys*
- *3xx.x series alloys that contain copper*
- *5xx.x series alloys with a magnesium content of greater than 8 weight percent*

The material is evaluated to verify that it is not susceptible to SCC and that the basis used to make the determination is technically substantiated. Tempers have been specifically developed to improve the SCC resistance for some aluminum alloys.

Aluminum alloy and temper combination which are not susceptible to SCC when used in piping, piping component, and tank applications include 1xxx series, 3xxx series, 6061-T6x, and 5454-x. If it is determined that a material is not susceptible to SCC, the SLRA provides the components/ locations where it is used, alloy composition, temper or condition, product form, and for tempers not addressed above, the basis used to determine the alloy is not susceptible and technical information substantiating the basis.

<u>Aggressive Environment:</u> If the environment to which an aluminum alloy is exposed is not aggressive, such as dry gas or treated water, then cracking due to SCC will not occur and it is not an aging effect requiring management. Aggressive environments that are known to result in cracking due to SCC of susceptible aluminum alloys are aqueous solutions, air, condensation, and underground locations that contain halides (e.g., chloride). Halide concentrations should be considered high enough to facilitate SCC of aluminum alloys in uncontrolled or untreated aqueous solutions and air, such as raw water, waste water, condensation, underground locations, and outdoor air, unless demonstrated otherwise.

Halides could be present on the surface of the aluminum material if the component is encapsulated in a material such as insulation or concrete. In a controlled or uncontrolled indoor air, condensation, or underground environment, sufficient halide concentrations to cause SCC could be present due to secondary sources such as leakage from nearby components (e.g., leakage from insulated flanged connections or valve packing). If an aluminum component is exposed to a halide-free indoor air environment, not encapsulated in materials containing halides, and the exposure to secondary sources of moisture or halides is precluded, cracking due *to SCC is not expected to occur. The plant-specific configuration can be used to demonstrate that exposure to halides will not occur. If it is determined that SCC will not occur because the environment is not aggressive, the SLRA provides the components and locations exposed to the environment, description of the environment, basis used to determine the environment is not aggressive, and technical information substantiating the basis. GALL-SLR Report AMP XI.M32, "One-Time Inspection," and a review of plant-specific OE describe an acceptable means to confirm the absence of moisture or halides within the proximity of the aluminum component.*

If the environment potentially contains halides, GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," describes an acceptable program to manage cracking due to SCC of aluminum tanks. GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," describes an acceptable program to manage cracking due to SCC of aluminum piping and piping components. GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," describes an acceptable program to manage cracking due to SCC of aluminum piping and tanks which are buried or underground. GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," describes an acceptable program to manage cracking due to SCC of aluminum components that are not included in other AMPs.

An alternative strategy to demonstrating that an aggressive environment is not present is to isolate the aluminum alloy from the environment using a barrier to prevent SCC. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," describes an acceptable program to manage the integrity of a barrier coating for internal or external coatings.

Table 3.4.1 Item Number 3.4-1, 102: Not applicable. There are no aluminum tanks (within the scope of AMP XI.M29, 'Outdoor and Large Atmospheric Metallic Storage Tanks') exposed to air, condensation, soil, concrete, raw water, waste water within the screened-in portions of the Steam and Power Conversion Systems.

Table 3.4.1 Item Number 3.4-1, 105: This item evaluates cracking due to SCC in insulated aluminum piping, piping components, and tanks exposed to air and condensation environments. There are no insulated aluminum piping and piping components exposed to an air-indoor controlled environment in the screened-in portions of the Steam and Power Conversion Systems. The aluminum tanks, the Condensate Head Tank and the Demineralized Water Tanks, in the screened-in portions of the Steam and Power Conversion Systems are not insulated. This leaves insulated aluminum piping and piping components exposed to air-indoor uncontrolled, air-outdoor and condensation environments in the screened-in portion of the Steam and Power Conversion Systems needing evaluation. Insulated aluminum piping and piping components with the passive function Pressure Boundary and within the screened-in portions of the Steam and Power Conversion Systems are located in the following systems: Condensate/Demineralized Water. Plant-specific OE associated with insulated aluminum components in the screened-in portions of the Steam and Power Conversion Systems has been evaluated to determine if prolonged exposure to the air-indoor uncontrolled, air-outdoor, and condensation environments has resulted in cracking due to SCC. Cracking has not been identified as an aging effect at BFN for insulated aluminum screened-in components in these environments. Cracking has not been identified as an aging effect at BFN for screened-in insulated aluminum components as a result of transportable halogens, indicating that the environments do not contain sufficient halides (e.g., chlorides) in the presence of moisture to result in SCC. Accordingly, the One-Time Inspection program (B.2.1.20) will be used to demonstrate that the aging effect of cracking due to SCC is not occurring in insulated aluminum piping and piping components exposed to air-indoor uncontrolled, air- outdoor, or condensation environments. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

Table 3.4.1 Item Number 3.4-1, 109: This item evaluates cracking due to SCC in aluminum piping, piping components, and tanks exposed to air, condensation, raw water, and waste water environments. The aluminum tanks, the Condensate Head Tank and the Demineralized Water Tanks, in the screened-in portions of the Steam and Power Conversion Systems are exposed to air and condensation environments, but are not exposed to raw water or waste water environments. There are no aluminum piping, piping components or tanks exposed to the air-indoor controlled, raw water, or waste water environments in the screened-in portions of the Steam and Power Conversion Systems. This leaves aluminum piping, piping components and tanks exposed to air-indoor uncontrolled, air-outdoor, and condensation in the screened-in portions of the Steam and Power Conversion Systems to be evaluated. Aluminum piping, piping components, tanks within the screened-in portions of the Steam and Power Conversion Systems are located in the following systems: Main Steam, and Condensate/Demineralized Water. Plant-specific OE associated with aluminum components in the screened-in portions of the Steam and Power Conversion Systems has been evaluated to determine if prolonged exposure to the air-indoor uncontrolled, air-outdoor, and condensation environments has resulted in cracking due to SCC. Cracking due to SCC has not been identified as an aging effect at BFN for aluminum components located in the Condensate/Demineralized Water System in these environments. Additionally, because cracking due to SCC has not been identified as an aging effect at BFN for aluminum components located in the Condensate/Demineralized Water System in these environments, cracking due to SCC resulting from transportable halogens, has not been identified, indicating that these environments do not contain sufficient halides (e.g., chlorides) in the presence of moisture to result in SCC. Accordingly, the One-Time Inspection program (B.2.1.20) will be used to demonstrate the aging effect of cracking due to SCC in aluminum piping, piping components and tanks exposed to air-indoor uncontrolled, air-outdoor, and condensation environments within the screened-in portions of the Steam and Power Conversion Systems is not occurring. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

Table 3.4.1 Item Number 3.4-1, 112: This item evaluates cracking due to SCC of aluminum piping, piping components and tanks located in an underground environment. This item is restricted to only underground environments. There are no aluminum underground piping, piping components, or tanks within the screened-in portions of the Steam and Power Conversion Systems.

3.4.2.2.8 Loss of Material Due to General, Crevice or Pitting Corrosion and Cracking Due to Stress Corrosion Cracking

Loss of material due to general (steel only), crevice, or pitting corrosion and cracking due to SCC (SS only) can occur in steel and SS piping and piping components exposed to concrete. Concrete provides a high alkalinity environment that can mitigate the effects of loss of material for steel piping, thereby significantly reducing the corrosion rate. However, if water intrudes through the concrete, the pH can be reduced and ions that promote loss of material such as chlorides, which can penetrate the protective oxide layer created in the high alkalinity environment, can reach the surface of the metal. Carbonation can reduce the pH within concrete.

The rate of carbonation is reduced by using concrete with a low water-to-cement ratio and low permeability. Concrete with low permeability also reduces the potential for the penetration of water. Adequate air entrainment improves the ability of the concrete to resist freezing and thawing cycles and therefore reduces the potential for cracking and intrusion of water. Cracking due to SCC, as well as pitting and crevice corrosion can occur due to halides present in the water that penetrates to the surface of the metal.

If the following conditions are met, loss of material is not considered to be an applicable aging effect for steel: (a) attributes of the concrete are consistent with American Concrete Institute (ACI) 318 or ACI 349 (low water-to-cement ratio, low permeability, and adequate air entrainment) as cited in NUREG-1557; (b) plant-specific OE indicates no degradation of the concrete that could lead to penetration of water to the metal surface; and (c) the piping is not potentially exposed to groundwater. For SS components loss of material and cracking due to SCC are not considered to be applicable aging effects as long as the piping is not potentially exposed to groundwater. Where these conditions are not met, loss of material due to general (steel only), crevice, or pitting corrosion, and cracking due to SCC (SS only) are identified as applicable aging effects. GALL-SLR Report AMP XI.M41, "Buried and Underground Piping and Tanks," describes an acceptable program to manage these aging effects.

Table 3.4.1 Item Number 3.4-1, 051: Consistent with NUREG-2191. This item evaluates loss of material due to general, crevice or pitting corrosion of steel piping and piping components exposed to a concrete environment. For the screened-in portions of the BFN Steam and Power Conversion System, loss of material due to general, crevice or pitting corrosion of steel piping and piping components is not an applicable aging effect because the exclusion criteria are met. The same concrete specification was used for all structures at BFN. The original designs and construction of these structures conformed to ACI 318 (1963 and later revisions as noted in FSAR Section 12.2) and ACI 307 (as referenced in FSAR Section 12.2 and the constructions specifications) except as noted. The concrete mix designs provide for low permeability by incorporating fly ash and water reducing agents. Concrete fine and course aggregates conform to ASTM C33. The cement is primarily Type II Portland cement with small scale concrete being Type I Portland cement. The Portland cement conforms to ASTM C-150. A site-specific OE review was performed and it was determined that BFN has not found any evidence of concrete degradation that could lead to penetration of water to the metal surface. Furthermore, the steel piping that is screened-in for SLR and exposed to concrete is not potentially exposed to groundwater.

Table 3.4.1 Item Number 3.4-1, 082: Consistent with NUREG-2191. This item evaluates stainless steel piping and piping components exposed to a concrete environment. The combination of stainless steel piping and piping components and a concrete environment exists in the screened-in portions of the following Steam and Power Conversion Systems: Condensate/ Demineralized Water System. Loss of material and cracking due to SCC are not considered to be applicable aging effects for portions of the stainless steel piping and piping components exposed to concrete that is indoors, or outdoors and above ground level, in the screened-in portions of the Condensate/Demineralized Water System because the piping is not potentially exposed to groundwater. Therefore, loss of material and cracking due to SCC are not considered to be applicable aging effects for the screened-in portions of the Condensate/Demineralized

Water System because there are no stainless steel piping and piping components that are exposed to concrete, and are outdoors and below ground level.

3.4.2.2.9 Loss of Material Due to Pitting and Crevice Corrosion in Aluminum Alloys

Loss of material due to pitting and crevice corrosion could occur in aluminum piping, piping components, and tanks exposed to an air, condensation, underground, raw water, or waste water environment for a sufficient duration of time. Environments that can result in pitting and/or crevice corrosion of aluminum alloys are those that contain halides (e.g., chloride) in the presence of moisture. The moisture level and halide concentration in atmospheric and uncontrolled air are greatly dependent on geographical location and site-specific conditions. Moisture level and halide concentration should be considered high enough to facilitate pitting and/or crevice corrosion of aluminum alloys in atmospheric and uncontrolled air, unless demonstrated otherwise. The periodic introduction of moisture or halides into an environment from secondary sources should also be considered. Leakage of fluids from mechanical connections (e.g., insulated bolted flanges and valve packing); onto a component in indoor controlled air is an example of a secondary source that should be considered. Halide concentrations should be considered high enough to facilitate loss of material of aluminum alloys in untreated aqueous solutions, unless demonstrated otherwise. Plant-specific OE and the condition of aluminum alloy components are evaluated to determine if prolonged exposure to the plant-specific air, condensation, underground, or water environments has resulted in pitting or crevice corrosion. Loss of material due to pitting and crevice corrosion is not an aging effect requiring management for aluminum alloys if (a) plant-specific OE does not reveal a history of loss of material due to pitting or crevice corrosion and (b) a one-time inspection demonstrates that the aging effect is not occurring or is occurring so slowly that it will not affect the intended function of the components. The applicant documents the results of the plant-specific OE review in the SLRA.

In the environment of air-indoor controlled, pitting and crevice corrosion is only expected to occur as the result of a source of moisture and halides. Alloy susceptibility may be considered when reviewing OE and interpreting inspection results. Inspections focus on the most susceptible alloys and locations.

The GALL-SLR Report recommends the further evaluation of aluminum piping, piping components, and tanks exposed to an air, condensation, or underground environment to determine whether an AMP is needed to manage the aging effect of loss of material due to pitting and crevice corrosion. GALL-SLR Report AMP XI.M32, "One-Time Inspection," describes an acceptable program to demonstrate that the aging effect of loss of material due to pitting and crevice corrosion is not occurring at a rate that will affect the intended function of the components. If loss of material due to pitting or crevice corrosion has occurred and is sufficient to potentially affect the intended function of an SSC, the following AMPs describe acceptable programs to manage loss of material due to pitting and crevice corrosion: (i) GALL-SLR Report AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks," for tanks; (ii) GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," for external surfaces of piping and piping components; (iii) GALL-SLR Report AMP XI.M41,"Buried and Underground Piping and Tanks," for underground piping, piping components and tanks; and (iv) GALL-SLR Report AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components" for internal surfaces of components that are not included in other AMPs. The timing of the one-time or periodic inspections is consistent with that recommended in the AMP selected by the applicant during the development of the SLRA. For example, one-time inspections would be conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in AMP XI.M32.

An alternative strategy to demonstrating that an aggressive environment is not present is to isolate the aluminum alloy from the environment using a barrier to prevent loss of material due to pitting and crevice corrosion. Acceptable barriers include tightly-adhering coatings that have been demonstrated to be impermeable to aqueous solutions and air that contain halides. The GALL-SLR Report AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks," or equivalent program, describes an acceptable program to manage the integrity of a barrier coating.

<u>Table 3.4.1 Item Numbers 3.4-1, 035:</u> This item evaluates loss of material due to pitting and crevice corrosion in aluminum piping, piping components, and tanks exposed to air or condensation environments, and not located in an underground environment. There are aluminum tanks, the Condensate Head Tank and the Demineralized Water Tanks, in the screened-in portions of the Steam and Power Conversion Systems exposed to air, condensation. Additionally, there are aluminum piping or piping components exposed to the air-outdoor, or condensation environments in the screened-in portions of the Steam and Power Conversion Systems. Aluminum components within the screened-in portions of the Steam and Power Conversion Systems are located in the following systems: Main Steam, and Condensate/ Demineralized Water. Plant-specific OE associated with aluminum components in the Steam and Power Conversion Systems has been evaluated to determine if prolonged exposure to the air-indoor uncontrolled environment has resulted in loss of material due to pitting and crevice corrosion. Loss of material has not been identified as an aging effect at BFN for aluminum components in this environment. Consequently, loss of material as a result of transportable halogens has not been identified, indicating that these environments do not contain sufficient halides (e.g., chlorides) in the presence of moisture to result in loss of material. Accordingly, the One-Time Inspection program (B.2.1.20) will be implemented to demonstrate the aging effect of loss of material in aluminum piping, piping components exposed to air-indoor uncontrolled is not occurring in the screened-in portions of the Steam and Power Conversion systems. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

<u>Table 3.4.1 Item Number 3.4-1, 094:</u> This item evaluates loss of material due to pitting, crevice corrosion of aluminum piping, piping components and tanks located in an underground environment. This item is restricted to only underground environments. There are no aluminum underground piping, piping components, or tanks within the screened-in portions of the Steam and Power Conversion Systems.

<u>Table 3.4.1 Item Number 3.4-1, 097:</u> Not applicable. There are no aluminum tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") in the screened-in portions of the Steam and Power Conversion Systems.

<u>Table 3.4.1 Item Number 3.4-1, 119:</u> This item evaluates loss of material due to pitting and crevice corrosion in insulated aluminum piping, piping components, and tanks exposed to air and condensation environments. There are no insulated aluminum piping, piping components, or tanks in the screened-in portions of the Steam and Power Conversion Systems exposed to an air-indoor controlled environment. Aluminum tanks, the Condensate Head Tank and the Demineralized Water Tanks, are exposed to air, and condensation environments in the screened-in portions of the Steam and Power Conversion Systems, however, these tanks are not insulated. This leaves insulated aluminum piping and piping components exposed to air-indoor uncontrolled, air-outdoor, and condensation environments, and not located in an underground environment, needing evaluation. Insulated aluminum components with the passive function Pressure Boundary within the screened-in portions of the Steam and Power Conversion Systems

are located in the following systems: Condensate/Demineralized Water. Plant-specific OE associated with insulated aluminum components in the screened-in portions of the Steam and Power Conversion Systems has been evaluated to determine if prolonged exposure to air-indoor uncontrolled, air-outdoor, or condensation environments has resulted in loss of material due to pitting and crevice corrosion. Loss of material has not been identified as an aging effect at BFN for screened-in insulated aluminum components in these environments, indicating that moisture intrusion into the insulation and leaching of contaminants present in the insulation on to component surfaces, or onto other components below the insulated component, resulting in loss of material, has not occurred. Accordingly, the One-Time Inspection program (B.2.1.20) will be used to demonstrate the aging effect of loss of material from insulated aluminum piping and piping components exposed to air-indoor uncontrolled, air- outdoor, or condensation environments within the screened-in portions of the BFN Steam and Power Conversion Systems is not occurring. Deficiencies will be documented in accordance with 10 CFR Part 50, Appendix B Corrective Action Program. The One-Time Inspection program (B.2.1.20) is described in Appendix B.

Table 3.4.1 Item Number 3.4-1, 120: Not applicable. There are no aluminum piping, piping components, or tanks exposed to raw water or waste water within the screened-in portions of the Steam and Power Conversion Systems. There are aluminum tanks, the Condensate Head Tank and the Demineralized Water Tanks, in the screened-in portions of the Steam and Power Conversion Systems. However, these tanks are exposed to treated water, not raw water, waste water. There are no components exposed to waste water in the screened-in portions of the Steam and Power Conversion Systems. The Condenser Circulating Water System is the only Steam and Power Conversion System where the components are exposed to raw water, however, there are no aluminum piping, piping components, or tanks located in the screened-in portions of the Condenser Circulating Water System.

3.4.2.3 Time-Limited Aging Analysis

The time-limited aging analyses identified below are associated with the Steam and Power Conversion System components:

- Section 4.3, Metal Fatigue Analyses
  - Section 4.3.2, Metal Fatigue of Class 1 Components
  - Section 4.3.4, Metal Fatigue of Non-Class 1 Components
  - Section 4.3.5, Environmental Fatigue Analyses for Reactor Vessel and Class 1 Piping

3.4.3 Conclusion

The Steam and Power Conversion System components that are subject to aging management review have been identified in accordance with the requirements of 10 CFR 54.4. The aging management programs selected to manage aging effects for the Steam and Power Conversion System components are identified in the summaries in Section 3.4.2.1 above.

A description of these aging management programs is provided in Appendix B, along with the demonstration that the identified aging effects will be managed for the subsequent period of extended operation.

Therefore, based on the conclusions provided in Appendix B, the effects of aging associated with the Steam and Power Conversion System components will be adequately managed so that there is reasonable assurance that the intended functions are maintained consistent with the current licensing basis during the subsequent period of extended operation.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems					
Item Number	**Component**	**Aging Effect/Mechanism**	**Aging Management Programs**	**Further Evaluation Recommended**	**Discussion**
3.4-1, 001	Steel piping, piping components exposed to any environment	Cumulative fatigue damage due to fatigue	TLAA, SRP-SLR Section 4.3 “Metal Fatigue”	Yes	Fatigue is a TLAA; further evaluation is documented in Subsection 3.4.2.2.1.
3.4-1, 002	Stainless steel piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage cracking of the stainless steel piping, piping components exposed to air and condensation in the Main Steam System, Condensate/Demineralized Water System, Reactor Feedwater System, and Condenser Circulating Water System See Subsection 3.4.2.2.2.
3.4-1, 003	Stainless steel, nickel alloy piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to demonstrate the absence of loss of material of the stainless steel piping, piping components exposed to air and condensation in the Main Steam System, Condensate/Demineralized Water System, Reactor Feedwater System, and Condenser Circulating Water System. See Subsection 3.4.2.2.3.
3.4-1, 004	PWR Only				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 005	Steel piping, piping components exposed to steam, treated water	Wall thinning due to flow-accelerated corrosion	AMP XI.M17, “Flow-Accelerated Corrosion”	No	Consistent with NUREG-2191. The Flow-Accelerated Corrosion program (B.2.1.9) will be used to manage wall thinning of the carbon steel piping, piping components exposed to steam or treated water in the Main Steam System, Condensate/Demineralized Water System, Reactor Feedwater System, Heater Drains and Vents System, Miscellaneous Turbine Connections System, and Auxiliary Boiler System.
3.4-1, 006	Metallic closure bolting exposed to any environment, soil, underground	Loss of preload due to thermal effects, gasket creep, self-loosening	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage loss of preload of the carbon and low alloy steel and stainless steel closure bolting exposed to air in the Main Steam System, Condensate/Demineralized Water System, Reactor Feedwater System, Heater Drains and Vents System, Miscellaneous Turbine Connections System, Condenser Circulating Water System, and Gland Seal Water System.
3.4-1, 007	High-strength steel closure bolting exposed to air, soil, underground	Cracking due to SCC; cyclic loading	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage cracking due to SCC, cyclic loading of high-strength steel closure bolting exposed to air, soil, underground within the screened-in portions of the Main Steam System, Condensate/ Demineralized Water System, and Reactor Feedwater System.
3.4-1, 008	This Item Number is not used in NUREG-2192.				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 009	Steel, stainless steel, nickel alloy closure bolting exposed to air- indoor uncontrolled, air-outdoor, condensation	Loss of material due to general (steel only), pitting, crevice corrosion	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage loss of material from steel, stainless steel, and nickel alloy closure bolting exposed to air-indoor uncontrolled, air-outdoor, or condensation in the Main Steam System, Condensate/ Demineralized Water System, Reactor Feedwater System, Heater Drains and Vents System, Miscellaneous Turbine Connections System, Condenser Circulating Water System, and Gland Seal Water System.
3.4-1, 010	This Item Number is not used in NUREG-2192.				
3.4-1, 011	Stainless steel piping, piping components, tanks, heat exchanger components exposed to steam, treated water >60°C (>140°F)	Cracking due to SCC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Water Chemistry program (B.2.1.2) and One-Time Inspection program (B.2.1.20) will be used to manage cracking due to SCC of stainless steel piping, piping components, tanks, heat exchanger components exposed to steam, treated water >60°C (>140°F) in the screened-in portions of the Main Steam System, Condensate/ Demineralized Water System, and Reactor Feedwater System.
3.4-1, 012	Steel tanks exposed to treated water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Water Chemistry program (B.2.1.2) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material from steel tanks exposed to treated water within the screened-in portions of the Condensate/ Demineralized Water System, Reactor Feedwater System and Gland Seal Water System.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 013	This Item Number is not used in NUREG-2192.				
3.4-1, 014	Steel piping, piping components exposed to steam, treated water	Loss of material due to general, pitting, crevice corrosion, MIC (treated water only)	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Water Chemistry program (B.2.1.2) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material from steel piping, piping components exposed to steam, treated water within the screened-in portions of the Main Steam System, Condensate/Demineralized Water System, Reactor Feedwater System, Heater Drains and Vents System, Miscellaneous Turbine Connections System, and Gland Seal Water System.
3.4-1, 015	Steel heat exchanger components exposed to treated water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Water Chemistry program (B.2.1.2) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material from steel heat exchanger components exposed to treated water in the Condensate/ Demineralized Water System.
3.4-1, 016	Copper alloy, aluminum piping, piping components exposed to treated water, treated borated water	Loss of material due to pitting, crevice corrosion, MIC (copper alloy only)	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Water Chemistry program (B.2.1.2) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material from copper alloy, and aluminum piping, piping components exposed to treated water, or treated borated water within the screened-in portions of the Condensate/ Demineralized Water System, Gland Seal Water System, and Reactor Core Isolation Cooling System.
3.4-1, 017	This Item Number is not used in NUREG-2192.				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 018	Copper alloy, stainless steel heat exchanger tubes exposed to treated water	Reduction of heat transfer due to fouling	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Water Chemistry program (B.2.1.2) and One-Time Inspection program (B.2.1.20) will be used to manage reduction of heat transfer due to fouling of copper alloy, and stainless steel heat exchanger tubes exposed to treated water within the screened-in portions of the Reactor Core Isolation Cooling System and High Pressure Coolant Injection System.
3.4-1, 019	Stainless steel, steel heat exchanger components exposed to raw water	Loss of material due to general (steel only), pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Not Applicable. There are no stainless steel or steel heat exchanger components exposed to raw water in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 020	Copper alloy, stainless steel piping, piping components exposed to raw water	Loss of material due to general (copper alloy only), pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Not Applicable. There are no copper alloy or stainless steel piping, piping components exposed to raw water in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 021	This Item Number is not used in NUREG-2192.				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 022	Stainless steel, copper alloy, steel heat exchanger tubes exposed to raw water	Reduction of heat transfer due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System”	No	Not Applicable. The Condensate Pump Lube Oil Coolers and the Condensate Booster Pump Lube Oil Coolers in the Condensate/ Demineralized Water System, and the Condenser Circulating Water pump motors in the Condenser Circulating Water System have heat exchanger tubes exposed to raw water. However, these components are evaluated in the respective raw water systems cooling these components (see Section 3.3). The stainless steel main condenser tubes in the Condenser Circulating Water System do not have a heat transfer intended function and are consequently not subject to this Aging Effect/ Mechanism. There are no other stainless steel, copper alloy, or steel heat exchanger tubes exposed to raw water in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 023	Stainless steel piping, piping components exposed to closed-cycle cooling water >60°C (>140°F)	Cracking due to SCC	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no stainless steel piping, piping components exposed to closed-cycle cooling water >140 F in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 024	This Item Number is not used in NUREG-2192.				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 025	Steel heat exchanger components exposed to closed-cycle cooling water	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no steel heat exchanger components exposed to closed-cycle cooling water in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 026	Stainless steel heat exchanger components, piping, piping components exposed to closed-cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no stainless steel heat exchanger components or piping, piping components exposed to closed-cycle cooling water in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 027	Copper alloy piping, piping components exposed to closed-cycle cooling water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no copper alloy piping, piping components exposed to closed-cycle cooling water in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 028	Steel, stainless steel, copper alloy heat exchanger tubes exposed to closed-cycle cooling water	Reduction of heat transfer due to fouling	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no steel, stainless steel, or copper alloy heat exchanger tubes exposed to closed-cycle cooling water in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 029	This Item Number is not used in NUREG-2192.				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 030	Steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete, air, condensation	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Consistent with NUREG-2191 with exceptions. The Outdoor and Large Atmospheric Metallic Storage Tanks program (B.2.1.17) will be used to manage loss of material from steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete, air, or condensation within the screened-in portions of the Condensate/Demineralized Water System. Exceptions apply to the NUREG-2191 recommendations for Outdoor and Large Atmospheric Metallic Storage Tanks program (B.2.1.17) implementation.
3.4-1, 031	This Item Number is not used in NUREG-2192.				
3.4-1, 032	Gray cast iron, ductile iron piping, piping components exposed to soil	Loss of material due to selective leaching	AMP XI.M33, “Selective Leaching”	No	Not Applicable. There are no gray cast iron or ductile iron piping, piping components exposed to soil in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 033	Gray cast iron, ductile iron, copper alloy (>15% Zn or >8% Al) piping, piping components exposed to treated water, raw water, closed-cycle cooling water	Loss of material due to selective leaching	AMP XI.M33, “Selective Leaching”	No	Consistent with NUREG-2191. The Selective Leaching program (B.2.1.21) will be used to manage loss of material from gray cast iron, ductile iron, and copper alloy (>15% Zn or >8% Al) piping, piping components exposed to treated water, raw water, or closed-cycle cooling water in the Condensate/Demineralized Water System, Gland Seal Water System, and Reactor Core Isolation Cooling System.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)					
Item Number	**Component**	**Aging Effect/Mechanism**	**Aging Management Programs**	**Further Evaluation Recommended**	**Discussion**
3.4-1, 034	Steel external surfaces exposed to air – indoor uncontrolled, air – outdoor, condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage loss of material of carbon steel and cast iron heat exchanger components, piping, piping components, and tanks exposed to air - indoor uncontrolled, air - outdoor or condensation in the Main Steam System, Condensate/Demineralized Water System, Reactor Feedwater System, Heater Drains and Vents System, Miscellaneous Turbine Connections System, Condenser Circulating Water System, and Gland Seal Water System.
3.4-1, 035	Aluminum piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M36, "External Surfaces Monitoring of Mechanical Components," AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components," or AMP XI.M42, "Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage loss of material from aluminum piping, piping components and tanks exposed to air in the Main Steam System, and Condensate/ Demineralized Water Systems. See Subsection 3.4.2.2.9.
3.4-1, 036	Steel piping, piping components exposed to air – outdoor	Loss of material due to general, pitting, crevice corrosion	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not Applicable. There are no steel piping, piping components internal surfaces exposed to air – outdoor within the screened-in portions of the Steam and Power Conversion Systems.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 037	Steel piping, piping components exposed to condensation	Loss of material due to general, pitting, crevice corrosion	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material from steel piping, piping components exposed to condensation in the screened-in portions of the Condenser Circulating Water System.
3.4-1, 038	PWR Only				
3.4-1, 039	This Item Number is not used in NUREG-2192.				
3.4-1, 040	Steel piping, piping components exposed to lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Lubricating Oil Analysis program (B.2.1.25) and the One-Time Inspection program (B.2.1.20) will be used to manage loss of material in the steel piping components exposed to lubricating oil in the Condensate/Demineralized Water System. There are no other steel piping, piping components exposed to lubricating oil in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 041	PWR Only				
3.4-1, 042	PWR Only				
3.4-1, 043	Copper alloy piping, piping components exposed to lubricating oil	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Not Applicable There are no copper alloy piping, piping components exposed to lubricating oil in the screened-in portions of the Steam and Power Conversion Systems.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 044	Stainless steel piping, piping components, heat exchanger components exposed to lubricating oil	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Not Applicable There are no stainless steel piping, piping components, heat exchanger components exposed to lubricating oil in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 045	Aluminum heat exchanger tubes exposed to lubricating oil	Reduction of heat transfer due to fouling	AMP XI.M39, “Lubricating Oil Analysis,” and AMP XI.M32, “One-Time Inspection”	No	Not Applicable. There are no aluminum heat exchanger tubes exposed to lubricating oil in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 046	PWR Only				
3.4-1, 047	Stainless steel piping, piping components, tanks, closure bolting exposed to soil, concrete	Loss of material due to pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable There are no stainless steel piping, piping components, tanks, closure bolting exposed to soil, concrete within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 048	Nickel alloy piping, piping components, tanks, closure bolting exposed to soil, concrete	Loss of material due to pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There are no nickel alloy piping, piping components, tanks, or closure bolting exposed to soil or concrete in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 049	This Item Number is not used in NUREG-2192.				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 050	Steel piping, piping components, tanks, closure bolting exposed to soil, concrete, underground	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Consistent with NUREG-2191 with exceptions. The Buried and Underground Piping and Tanks program (B.2.1.27) will be used to manage loss of material from steel piping, piping components, tanks or closure bolting exposed to soil, concrete, or underground within the screened-in portions of the Condensate/Demineralized Water System and Condenser Circulating Water System. Exceptions apply to the NUREG-2191 recommendations for Buried and Underground Piping and Tanks program (B.2.1.27) implementation.
3.4-1, 050a	This Item Number is not used in NUREG-2192.				
3.4-1, 051	Steel piping, piping components exposed to concrete	None	None	Yes	Consistent with NUREG-2191. The only Steam and Power Conversion Systems where steel piping, piping components are exposed to concrete within the screened-in portion of the system are the Condensate/ Demineralized Water System and the Condenser Circulating Water System. See Subsection 3.4.2.2.8.
3.4-1, 052	Aluminum piping, piping components exposed to gas	None	None	No	Not Applicable. There are no aluminum piping, piping components exposed to gas in the screened-in portions of the Steam and Power Conversion Systems.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 053	Copper alloy, copper alloy (>8% Al) piping, piping components exposed to air with borated water leakage	None	None	No	Not Applicable. There are no copper alloy, copper alloy (>8% Al) piping, piping components exposed to air with borated water leakage in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 054	Copper alloy piping, piping components exposed to air, condensation, gas	None	None	No	Consistent with NUREG-2191. Copper alloy piping, piping components exposed to air, condensation, gas within the screened-in portions of the Condensate/ Demineralized Water System, Reactor Feedwater System, Condenser Circulating Water System, and Gland Seal Water System does not require any Aging Management Program.
3.4-1, 055	Glass piping elements exposed to lubricating oil, air, condensation, raw water, treated water, air with borated water leakage, gas, closed-cycle cooling water	None	None	No	Consistent with NUREG-2191. Glass piping elements exposed to lubricating oil, air, condensation, raw water, treated water, air with borated water leakage, gas, or closed-cycle cooling water within the screened-in portions of the Gland Seal Water System do not require any Aging Management Program.
3.4-1, 056	Nickel alloy piping, piping components exposed to air with borated water leakage	None	None	No	Not Applicable. There are no nickel alloy piping, piping components exposed to air with borated water leakage in the screened-in portions of the Steam and Power Conversion Systems.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 057	PVC piping, piping components exposed to air – indoor uncontrolled, condensation	None	None	No	Consistent with NUREG-2191. There is no Aging Effect/Mechanism or Aging Management Program required for the PVC piping, piping components exposed to air – indoor uncontrolled or condensation in the screened-in portions of the Condensate/Demineralized Water System.
3.4-1, 058	Stainless steel piping, piping components exposed to gas	None	None	No	Not Applicable. There are no stainless steel piping, piping components exposed to gas in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 059	Steel piping, piping components exposed to air – indoor controlled, gas	None	None	No	Not Applicable. There are no steel piping, piping components exposed to air – indoor controlled or gas in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 060	Metallic piping, piping components exposed to steam, treated water	Wall thinning due to erosion	AMP XI.M17, “Flow-Accelerated Corrosion”	No	Consistent with NUREG-2191. The Flow-Accelerated Corrosion program (B.2.1.9) will be used to manage wall thinning due to erosion of carbon steel, stainless steel and gray cast iron piping, piping components exposed to steam and treated water in the Main Steam System, Condensate/ Demineralized Water System, Reactor Feedwater System, Heater Drains and Vents System, and Miscellaneous Turbine Connections System.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 061	Metallic piping, piping components, tanks exposed to raw water, waste water	Loss of material due to recurring internal corrosion	AMP XI.M20, “Open-Cycle Cooling Water System,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	Yes	Not Applicable. There are no components within the Steam and Power Conversion Systems where the frequency and severity for loss of material met the thresholds that would require augmenting the aging management recommendations in the GALL-SLR Report to manage loss of material due to recurring internal corrosion. See Subsection 3.4.2.2.6.
3.4-1, 062	Steel, stainless steel or aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to treated water	Loss of material due to general (steel only), pitting, crevice corrosion, MIC (steel, stainless steel only)	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Consistent with NUREG-2191 with exceptions. The Outdoor and Large Atmospheric Metallic Storage Tanks program (B.2.1.17) will be used to manage loss of material from steel, stainless steel or aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to treated water in the Condensate/Demineralized Water System. Exceptions apply to the NUREG-2191 recommendations for Outdoor and Large Atmospheric Metallic Storage Tanks program (B.2.1.17) implementation.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 063	Insulated steel, copper alloy (>15% Zn or >8% Al), piping, piping components, tanks, tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to air, condensation	Loss of material due to general, pitting, crevice corrosion (steel only); cracking due to SCC (copper alloy (>15% Zn or >8% Al) only)	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components" or AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks"	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage loss of material from insulated steel, copper alloy (>15% Zn or >8% Al) piping, piping components, tanks, tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to air, condensation within the screened-in portions of the Reactor Feedwater System. There are no steel insulated tanks (within the scope of AMP XI.M29, "Outdoor and Large Metallic Storage Tanks" within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 064	Non-metallic thermal insulation exposed to air, condensation	Reduced thermal insulation resistance due to moisture intrusion	AMP XI.M36, "External Surfaces Monitoring of Mechanical Components"	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage reduced thermal insulation resistance due to moisture intrusion for non-metallic thermal insulation exposed to air, as shown in Table 3.5.2-36, Structural Commodities (Thermal Insulation), in the Main Steam System, Condensate/Demineralized Water System, Reactor Feedwater System, and Heater Drains and Vents System.
3.4-1, 065	This Item Number is not used in NUREG-2192.				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 066	Any material piping, piping components, heat exchangers, tanks with internal coatings/ linings exposed to closed-cycle cooling water, raw water, treated water, lubricating oil	Loss of coating or lining integrity due to blistering, cracking, flaking, peeling, delamination, rusting, or physical damage; loss of material or cracking for cementitious coatings/ linings	AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	No	Consistent with NUREG-2191. The Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks program (B.2.1.28) will be used to manage loss of coating or lining integrity of the stainless steel tanks with internal coating exposed to treated water in the Condensate/ Demineralized Water System. The Outdoor and Large Atmospheric Metallic Storage Tanks program (B.2.1.17) has been substituted and will be used to manage loss of coating or lining integrity of the carbon steel tanks with internal coating exposed to treated water in the Condensate/Demineralized Water System. Exceptions apply to the NUREG-2191 recommendations for Outdoor and Large Atmospheric Metallic Storage Tanks program (B.2.1.17) implementation.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)					
Item Number	**Component**	**Aging Effect/Mechanism**	**Aging Management Programs**	**Further Evaluation Recommended**	**Discussion**
3.4-1, 067	Any material piping, piping components, heat exchangers, tanks with internal coatings/ linings exposed to closed-cycle cooling water, raw water, treated water, lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	No	Consistent with NUREG-2191. The Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks program (B.2.1.28) will be used to manage loss of material from the stainless steel tanks with internal coating exposed to treated water in the Condensate/Demineralized Water System. The Outdoor and Large Atmospheric Metallic Storage Tanks program (B.2.1.17) has been substituted and will be used to manage loss of material from the carbon steel tanks with internal coating exposed to treated water in the Condensate/ Demineralized Water System. Exceptions apply to the NUREG-2191 recommendations for Outdoor and Large Atmospheric Metallic Storage Tanks program (B.2.1.17) implementation.
3.4-1, 068	Gray cast iron, ductile iron piping, piping components with internal coatings/linings exposed to closed-cycle cooling water, raw water, treated water, waste water	Loss of material due to selective leaching	AMP XI.M42, "Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	No	Not Applicable. There are no gray cast iron or ductile iron piping, piping components with internal coatings/linings exposed to closed-cycle cooling water, raw water, treated water, or waste water in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 069	This Item Number is not used in NUREG-2192.				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 070	Stainless steel, steel, nickel alloy, copper alloy closure bolting exposed to lubricating oil, treated water, treated borated water, raw water, waste water	Loss of material due to general (steel; copper alloy in raw water, waste water only), pitting, crevice corrosion, MIC (raw water, waste water environments only)	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage loss of material from stainless steel, steel, nickel alloy, copper alloy closure bolting exposed to lubricating oil, treated water, treated borated water, raw water, or waste water in the Main Steam System, Condensate/Demineralized Water System, Reactor Feedwater System, Heater Drains and Vents System, Miscellaneous Turbine Connections System, Condenser Circulating Water System, and Gland Seal Water System.
3.4-1, 071	This Item Number is not used in NUREG-2192.				
3.4-1, 072	Stainless steel, steel, aluminum piping, piping components, tanks exposed to soil, concrete	Cracking due to SCC (steel in carbonate / bicarbonate environment only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Consistent with NUREG-2191 with exceptions. The Buried and Underground Piping and Tanks program (B.2.1.27) will be used to manage cracking due to SCC of stainless steel, steel, aluminum piping, and piping components, tanks exposed to concrete (steel in carbonate / bicarbonate environment only) within the screened-in portions of the Condenser Circulating Water System. Exceptions apply to the NUREG-2191 recommendations for Buried and Underground Piping and Tanks program (B.2.1.27) implementation. The Condensate Storage Tanks are steel and the tank bottoms are exposed to soil, concrete. However, the steel Condensate Storage Tanks are managed by the Outdoor and Large Atmospheric Metallic Storage Tanks program (B.2.1.17) for exposure to soil, concrete, air, condensation environments. See Item Number 3.4-1, 030.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 073	Stainless steel closure bolting exposed to air, soil, concrete, underground, waste water	Cracking due to SCC	AMP XI.M18, “Bolting Integrity”	No	Consistent with NUREG-2191. The Bolting Integrity program (B.2.1.10) will be used to manage cracking due to SCC of stainless steel closure bolting exposed to air, soil, concrete, underground, or waste water in the Main Steam System, Condensate/ Demineralized Water System and Reactor Feedwater System.
3.4-1, 074	Stainless steel underground piping, piping components, tanks	Cracking due to SCC	AMP XI.M32, “One-Time Inspection,” AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings/ Linings for In- Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not applicable. There are no stainless steel underground piping, piping components, or tanks within the screened-in portions of the Steam and Power Conversion Systems. See Subsection 3.4.2.2.2.
3.4-1, 075	Stainless steel, steel, aluminum, copper alloy, titanium heat exchanger tubes exposed to air, condensation	Reduction of heat transfer due to fouling	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Not Applicable. There are no stainless steel, steel, aluminum, copper alloy, or titanium heat exchanger tubes exposed to air, or condensation within the screened in portions of the Steam and Power Conversion Systems that have a passive function requiring heat transfer. Consequently, management of the aging effect, reduction of heat transfer due to fouling, is not required.
3.4-1, 076	This Item Number is not used in NUREG-2192.				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 077	Elastomer piping, piping components, seals exposed to air, condensation	Hardening or loss of strength due to elastomer degradation	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Not Applicable. There are no elastomer piping, piping components, or seals exposed to air or condensation within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 078	Elastomer piping, piping components, seals exposed to air, condensation	Hardening or loss of strength due to elastomer degradation	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no elastomer piping, piping components, or seals exposed to air or condensation within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 079	This Item Number is not used in NUREG-2192.				
3.4-1, 080	This Item Number is not used in NUREG-2192.				
3.4-1, 081	Steel components exposed to treated water, raw water	Long-term loss of material due to general corrosion	AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to demonstrate the absence of long-term loss of material from steel components exposed to treated water, or raw water within the screened-in portions of the Condensate/Demineralized Water System, Heater Drains and Vents System, Miscellaneous Turbine Connections System, and Condenser Circulating Water System.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 082	Stainless steel piping, piping components exposed to concrete	None	None	Yes	Consistent with NUREG-2191. The only Steam and Power Conversion System where stainless steel piping, piping components are exposed to concrete within the screened-in portion of the system is the Condensate/Demineralized Water System. Loss of material and cracking due to SCC are not considered to be applicable aging effects for portions of the stainless steel piping and piping components exposed to concrete that is indoors, or outdoors and above ground level, in the screened-in portions of the Condensate/Demineralized Water System because the piping is not potentially exposed to groundwater. There are no stainless steel piping and piping components in the screened-in portions of the Condensate/Demineralized Water System that are exposed to concrete, and are outdoors and below ground level, susceptible to loss of material and cracking due to SCC (because the piping is potentially exposed to groundwater). See Subsection 3.4.2.2.8.
3.4-1, 083	Stainless steel, nickel alloy tanks exposed to treated water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Consistent with NUREG-2191. The Water Chemistry program (B.2.1.2) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material from stainless steel, nickel alloy tanks exposed to treated water in the screened-in portions of the Condensate/Demineralized Water System, Spent Fuel Pool Cooling/Cleanup System, and Control Rod Drive System.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 084	Stainless steel, nickel alloy piping, piping components exposed to steam	Loss of material due to pitting, crevice corrosion	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191. The Water Chemistry program (B.2.1.2) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material from stainless steel, nickel alloy piping, piping components exposed to steam in the screened-in portions of the Main Steam System.
3.4-1, 085	Stainless steel, nickel alloy piping, piping components, PWR heat exchanger components exposed to treated water	Loss of material due to pitting, crevice corrosion, MIC	AMP XI.M2, "Water Chemistry," and AMP XI.M32, "One-Time Inspection"	No	Consistent with NUREG-2191. The Water Chemistry program (B.2.1.2) and One-Time Inspection program (B.2.1.20) will be used to manage loss of material from stainless steel, and nickel alloy piping, piping components exposed to treated water in the Condensate/Demineralized Water System, and Reactor Feedwater System. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) is substituted to manage loss of material from stainless steel heat exchanger components exposed to treated water in the Condensate/Demineralized Water System and Reactor Feedwater System.
3.4-1, 086	Stainless steel, steel, aluminum, copper alloy, titanium heat exchanger tubes internal to components exposed to air, condensation	Reduction of heat transfer due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not Applicable. None of the heat exchangers in the screened-in portions of the Steam and Power Conversion Systems have a passive function requiring heat transfer. Consequently, the Aging Effect, Reduction of Heat Transfer due to Fouling, is not required to be managed. Condenser and heater tubes are stainless steel.
3.4-1, 087	This Item Number is not used in NUREG-2192.				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 088	This Item Number is not used in NUREG-2192.				
3.4-1, 089	Steel, stainless steel, copper alloy piping, piping components exposed to raw water (for components not covered by NRC GL 89-13)	Loss of material due to general (steel, copper alloy only), pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material from steel, stainless steel, or copper alloy piping, piping components exposed to raw water (for components not covered by NRC GL 89-13) within the screened-in portions of the Condenser Circulating Water System.
3.4-1, 090	Steel, stainless steel, copper alloy heat exchanger tubes exposed to raw water (for components not covered by NRC GL 89-13)	Reduction of heat transfer due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Not Applicable. None of the heat exchangers in the screened-in portions of the Steam and Power Conversion Systems have a passive function requiring heat transfer. Consequently, the Aging Effect, Reduction of Heat Transfer due to Fouling, is not required to be managed. Main condenser and heater tubes are stainless steel.
3.4-1, 091	Steel, stainless steel, copper alloy heat exchanger components exposed to raw water (for components not covered by NRC GL 89-13)	Loss of material due to general (steel, copper alloy only), pitting, crevice corrosion, MIC; flow blockage due to fouling	AMP XI.M38, "Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components"	No	Consistent with NUREG-2191. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage loss of material from steel, stainless steel, or copper alloy heat exchanger components exposed to raw water (for components not covered by NRC GL 89-13) within the screened-in portions of the Condenser Circulating Water System.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)					
Item Number	**Component**	**Aging Effect/Mechanism**	**Aging Management Programs**	**Further Evaluation Recommended**	**Discussion**
3.4-1, 092	Copper alloy (>15% Zn or >8% Al) piping, piping components exposed to soil	Loss of material due to selective leaching	AMP XI.M33, "Selective Leaching"	No	Not Applicable. There are no copper alloy (>15% Zn or >8% Al) piping, piping components exposed to soil in the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 093	This Item Number is not used in NUREG-2192.				
3.4-1, 094	Aluminum underground piping, piping components, tanks	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M41, "Buried and Underground Piping and Tanks," or AMP XI.M42, "Internal Coatings / Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes	Not applicable. There are no aluminum underground piping, piping components, or tanks within the screened-in portions of the Steam and Power Conversion Systems. See Subsection 3.4.2.2.9.
3.4-1, 095	Stainless steel, nickel alloy underground piping, piping components, tanks	Loss of material due to pitting, crevice corrosion	AMP XI.M32, "One-Time Inspection," AMP XI.M41, "Buried and Underground Piping and Tanks," or AMP XI.M42, "Internal Coatings / Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks"	Yes	Not applicable. There are no stainless steel and nickel alloy underground piping, piping components, or tanks within the screened-in portions of the Steam and Power Conversion Systems. See Subsection 3.4.2.2.3.
3.4-1, 096	Aluminum tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to soil, concrete	Loss of material due to pitting, crevice corrosion	AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks"	No	Not Applicable. There are no aluminum tanks (within the scope of AMP XI.M29, "Outdoor and Large Atmospheric Metallic Storage Tanks") exposed to soil or concrete in the screened-in portions of the Steam and Power Conversion Systems.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 097	Aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings / Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There are no aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) in the screened-in portions of the Steam and Power Conversion Systems. See Subsection 3.4.2.2.9.
3.4-1, 098	Stainless steel, nickel alloy tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings / Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There are no stainless steel or nickel alloy tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation in the screened-in portions of the Steam and Power Conversion Systems. See Subsection 3.4.2.2.3.
3.4-1, 099	Stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete	Loss of material due to pitting, crevice corrosion, MIC (soil only)	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not Applicable. There are no stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil or concrete in the screened-in portions of the Steam and Power Conversion Systems.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 100	Stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings / Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There are no stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air or condensation in the screened-in portions of the Steam and Power Conversion Systems. See Subsection 3.4.2.2.2.
3.4-1, 101	Stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil, concrete	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	No	Not Applicable. There are no stainless steel tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to soil or concrete within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 102	Aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation, soil, concrete, raw water, waste water	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” or AMP XI.M42, “Internal Coatings / Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There are no aluminum tanks (within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”) exposed to air, condensation, soil, concrete, raw water, waste water within the screened-in portions of the Steam and Power Conversion Systems. See Subsection 3.4.2.2.7.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 103	Insulated stainless steel, nickel alloy piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to demonstrate the absence of loss of material due to pitting, crevice corrosion in insulated stainless steel piping and piping components exposed to air, condensation environments in the screened-in portions of the Main Steam System, Condensate/Demineralized Water System, and Reactor Feedwater System. See Subsection 3.4.2.2.3.
3.4-1, 104	Insulated stainless steel piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to demonstrate the absence of cracking in screened-in insulated stainless steel piping and piping components, tanks exposed to air, condensation environments in the screened-in portions of the Main Steam System, Condensate/ Demineralized Water System and Reactor Feedwater System. See Subsection 3.4.2.2.2.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)					
Item Number	**Component**	**Aging Effect/Mechanism**	**Aging Management Programs**	**Further Evaluation Recommended**	**Discussion**
3.4-1, 105	Insulated aluminum piping, piping components, tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The One-Time Inspection program (B.2.1.20) will be used to demonstrate the absence of cracking in insulated aluminum piping, piping components, tanks exposed to air, condensation environments within the screened-in portions of the Condensate/ Demineralized Water System. See Subsection 3.4.2.2.7.
3.4-1, 106	Copper alloy (>15% Zn or >8% Al) piping, piping components exposed to air, condensation	Cracking due to SCC	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage cracking due to SCC of copper alloy (>15% Zn or >8% Al) piping, piping components exposed to air, condensation within the screened-in portions of the Condensate/ Demineralized Water System, Reactor Feedwater System, and Gland Seal Water System.
3.4-1, 107	Copper alloy (>15% Zn or >8% Al) tanks exposed to air, condensation	Cracking due to SCC	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Not Applicable. There are no copper alloy (>15% Zn or >8% Al) tanks exposed to air or condensation within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 108	This Item Number is not used in NUREG-2192.				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)					
Item Number	**Component**	**Aging Effect/Mechanism**	**Aging Management Programs**	**Further Evaluation Recommended**	**Discussion**
3.4-1, 109	Aluminum piping, piping components, tanks exposed to air, condensation, raw water, waste water	Cracking due to SCC	AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage the aging effect of cracking due to SCC in aluminum piping, piping components and tanks exposed to air, condensation, raw water, waste water environments within the screened-in portions of the Main Steam System and Condensate/ Demineralized Water System. See Subsection 3.4.2.2.7.
3.4-1, 110	This Item Number is not used in NUREG-2192.				
3.4-1, 111	This Item Number is not used in NUREG-2192.				
3.4-1, 112	Aluminum underground piping, piping components, tanks	Cracking due to SCC	AMP XI.M32, “One-Time Inspection,” AMP XI.M41, “Buried and Underground Piping and Tanks,” or AMP XI.M42, “Internal Coatings / Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not applicable. There are no aluminum underground piping, piping components, or tanks within the screened-in portions of the Condensate/Demineralized Water System. See Subsection 3.4.2.2.7.
3.4-1, 113	This Item Number is not used in NUREG-2192.				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 114	Titanium heat exchanger tubes exposed to treated water	Cracking due to SCC, reduction of heat transfer due to fouling	AMP XI.M2, “Water Chemistry,” and AMP XI.M32, “One-Time Inspection”	No	Not Applicable. There are no titanium heat exchanger tubes exposed to treated water within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 115	Titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to treated water	None	None	No	Not Applicable There are no titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, or piping components exposed to treated water within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 116	Titanium heat exchanger tubes exposed to closed- cycle cooling water	Cracking due to SCC, reduction of heat transfer due to fouling	AMP XI.M21A, “Closed Treated Water Systems”	No	Not Applicable. There are no titanium heat exchanger tubes exposed to closed cycle cooling water within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 117	Aluminum piping, piping components, tanks exposed to soil, concrete	Loss of material due to pitting, crevice corrosion	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There are no aluminum piping, piping components or tanks exposed to soil or concrete within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 118	This Item Number is not used in NUREG-2192.				

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)					
Item Number	**Component**	**Aging Effect/Mechanism**	**Aging Management Programs**	**Further Evaluation Recommended**	**Discussion**
3.4-1, 119	Insulated aluminum piping, piping components, tanks exposed to air, condensation	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to manage loss of material from insulated aluminum piping and piping components exposed to air, condensation environments within the screened-in portions of the Condensate/ Demineralized Water System. See Subsection 3.4.2.2.9.
3.4-1, 120	Aluminum piping, piping components, tanks exposed to raw water, waste water	Loss of material due to pitting, crevice corrosion	AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks,” AMP XI.M32, “One-Time Inspection,” AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components,” or AMP XI.M42, “Internal Coatings/Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks”	Yes	Not Applicable. There are no aluminum piping, piping components, or tanks exposed to raw water or waste water within the screened-in portions of the Steam and Power Conversion Systems. See Subsection 3.4.2.2.9.
3.4-1, 121	This Item Number is not used in NUREG-2192.				
3.4-1, 122	Elastomer piping, piping components, seals exposed to air	Loss of material due to wear	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components”	No	Not Applicable. There are no elastomer piping, piping components, or seals exposed to air within the screened-in portions of the Steam and Power Conversion Systems.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)					
Item Number	**Component**	**Aging Effect/Mechanism**	**Aging Management Programs**	**Further Evaluation Recommended**	**Discussion**
3.4-1, 123	Elastomer piping, piping components, seals exposed to air	Loss of material due to wear	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no elastomer piping, piping components, or seals exposed to air within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 124	PVC piping, piping components, tanks exposed to concrete	None	None	No	Not Applicable. There are no PVC piping, piping components, or tanks exposed to concrete within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 125	PVC piping, piping components, tanks exposed to soil	Loss of material due to wear	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not Applicable. There are no PVC piping, piping components, or tanks exposed to soil within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 126	Titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes, piping, piping components exposed to closed-cycle cooling water	None	None	No	Not Applicable. There are no titanium (ASTM Grades 1, 2, 7, 9, 11, or 12) heat exchanger components other than tubes or piping, piping components exposed to closed-cycle cooling water within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 127	Aluminum piping, piping components, tanks exposed to air with borated water leakage	None	None	No	Not Applicable. There are no aluminum piping, piping components, or tanks exposed to air with borated water leakage within the screened-in portions of the Steam and Power Conversion Systems.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 128	Copper alloy piping, piping components exposed to concrete	None	None	No	Not Applicable. There are no copper alloy piping, piping components exposed to concrete within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 129	Copper alloy piping, piping components exposed to soil, underground	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	AMP XI.M41, “Buried and Underground Piping and Tanks”	No	Not applicable. There are no copper alloy piping, piping components exposed to soil or underground within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 130	Titanium piping, piping components, heat exchanger components other than tubes exposed to raw water	Cracking due to SCC, flow blockage due to fouling	AMP XI.M20, “Open-Cycle Cooling Water System,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no titanium piping, piping components, heat exchanger components other than tubes exposed to raw water within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 131	PWR Only				
3.4-1, 132	PWR Only				
3.4-1, 133	Aluminum piping, piping components exposed to raw water	Flow blockage due to fouling	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no aluminum piping, piping components exposed to raw water within the screened-in portions of the Steam and Power Conversion Systems.

Table 3.4.1, Summary of Aging Management Evaluations for the Steam and Power Conversion Systems (Continued)

Item Number	Component	Aging Effect/Mechanism	Aging Management Programs	Further Evaluation Recommended	Discussion
3.4-1, 134	Titanium (ASTM Grades 3, 4, or 5) heat exchanger tubes exposed to raw water	Cracking due to SCC	AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Not Applicable. There are no titanium (ASTM Grades 3, 4, or 5) heat exchanger tubes exposed to raw water within the screened-in portions of the Steam and Power Conversion Systems.
3.4-1, 135	Polymeric piping, piping components, ducting, ducting components, seals exposed to air, condensation, raw water, raw water (potable), treated water, waste water, underground, concrete, soil	Hardening or loss of strength due to polymeric degradation; loss of material due to peeling, delamination, wear; cracking or blistering due to exposure to ultraviolet light, ozone, radiation, or chemical attack; flow blockage due to fouling	AMP XI.M36, “External Surfaces Monitoring of Mechanical Components,” or AMP XI.M38, “Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components”	No	Consistent with NUREG-2191. The External Surfaces Monitoring of Mechanical Components program (B.2.1.23) or Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) will be used to manage hardening or loss of strength due to polymeric degradation; loss of material due to peeling, delamination, wear; cracking or blistering due to exposure to ultraviolet light, ozone, radiation, or chemical attack; flow blockage due to fouling of polymeric piping, piping components, ducting, ducting components, and seals exposed to air, condensation, raw water, raw water (potable), treated water, waste water, underground, concrete, or soil within the screened-in portions of the Condensate/ Demineralized Water System.

Table 3.4.2-1, Main Steam System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Closure bolting	Mechanical Closure	High-strength steel	Air - indoor uncontrolled	Cracking due to SCC	Bolting Integrity (B.2.1.10)	IV.C1.R-11	3.1-1, 062	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion, wear	Bolting Integrity (B.2.1.10)	IV.C1.RP-42	3.1-1, 063	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled (external)	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	IV.C1.RP-43	3.1-1, 067	A
Closure bolting	Mechanical Closure	Steel	Any	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VIII.H.SP-142	3.4-1, 006	A, 2
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VIII.H.S-03	3.4-1, 007	A
Closure bolting	Mechanical Closure	Stainless Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VIII.H.S-02	3.4-1, 009	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VIII.H.S-02	3.4-1, 009	A
Closure bolting	Mechanical Closure	Stainless Steel	Treated water	Loss of material due to general (steel; copper alloy in raw water, waste water only), pitting, crevice corrosion, MIC (raw water, waste water environments only)	Bolting Integrity (B.2.1.10)	VIII.H.S-418	3.4-1, 070	A, 2

Table 3.4.2-1, Main Steam System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Closure bolting	Mechanical Closure	Steel	Treated water	Loss of material due to general (steel; copper alloy in raw water, waste water only), pitting, crevice corrosion, MIC (raw water, waste water environments only)	Bolting Integrity (B.2.1.10)	VIII.H.S-418	3.4-1, 070	A, 2
Closure bolting	Mechanical Closure	Stainless steel	Air	Cracking due to SCC	Bolting Integrity (B.2.1.10)	VIII.H.S-421	3.4-1, 073	A
External surfaces	Pressure Boundary, Holdup and Plateout	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VIII.H.S-29	3.4-1, 034	A
Insulated piping, piping components, tanks	Pressure Boundary	Stainless steel	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VIII.H.S-451b	3.4-1, 103	A
Insulated piping, piping components, tanks	Pressure Boundary	Stainless steel	Air	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VIII.H.S-452b	3.4-1, 104	A
Reactor coolant pressure boundary components: piping, piping components; other pressure retaining components with fatigue analyses	Pressure Boundary	Steel (with or without nickel alloy or stainless steel cladding)	Reactor coolant	Cumulative fatigue damage: cracking due to fatigue, cyclic loading	Section 4.3 “Metal Fatigue”	IV.C1.R-220	3.1-1, 006	A

Table 3.4.2-1, Main Steam System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Class 1 piping, fittings and branch connections < NPS 4	Pressure Boundary	Stainless steel	Reactor coolant	Cracking due to SCC (for stainless steel or nickel alloy surfaces exposed to reactor coolant only), IGSCC (for stainless steel or nickel alloy surfaces exposed to reactor coolant only), thermal, mechanical, vibratory loading	ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1), Water Chemistry (B.2.1.2), and ASME Code Class 1 Small-bore Piping (B.2.1.22)	IV.C1.RP-230	3.1-1, 039	A
Class 1 piping, fittings and branch connections < NPS 4	Pressure Boundary	Steel (with or without nickel alloy or stainless steel cladding)	Reactor coolant	Cracking due to SCC (for stainless steel or nickel alloy surfaces exposed to reactor coolant only), IGSCC (for stainless steel or nickel alloy surfaces exposed to reactor coolant only), thermal, mechanical, vibratory loading	ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD (B.2.1.1), Water Chemistry (B.2.1.2), and ASME Code Class 1 Small-bore Piping (B.2.1.22)	IV.C1.RP-230	3.1-1, 039	A
Class 1 piping, piping components, including pump casings	Pressure Boundary, Throttle	Cast austenitic stainless steel	Reactor coolant >250°C (>482°F)	Loss of fracture toughness due to thermal aging embrittlement	Thermal Aging Embrittlement of Cast Austenitic Stainless Steel (CASS) (B.2.1.8)	IV.C1.R-52	3.1-1, 050	A
Piping, piping components	Pressure Boundary	Steel	Reactor coolant	Wall thinning due to flow-accelerated corrosion	Flow-Accelerated Corrosion (B.2.1.9)	IV.C1.R-23	3.1-1, 060	A
Reactor coolant pressure boundary components	Pressure Boundary	Stainless Steel	Reactor coolant	Loss of material due to pitting, crevice corrosion	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	IV.C1.RP-158	3.1-1, 079	A

Table 3.4.2-1, Main Steam System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components greater than or equal to 4 NPS	Pressure Boundary	Stainless steel	Reactor coolant	Cracking due to SCC, IGSCC	BWR Stress Corrosion Cracking, (B.2.1.5) and Water Chemistry (B.2.1.2)	IV.C1.R-20	3.1-1, 097	B
Piping, piping components	Pressure Boundary, Holdup and Plateout	Cast Austenitic Stainless Steel	Reactor Coolant	Wall thinning due to erosion	Flow-Accelerated Corrosion (B.2.1.9)	IV.C1.R-406	3.1-1, 110	A
Piping, piping components	Pressure Boundary, Holdup and Plateout	Stainless steel	Reactor Coolant	Wall thinning due to erosion	Flow-Accelerated Corrosion (B.2.1.9)	IV.C1.R-406	3.1-1, 110	A
Piping, piping components	Pressure Boundary, Holdup and Plateout	Steel	Reactor Coolant	Wall thinning due to erosion	Flow-Accelerated Corrosion (B.2.1.9)	IV.C1.R-406	3.1-1, 110	A
Reactor coolant system components: Components defined as ASME Section XI components (e.g., reactor coolant pressure boundary components, core support structure components, ASME Class 2 or 3 components, including associated pressure retaining welds) not managed by other AMR line items in GALL-SLR Chapter IV	Pressure Boundary, Throttle	Stainless Steel	Air	Cracking due to SCC, IGSCC (stainless steel or nickel alloy components only), cyclic loading; loss of material due to general corrosion (steel only), pitting corrosion, crevice corrosion, wear	ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD, (B.2.1.1) and Water Chemistry (B.2.1.2) (water chemistry-related or corrosion-related aging effect mechanisms only)	IV.E.R-444	3.1-1, 114	A

Table 3.4.2-1, Main Steam System - Summary of Aging Management Evaluation (Continued)								
Component Type	**Intended Function**	**Material**	**Environment**	**Aging Effect Requiring Management**	**Aging Management Program**	**NUREG-2191 Item**	**NUREG-2192 Table 1 Item**	**Notes**
Reactor coolant system components: Components defined as ASME Section XI components (e.g., reactor coolant pressure boundary components, core support structure components, ASME Class 2 or 3 components, including associated pressure retaining welds) not managed by other AMR line items in GALL-SLR Chapter IV	Pressure Boundary	Steel	Air	Cracking due to SCC, IGSCC (stainless steel or nickel alloy components only), cyclic loading; loss of material due to general corrosion (steel only), pitting corrosion, crevice corrosion, wear	ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD, (B.2.1.1) and Water Chemistry (B.2.1.2) (water chemistry-related or corrosion-related aging effect mechanisms only)	IV.E.R-444	3.1-1, 114	A
Reactor coolant system components: Components defined as ASME Section XI components (e.g., reactor coolant pressure boundary components, core support structure components, ASME Class 2 or 3 components, including associated pressure retaining welds) not managed by other AMR line items in GALL-SLR Chapter IV	Pressure Boundary	Steel	Treated water	Cracking due to SCC, IGSCC (stainless steel or nickel alloy components only), cyclic loading; loss of material due to general corrosion (steel only), pitting corrosion, crevice corrosion, wear	ASME Section XI Inservice Inspection, Subsections IWB, IWC, and IWD, (B.2.1.1) and Water Chemistry (B.2.1.2) (water chemistry-related or corrosion-related aging effect mechanisms only)	IV.E.R-444	3.1-1, 114	A
Piping, piping components	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	IV.C1.R-431	3.1-1, 124	A

Table 3.4.2-1, Main Steam System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Steel	Treated water	Long-term loss of material due to general corrosion	One-Time Inspection (B.2.1.20)	IV.C1.R-448	3.1-1, 133	A
Piping, piping components	Pressure Boundary	Stainless steel	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	IV.C1.R-452a	3.1-1, 136	A
Piping, piping components	Pressure Boundary	Aluminum	Air - dry	Loss of material due to general (steel only), pitting, crevice corrosion	Compressed Air Monitoring (B.2.1.14)	VII.D.A-764	3.3-1, 235	A, 1
Piping, piping components	Pressure Boundary	Steel	Air - dry	Loss of material due to general (steel only), pitting, crevice corrosion	Compressed Air Monitoring (B.2.1.14)	VII.D.A-764	3.3-1, 235	A
Piping, piping components	Pressure Boundary, Holdup and Plateout	Steel	Treated Water	Cumulative fatigue damage due to fatigue	Section 4.3 “Metal Fatigue”	VIII.B2.S-08	3.4-1, 001	A
Piping, piping components, tanks	Pressure Boundary	Stainless steel	Air	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VIII.B2.SP-118a	3.4-1, 002	A
Piping, piping components	Pressure Boundary, Holdup and Plateout	Stainless steel	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VIII.B2.SP-127a	3.4-1, 003	A
Piping, piping components	Pressure Boundary, Holdup and Plateout	Steel	Steam	Wall thinning due to flow-accelerated corrosion	Flow-Accelerated Corrosion (B.2.1.9)	VIII.B2.S-15	3.4-1, 005	A
Piping, piping components	Pressure Boundary, Holdup and Plateout	Stainless steel	Steam	Cracking due to SCC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.B2.SP-98	3.4-1, 011	A

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary, Holdup and Plateout	Steel	Steam	Loss of material due to general, pitting, crevice corrosion	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.B2.SP-160	3.4-1, 014	A
Piping, piping components	Pressure Boundary, Holdup and Plateout	Steel	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.B2.SP-73	3.4-1, 014	A
Piping, piping components	Pressure Boundary	Aluminum	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VIII.E.SP-147a	3.4-1, 035	A, 1
Piping, piping components	Pressure Boundary	Stainless steel	Steam	Wall thinning due to erosion	Flow-Accelerated Corrosion (B.2.1.9)	VIII.B2.S-408	3.4-1, 060	A
Piping, piping components	Pressure Boundary, Holdup and Plateout	Stainless steel	Steam	Wall thinning due to erosion	Flow-Accelerated Corrosion (B.2.1.9)	VIII.B2.S-408	3.4-1, 060	A
Piping, piping components	Pressure Boundary	Steel	Steam	Wall thinning due to erosion	Flow-Accelerated Corrosion (B.2.1.9)	VIII.B2.S-408	3.4-1, 060	A
Piping, piping components	Pressure Boundary	Stainless steel	Steam	Loss of material due to pitting, crevice corrosion	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.B2.SP-155	3.4-1, 084	A
Piping, piping components	Pressure Boundary	Aluminum	Air	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VIII.D2.S-457b	3.4-1, 109	A, 1

Table 3.4.2-1 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. The only aluminum materials in the Main Steam System are the Control Air Solenoid Valve bodies.
2. This GALL-SLR item reflects consideration of leakage from a flanged connection. However, this system does not contain any submerged closure bolting.

Table 3.4.2-2, Condensate/Demineralized Water System - Summary of Aging Management Evaluation								
Component Type	**Intended Function**	**Material**	**Environment**	**Aging Effect Requiring Management**	**Aging Management Program**	**NUREG-2191 Item**	**NUREG-2192 Table 1 Item**	**Notes**
Closure bolting	Mechanical Closure	Stainless steel	Any	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VIII.H.SP-142	3.4-1, 006	A, 2
Closure bolting	Mechanical Closure	Steel	Any	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VIII.H.SP-142	3.4-1, 006	A, 2
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VIII.H.S-03	3.4-1, 007	A
Closure bolting	Mechanical Closure	Stainless steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VIII.H.S-02	3.4-1, 009	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VIII.H.S-02	3.4-1, 009	A
Closure bolting	Mechanical Closure	Steel	Concrete	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	Buried and Underground Piping and Tanks (B.2.1.27)	VIII.H.SP-141	3.4-1, 050	B
Closure bolting	Mechanical Closure	Stainless steel	Treated water	Loss of material due to general (steel; copper alloy in raw water, waste water only), pitting, crevice corrosion, MIC (raw water, waste water environments only)	Bolting Integrity (B.2.1.10)	VIII.H.S-418	3.4-1, 070	A, 2

Table 3.4.2-2, Condensate/Demineralized Water System - Summary of Aging Management Evaluation (Continued)								
Component Type	**Intended Function**	**Material**	**Environment**	**Aging Effect Requiring Management**	**Aging Management Program**	**NUREG-2191 Item**	**NUREG-2192 Table 1 Item**	**Notes**
Closure bolting	Mechanical Closure	Steel	Treated water	Loss of material due to general (steel; copper alloy in raw water, waste water only), pitting, crevice corrosion, MIC (raw water, waste water environments only)	Bolting Integrity (B.2.1.10)	VIII.H.S-418	3.4-1, 070	A, 2
Closure bolting	Mechanical Closure	Stainless steel	Air	Cracking due to SCC	Bolting Integrity (B.2.1.10)	VIII.H.S-421	3.4-1, 073	A
External surfaces	Pressure Boundary	Cast Iron and Cast Iron Alloys	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VIII.H.S-29	3.4-1, 034	A
External surfaces	Pressure Boundary	Cast Iron and Cast Iron Alloys	Air - outdoor	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VIII.H.S-29	3.4-1, 034	A
External surfaces	Filter, Holdup and Plateout, Pressure Boundary, Thermal Insulation Jacket Integrity	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VIII.H.S-29	3.4-1, 034	A
External surfaces	Pressure Boundary	Steel	Air - outdoor	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VIII.H.S-29	3.4-1, 034	A
Heat exchanger components	Pressure Boundary	Steel with stainless steel cladding	Treated water >60°C (>140°F)	Cracking due to SCC	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.E3.AP-112	3.3-1, 020	E, 3

Table 3.4.2-2, Condensate/Demineralized Water System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Heat exchanger components	Pressure Boundary	Steel	Lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	Lubricating Oil Analysis, (B.2.1.25) and One-Time Inspection (B.2.1.20)	VII.H2.AP-131	3.3-1, 098	A
Heat exchanger components	Pressure Boundary	Metallic	Raw water	Wall thinning due to erosion	Flow-Accelerated Corrosion (B.2.1.9)	VII.C1.A-409	3.3-1, 126	C, 1
Heat exchanger tubes	Heat Transfer	Copper alloy	Lubricating oil	Reduction of heat transfer due to fouling	Lubricating Oil Analysis, (B.2.1.25) and One-Time Inspection (B.2.1.20)	VII.C1.A-791	3.3-1, 257	A
Heat exchanger components	Pressure Boundary,	Steel	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.E.SP-77	3.4-1, 015	A
Heat exchanger components and tubes	Pressure Boundary,	Stainless steel	Treated water	Loss of material due to pitting, crevice corrosion, MIC	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VIII.E.SP-80	3.4-1, 085	E, 3
Insulated piping, piping components, tanks	Pressure Boundary	Stainless steel	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VIII.H.S-451b	3.4-1, 103	A
Insulated piping, piping components, tanks	Pressure Boundary	Stainless steel	Air	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VIII.H.S-452b	3.4-1, 104	A
Insulated piping, piping components, tanks	Pressure Boundary	Aluminum	Air	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VIII.H.S-453b	3.4-1, 105	A
Insulated piping, piping components, tanks	Pressure Boundary	Aluminum	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VIII.H.S-468b	3.4-1, 119	A

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components, ducting, ducting components, seals	Pressure Boundary	Polymeric	Concrete	Hardening or loss of strength due to polymeric degradation; loss of material due to peeling, delamination, wear; cracking or blistering due to exposure to ultraviolet light, ozone, radiation, or chemical attack; flow blockage due to fouling	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VII.E5.A-797b	3.3-1, 263	A
Piping, piping components, tanks	Pressure Boundary	Stainless steel	Air	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VIII.E.SP-118a	3.4-1, 002	A
Piping, piping components	Pressure Boundary	Stainless steel	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VIII.E.SP-127a	3.4-1, 003	A
Piping, piping components	Pressure Boundary	Steel	Treated water	Wall thinning due to flow-accelerated corrosion	Flow-Accelerated Corrosion (B.2.1.9)	VIII.E.S-16	3.4-1, 005	A
Piping, piping components	Pressure Boundary	Stainless steel	Treated water >60°C (>140°F)	Cracking due to SCC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.E.SP-88	3.4-1, 011	A
Piping, piping components	Pressure Boundary	Steel	Steam	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.A.SP-71	3.4-1, 014	A
Piping, piping components	Pressure Boundary	Cast Iron and Cast Iron Alloy	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.E.SP-73	3.4-1, 014	A
Piping, piping components	Pressure Boundary	Steel	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.E.SP-73	3.4-1, 014	A

Table 3.4.2-2, Condensate/Demineralized Water System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components	Pressure Boundary	Copper alloy	Treated water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.A.SP-101	3.4-1, 016	A
Piping, piping components	Pressure Boundary	Aluminum	Treated water	Loss of material due to pitting, crevice corrosion	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.E.SP-90	3.4-1, 016	A
Piping, piping components	Pressure Boundary	Ductile iron	Treated water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VIII.E.SP-27	3.4-1, 033	A
Piping, piping components	Pressure Boundary	Gray cast iron	Treated water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VIII.E.SP-27	3.4-1, 033	A
Piping, piping components	Pressure Boundary	Copper alloy (>15% Zn or >8% Al)	Treated water	Loss of material due to selective leaching	Selective Leaching (B.2.1.21)	VIII.E.SP-55	3.4-1, 033	A
Piping, piping components	Pressure Boundary	Aluminum	Air	Loss of material due to pitting, crevice corrosion	One-Time Inspection (B.2.1.20)	VIII.E.SP-147a	3.4-1, 035	A
Piping, piping components	Pressure Boundary	Steel	Lubricating oil	Loss of material due to general, pitting, crevice corrosion, MIC	Lubricating Oil Analysis, (B.2.1.25) and One-Time Inspection (B.2.1.20)	VIII.E.SP-91	3.4-1, 040	A
Piping, piping components	Pressure Boundary	Steel	Concrete	None	None	VIII.I.SP-154	3.4-1, 051	A
Piping, piping components	Pressure Boundary	Copper alloy	Air	None	None	VIII.I.SP-6	3.4-1, 054	A
Piping, piping components	Pressure Boundary	PVC	Air - indoor uncontrolled	None	None	VIII.I.SP-152	3.4-1, 057	A
Piping, piping components	Pressure Boundary	Metallic	Treated water	Wall thinning due to erosion	Flow-Accelerated Corrosion (B.2.1.9)	VIII.D2.S-408	3.4-1, 060	A

Table 3.4.2-2, Condensate/Demineralized Water System - Summary of Aging Management Evaluation (Continued)

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Piping, piping components, heat exchangers, tanks with internal coatings/linings	Pressure Boundary	Stainless steel	Treated water	Loss of coating or lining integrity due to blistering, cracking, flaking, peeling, delamination, rusting, physical damage; loss of material or cracking for cementitious coatings/linings	Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B.2.1.28)	VIII.E.S-401	3.4-1, 066	A
Piping, piping components, heat exchangers, tanks with internal coatings/linings	Pressure Boundary	Stainless steel	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Internal Coatings/ Linings for In-Scope Piping, Piping Components, Heat Exchangers, and Tanks (B.2.1.28)	VIII.E.S-414	3.4-1, 067	A
Piping, piping components	Pressure Boundary	Steel	Treated water	Long-term loss of material due to general corrosion	One-Time Inspection (B.2.1.20)	VIII.E.S-432	3.4-1, 081	A
Piping, piping components	Pressure Boundary	Stainless steel	Concrete	None	None	VIII.I.SP-13	3.4-1, 082	A
Piping, piping components	Pressure Boundary	Stainless steel	Treated water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.E.SP-87	3.4-1, 085	A
Piping, piping components	Pressure Boundary	Copper alloy (>15% Zn or >8% Al)	Air	Cracking due to SCC	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VIII.H.S-454	3.4-1, 106	A
Piping, piping components	Pressure Boundary	Aluminum	Air	Cracking due to SCC	One-Time Inspection (B.2.1.20)	VIII.D2.S-457b	3.4-1, 109	A

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Tanks within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	Pressure Boundary	Steel	Air	Loss of material due to general, pitting, crevice corrosion, MIC (soil only)	Outdoor and Large Atmospheric Metallic Storage Tanks (B.2.1.17)	VIII.E.SP-115	3.4-1, 030	B
Tanks within the scope of AMP XI.M29, “Outdoor and Large Atmospheric Metallic Storage Tanks”	Pressure Boundary	Steel	Treated water	Loss of material due to general (steel only), pitting, crevice corrosion, MIC (steel, stainless steel only)	Outdoor and Large Atmospheric Metallic Storage Tanks (B.2.1.17)	VIII.E.S-405	3.4-1, 062	B
Tanks	Pressure Boundary	Stainless steel	Treated water	Loss of material due to pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.E.SP-162	3.4-1, 083	A

Table 3.4.2-2 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. While these components are designated as part of the Condensate/Demineralized Water System in BFN design documents, it is the raw water environment of the Raw Cooling Water System that contributes to the erosion of these heat exchanger tubesheets.
2. This GALL-SLR item reflects consideration of leakage from a flanged connection. However, this system does not contain any submerged closure bolting.
3. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) is substituted to manage the aging effect(s) applicable to this component type, material, and environment combination.

Table 3.4.2-3, Reactor Feedwater System - Summary of Aging Management Evaluation

Component Type	Intended Function	Material	Environment	Aging Effect Requiring Management	Aging Management Program	NUREG-2191 Item	NUREG-2192 Table 1 Item	Notes
Closure bolting	Mechanical Closure	High-strength steel	Air - indoor uncontrolled	Cracking due to SCC	Bolting Integrity (B.2.1.10)	IV.C1.R-11	3.1-1, 062	A
Closure bolting	Mechanical Closure	Stainless steel	Air - indoor uncontrolled	Cracking due to SCC	Bolting Integrity (B.2.1.10)	IV.C1.R-11	3.1-1, 062	A
Closure bolting	Mechanical Closure	Stainless steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion, wear	Bolting Integrity (B.2.1.10)	IV.C1.RP-42	3.1-1, 063	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion, wear	Bolting Integrity (B.2.1.10)	IV.C1.RP-42	3.1-1, 063	A
Closure bolting	Mechanical Closure	Stainless steel	Air - indoor uncontrolled (external)	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	IV.C1.RP-43	3.1-1, 067	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled (external)	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	IV.C1.RP-43	3.1-1, 067	A
Closure bolting	Mechanical Closure	Stainless steel	Any	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VIII.H.SP-142	3.4-1, 006	A, 1
Closure bolting	Mechanical Closure	Steel	Any	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VIII.H.SP-142	3.4-1, 006	A, 1
Closure bolting	Mechanical Closure	High-strength steel	Air	Cracking due to SCC; cyclic loading	Bolting Integrity (B.2.1.10)	VIII.H.S-03	3.4-1, 007	A
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VIII.H.S-02	3.4-1, 009	A

Piping, piping components	Pressure Boundary	Copper alloy (>15% Zn or >8% Al)	Air	Cracking due to SCC	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VIII.H.S-454	3.4-1, 106	A
Tanks	Pressure Boundary	Steel	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.E.SP-75	3.4-1, 012	A

Table 3.4.2-3 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. This GALL-SLR item reflects consideration of leakage from a flanged connection. However, this system does not contain any submerged closure bolting.
2. The Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components program (B.2.1.24) is substituted to manage the aging effect(s) applicable to this component type, material, and environment combination.

Table 3.4.2-4, Heater Drains and Vents System - Summary of Aging Management Evaluation								
Component Type	**Intended Function**	**Material**	**Environment**	**Aging Effect Requiring Management**	**Aging Management Program**	**NUREG-2191 Item**	**NUREG-2192 Table 1 Item**	**Notes**
Closure bolting	Mechanical Closure	Steel	Any	Loss of preload due to thermal effects, gasket creep, self-loosening	Bolting Integrity (B.2.1.10)	VIII.H.SP-142	3.4-1, 006	A, 1
Closure bolting	Mechanical Closure	Steel	Air - indoor uncontrolled	Loss of material due to general (steel only), pitting, crevice corrosion	Bolting Integrity (B.2.1.10)	VIII.H.S-02	3.4-1, 009	A
Closure bolting	Mechanical Closure	Steel	Treated water	Loss of material due to general (steel; copper alloy in raw water, waste water only), pitting, crevice corrosion, MIC (raw water, waste water environments only)	Bolting Integrity (B.2.1.10)	VIII.H.S-418	3.4-1, 070	A, 1
External surfaces	Pressure Boundary	Steel	Air - indoor uncontrolled	Loss of material due to general, pitting, crevice corrosion	External Surfaces Monitoring of Mechanical Components (B.2.1.23)	VIII.H.S-29	3.4-1, 034	A
Piping, piping components	Pressure Boundary	Steel	Treated water	Wall thinning due to flow-accelerated corrosion	Flow-Accelerated Corrosion (B.2.1.9)	VIII.D2.S-16	3.4-1, 005	A
Piping, piping components	Pressure Boundary	Steel	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.D2.SP-73	3.4-1, 014	A
Piping, piping components	Pressure Boundary	Cast Iron	Treated water	Wall thinning due to erosion	Flow-Accelerated Corrosion (B.2.1.9)	VIII.D2.S-408	3.4-1, 060	A
Piping, piping components	Pressure Boundary	Steel	Treated water	Wall thinning due to erosion	Flow-Accelerated Corrosion (B.2.1.9)	VIII.D2.S-408	3.4-1, 060	A
Piping, piping components	Pressure Boundary	Steel	Treated water	Long-term loss of material due to general corrosion	One-Time Inspection (B.2.1.20)	VIII.D2.S-432	3.4-1, 081	A

Table 3.4.2-4 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. This GALL-SLR item reflects consideration of leakage from a flanged connection. However, this system does not contain any submerged closure bolting.

Piping, piping components (for components not covered by NRC GL 89-13)	Pressure Boundary	Stainless Steel	Raw water	Loss of material due to general (steel, copper alloy only), pitting, crevice corrosion, MIC; flow blockage due to fouling	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VIII.E.S-436	3.4-1, 089	A
Piping, piping components (for components not covered by NRC GL 89-13)	Pressure Boundary	Steel	Raw water	Loss of material due to general (steel, copper alloy only), pitting, crevice corrosion, MIC; flow blockage due to fouling	Inspection of Internal Surfaces in Miscellaneous Piping and Ducting Components (B.2.1.24)	VIII.E.S-436	3.4-1, 089	A

Table 3.4.2-6 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. Component is exposed to Condenser Circulating Water pump motor bearing lubricating oil.

Tanks	Pressure Boundary	Steel	Treated water	Loss of material due to general, pitting, crevice corrosion, MIC	Water Chemistry (B.2.1.2) and One-Time Inspection (B.2.1.20)	VIII.E.SP-75	3.4-1, 012	A

Table 3.4.2-7 Notes

Generic Notes

A. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
B. Consistent with component, material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
C. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP is consistent with NUREG-2191 AMP.
D. Component is different, but consistent with material, environment, aging effect and aging management program listed for NUREG-2191 line item. AMP has exceptions to NUREG-2191 AMP.
E. Consistent with NUREG-2191 material, environment, and aging effect but a different aging management program is credited or NUREG-2191 identifies a plant-specific aging management program.
F. Material not in NUREG-2191 for this component.
G. Environment not in NUREG-2191 for this component and material.
H. Aging effect not in NUREG-2191 for this component, material and environment combination.
I. Aging effect in NUREG-2191 for this component, material and environment combination is not applicable.
J. Neither the component nor the material and environment combination is evaluated in NUREG-2191.

Plant Specific Notes

1. This GALL-SLR item reflects consideration of leakage from a flanged connection. However, this system does not contain any submerged closure bolting.

3.5 AGING MANAGEMENT OF CONTAINMENTS, STRUCTURES, AND COMPONENT SUPPORTS

3.5.1 Introduction

This section provides the results of the aging management review for those components identified in Section 2.4, Scoping and Screening Results: Structures, as being subject to aging management review. The systems, or portions of systems, which are addressed in this section are described in the indicated sections.

- Reactor Buildings (2.4.1)
- Primary Containment Structures (2.4.2)
- Diesel Generator Buildings (2.4.3)
- Intake Pumping Station (2.4.4)
- Reinforced Concrete Chimney (2.4.5)
- Standby Gas Treatment Building (2.4.6)
- Off-Gas Treatment Building (2.4.7)
- Equipment Access Lock (2.4.8)
- Vacuum Pipe Building (2.4.9)
- Turbine Buildings (2.4.10)
- Radwaste Building (2.4.11)
- Service Building (2.4.12)
- Vent Vaults (2.4.13)
- Gate Structure Number 2 (2.4.14)
- Gate Structure Number 3 (2.4.15)
- Discharge Control Structure (2.4.16)
- Circulating Water Conduits (2.4.17)
- Diesel High Pressure Fire Pump House (2.4.18)
- Low Level Radwaste (LLRW) Storage Facility (2.4.19)
- Transformer Yard (2.4.20)
- 161 kV Switchyard (2.4.21)
- 500 kV Switchyard (2.4.22)
- Condensate Water Storage Tanks Foundations, Trenches, and Tunnels (2.4.23)
- Nitrogen Storage Tank Foundation (2.4.24)
- Supplemental Diesel Generator Building (2.4.25)
- Containment Atmosphere Dilution System Storage Tank Foundation (2.4.26)
- Intake Channel (2.4.27)
- North Bank of Cool Water Channel East of Gate Structure Number 2 (2.4.28)
- South Dike of Cool Water Channel between Gate Structures Number 2 and Number 3 (2.4.29)
- Earth Berm (2.4.30)
- Residual Heat Removal Service Water Tunnel (2.4.31)
- Electrical Cable Tunnel (from Intake Pumping Station to Powerhouse) (2.4.32)
- Underground Concrete Encased Structures (2.4.33)

- Yard, General (2.4.34)
- South Access Retaining Wall (2.4.35)
- Structural Commodities (2.4.36)
- Isolation Valve Pits (2.4.37)

3.5.2 Results

The following tables summarize the results of the aging management review for Containments, Structures, and Component Supports.

- Table 3.5.2-1, Reactor Buildings - Summary of Aging Management Evaluation

3.5.2.1 Materials, Environments, Aging Effects Requiring Management And Aging Management Programs

3.5.2.1.1 Reactor Buildings

Materials

The materials of construction for the Reactor Buildings components are:

- Aluminum
- Concrete
- Concrete Block
- Galvanized Steel
- Non-Ferrous Aluminum
- Polyurethane Foam
- Stainless Steel
- Steel

Environments

The Reactor Buildings components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Concrete
- Condensation
- Embedded/encased
- Groundwater
- Groundwater/soil

- Soil
- Treated Water
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Reactor Buildings components require management:

- Cracking
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material
- Loss of material (spalling, scaling) and cracking
- Loss of preload
- Radiation embrittlement; Hardening, loss of strength

Aging Management Programs

The following aging management programs manage the aging effects for the Reactor Buildings components:

- Masonry Walls (B.2.1.32)
- Structures Monitoring (B.2.1.33)
- TLAA (Section 4.7)
- Water Chemistry (B.2.1.2)
- One-Time Inspection (B.2.1.20)

3.5.2.1.2 Primary Containment Structures

Materials

The materials of construction for the Primary Containment Structures components are:

- Concrete
- Galvanized Steel
- Graphite
- Lubrite®
- Molykote® 321 or equal
- Service Level I Coatings
- Stainless steel
- Stainless Steel; Dissimilar Metal Welds
- Steel

Environments

The Primary Containment Structures components are exposed to the following environments:

- Air - indoor uncontrolled

- Concrete
- Treated Water

Aging Effects Requiring Management

The following aging effects associated with the Primary Containment Structures components require management:

- Cracking
- Cracking; loss of bond; and loss of material (spalling, scaling)
- Cumulative fatigue damage
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Loss of coating or lining integrity
- Loss of leak tightness
- Loss of material
- Loss of mechanical function
- Loss of preload
- Reduction in strength; loss of mechanical properties

Aging Management Programs

The following aging management programs manage the aging effects for the Primary Containment Structures components:

- 10 CFR Part 50, Appendix J (B.2.1.31)
- ASME Section XI, Subsection IWE (B.2.1.29)
- ASME Section XI, Subsection IWF (B.2.1.30)
- TLAA (Section 4.3)
- TLAA (Section 4.6)
- Protective Coating Monitoring and Maintenance (B.2.1.35)
- Structures Monitoring (B.2.1.33)
- One-Time Inspection (B.2.1.20)

3.5.2.1.3 Diesel Generator Buildings

Materials

The materials of construction for the Diesel Generator Buildings components are:

- Concrete
- Concrete Block
- Galvanized Steel
- Steel

Environments

The Diesel Generator Buildings components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor

- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Diesel Generator Buildings components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material
- Loss of material (spalling, scaling) and cracking
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Diesel Generator Buildings components:

- Masonry Walls (B.2.1.32)
- Structures Monitoring (B.2.1.33)

3.5.2.1.4 Intake Pumping Station

Materials

The materials of construction for the Intake Pumping Station components are:

- Concrete
- Concrete Block
- Galvanized Steel
- Steel

Environments

The Intake Pumping Station components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater
- Groundwater/soil
- Soil
- Water - flowing
- Water - standing

Aging Effects Requiring Management

The following aging effects associated with the Intake Pumping Station components require management:

- Cracking
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material
- Loss of material (spalling, scaling) and cracking
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Intake Pumping Station components:

- Inspection of Water-Control Structures associated with Nuclear Power Plants (B.2.1.34)
- Masonry Walls (B.2.1.32)
- Structures Monitoring (B.2.1.33)

3.5.2.1.5 Reinforced Concrete Chimney

Materials

The materials of construction for the Reinforced Concrete Chimney components are:

- Concrete
- Concrete Block
- Galvanized Steel
- Steel

Environments

The Reinforced Concrete Chimney components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Reinforced Concrete Chimney components require management:

- Cracking
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength

- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Loss of material
- Loss of material (spalling, scaling) and cracking
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Reinforced Concrete Chimney components:

- Masonry Walls (B.2.1.32)
- Structures Monitoring (B.2.1.33)

3.5.2.1.6 Standby Gas Treatment Building

Materials

The materials of construction for the Standby Gas Treatment Building components are:

- Concrete

Environments

The Standby Gas Treatment Building components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Standby Gas Treatment Building components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Loss of material (spalling, scaling) and cracking
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength

Aging Management Programs

The following aging management programs manage the aging effects for the Standby Gas Treatment Building components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.7 Off-Gas Treatment Building

Materials

The materials of construction for the Off-Gas Treatment Building components are:
- Concrete
- Concrete Block

Environments

The Off-Gas Treatment Building components are exposed to the following environments:
- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Off-Gas Treatment Building components require management:
- Cracking
- Cracking; loss of bond; loss of material (spalling, scaling)
- Loss of material (spalling, scaling) and cracking
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength

Aging Management Programs

The following aging management programs manage the aging effects for the Off-Gas Treatment Building components:
- Masonry Walls (B.2.1.32)
- Structures Monitoring (B.2.1.33)

3.5.2.1.8 Equipment Access Lock

Materials

The materials of construction for the Equipment Access Lock components are:
- Concrete
- Galvanized Steel
- Steel

Environments

The Equipment Access Lock components are exposed to the following environments:
- Air - indoor uncontrolled
- Air - outdoor

- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Equipment Access Lock components require management:

- Cracking
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Equipment Access Lock components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.9 Vacuum Pipe Building

Materials

The materials of construction for the Vacuum Pipe Building components are:

- Concrete

Environments

The Vacuum Pipe Building components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Vacuum Pipe Building components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)

- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking

Aging Management Programs

The following aging management programs manage the aging effects for the Vacuum Pipe Building components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.10 Turbine Buildings

Materials

The materials of construction for the Turbine Buildings components are:

- Concrete
- Concrete Block
- Galvanized Steel
- Steel

Environments

The Turbine Buildings components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Turbine Buildings components require management:

- Cracking
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Turbine Buildings components:

- Masonry Walls (B.2.1.32)
- Structures Monitoring (B.2.1.33)

3.5.2.1.11 Radwaste Building

Materials

The materials of construction for the Radwaste Building components are:

- Aluminum
- Concrete
- Concrete Block
- Galvanized Steel
- Steel

Environments

The Radwaste Building components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Condensation
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Radwaste Building components require management:

- Cracking
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Radwaste Building components:

- Masonry Walls (B.2.1.32)
- One-Time Inspection (B.2.1.20)
- Structures Monitoring (B.2.1.33)

3.5.2.1.12 Service Building

Materials

The materials of construction for the Service Building components are:

- Concrete
- Concrete Block
- Galvanized Steel
- Steel

Environments

The Service Building components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Service Building components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Service Building components:

- Masonry Walls (B.2.1.32)
- Structures Monitoring (B.2.1.33)

3.5.2.1.13 Vent Vaults

Materials

The materials of construction for the Vent Vaults components are:

- Concrete

Environments

The Vent Vaults components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Vent Vaults components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking

Aging Management Programs

The following aging management programs manage the aging effects for the Vent Vaults components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.14 Gate Structure Number 2

Materials

The materials of construction for the Gate Structure Number 2 components are:

- Concrete
- Steel

Environments

The Gate Structure Number 2 components are exposed to the following environments:

- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Gate Structure Number 2 components require management:

- Cracking
- Cracking; loss of bond; loss of material (spalling, scaling)

- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking
- Loss of material

Aging Management Programs

The following aging management programs manage the aging effects for the Gate Structure Number 2 components:

- Inspection of Water-Control Structures associated with Nuclear Power Plants (B.2.1.34)
- Structures Monitoring (B.2.1.33)

3.5.2.1.15 Gate Structure Number 3

Materials

The materials of construction for the Gate Structure Number 3 components are:

- Concrete
- Steel

Environments

The Gate Structure Number 3 components are exposed to the following environments:

- Air - outdoor
- Concrete
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Gate Structure Number 3 components require management:

- Cracking
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking
- Loss of material
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Gate Structure Number 3 components:

- Inspection of Water-Control Structures associated with Nuclear Power Plants (B.2.1.34)
- Structures Monitoring (B.2.1.33)

3.5.2.1.16 Discharge Control Structure

Materials

The materials of construction for the Discharge Control Structure components are:
- Concrete

Environments

The Discharge Control Structure components are exposed to the following environments:
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Discharge Control Structure components require management:
- Cracking
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking
- Loss of material

Aging Management Programs

The following aging management programs manage the aging effects for the Discharge Control Structure components:
- Inspection of Water-Control Structures associated with Nuclear Power Plants (B.2.1.34)
- Structures Monitoring (B.2.1.33)

3.5.2.1.17 Circulating Water Conduits

Materials

The materials of construction for the Circulating Water Conduits components are:
- Concrete
- Concrete, concrete cylinder piping, reinforced concrete
- Steel

Environments

The Circulating Water Conduits components are exposed to the following environments:
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Circulating Water Conduits components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material

Aging Management Programs

The following aging management programs manage the aging effects for the Circulating Water Conduits components:

- Inspection of Water-Control Structures associated with Nuclear Power Plants (B.2.1.34)
- Structures Monitoring (B.2.1.33)

3.5.2.1.18 Diesel High Pressure Fire Pump House

Materials

The materials of construction for the Diesel High Pressure Fire Pump House components are:

- Concrete
- Galvanized Steel
- Steel

Environments

The Diesel High Pressure Fire Pump House components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Raw or Treated Water
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Diesel High Pressure Fire Pump House components require management:

- Cracking
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material
- Loss of material (spalling, scaling) and cracking
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Diesel High Pressure Fire Pump House components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.19 Low Level Radwaste (LLRW) Storage Facility

Materials

The materials of construction for the LLRW Storage Facility components are:

- Concrete
- Galvanized Steel
- Steel

Environments

The LLRW Storage Facility components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the LLRW Storage Facility components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material
- Loss of material (spalling, scaling) and cracking
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the LLRW Storage Facility components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.20 Transformer Yard

Materials

The materials of construction for the Transformer Yard components are:

- Concrete
- Galvanized Steel
- Steel

Environments

The Transformer Yard components are exposed to the following environments:

- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Transformer Yard components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material
- Loss of material (spalling, scaling) and cracking
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Transformer Yard components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.21 161 kV Switchyard

Materials

The materials of construction for the 161 kV Switchyard components are:

- Concrete
- Galvanized Steel
- Steel

Environments

The 161 kV Switchyard components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the 161 kV Switchyard components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material
- Loss of material (spalling, scaling) and cracking
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the 161 kV Switchyard components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.22 500 kV Switchyard

Materials

The materials of construction for the 500 kV Switchyard components are:

- Concrete
- Galvanized Steel
- Steel

Environments

The 500 kV Switchyard components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the 500 kV Switchyard components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material
- Loss of material (spalling, scaling) and cracking
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the 500 kV Switchyard components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.23 Condensate Water Storage Tanks Foundations, Trenches, and Tunnels

Materials

The materials of construction for the Condensate Water Storage Tanks Foundations, Trenches, and Tunnels components are:

- Concrete
- Earthfill (rock and sand)
- Galvanized Steel
- Steel

Environments

The Condensate Water Storage Tanks Foundations, Trenches, and Tunnels components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing
- Water - standing

Aging Effects Requiring Management

The following aging effects associated with the Condensate Water Storage Tanks Foundations, Trenches, and Tunnels components require management:

- Cracking
- Cracking and distortion

- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material
- Loss of material (spalling, scaling) and cracking
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Condensate Water Storage Tanks Foundations, Trenches, and Tunnels components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.24 Nitrogen Storage Tank Foundation

Materials

The materials of construction for the Nitrogen Storage Tank Foundation components are:

- Concrete

Environments

The Nitrogen Storage Tank Foundation components are exposed to the following environments:

- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Nitrogen Storage Tank Foundation components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking

Aging Management Programs

The following aging management programs manage the aging effects for the Nitrogen Storage Tank Foundation components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.25 Supplemental Diesel Generator Building

Materials

The materials of construction for the Supplemental Diesel Generator Building components are:

- Concrete
- Galvanized Steel
- Steel

Environments

The Supplemental Diesel Generator Building components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Supplemental Diesel Generator Building components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material
- Loss of material (spalling, scaling) and cracking
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Supplemental Diesel Generator Building components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.26 Containment Atmosphere Dilution System Storage Tank Foundation

Materials

The materials of construction for the Containment Atmosphere Dilution System Storage Tank Foundation components are:

- Concrete

Environments

The Containment Atmosphere Dilution System Storage Tank Foundation components are exposed to the following environments:

- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Containment Atmosphere Dilution System Storage Tank Foundation components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking

Aging Management Programs

The following aging management programs manage the aging effects for the Containment Atmosphere Dilution System Storage Tank Foundation components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.27 Intake Channel

Materials

The materials of construction for the Intake Channel components are:

- Earthfill (Clay and In-situ Soil)

Environments

The Intake Channel components are exposed to the following environments:

- Air - outdoor
- Soil
- Water - flowing
- Water - standing

Aging Effects Requiring Management

The following aging effects associated with the Intake Channel components require management:

- Loss of material; loss of form

Aging Management Programs

The following aging management programs manage the aging effects for the Intake Channel components:

- Inspection of Water-Control Structures associated with Nuclear Power Plants (B.2.1.34)

3.5.2.1.28 North Bank of Cool Water Channel East of Gate Structure Number 2

Materials

The materials of construction for the North Bank of Cool Water Channel East of Gate Structure Number 2 components are:

- Earthfill (Clay and In-situ Soil)

Environments

The North Bank of Cool Water Channel East of Gate Structure Number 2 components are exposed to the following environments:

- Air - outdoor
- Soil
- Water - flowing
- Water - standing

Aging Effects Requiring Management

The following aging effects associated with the North Bank of Cool Water Channel East of Gate Structure Number 2 components require management:

- Loss of material; loss of form

Aging Management Programs

The following aging management programs manage the aging effects for the North Bank of Cool Water Channel East of Gate Structure Number 2 components:

- Inspection of Water-Control Structures associated with Nuclear Power Plants (B.2.1.34)

3.5.2.1.29 South Dike of Cool Water Channel between Gate Structures Number 2 and Number 3

Materials

The materials of construction for the South Dike of Cool Water Channel between Gate Structures Number 2 and Number 3 components are:

- Earthfill (Clay and In-situ Soil)

Environments

The South Dike of Cool Water Channel between Gate Structures Number 2 and Number 3 components are exposed to the following environments:

- Air - outdoor
- Soil

- Water - flowing
- Water - standing

Aging Effects Requiring Management

The following aging effects associated with the South Dike of Cool Water Channel between Gate Structures Number 2 and Number 3 components require management:

- Loss of material; loss of form

Aging Management Programs

The following aging management programs manage the aging effects for the South Dike of Cool Water Channel between Gate Structures Number 2 and Number 3 components:

- Inspection of Water-Control Structures associated with Nuclear Power Plants (B.2.1.34)

3.5.2.1.30 Earth Berm

Materials

The materials of construction for the Earth Berm components are:

- Rock and Earthfill

Environments

The Earth Berm components are exposed to the following environments:

- Air - outdoor
- Groundwater/soil

Aging Effects Requiring Management

The following aging effects associated with the Earth Berm components require management:

- Loss of material; loss of form

Aging Management Programs

The following aging management programs manage the aging effects for the Earth Berm components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.31 Residual Heat Removal Service Water Tunnel

Materials

The materials of construction for the Residual Heat Removal Service Water Tunnel components are:

- Concrete
- Galvanized Steel
- Steel

Environments

The Residual Heat Removal Service Water Tunnel components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Residual Heat Removal Service Water Tunnel components require management:

- Cracking
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material
- Loss of material (spalling, scaling) and cracking
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Residual Heat Removal Service Water Tunnel components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.32 Electrical Cable Tunnel (from Intake Pumping Station to Powerhouse)

Materials

The materials of construction for the Electrical Cable Tunnel (from Intake Pumping Station to Powerhouse) components are:

- Concrete

Environments

The Electrical Cable Tunnel (from Intake Pumping Station to Powerhouse) components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Electrical Cable Tunnel (from Intake Pumping Station to Powerhouse) components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking

Aging Management Programs

The following aging management programs manage the aging effects for the Electrical Cable Tunnel (from Intake Pumping Station to Powerhouse) components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.33 Underground Concrete Encased Structures

Materials

The materials of construction for the Underground Concrete Encased Structures components are:

- Concrete
- Steel

Environments

The Underground Concrete Encased Structures components are exposed to the following environments:

- Air - indoor uncontrolled
- Air - outdoor
- Concrete
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Underground Concrete Encased Structures components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength

- Loss of material
- Loss of material (spalling, scaling) and cracking

Aging Management Programs

The following aging management programs manage the aging effects for the Underground Concrete Encased Structures components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.34 Yard Structures, General

Materials

The materials of construction for the Yard Structures, General components are:

- Concrete

Environments

The Yard Structures, General components are exposed to the following environments:

- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Yard Structures, General components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking

Aging Management Programs

The following aging management programs manage the aging effects for the Yard Structures, General components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.35 South Access Retaining Wall

Materials

The materials of construction for the South Access Retaining Wall components are:

- Concrete

Environments

The South Access Retaining Wall components are exposed to the following environments:

- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the South Access Retaining Wall components require management:

- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material (spalling, scaling) and cracking

Aging Management Programs

The following aging management programs manage the aging effects for the South Access Retaining Wall components:

- Structures Monitoring (B.2.1.33)

3.5.2.1.36 Structural Commodities

Materials

The materials of construction for the Structural Commodities components are:

- Aluminum
- Asbestos
- Asphalt coating
- Calcium silicate
- Canvas
- Cast Iron and Cast Iron Alloys
- Cellular elastomeric
- Cement
- Cementitious coatings (Flamemastic, and other similar materials)
- Ceramic Fiber
- Cloth fabric
- Coatings (ALBI CLAD-161)
- Concrete
- Corkmastic
- Elastomer

- Fabricell
- Fiberglass
- Fluorogold
- Foam plastic
- Foil
- Galvanized steel
- Glass
- Glass fabric
- Graphitic tool steel
- Grout
- Gypsum
- High-strength steel
- Kraft
- Lead blankets (SS Mesh)
- Lubrite®
- Lubrofluor
- Masonry Walls
- Metal reflective
- Mineral wool
- Non-ferrous - aluminum
- Non-ferrous - copper alloys
- Non-metallic (e.g., rubber)
- Permali
- Polymer
- PVC tape
- Membrane (asphalt impregnated membrane water seal)
- Silicates (Marinite® or other similar materials)
- Stainless Steel
- Stainless Steel; Dissimilar metal welds
- Steel
- Steel; Dissimilar Metal Welds
- Subliming compounds (Thermolag ®)
- Vinyl Plastic
- Wire Fabric/Mesh

Environments

The Structural Commodities components are exposed to the following environments:

- Air
- Air - indoor uncontrolled
- Air - outdoor
- Condensation

- Concrete
- Groundwater/soil
- Raw Water
- Treated Water
- Underground
- Water - flowing
- Water - standing

Aging Effects Requiring Management

The following aging effects associated with the Structural Commodities components require management:

- Cracking
- Cracking; loss of material
- Cracking; loss of material (spalling, scaling) and cracking
- Cumulative fatigue damage
- Hardening or loss of strength; loss of material; cracking or blistering
- Hardening, loss of strength, shrinkage
- Loss of leak tightness
- Loss of leak tightness in closed position
- Loss of material
- Loss of material; cracking; hardening, loss of strength, shrinkage
- Loss of material; cracking/ delamination; change in material properties; separation
- Loss of mechanical function
- Loss of preload
- Loss of sealing
- Loss of weatherproofing integrity
- Reduction in concrete anchor capacity
- Reduction or loss of isolation function
- Reduced thermal insulation resistance
- SS mesh cracking, decomposition

Aging Management Programs

The following aging management programs manage the aging effects for the Structural Commodities components:

- 10 CFR Part 50, Appendix J (B.2.1.31)
- ASME Section XI, Subsection IWE (B.2.1.29)
- ASME Section XI, Subsection IWF (B.2.1.30)
- External Surfaces Monitoring of Mechanical Components (B.2.1.23)
- Fire Protection (B.2.1.15)
- Inspection of Water-Control Structures associated with Nuclear Power Plants (B.2.1.34)
- Masonry Walls (B.2.1.32)

- One-Time Inspection (B.2.1.20)
- Structures Monitoring (B.2.1.33)
- Water Chemistry (B.2.1.2)

3.5.2.1.37 Isolation Valve Pits

Materials

The materials of construction for the Isolation Valve Pits components are:
- Concrete
- Galvanized Steel
- Steel

Environments

The Isolation Valve Pits components are exposed to the following environments:
- Air - indoor uncontrolled
- Air - outdoor
- Groundwater/soil
- Soil
- Water - flowing

Aging Effects Requiring Management

The following aging effects associated with the Isolation Valve Pits components require management:
- Cracking
- Cracking and distortion
- Cracking; loss of bond; loss of material (spalling, scaling)
- Increase in porosity and permeability; cracking; loss of material (spalling, scaling)
- Increase in porosity and permeability; loss of strength
- Loss of material
- Loss of material (spalling, scaling) and cracking
- Loss of preload

Aging Management Programs

The following aging management programs manage the aging effects for the Isolation Valve Pits components:
- Structures Monitoring (B.2.1.33)

3.5.2.2 AMR Results for Which Further Evaluation is Recommended by the GALL-SLR Report

NUREG-2191 provides the basis for identifying those programs that warrant further evaluation by the reviewer in the subsequent license renewal application. For the Containments, Structures and Component Supports, those programs are addressed in the following subsections.

3.5.2.2.1 Pressurized Water Reactor and Boiling Water Reactor Containments

3.5.2.2.1.1 Cracking and Distortion Due to Increased Stress Levels from Settlement; Reduction of Foundation Strength, and Cracking Due to Differential Settlement and Erosion of Porous Concrete Subfoundations

Cracking and distortion due to increased stress levels from settlement could occur in PWR and BWR concrete and steel containments. The existing program relies on ASME Code Section XI, Subsection IWL to manage these aging effects. Also, reduction of foundation strength and cracking, due to differential settlement and erosion of porous concrete subfoundations could occur in all types of PWR and BWR containments. The existing program relies on the structures monitoring program to manage these aging effects. However, some plants may rely on a dewatering system to lower the site groundwater level. If the plant's current licensing basis (CLB) credits a dewatering system to control settlement, further evaluation is recommended to verify the continued functionality of the dewatering system during the subsequent period of extended operation.

Table 3.5.1 Item Number 3.5-1, 001: This item does not apply to the BFN Mark I steel containments. The BFN containments are supported on reinforced concrete and are enclosed in reinforced concrete. The BFN suppression chambers are supported on steel supporting members which transmit loads to the reinforced foundation of the Reactor Building as described by FSAR Section 5.2 and shown on FSAR Figure 5.2-1a. The containment types described in this Item Number do not exist at BFN, the ASME Code Section XI, Subsection IWL is not applicable at BFN.

Table 3.5.1 Item Number 3.5-1, 002: This item is not applicable to the BFN Mark I steel containments, which are supported on the Reactor Building foundation, for which the design incorporates concrete in the sub-foundation. The design originally was supported by a steel skirt, reinforced by filling the internal cavity of the skirt with concrete, and vibrated to fill all voids. The skirt was later cut loose and the drywell now sits on a concrete pillar. BFN does not incorporate porous concrete in its subfoundation. Therefore, the causal factor of erosion of porous concrete utilized for the foundation or subfoundation is not applicable and requires no further consideration nor aging management. For components at BFN that are managed for settlement, the aging management program, Structures Monitoring program (B.2.1.33), will be used to manage cracks and distortion due to increased stress level from settlement; however, this aging mechanism is insignificant for the BFN Reactor Building structures because the structures are founded on bedrock as described in FSAR Sections 12.2 and 2.5. Cracking and distortion due to settlement has not been identified in BFN power block concrete structures. The condition of accessible and above grade reactor building concrete is used as an indicator for the condition of the inaccessible and below grade structural components and provides reasonable assurance that degradation of inaccessible structural components will be detected before a loss of an intended function. Cracks extending into accessible areas, if any, will be managed by the Structures Monitoring program (B.2.1.33). In the event that unacceptable conditions due to this mechanism are identified in the accessible areas of structures, procedures require that extent of condition be determined and additional inspections or evaluations, would address inaccessible and below grade portions of the structure. Reduction in foundation strength, cracking, and differential settlement due to erosion of porous concrete sub-foundation is not applicable because porous concrete is not used in the foundation design. This is validated from the termination of BFN dewatering system operation in 1983, due to no evidence of soil voids associated with the pumping ever manifesting. With no noted history for settlement since the termination, no additional considerations need be made. Since the settlement proceeds at a comparatively slow rate, the required five-year inspection frequency and scope of the Structures Monitoring program (B.2.1.33) are determined to be adequate. These programs address the monitoring for and evaluation of any signification concrete damage due to settlement before it can cause a loss of intended function.

3.5.2.2.1.2 Reduction of Strength and Modulus Due to Elevated Temperature

Reduction of strength and modulus of concrete due to elevated temperatures could occur in PWR and BWR concrete and steel containments. The implementation of 10 CFR 50.55a and ASME Code Section XI, Subsection IWL would not be able to identify the reduction of strength and modulus of concrete due to elevated temperature. Subsection CC-3440 of ASME Code Section III, Division 2, specifies the concrete temperature limits for normal operation or any other long-term period. Further evaluation is recommended to determine the need for a plant-specific AMP or plant-specific enhancements to ASME Code Section XI Subsection IWL and/or Structures Monitoring AMPs, essential to manage these aging effects for any portions of the concrete containment components that exceeds specified temperature limits {i.e., general area temperature greater than 66 degrees Celsius [(150 degrees Fahrenheit] and local area temperature greater than 93 degrees Celsius (200 degrees Fahrenheit)}. Higher temperatures may be allowed if tests and/or calculations are provided to evaluate the reduction in strength and modulus of elasticity and these reductions are applied to the design calculations. Acceptance criteria are described in Branch Technical Position (BTP) RLSB (License Renewal and Standardization Branch)-1, "Aging Management Review - Generic, July 2017" (Appendix A.1 of this SRP-SLR).

<u>Table 3.5.1 Item Number 3.5-1, 003:</u> This item is not applicable to the BFN Mark I steel containments. The components for this Item Number are concrete containment components. BFN Technical Specification 3.6.1.4 limits the drywell average air temperature to be less than 150°F. Each drywell is cooled during normal operation of the unit by a closed loop ventilation system designed to hold the average temperature in the drywell to ≤ 150°F. The normal drywell environment is described in FSAR Sections 5.2.3.2 and 5.2.3.7 as an average temperature of 150 degrees Fahrenheit or lower. Furthermore, regarding maintenance of local temperature limit (200°F), insulation and air gaps are provided to reduce thermal stress. Therefore, the concrete structural components located inside the drywell are not subject to general area temperature greater than 150°F or local area concrete temperature greater than 200°F. A review has confirmed that plant operating experience has not identified elevated general area and local area temperature as a concern for concrete structural components. The potential for gamma radiation induced heating in the sacrificial shield wall is addressed in EPRI Report 3002002676, Revision 0, February 2014, "Expected Condition of Reactor Cavity Concrete After 80 Years of Radiation Exposure," which concludes that the gamma dose for BWR plants will be no higher than the gamma dose for PWR plants. EPRI Report 3002008129, Revision 0, December 2016, "Long-Term Operations: Impact of Radiation Heating on PWR Biological Shield Concrete," evaluates the impact of radiation induced heating on bounding PWR plants. The evaluation determined that the localized temperature rise in the shield wall resulted in a localized concrete temperature of less than 180°F. The configuration of the BFN sacrificial shield wall, which is

described in FSAR Section 12.2.2.6, Figure 12.2-23, and Figure 12.2-27A, reflects the configuration shown in EPRI Report 3002002676, Figure 7.6, for the wall described (in the figure) as a biological shield.

3.5.2.2.1.3 Loss of Material Due to General, Pitting and Crevice Corrosion

1. *Loss of material due to general, pitting, and crevice corrosion could occur in steel elements of inaccessible areas for all types of PWR and BWR containments. The existing program relies on ASME Code Section XI, Subsection IWE, and 10 CFR Part 50, Appendix J AMPs, to manage this aging effect. Further evaluation is recommended of plant-specific programs to manage this aging effect if corrosion is indicated from the IWE examinations. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

   <u>Table 3.5.1 Item Numbers 3.5.1, 004 and 3.5.1, 005:</u> These Item Numbers are not applicable to the BFN Mark I steel containments. This Item is applicable instead to Mark II and Mark III containments. However, Item Number 3.5-1, 035 is applicable to BFN. The ASME Section XI, Subsection IWE program and the 10 CFR Part 50, Appendix J program will be used to manage the loss of material of steel elements in the accessible and inaccessible areas of the containment liner (which includes integral attachments), penetration sleeves, drywell shell, drywell head, drywell shell in the sand pocket regions, and embedded shell exposed to air-indoor. The majority of the ASME Section XI, Subsection IWE steel components, including the drywell head, are accessible for inspection. Preventive actions associated with Mark I steel containments as addressed by the ASME Section XI, Subsection IWE program (B.2.1.29) and 10 CFR Appendix J program (B.2.1.31), including components associated with sand pockets and sand pocket area drains, are applicable to the BFN Mark I Steel containments.

   The BFN primary containment design includes an accessible moisture barrier at the bottom floor inside of the drywell and includes an inaccessible sheet metal cover and joint sealing compound above the sand pocket region on the exterior of the drywell shell. The ASME Section XI, Subsection IWE program performs an examination of the accessible moisture barriers at the interior concrete to shell interface for wear, damage, erosion, tears, cracks, or other defects that may violate the leak-tight integrity. The examination of moisture barriers is intended to prevent intrusion of moisture into inaccessible areas of the pressure retaining metal containment shell. There has been no corrosion detected at the moisture barrier at the bottom of the drywell interior. However, for BFN Unit 2, Notice of Indication (NOI) U2R19-001 identified the following pitting and mechanical damage that required Engineering Evaluation: Bay 2 - 31.3 mils, Bay 3 - 125 mils, and Bay 8 - 31.3 mils. Examinations completed during Unit 2 refueling outages U2R20 and U2R21 documented that the degradation in these areas was essentially unchanged and these locations no longer require Augmented Examination.

   Additionally, BFN Units 1, 2, and 3 Mark I steel primary containment design is subject to corrosion and generalized wasting at the sand bed region (SBR) as identified in NRC Generic Letter (GL) 87-05. The generic letter documented wall thinning at the sand bed region at Oyster Creek Generating Station that resulted from significant material wasting of the carbon steel plates from corrosion with potential to impair operability of containment. The activities performed by BFN to monitor and maintain the condition of drywell shell in the sand bed region as well as the sand bed drains have been reviewed and documented to support this further evaluation. This included a review of associated documentation of this issue since 1980, BFN Response to GL 87-05, Drywell Shell Thickness Monitoring for U1-3, Drywell Shell Evaluation, and evaluations for the Sand Bed Drains and Drain Lines.

The conclusions from the review noted that continued drywell shell Ultrasonic Testing in conjunction with updated Finite Element Analyses, statistical analyses, and subsequent calculations, shows a minimal corrosion rate and sufficient available margin for thinning at the SBR to support operation through the end of the subsequent period of extended operation. Furthermore, recent inspections of the BFN Unit 1 sand bed drains have shown the drains to be operational and functioning as designed, which allows the SBR to dry after being wetted, and in turn limits corrosion and wastage. However, in Unit 2, current walkdowns have found a lack of drainage from the Sand Bed Drains, which was verified from the initial GL 87-05 response as well as a composite Condition Report search. A Condition Report, in the Corrective Action Program was initiated to evaluate the drains for blockage and subsequently ensure the drains are open and functioning properly.

The BFN design incorporates a polyurethane foam and sand bed region in place of an air gap region and incorporates seal rupture drains to divert drywell bellows leakage. The design also incorporates a weir wall, which prevents drywell bellows leakage from entering the reactor well before being drained away with drains going to radwaste. Additionally, this prevents in-leakage to the sand pocket by use of a sheet metal cover, which is sealed to the drywell shell. The sealed cover prevents mortar from entering the sand pocket region. Located at the level of the sealed cover plate are sand filled drains that remove any in-leakage away from the sealed cover plate.

As part of the ASME Section XI, Subsection IWE program, several examinations and tests of components associated with the drywell sand bed and polyurethane foam region confirm that conditions that could lead to containment degradation would be identified and addressed before loss of an intended function. Inspections performed on October 17, 2022, confirmed that leaking is occurring at the Unit 1 drywell equipment hatch; however, evaluations have shown the results of that leaking have not put the involved SSCs in an unacceptable condition. The condition is still being monitored at the sand bed drain lines (via walkdowns, and tracking drops per minute), and in the case of components found with poor performance history, the Corrective Action Program will be used to support issue resolution.

The ASME Section XI Subsection IWE program, and 10 CFR 50 Appendix J program will be utilized to perform the inspections for these types of conditions as well as those pertaining to conditions of defects identified by moisture seal barrier inspections and coating inspections. However, this design, along with the aforementioned monitoring and testing measures, provide a substantial defense against water entering the drywell sand bed region. The ASME Section XI Subsection IWE program will ensure that degradation will be detected before a loss of function occurs. Furthermore, the ASME Section XI, Subsection IWE program has been enhanced to revise implementing procedures to carry forward Commitment No. NCO040006088, “Enhance ASME Section XI, Subsection IWE Program to perform a UT inspection of the sand bed area of the drywell liner of Units 1, 2, and 3.” Subsequent periodic inspections will be performed on each unit prior to entry into the subsequent period of extended operation and at least once every 10 years thereafter. The ultrasonic inspections of the Units 1, 2, and 3 drywell liner plate near the sand bed region will ensure the impacts from water intrusion, including potential degradation, on the outside surface of the drywell, are mitigated.

For BFN, no additional plant-specific activities are warranted beyond those described above, those pertaining to the Unit 2 drain lines, and those that are established as part of the ASME Section XI, Subsection IWE program. The continued monitoring of the containment shell in accordance with the ASME Section XI, Subsection IWE program (B.2.1.29), and the testing, conducted in accordance with the 10 CFR Part 50, Appendix J program (B.2.1.31), provide reasonable assurance that the loss of material due to corrosion of steel elements of the containment will be detected prior to a loss of intended function. These activities and programs provide assurance that the containment liner will remain capable of performing its design function through the subsequent period of extended operation.

2. *Loss of material due to general, pitting, and crevice corrosion could occur in steel torus shell of Mark I containments. The existing program relies on ASME Code Section XI, Subsection IWE, and 10 CFR Part 50, Appendix J, to manage this aging effect. If corrosion is significant, recoating of the torus is recommended. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

   <u>Table 3.5.1 Item Number 3.5-1, 006:</u> This Item Number (3.5-1, 006) is applicable to BFN Mark I steel containments and evaluates loss of material due to general, pitting, and crevice corrosion in steel torus shell of the BFN Mark I containments exposed to air-indoor and treated water environments. The ASME Section XI, Subsection IWE program (B.2.1.29) and the 10 CFR Part 50, Appendix J program (B.2.1.31) will be used to manage the loss of material of steel elements in the torus shell. BFN procedures require wetted surface areas that are submerged to be visually examined.

   The areas containing the torus interior surfaces (waterline and below) are subjected to corrosion due to moisture and repeated wetting and drying in the waterline region. Accessible portions of the torus inside surface are inspected each refueling outage as required by BFN procedures. Additionally, underwater inspections are performed as part of the Protective Coating Monitoring and Maintenance program (B.2.1.35) on an interval not to exceed two years. Underwater coatings processes allow divers to inspect, document, and perform minor coatings repairs as one sequenced activity. These programs have been demonstrated to be effective in prevention of degradation to the torus surface.

   During BFN Unit 1 refueling outage U1R14 inspections in the torus immersion area, an indication of 134.3 mils metal loss was identified in Bay 13, plate 03 and has been reported on Notice of Indication (NOI) U1R14-006. A Condition Report was initiated to document the resulting engineering evaluation and follow up actions. The indication found in Bay 13 of the Unit 1 Torus was greater in depth than the acceptance criteria of 0.075". The conclusion from the resulting engineering evaluation (pertaining to the conditions identified by NOI U1R14-006) was that the indication identified was acceptable and in-line with all applicable code requirements. However, a visual examination (VT-1) of this indication was scheduled for Unit 1 refueling outage U1R17 in accordance with IWE-2420 of the 2013 Edition of ASME Section XI.

During BFN Unit 2 refueling outage U2R21 inspections in the torus immersion area, three indications ranging from 79.7 mils to 89.3 mils metal loss were identified in Bay-10 and have been reported on NOI U2R21-R007. NOI U2R21-R007 confirmed that at Bay 10, three areas of corrosion were indicated, there was isolated spot corrosion affecting the substrate, and metal loss was found to be > 75mils. The indications (noted to be on the weld seam) were found to have greater depth than the acceptance criteria of 0.075." Conservatively, the indication with the largest diameter indication combined with the deepest indication (0.5" diameter x 0.0893" deep) was evaluated to envelop all three indications. The evaluation concluded that all three indications (B10-P3-4, B10-P3-5, B10-P3-7) were acceptable and in-line with all applicable code requirements.

During BFN Unit 3 refueling outage U3R18, numerous pits greater than 0.035 inches were identified on submerged surfaces of Torus Bays 1 through 16 (per CR 1397211). Protective coating was re-applied to all pits greater than 0.030" in accordance with procedures.

Previous performances of BFN surveillance have documented evidence of minor coating degradation at the waterline region. This area appears to be within the category of “repeated loss of protective coatings;” however, based on above conclusions from operating experience (OE), it is determined that the underwater region of the torus has not been subjected to accelerated degradation.

Periodic inspections continue to be performed on the wetted surfaces in accordance with the ASME Section XI, Subsection IWE program (B.2.1.29) and follow-up inspections will be performed under the ASME Section XI, Subsection IWE program (B.2.1.29) in accordance with ASME Table IWE-2500-1, Examination Category E-C. Examinations conducted in accordance with ASME Section XI, Subsection IWE have not identified significant corrosion in the steel torus shell of the BFN Mark I containments.

3. *Loss material due to general, pitting, and crevice corrosion could occur in steel torus ring girders and downcomers of Mark I containments, downcomers of Mark II containments, and interior surface of suppression chamber shell of Mark III containments. The existing program relies on ASME Code Section XI, Subsection IWE to manage this aging effect. Further evaluation is recommended of plant- specific programs to manage this aging effect if corrosion is significant. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

<u>Table 3.5.1 Item Number 3.5-1, 007:</u> This Item Number (3.5-1, 007) is applicable to the BFN Mark I steel containments and evaluates loss of material due to general, pitting, and crevice corrosion in steel torus ring girders and downcomers of the BFN Mark I containments exposed to air-indoor and treated water environments. ASME Section XI, Subsection IWE program (B.2.1.29) will be used to manage the loss of material of steel torus ring girders and downcomers.

Steel torus ring girders and downcomers of the BFN containments are subject to periodic examinations to detect loss of material due to general, pitting and crevice corrosion. The plant specific OE search revealed one Condition Report for Unit 3 associated with the torus ring girders and downcomers that identified loss of material due to pitting and crevice corrosion within an environment of air-indoor and treated water. The pitting and heavy corrosion on the downcomers was identified during an inspection and then entered into the Corrective Action Program. Previous OE from 1994, revealed Unit 1 Spent Fuel Pool leakage into the Unit 1 Reactor Building basement from the top of the downcomers onto the torus ring girders around Bay 14 for which the conditions (downcomers and ring girders noted to be corroding with iron oxide build up), have been documented in the Corrective Action Program, evaluated, and corrected as required. Any future deficiencies will be documented and addressed in accordance with Corrective Action Program.

The implementation of the ASME Section XI, Subsection IWE program (B.2.1.29) and the 10 CFR Part 50, Appendix J program (B.2.1.31) provides reasonable assurance that loss of material due to corrosion of the steel torus ring girders and downcomers will be adequately managed during the subsequent period of extended operation, such that the intended functions of the Mark I steel containment are maintained consistent with the current licensing basis.

3.5.2.2.1.4 Loss of Prestress Due to Relaxation, Shrinkage, Creep, and Elevated Temperature

Loss of prestress forces due to relaxation, shrinkage, creep, and elevated temperature for PWR prestressed concrete containments and BWR Mark II prestressed concrete containments is a time-limited aging analysis (TLAA) as defined in 10 CFR 54.3. TLAAs are required to be evaluated in accordance with 10 CFR 54.21(c). The evaluation of this TLAA is addressed in Section 4.5, "Concrete Containment Unbonded Tendon Pre-stress Analysis," and/or Section 4.7 "Other Plant-Specific Time-Limited Aging Analyses," of this SRP-SLR.

<u>Table 3.5.1 Item Number 3.5-1, 008:</u> This Item Number is not applicable to the BFN Mark I steel containments. The Item Number is applicable only to PWR prestressed concrete containments and BWR Mark II Concrete Containments.

3.5.2.2.1.5 Cumulative Fatigue Damage

Evaluations involving time-dependent fatigue, cyclical loading, or cyclical displacement of metal liner, metal plates, suppression pool steel shells (including welded joints) and penetrations (including personnel airlock, equipment hatch, control rod drive (CRD) hatch, penetration sleeves, dissimilar metal welds, and penetration bellows) for all types of PWR and BWR containments and BWR vent header, vent line bellows, and downcomers may be TLAAs as defined in 10 CFR 54.3. TLAAs are required to be evaluated in accordance with 10 CFR 54.21(c)(1). The evaluation of this TLAA is addressed in Section 4.6, "Containment Liner Plates, Metal Containments, and Penetrations Fatigue Analysis," and for cases of plant-specific components, in Section 4.7 "Other Plant-Specific Time-Limited Aging Analyses," of this SRP-SLR. For plant- specific cumulative usage factor calculations, the method used is appropriately defined and discussed in the applicable TLAAs.

For the above-stated containment pressure-retaining components (corresponding to Table 3.5-1, Items 027 and 040) subject to cyclic loading for which no CLB fatigue analysis exists at the time of an SLRA submittal, a plant-specific further evaluation may be performed to demonstrate that cracking due to cyclic loading is an aging effect that does not require aging management for the component. As one acceptable approach, the aging effect does not require aging management actions if the further evaluation demonstrates that the six criteria for cyclic loading in paragraph NE-3222.4(d) (NE-3221.5(d) in 1980 and later code editions), "Analysis for Cyclic Operation, *Vessels Not Requiring Analysis for Cyclic Service," of ASME Code, Section III, Division 1 (1974 edition or later edition incorporated by reference in 10 CFR 50.55a(a)(i)), that provide for a waiver from detailed fatigue analysis are satisfied for applicable component materials through the end of the subsequent period of extended operation. The option to perform a fatigue waiver analysis to address the aging effect of cracking due to cyclic loading, for specific containment metallic components, is in lieu of performing supplemental surface examinations or performing or crediting an appropriate 10 CFR Part 50, Appendix J, leak-rate test discussed in GALL-SLR Report AMP XI.S1, "ASME Section XI, Subsection IWE."*

<u>Table 3.5.1 Item Number 3.5-1, 009:</u> This item evaluates cumulative fatigue damage due to cyclic loading (only for existing analyses that are part of the current licensing basis (CLB)) in metal plates, suppression pool steel shells (including welded joints) and penetrations (including personnel airlock, equipment hatch, CRD hatch, penetration sleeves, dissimilar metal welds, and penetration bellows), vent header, vent line bellows, and downcomers of the BFN Mark I containments exposed to air-indoor and treated water environments. Components of the primary containment that were analyzed for fatigue and evaluated as a TLAA include the BFN torus, torus penetrations, vent header and downcomers, drywell to torus vents, safety relief valve discharge piping externally attached to the torus, other piping attached to the torus, and drywell to torus vent bellows. These components, in addition to the evaluation of fatigue as a TLAA for the containment process line penetration bellows, are addressed in Section 4.6. The containment analysis was completed in accordance with BFN design specifications.

Components of this Item Number 3.5-1, 009, for which fatigue analyses were not performed, include: the metal liner, airlock, equipment hatch, CRD hatch, and penetration sleeves. These components met the qualifications for fatigue waivers and will be addressed in Item Number 3.5-1, 027, which allows for the use of fatigue waiver in lieu of using supplemental surface examinations with ASME Section XI, Subsection IWE or crediting an appropriate 10 CFR Part 50, Appendix J, leak-rate test discussed in ASME Section XI, Subsection IWE. Fatigue analysis, or a fatigue waiver, for the drywell shell, drywell head, or drywell penetrations was not required since no cyclical loads were identified for these components in the applicable design specifications per the CLB. Though a fatigue analysis or waiver was not required, a fatigue exemption (waiver) analysis was performed. The conclusion of this analysis was that, in accordance with the rules of N-415.1 of Section III of the ASME Code, the drywell and the portions of its penetrations within the scope of the evaluation could be considered exempt from fatigue analysis.

The BFN Units 1 and 2 drywells were designed in accordance with the ASME Code Section III 1965 Edition with addenda through Winter 1966, and the Unit 3 drywell was designed in accordance with the ASME Code Section III 1965 Edition with addenda through Summer 1967. The criteria to be met for a fatigue waiver from these editions involves: 1) atmospheric to operating pressure cycles, 2) normal operation pressure fluctuations, 3) temperature differences between startup and shutdown, 4) temperature differences during normal operation, 5) temperature differences at dissimilar metal discontinuities, and 6) full range of stress due to mechanical loads.

Subsequent to the original design, design changes were made to some portions of the containment, which added new requirements for fatigue analyses, and are described below.

These changes include: (1) those to supports RS-3 and RS-8 (the attachment of 8-inch double extra strong portion to the ring girder clevis instead of the pipe clamp clevis from consideration of pool swell impact effects), (2) miter changes (where existing mitered joints in various torus internal piping were changed to standard welding elbow fittings in order to comply with piping code requirements), and (3) ECCS suction strainers.

The original design ECCS suction strainers were analyzed and modified for Long-Term Torus Integrity Program (LTTIP) loading conditions as described in section 8.5.2 of the Plant Unique Analysis Report (PUAR). Those strainers were subsequently replaced with much larger strainers in response to NRC Bulletin 96-03, as described in Sections C.3.5 and C.5.3 of the FSAR. Loading and acceptance criteria for the new strainers are described in Section C.5.3 of the FSAR.

Consequently, equipment attached to the torus containment structure, vent system, and within the boundary of influence of SRV discharge and LOCA hydrodynamic loads on torus attached piping must be qualified for LTTIP load combinations and allowable stresses. In the fatigue section of the PUAR, it was noted there were no abrupt changes in geometry. Despite that, a stress concentration factor of 1.5 was still conservatively assumed for the general torus stresses.

The load definitions used for the BFN plant unique analysis comply with the General Electric (GE) Mark I Containment Program - Load Definition Report, Revision 2 (NEDO- 21888 dated November 1981). The load definitions include assumed pressure and temperature transient cycles resulting from SRV discharge and design basis loss of coolant accident (LOCA) events. This report provided the methodology and definition of the thermal-hydraulic loads produced on the pressure suppression containment system of the GE Mark I containment during postulated loss-of-coolant accident, safety/relief valve discharges and related dynamic events. The PUAR describes that a fatigue evaluation of the torus attached piping (TAP), including the main steam SRV piping, was performed per a program developed by the Mark I Owner's Group. This analysis included the effects of mechanical load cycling in addition to the thermal expansion. The results justified fatigue life acceptability for TAP, including the SRV suppression chamber piping. These original analyses assume a limited number of main steam relief valve actuations throughout the 40-year life for the plant and are therefore TLAAs.

As such, only the components specified previously (primary containment structures, penetrations, and associated components) are evaluated for fatigue in Section 4.6 as they pertain to the BFN Mark I Steel Containment System primary containments. This does not include components related to the vessel internals (i.e., vessel shell) as they would be located inside of containment and are not evaluated as a part of containment fatigue.

Table 3.5.1 Item Number 3.5-1, 027: Fatigue analyses or fatigue waivers exist for all components in this Item Number pertaining to Mark I Steel Containments. The components with fatigue waivers include: the metal liner, airlock, equipment hatch, CRD hatch, and penetration sleeves. Components that do not have fatigue analyses have had fatigue waivers performed in lieu of managing for cracking due to cyclic loading with the 10 CFR Part 50, Appendix J program (B.2.1.31) and ASME Section XI, Subsection IWE program (B.2.1.29) via supplemental surface examinations or leak rate tests.

Table 3.5.1 Item Number 3.5-1, 040: This Item Number is not applicable to the BFN Mark I steel containments as it only applies to Mark II containments.

3.5.2.2.1.6 Cracking Due to Stress Corrosion Cracking

Stress corrosion cracking (SCC) of stainless steel (SS) penetration sleeves, penetration bellows, vent line bellows, suppression chamber shell (interior surface), and dissimilar metal welds could *occur in PWR and/or BWR containments. The existing program relies on ASME Code Section XI, Subsection IWE and 10 CFR Part 50, Appendix J, to manage this aging effect. Further evaluation, including consideration of SCC susceptibility and applicable operating experience (OE) related to detection, is recommended of additional appropriate examinations/evaluations implemented to detect this aging effect for these SS components and dissimilar metal welds.*

<u>Table 3.5.1 Item Number 3.5-1, 010 and Item Number 3.5-1, 039:</u> These items evaluate cracking due to SCC in stainless steel penetration sleeves, penetration bellows, vent line bellows, and dissimilar metal welds of the BFN Mark I steel containments exposed to the designated environment pertaining to each item. The enhanced ASME Section XI, Subsection IWE program (B.2.1.29) and the 10 CFR Part 50, Appendix J program (B.2.1.31) will be used to manage the cracking of stainless steel penetration sleeves, penetration bellows, vent line bellows, and dissimilar metal welds.

Material can potentially signify susceptibility of SSC. At BFN, the penetration sleeves, penetration bellows, and vent line bellows are stainless steel and susceptible to SCC; however, the suppression chamber shell at BFN is made of carbon steel and therefore is not susceptible to SCC.

Chemical factors should also be examined as stress corrosion cracking is associated with stress, temperature, and high concentration of chlorides/sulfates; however, while evidence of concentrations of chlorides and sulfate was found, there were no Condition Reports (CRs) or plant specific operating experience (OE) found for chloride or sulfate contaminants present at significant quantities inside the containment nor were there CRs or plant specific OE that pertained to areas of high stress or temperature associated with containment and SCC.

Section 5.2.3.2 of the FSAR specifies that thermal stresses in the steel shell due to temperature gradients were taken into account for the design (of the shell) and it is noted that the pipe penetrations are utilized as required by stress conditions. This further justifies mitigation of stress levels that could potential contribute to SCC.

Cyclical loading of stainless steel components, like those identified by this Item Number, is not expected to result in SCC at BFN because of the containment design which limits cyclical loadings. Furthermore, analysis of torus attached piping (TAP), which includes small bore piping (as defined as Class 1, 2-inch Nominal Pipe Size and smaller by FSAR C.3.2), was described in the Section 4.6 of this application and the PUAR. This analysis covered the effects of mechanical load cycling (in addition to thermal expansion) and resulted in the justification of fatigue life acceptability. Stress to the drywell components (thermal and mechanical) was determined to be limited, which also contributes to the mitigation of any potential stress corrosion cracking of the involved stainless-steel components. Consistent with the BFN design specifications, the containment was analyzed for fatigue. A fatigue waiver exemption calculation for the drywell penetrations was completed. BFN Units 1, 2 and 3 process lines that penetrate the drywell and experience significant differences in temperature during plant operation were designed with penetration bellows to ensure that fatigue due to thermal and mechanical loads during plant operation is acceptable (the design fatigue life of the bellows-type expansion joints for containment penetrations and vent pipes is 7000 cycles), which prevents a potential cause of SCC at the penetrations. The following process lines were designed with penetration bellows: the main steam lines, the feedwater lines, the HPCI steam line, the RHR supply and return lines, the RWCU pump suction line, and the core spray discharge lines. In addition, BFN has performed an assessment to evaluate containment and penetration fatigue, which reflected that criteria was met in regards to utilizing a fatigue waiver. License renewal applications for other Mark I containments designed to later code years have credited fatigue waivers. The criteria to be met for a fatigue waiver involves: 1) atmospheric to operating pressure cycles, 2) normal operation pressure fluctuations, 3) temperature differences between startup and shutdown, 4) temperature differences during normal operation, 5) temperature differences at dissimilar metals, and 6) mechanical loads. The primary containment fatigue assessment concluded that components from primary containment could be subject to cyclic loading; however, the thermal cycles can be extrapolated to less than 2200 for an 80-year plant life, which is roughly 31% of the 7000-cycle threshold design limit and signifies that the existing analysis is expected to remain valid for the 80-year plant life. The containment components with fatigue waivers include penetrations and dissimilar metal welds. The containment components with a fatigue analyses, that are addressed in Section 4.6 are representative of the stainless steel penetration bellows and vent line bellows and can be used as a leading indicator for these components.

Plant operating experience confirms that SCC of stainless steel penetration sleeves, penetration bellows, vent line bellows, and dissimilar metal welds of the BFN Mark I containments is not expected. Original design and installation specifications for containment penetration components such as bellows, welds, and penetration adapters required initial surface examinations to ensure no flaws existed as part of initial installation. Appropriate integrated and local leak rate testing is conducted for pressure boundary components per the 10 CFR Part 50, Appendix J program (B.2.1.31). For example, through-wall cracking would be detected by the Type B integrated leak rate test. Additionally, visual inspections (VT-1 and VT-3) are performed on accessible portions of the containment penetrations in accordance with the ASME Section XI, Subsection IWE program (B.2.1.29). BFN has not experienced a failure of the above listed containment components, as verified by a review of BFN operating experience. Additionally, the industry has found that the 10 CFR 50, Appendix J testing program has been effective in maintaining the pressure integrity of the primary containment boundaries. Furthermore, BFN has demonstrated good operating experience in maintaining the integrity of the primary containment boundaries. Moreover, the plant specific operating experience and Condition Report review did not identify failures at the BFN penetration bellows at BFN a result of routine testing by the BFN Appendix J program or inspections. Industry operating experience has also shown good performance of the primary containment components.

Even though the aging effect of SCC for stainless steel penetration sleeves, penetration bellows, vent line bellows, and dissimilar metal welds is not expected to occur, the testing, conducted in accordance with the 10 CFR Part 50, Appendix J program (B.2.1.31), and examinations, conducted in accordance with the ASME Section XI, Subsection IWE program (B.2.1.29), are applied to manage this aging effect and provide reasonable assurance that the cracking of stainless steel containment penetration bellows and dissimilar metal welds at containment penetration sleeves will be detected prior to a loss of intended function. To address concerns identified in this Further Evaluation, as well as Item Number 3.5-1, 027, the ASME Section XI, Subsection IWE program (B.2.1.29) will be enhanced to revise implementing procedures to state that for the containment components subject to cyclic loading, but with no CLB fatigue analysis, and pressurized during 10 CFR 50 Appendix J local leak rate testing, local leak rate testing will be performed and can be credited (if needed) in lieu of supplemental surface examinations. The majority of the surface of the stainless-steel penetration sleeves, penetration bellows, vent line bellows, and dissimilar metal welds are not accessible for visual inspection or surface examination for cracking due to the Mark I containment design; however, the design is such that the components like the penetration sleeves are accessible from the side.

Therefore, the 10 CFR Part 50, Appendix J program (B.2.1.31) and enhanced ASME Section XI, Subsection IWE program (B.2.1.29) will detect SCC for these stainless-steel components and dissimilar metal welds prior to a loss of intended function.

Table 3.5.1 Item Number 3.5-1, 038: This item is not applicable to the BFN Mark I steel containment. This Item is applicable instead to BWR Mark III concrete and steel containments.

3.5.2.2.1.7 Loss of Material (Scaling, Spalling) and Cracking Due to Freeze-Thaw

Loss of material (scaling, spalling) and cracking due to freeze-thaw could occur in inaccessible areas of PWR and BWR concrete containments. Further evaluation is recommended of this aging effect to determine the need for a plant-specific AMP or plant-specific enhancements to ASME Code Section XI, Subsection IWL, and/or Structures Monitoring AMPs, to manage these aging effects for plants located in moderate to severe weathering conditions. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).

Table 3.5.1 Item Number 3.5-1, 011: This item is not applicable to the BFN Mark I steel containments, which are supported on the Reactor Building foundation, for which the design incorporates concrete in the sub-foundation. The design originally was supported by a steel skirt, reinforced by filling the internal cavity of the skirt with concrete, and vibrated to fill all voids. This concrete provided vertical support to the steel containment, was completely enclosed by the skirt, and had no way to react with any environment. The skirt was later cut loose and the drywell now sits on a concrete pillar. The BFN Containment Structures are completely enclosed and sheltered within the air-indoor environment of the Reactor Building (secondary containment). As such, the containment structure concrete is not exposed to air-outdoor, or groundwater/soil environments. Thus, repeated freeze-thaw is not applicable, and Containment Structure concrete is not subject to loss of material (scaling, spalling) and cracking due to freeze-thaw. Therefore, no additional aging management or further evaluation of inaccessible concrete of the Containment Structure for this mechanism is required.

3.5.2.2.1.8 Cracking Due to Expansion From Reaction With Aggregates

Cracking due to expansion from reaction with aggregates could occur in inaccessible areas of concrete elements of PWR and BWR concrete and steel containments. The GALL-SLR Report recommends further evaluation to determine the need for a plant-specific AMP or plant-specific enhancements to ASME Code Section XI, Subsection IWL, and/or Structures Monitoring AMPs is required to manage this aging effect. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).

Table 3.5.1 Item Number 3.5-1, 012: This item is not applicable to the BFN Mark I steel containments, which were originally supported by the steel skirts, reinforced by filling the internal cavity of the skirts with concrete, and vibrated to fill all voids. This concrete provided vertical support to the steel containment, was completely enclosed by the skirt, and had no way to react with any environment or expand due to a reaction with the aggregates. The skirt was later cut loose and the drywell now sits on a concrete pillar. The Containment Structures are completely enclosed and sheltered within the air-indoor environment of the Reactor Building (secondary containment). Therefore, no additional aging management or further evaluation of inaccessible concrete of the Containment Structure for this mechanism is required.

3.5.2.2.1.9 Increase in Porosity and Permeability Due to Leaching of Calcium Hydroxide and Carbonation

Increase in porosity and permeability due to leaching of calcium hydroxide and carbonation could occur in inaccessible areas of concrete elements of PWR and BWR concrete and steel containments. Further evaluation is recommended to determine the need for a plant-specific AMP or plant-specific enhancements to ASME Code Section XI, Subsection IWL and/or Structures Monitoring AMPs, essential to manage these aging effects if leaching is observed in accessible areas that impact intended functions. Acceptance criteria are described in BTP RLSB 1 (Appendix A.1 of this SRP-SLR).

Table 3.5.1 Item Number 3.5-1, 014: This Item Number is not applicable to the BFN Mark I steel containments, which were originally supported by the steel skirts, reinforced by filling the internal cavity of the skirts with concrete, and vibrated to fill all voids. This concrete provided vertical support to the steel containment and was completely enclosed by the skirt. The skirt was later cut loose and the drywell now sits on a concrete pillar. The Item Number is applicable only to PWR concrete containments (Reinforced and Prestressed), PWR steel containments, BWR concrete containments (Mark I, II, and III), and BWR steel containments (Mark III). The Containment Structures for BFN are completely enclosed and sheltered within the air-indoor environment of the Reactor Building (secondary containment). The BFN Containment Structures are also not subject to a long-term flowing water environment, which would be conducive to porosity and permeability due to leaching of calcium hydroxide and carbonation. No increase in porosity and permeability has been identified in accessible areas of the Containment Structures that could have an impact on intended function. No additional aging management or further evaluation of inaccessible concrete of the Containment Structures for this aging mechanism is required.

3.5.2.2.2 Safety-Related and Other Structures and Component Supports

3.5.2.2.2.1 Aging Management of Inaccessible Areas

1. *Loss of material (spalling, scaling) and cracking due to freeze-thaw could occur in below-grade inaccessible concrete areas of Groups 1-3, 5 and 7-9 structures. Further evaluation is recommended for inaccessible areas of these Groups of structures for plants located in moderate to severe weathering conditions to determine the need for a plant-specific AMP or plant-specific enhancements to Structures Monitoring AMP, to manage these aging effects. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

   Table 3.5.1 Item Number 3.5-1, 042: This aging effect and mechanism, the loss of material (spalling, scaling) and cracking due to freeze-thaw, is applicable to BFN reinforced concrete structures. BFN is located in a region where weathering conditions are considered moderate as shown in Figure 1 of ASTM C33. The Structures Monitoring program (B.2.1.33) will be used to manage the loss of material (spalling, scaling) and cracking in both accessible and inaccessible areas of reinforced concrete for the Groups 2, 3, 8 and 9 structures. At BFN, there are no stand-alone Group 1 or 5 structures, which, at BFN, are part of the Group 2 Reactor Buildings. In addition, BFN does not have any stand-alone Group 7 structures. Furthermore, none of these structures are completely inaccessible, and there are significant portions of the structures that are accessible, which can provide indications of reinforced concrete conditions in inaccessible areas.

The original designs and construction of these structures conformed to ACI 318 (1963 and later revisions) and ACI 307 (1969) except as noted in licensing documents requiring higher design values/standards. Based on a sample of available concrete drawings for scoped in structures, the concrete mix design provides for low permeability by incorporating fly ash, water reducing agents, and adequate air entrainment (3 percent to 10 percent based on aggregate size and exposure) such that the concrete has good freeze-thaw resistance.

Structural reinforced concrete has not exhibited significant loss of material (spalling, scaling) and cracking due to freeze-thaw of in-scope reinforced concrete structures (based on documented site history). The same concrete specification was used for all structures at BFN, including the Groups 2, 3, 8, and 9 structures, such that these results are representative of the expected effects of spalling, scaling and cracking of all structures within the scope of subsequent license renewal. This operating experience provides objective evidence that the design and construction of external reinforced concrete at BFN has provided concrete with good freeze-thaw resistance. Although operating experience has not identified significant loss of material and cracking due to freeze-thaw, the Structures Monitoring program includes inspection for these aging effects in the accessible areas. As described in the current procedure for the inspection of existing structures, when buried reinforced concrete is exposed, by excavations, removal of equipment, or panels blocking access, it should be inspected and all defects identified and documented. While a review of operating experience and maintenance rule inspections found no documented cases of degradation for uncovered reinforced concrete, buried concrete is rarely exposed. Interviews with plant personnel indicate inspections of uncovered reinforced concrete have been performed, but these inspections have not been formally documented.

The visual inspections of reinforced concrete serve the purpose of identifying concrete damage in accordance with the requirements of the Structures Monitoring program. If unacceptable conditions due to freeze thaw are identified in the accessible areas of structures, the conditions are evaluated, and, depending upon the initial conditions and evaluation, corrective actions are developed that may include additional inspections to determine the extent of degraded conditions as part of the corrective action process. If freeze thaw damage were to occur, it would occur at the surface of concrete exposed to significant moisture levels and sudden drops in temperature to below freezing degrees. In general, these areas are exposed at the ground surface and are accessible for inspection. Because of the higher level of water exposure, the accessible BFN Group 6 structures may be used as a leading indicator for exposure to weathering conditions for the other reinforced concrete structures that are in-scope.

The condition of the accessible and above grade concrete is used as an indicator for the condition of the inaccessible and below grade structural components and provides reasonable assurance that degradation of inaccessible structural components will be detected before a loss of an intended function. The number of freeze-thaw cycles is expected to be greater for concrete above grade, and the potential moisture content in the concrete is expected to also be significant at the grade surface; therefore, inaccessible portions of the reinforced concrete structures are expected to be less susceptible to freeze-thaw damage than exposed areas of reinforced concrete structures. Freeze-thaw is not considered an aging mechanism for concrete components below the frost line (depth of 20 to 22 inches). The concrete associated with the electric cable tunnel (from Intake Pumping Station to powerhouse) is buried below the frost line and not subject to loss of material (spalling, scaling) and cracking due to freeze-thaw.

Since freeze-thaw damage proceeds at a comparatively slow rate, the required five-year inspection frequency and scope of Structures Monitoring program (B.2.1.33) are determined to be adequate, and no plant-specific AMP is required.

2. *Cracking due to expansion and reaction with aggregates could occur in inaccessible concrete areas for Groups 1-5 and 7-9 structures. Further evaluation is recommended of inaccessible areas of these Groups of structures to determine the need for a plant-specific AMP or plant-specific enhancements to Structures Monitoring AMP, to manage this aging effect. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

   <u>Table 3.5.1 Item Number 3.5-1, 043:</u> This aging effect and mechanism, cracking due to expansion and reaction with aggregates, is considered applicable to BFN reinforced concrete structures. The Structures Monitoring program (B.2.1.33) will be used to manage cracking due to expansion and reaction with aggregates in both accessible and inaccessible areas of reinforced concrete for the Groups 2, 3, 4, 8, and 9 structures. At BFN, there are no standalone Group 1 or 5 structures, which, at BFN, are part of the Group 2 Reactor Buildings. In addition, BFN does not have any stand-alone Group 7 structures. Furthermore, none of these structures are completely inaccessible. There are significant portions of the structures that are accessible, which can provide indications of reinforced concrete conditions in inaccessible areas.

   The BFN structural concrete was constructed to preclude cracking due to this mechanism. The original designs and construction of these structures conformed to ACI 318 (1963 and later revisions) and ACI 307 except as noted in licensing documents requiring higher design values/standards. The aggregate in region of BFN is not known for reactive aggregate, including alkali reactive aggregate, and the site has very little possible evidence of aggregate alkali reactivity (only a few aggregate pop-outs have been observed). Despite this, the Structures Monitoring program (B.2.1.33) is conservatively being enhanced to include inspections of concrete areas for aging effects caused by reaction with aggregates.

   Based on a sample of available concrete drawings for scoped in structures, the concrete mix designs provide for low permeability by incorporating fly ash and water reducing agents. Concrete fine and coarse aggregates conform to ASTM C33. The cement is primarily Type II Portland cement with small scale concrete being Type I Portland cement. The Portland cement conforms to ASTM C-150.

   No significant cracking or swelling of concrete associated with expansion due to reaction with aggregates has been observed on BFN Group 2, 3, 4, 8, and 9 concrete structures during inspection or documented in Condition Reports resulting from plant work activities. Nevertheless, the Structures Monitoring program (B.2.1.33) continues to inspect and monitor reinforced concrete structures for cracking due to any mechanism. The condition of accessible and above grade concrete is used as an indicator for the condition of the inaccessible and below grade structural components and provides reasonable assurance that degradation of inaccessible structural components will be detected before a loss of an intended function. The same concrete specification was used for all structures at BFN, including the Groups 2, 3, 4, 8, and 9 structures, such that these results are representative of the expected effects of cracking due to expansion from reaction with aggregates of all structures within the scope of subsequent license renewal. If cracking due to expansion and reaction with aggregates was found to be significant, pattern cracking would be expected over most of the surfaces at grade level where the moisture level is higher. This has not been observed. The Group 6 structures (including the Intake Pumping Station and Gate Structures 2 and 3), have higher exposure to water compared to other reinforced concrete structures at BFN, and may be used as leading structures to indicate the presence of expansion and reaction with aggregates for the other reinforced concrete structures that are in-scope.

In addition, significant concrete deformations due to concrete expansion has not been detected at BFN. No significant concrete deformations due to differences in concrete expansion have been detected at the various accessible concrete structures that can be identified by looking for cracking between concrete elements below and above grade or at visible seismic gaps or expansion joints. This provides objective evidence that cracking associated with expansion due to reaction with aggregates has not yet occurred. Considering the age of BFN, the possibility of occurrence of expansion due to reactions with aggregates in the future is determined to be unlikely. Nevertheless, BFN will continue to look for indications of cracking associated with expansion due to reaction with aggregates.

As described in the current procedure for the inspection of existing structures, when buried reinforced concrete is exposed during excavations, it should be inspected and all defects identified and documented. Additionally, anytime concrete credited as inaccessible due to equipment, environmental conditions, or paneling becomes accessible, it should be inspected. While a review of operating experience and maintenance rule inspections found no documented cases of degradation of uncovered reinforced concrete, it should be noted that buried concrete is rarely exposed. Interviews with plant personnel indicate inspections of uncovered reinforced concrete have been performed, but these inspections have not been formally documented.

Since cracking due to expansion and reaction with aggregates occurs at a comparatively slow rate, the required five-year inspection frequency and scope of the Structures Monitoring program (B.2.1.33) are determined to be adequate, and no plant-specific AMP is required. However, the Structures Monitoring program (B.2.1.33) is being enhanced to include identification of leading indicator structures to receive an augmented inspection each cycle of the Structures Monitoring program. Augmented inspections will include examination for pattern cracking with darkened crack edges, water ingress, and misalignment inspections. These augmented inspection results will be evaluated by the responsible engineer each inspection cycle to identify changes that could be indicative of aging effects caused by reaction with aggregates. Such indications will be entered into the Corrective Action Program.

3. *Cracking and distortion due to increased stress levels from settlement could occur in below-grade inaccessible concrete areas of structures for all Groups, and reduction in foundation strength, and cracking due to differential settlement and erosion of porous concrete subfoundations could occur in below-grade inaccessible concrete areas of Groups 1-3, 5-9*

structures. The existing program relies on structure monitoring programs to manage these aging effects. Some plants may rely on a dewatering system to lower the site groundwater level. If the plant's CLB credits a dewatering system, verification is recommended of the continued functionality of the dewatering system during the subsequent period of extended operation. No further evaluation is recommended if this activity is included in the scope of the applicant's structures monitoring program.

<u>Table 3.5.1 Item Number 3.5-1, 044:</u> The Structures Monitoring program (B.2.1.33) will be used to manage cracks and distortion due to increased stress level from settlement for the Groups 3, 6, and 8 structures. At BFN, there are no stand-alone Group 1 or 5 structures, which at BFN, are part of the Group 2 Reactor Buildings. BFN does not have any Group 7 structures. Though this item was evaluated for all applicable groups (including Groups 2, 4, and 9), it was determined that, this aging mechanism is insignificant for the BFN concrete building structures that are founded on bedrock (such as the Reactor Building, Off Gas Treatment Building, Intake Pumping Station, and Reinforced Concrete Chimney). Furthermore, cracking and distortion due to settlement has not been identified in any BFN concrete building structures. Nevertheless, the Structures Monitoring program (B.2.1.33) continues to inspect and monitor applicable concrete structures for cracking due to any mechanism.

The foundations for the Turbine Buildings and Radwaste Building, among others, consist of steel piles that are founded on bedrock. Studies, such as those referenced in NUREG-1557 (Table B9), have shown that steel piles driven into undisturbed natural soil are not appreciably affected by corrosion due to the deficient oxygen environment that prevents significant loss of material. Piles driven into disturbed soil have been shown to experience only minor to moderate corrosion. In either case, the observed loss of material due to corrosion was not considered significant enough to impact the intended function of the piles, which is consistent with NUREG-1557. Therefore, cracking of the concrete due to settlement of the structure caused by corrosion of the piles is not expected.

Accessible piles are to be inspected as part of the 5-year maintenance rule inspections. Piles, exposed to environments such as air-outdoor, raw water, water-flowing, or water-standing, are to be monitored by either the Structures Monitoring program (B.2.1.33) or the Inspection of Water-Control Structures Associated with Nuclear Power Plants program (B.2.1.34).

The condition of the accessible and above grade concrete is used as an indicator for the condition of the inaccessible and below grade structural components and provides reasonable assurance that degradation of inaccessible structural components will be detected before a loss of an intended function. The same concrete specification was used for all structures at BFN, including the Groups 3, 6, and 8 structures, such that these results are representative of the expected effects of cracking and distortion due to increased stress levels from settlement of all structures within the scope of subsequent license renewal. Cracks extending into accessible areas, if any, will be managed by the Structures Monitoring program (B.2.1.33). If unacceptable conditions due to this mechanism were identified in the accessible areas of structures, procedures require that (1) extent of condition is determined and (2) that additional inspections or evaluations would address inaccessible and below grade portions of any affected structure. In addition, BFN examines exposed portions of the below-grade concrete when excavated for any reason, in accordance with the Structures Monitoring program

(B.2.1.33) and associated implementing procedures. Additionally, anytime inaccessible concrete (due to equipment, environmental conditions or paneling), becomes accessible, it should be inspected.

Table 3.5.1 Item Number 3.5-1, 046: This item is not applicable. The FSAR Chapter 12 and BFN Design Specifications do not have any reference to porous concrete. With the FSAR and specifications not providing for the use of porous concrete, it is concluded that there is no porous concrete utilized for the structural subfoundations. No further analysis is required for this item. BFN does not currently operate a dewatering program and dewatering is not credited for controlling settlement. Therefore, further considerations of the dewatering program are not required. The only recent recorded settlement was for the Electric Cable Tunnel running from the Intake Pumping Station to the Turbine Building. This settlement was evaluated and deemed to be acceptable. Since BFN dewatering system operation was terminated in 1983, no evidence of soil voids associated with the pumping has manifested. There is no further noted history of settlement since the dewatering system operation was terminated at BFN; however, this location within the cable tunnel will be specifically monitored for further settlement during the subsequent period of extended operation. Since the settlement proceeds at a comparatively slow rate, the required five-year inspection frequency and scope of the existing Structures Monitoring program (B.2.1.33) are determined to be adequate, and no plant-specific AMP is required. Inspection for loss of strength and settlement of concrete of the Electric Cable Tunnel between the Turbine Building and Intake Pumping Station is included in the scope of the existing Structures Monitoring program. Furthermore, an enhancement is being added to the Structures Monitoring program to revise implementing procedures to be consistent with ACI 349.3R-02 and SEI/ASCE 11-99 for selection of parameters to be monitored or inspected for concrete or steel structural elements and for steel liners, joints, coatings, and waterproofing membranes within the scope of the program.

4. *Increase in porosity and permeability, and loss of strength due to leaching of calcium hydroxide and carbonation could occur in below-grade inaccessible concrete areas of Groups 1-5 and 7-9 structures. Further evaluation is recommended to determine the need for a plant-specific AMP or plant-specific enhancements to Structures Monitoring AMP, to manage these aging effects if leaching is observed in accessible areas that impact intended functions. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

Table 3.5.1 Item Number 3.5-1, 047: This aging effect and mechanism, increase in porosity and permeability and loss of strength due to leaching of calcium hydroxide and carbonation, is considered applicable to BFN reinforced concrete structures. The Structures Monitoring program (B.2.1.33) will be used to manage the increase in porosity and permeability and loss of strength due to leaching of calcium hydroxide and carbonation in both accessible and inaccessible areas for the Groups 2, 3, 8, and 9 structures. At BFN, there are no stand-alone Group 1 or 5 structures, which at BFN, are part of the Group 2 Reactor Buildings. In addition, BFN does not have any Group 7 structures. Similarly, though this item was evaluated for all applicable groups (including Group 4), it was determined that, this aging mechanism is not applicable to BFN Group 4 structures (which include the biological shield wall, RPV Pedestal, and RPV Support Skirt), as BFN has a Mark 1 steel containment (not a concrete containment). Furthermore, operating experience searches did not identify increase in porosity and permeability; loss of strength due to leaching of calcium hydroxide and carbonation associated with BFN Group 4 structures. Nevertheless, the Structures Monitoring program continues to inspect and monitor applicable concrete structures for cracking due to any mechanism. Notably, none of these structures are completely inaccessible, and there are significant portions of the structures that are accessible that provide indications of reinforced concrete conditions in inaccessible areas.

The same concrete specification was used for all structures at BFN, including the Groups 2, 3, 4, 8, and 9 structures, such that these results are representative of the expected effects of leaching and carbonation of all structures within the scope of subsequent license renewal. The BFN structural concrete was constructed to minimize these potential effects of leaching of calcium hydroxide and carbonation. The original designs and construction of these structures conformed to ACI 318 (1963 and later revisions) and ACI 307 except as noted in licensing documents requiring higher design values / standards. Based on a sample of available concrete drawings for scoped in structures, the concrete mix designs provide for low permeability by incorporating fly ash and water reducing agents. Concrete fine and coarse aggregates conform to ASTM C33. The cement is primarily Type II Portland cement with small scale concrete being Type I Portland cement. The Portland cement conforms to ASTM C-150.

As described in NUREG/CR-5466, Service Life of Concrete, section 5.2.3.3, the rate and extent of carbonation depends on the environmental relative humidity reaching a maximum at 50 percent relative humidity. Diffusion of gaseous carbon dioxide takes place several orders of magnitude more rapidly though air than through water. If concrete is saturated with water, the amount of carbonation occurring will be negligible. As a result, carbonation is more of a concern in air environments than in inaccessible soil or raw water environments. In addition, the carbonation rate of penetration slows over time. Therefore, accessible areas can be used as an indicator of reinforced concrete conditions in inaccessible areas for carbonation. The effects of carbonation have not been observed at BFN reinforced concrete structures. The same concrete specification was used for all structures at BFN, such that these results are representative of the expected effects of carbonation of all structures within the scope of subsequent license renewal. Leaching has been identified in the Torus rooms for Units 2 and 3 and loss of concrete due to spalling has been observed in the Turbine Building interior and in discrete areas of the Reactor Building subgrade structures (Note that in-leakage of water through expansion joints is not a defect in structural concrete as the strength of the concrete is not degraded by the failure of the expansion joint). The integrity of the concrete structures has not been impacted by the loss of concrete due to spalls, leaching of calcium hydroxide, or carbonation, further inspections have been conducted, and the concrete has been found to be sound. In addition, the available leaching results show that the iron in the test samples is small and the reinforcement is not being degraded due to the leaching. The leaching in these areas will continue to be observed as part of the Structures Monitoring program (B.2.1.33), which with the 5-year frequency is sufficient to manage the aging effect.

Groundwater considered aggressive due to low pH or high sulfates could potentially result in a chemical attack or leaching of the concrete (NUREG-1557, Table B3). Concrete degradation due to a chemical attack or leaching has not been observed at BFN. High calcium content has been identified in the Units 1 and 3 Station sumps (located in the Turbine Building), which is a potential indicator of leaching.

However, while the sump calcium levels were found to be higher than the average river and sample well calcium levels, they were within maximum values of both. Additionally, the sump calcium levels were below the average site soil calcium levels based on data included in the Subsurface Soil Corrosivity Assessment performed in 2023. As a result, the sump calcium levels are not considered elevated. Furthermore, inputs and flow paths to the Units 1 and 3 Turbine Building Station Sump Pumps were identified on BFN drawings, and the most vulnerable source areas were further identified, where excessive wear would be expected due to water flows (based on unfinished concrete surfaces, etc.). BFN Engineering personnel performed inspections of these areas, and no degradation consistent with leaching of calcium hydroxide or carbonation was identified. The inspection plan included the Unit 1 and 3 Station sumps (located in the Turbine Building), 3-inch track area gutter drains, auxiliary boiler trench, south fan room drains, and the north fan room drains. The trench from the Auxiliary Boilers has limited access and could not be inspected through the grating as there is expanded metal across the trench below the grating; however, water could be seen in the bottom of the trench. No excessive concrete wear indicative of leaching was identified in the remaining areas. This issue has been added to the Civil Design Structural Maintenance Rule Calculation and the existing Structures Monitoring aging management program. These areas are monitored on a five-year interval as part of routine maintenance rule inspections, and no increase in inspection frequency is required.

Test results for groundwater and raw water samples showed that at a limited number of locations (Monitoring Wells (MW): MW-10, MW-11, MW-13 and MW-17), the pH limits are below the lower threshold limit for pH of 5.5 per NUREG-1557, Table B3, and therefore qualify as aggressive. However, for all monitoring wells and raw water tests (e.g., river water), the identified sulfate and chloride levels are substantially lower than the threshold limit of 1500 ppm for sulfates and 500 ppm for chlorides per NUREG-1557, Table B3. This indicates a non-aggressive environment associated with those substances. Therefore, some of the inaccessible below grade reinforced concrete for Groups 2, 3, 4, 8, and 9 structures is potentially subject to an aggressive environment. However, the groundwater is only considered to be aggressive at some locations, and only for low pH levels. A further evaluation of the soil was performed, and the soil was not found to be aggressive; however, the following evaluation will conservatively evaluate any potential impacts on inaccessible concrete if the soil and groundwater are found to be aggressive. Low pH levels are a concern as a potential initiator of reinforcing steel corrosion, which could be initially detected as (1) cracking and spalling of concrete as well as (2) deterioration of the concrete. The groundwater at BFN was determined to generally not be aggressive with respect to sulfates or chlorides. Further evaluation of the localized low pH levels on BFN structures is performed below.

Operating experience at BFN, which looks for concrete deterioration due to any mechanism, has not identified porosity and permeability and loss of strength due to these mechanisms. When inaccessible reinforced concrete is exposed during excavations, removal of equipment, opening of locked hatches, removal of large panels, or removal of cladding, it should be inspected and all defects identified and documented per the existing Structures Monitoring program. No reports of defects have been documented from exposed inaccessible concrete (due to excavations or other activities), though buried concrete is rarely exposed. Interviews with plant personnel indicate inspections of uncovered reinforced concrete have been performed, but these inspections have not been formally documented. This operating experience provides further objective evidence that the concrete at BFN is not susceptible to an increase in porosity and permeability and loss of strength due to leaching of calcium hydroxide, in addition to objective evidence that the inaccessible below grade reinforced concrete at BFN is not exhibiting reinforcing steel corrosion (which might have been expected considering the low pH levels found in a minority of the groundwater monitoring wells, as explained below).

The low pH levels are not found consistently across the site and were only found in a minority of the wells used for groundwater testing. Of these wells, only wells MW-10 and MW-11 are located near in-scope structures. Both of these monitoring wells are shallow wells, and the surrounding wells show acceptable pH levels. Additionally, from a subsequent soil test, the soil was found not to be aggressive. Therefore, it can be determined that low pH levels are localized, likely transitory, and not general to the site. MW-10 and MW-11 are located near the following Groups 2, 3, 4, 8, and 9 structures: Unit 3 Turbine Building, buried conduit banks and manways, Unit 3 Diesel Generator Building, Unit 3 Reactor Building, Cable tunnels between the Intake Pumping Station and Unit 3 Turbine Building, and Condensate Storage Supply Pipe Tunnel. The buried conduit banks and manways, and the Unit 3 Diesel Generator Building, are located above the water table and are not impacted by the low pH in the water table.

For the Turbine Building, most of the building is located above the water table. Additionally, the path of the groundwater is south-west from MW-10 parallel to face of the Turbine Building; thus, the Turbine Building is not impacted by low pH levels. The Cable Tunnel between the Turbine Building and Intake Pumping Station is located adjacent to MW-07, MW-08, and MW-08i, which show acceptable pH levels. Therefore, the tunnel is not subject to low pH levels. There have been no significant observations of cracks and leaching of the concrete in the Turbine Building or cable tunnel. Therefore, it can be reasoned that the localized low pH levels have not had negative impacts on these concrete structures.

The Reactor Building is nearer to MW-07, MW-08, MW-08i, and MW-09 than it is to MW-10 and MW-11. Therefore, with the adjacent monitoring wells having acceptable pH levels, it can be determined that the Reactor Building is not exposed to an aggressive environment.

The Structures Monitoring program (B.2.1.33) will continue to manage the increase in porosity and permeability and loss of strength due to leaching of calcium hydroxide and carbonation in both accessible and inaccessible areas of Groups 2, 3, 4, 8, and 9 structures. In addition, BFN will continue to examine exposed portions of the inaccessible concrete when exposed for any reason. Therefore, no additional measures for managing the aging effect of increase in porosity and permeability, and loss of strength for concrete, are required for inaccessible areas of Groups 2, 3, 4, 8, and 9 structures. Since leaching of calcium hydroxide and carbonation proceeds at a comparatively slow rate, the required five-year inspection frequency and scope of the Structures Monitoring program (B.2.1.33) are determined to be adequate, and no plant-specific AMP is required.

Further investigation of operating experience and documentation of the activities performed by BFN to monitor and mitigate the condition of leaching has been performed. The investigation revealed environments conducive to leaching exist at BFN as well as the condition of leaching; however, due to the minimal advancement and levels found and evaluated, the concrete was determined to retain its functional and operational integrity. Furthermore, the frequency of monitoring remains unchanged for all but the Gate Structures Numbers 2 and 3, whose frequencies do not pertain to leaching. The Structures Monitoring program (B.2.1.33) is determined to be adequate to manage the condition (no plant specific AMP is required). However, enhancements are being added to the Structures Monitoring program (B.2.1.33) to ensure adequate monitoring. The enhancements pertain to monitoring for aggressive environmental conditions with the inclusion of an additional implementing procedure as well as further instruction for Parameters Monitored or Inspected and Detection of Aging Effects to require indications of groundwater infiltration or through-concrete leakage will be assessed for aging effects.

3.5.2.2.2.2 Reduction of Strength and Modulus Due to Elevated Temperature

Reduction of strength and modulus of concrete due to elevated temperatures could occur in PWR and BWR Group 1-5 concrete structures. For any concrete elements that exceed specified temperature limits, further evaluations are recommended. Appendix A of American Concrete Institute (ACI) 349-85, “Code Requirements for Nuclear Safety-Related Concrete Structures,” specifies the concrete temperature limits for normal operation or any other long-term period. The temperatures shall not exceed 66 °C (150 °F) except for local areas, which are allowed to have increased temperatures not to exceed 93 °C (200°F). Further evaluation is recommended to determine the need for a plant-specific AMP or plant-specific enhancements to Structures Monitoring AMP, to manage these aging effects if any portion of the safety-related and other concrete structures exceeds specified temperature limits [i.e., general area temperature greater than 66 °C (150°F) and local area temperature greater than 93 °C (200 °F)]. Higher temperatures may be allowed if tests and/or calculations are provided to evaluate the reduction in strength and modulus of elasticity and these reductions are applied to the design calculations. The acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).

Table 3.5.1 Item Number 3.5-1, 048: This item is not applicable to BFN for either the components or situation (>150°F and >200°F for general area and localized temperatures, respectively). For example, the RHR System can be operated in parallel with the Spent Fuel Pool Cooling System (supplemental fuel pool cooling) to maintain the fuel pool temperature less than 150°F if a full core off load is performed.

Thermal insulation is also utilized at BFN to reduce thermal stresses. Reflective Metal Insulation (RMI) is managed using the One-Time Inspection program (B.2.1.20). Depending on the conditions found, the External Surfaces Monitoring of Mechanical Components program (B.2.1.23) will be used to identify and replace areas showing degradation. Other insulation (non RMI) is managed using the External Surfaces Monitoring of Mechanical Components program (B.2.1.23).

Additionally, review of the Equipment Qualification specification for electrical equipment revealed that general area, normal temperatures greater than 150 degrees Fahrenheit and local temperatures in excess of 200 degrees Fahrenheit are not applied at BFN. Plant operating experience has not identified elevated general area and local area temperature as a concern for concrete structural components. Hence, further evaluation of this item is not required.

3.5.2.2.2.3 Aging Management of Inaccessible Areas for Group 6 Structures

Further evaluation is recommended for inaccessible areas of certain Group 6 structure/aging effect combinations as identified below, whether or not they are covered by inspections in accordance with the GALL-SLR Report, AMP XI.S7, “Inspection of Water-Control Structures Associated with Nuclear Power Plants,” or Federal Energy Regulatory Commission (FERC)/US Army Corp of Engineers dam inspection and maintenance procedures.

1. *Loss of material (spalling, scaling) and cracking due to freeze-thaw could occur in below-grade inaccessible concrete areas of Group 6 structures. Further evaluation is recommended to determine the need for a plant-specific AMP or plant-specific enhancements to Structures Monitoring AMP to manage these aging effects for inaccessible areas for plants located in moderate to severe weathering conditions. Acceptance criteria are described in BTP RLSB-1 (Appendix A1 of this SRP-SLR).*

   Table 3.5.1 Item Number 3.5-1, 049: This aging effect and mechanism, loss of material (spalling, scaling) and cracking due to freeze thaw, is applicable to BFN reinforced concrete structures. BFN is located in a region where weathering conditions are considered moderate as shown in Figure 1 of ASTM C33. The Structures Monitoring program (B.2.1.33) will be used to manage the loss of material (spalling, scaling) and cracking in inaccessible areas of reinforced concrete for Group 6 structures. The Inspection of Water-Control Structures Associated with Nuclear Power program (B.2.1.34) will be used to manage the loss of material (spalling, scaling) and cracking for accessible Group 6 structures. The Condenser Circulating Water (CCW) conduits are included as part of the evaluation of Group 6 structures as their inspection will be added to the scope of the subsequent licensing renewal inspections. The CCW conduits are completely inaccessible during normal operations. Furthermore, the CCW conduits are constructed in accordance with the same specification and can be evaluated by comparison to the exposed concrete of other Group 6 structures. However, they are inspected from the inside during outages. The CCW conduits were investigated and found to be below the frost line, thus the aging effect of freeze-thaw was not considered applicable (negating its management with the Structures Monitoring program). The Group 6 structures have significant portions of the structures that are accessible and can provide indications of reinforced concrete conditions in inaccessible areas.

   The original designs and construction of these structures conformed to ACI 318 (1963 and later revisions) except as noted in licensing documents requiring higher design values / standards. Based on a sample of available concrete drawings for scoped in structures, the concrete mix design provides for low permeability by incorporating fly ash, water reducing agents, and adequate air entrainment (3 percent to 10 percent based on aggregate size and exposure) such that the concrete has good freeze-thaw resistance.

   Structural reinforced concrete has not exhibited significant loss of material (spalling, scaling) and cracking due to freeze-thaw in accessible areas of in-scope reinforced concrete structures. Gate Structures 2 and 3 have shown some signs of potential freeze thaw damage. Considering the age of the concrete, the high exposure to the elements, and close proximity to water at these locations, the level of cracking shown is within expectation and does not impact the intended function for Gate Structures 2 and 3. Additionally, cracking or spalling repairs are made, as appropriate, to (1) prevent cracks from propagating and (2) maintain the design function of the concrete. Inaccessible concrete is more protected from freeze-thaw cycles, and little to no freeze-thaw damage is expected; thus, the design function of the inaccessible concrete is also not expected to be adversely impacted. The operating experience provides objective evidence that the design and construction of external reinforced concrete at BFN has provided concrete with good freeze-thaw resistance. Although operating experience has not identified significant loss of material and cracking due to freeze-thaw, the Inspection of Water-Control Structures Associated with Nuclear Power Plants program (B.2.1.34) includes inspection for these aging effects in the accessible areas.

Though not part of the concrete structures, the sheet piling for the Gate Structures is also inspected as damage/degradation to the sheet piling due to freeze-thaw or other mechanisms could propagate into the concrete structures. The sheet piling for Gate Structures 2 and 3 was initially inspected annually; however, the inspection frequency was reduced to two years in 2014, and subsequently to three years in 2019. These changes were supported by review of previous inspection data which showed no significant decrease in the average pile thicknesses. Wear-rates and environmental conditions are not expected to change, and therefore there is no indication that significant degradation would occur within three-year intervals (such as thicknesses dropping below minimum acceptable values between inspections). A BFN calculation documents the thickness of the sheet piles remains within acceptable limits.

As described in the current procedure for the inspection of existing structures, when buried reinforced concrete is exposed during excavations, it should be inspected and all defects identified and documented. Additionally, anytime inaccessible concrete due to equipment, environmental conditions, or paneling becomes accessible, it should be inspected. While a review of operating experience and maintenance rule inspections found no documented cases of degradation of uncovered reinforced concrete, buried concrete is rarely exposed. Interviews with plant personnel indicated inspections of uncovered reinforced concrete have been performed, but these inspections have not been formally documented. The visual inspections of reinforced concrete identify concrete damage in accordance with the requirements of the Structures Monitoring program for inaccessible concrete, and the Inspection of Water-Control Structures Associated with Nuclear Power Plants program for accessible concrete. If unacceptable conditions due to freeze thaw are identified in the accessible areas of structures, the conditions are evaluated, and, depending upon the initial conditions and evaluation, corrective actions are developed, which may include additional inspections to determine the extent of degraded conditions as part of the corrective action process.

If freeze thaw damage was to occur, it would occur at the surface of concrete exposed to significant moisture levels and sudden drops in temperature (to below freezing). In general, these areas are exposed at the ground / water surface and are accessible for inspection. Because of the higher level of water exposure, the accessible portions of BFN Group 6 structures may be used as a leading indicator for exposure to weathering conditions for the other reinforced concrete structures that are in-scope for any structure group.

The condition of the accessible concrete is used as an indicator for the condition of the inaccessible and below grade / water structural components and provides reasonable assurance that degradation of inaccessible structural components will be detected before a loss of an intended function. The same concrete specification was used for all structures at BFN, including the Groups 6 structures, such that these results are representative of the expected effects of loss of material (spalling, scaling), and cracking due to freeze-thaw of all structures within the scope of subsequent license renewal.

The number of freeze-thaw cycles is expected to be greater for concrete at and above grade, and the potential moisture content in the concrete is expected to also be significant at the grade surface. Therefore, the inaccessible portions of the Group 6 structures are expected to be less susceptible to freeze-thaw damage than exposed areas of reinforced concrete structures.

Since freeze-thaw damage proceeds at a comparatively slow rate, the required five-year inspection frequency and scope of the Structures Monitoring program (B.2.1.33), supplemented by other inspection programs (Inspection of Water-Control Structures Associated with Nuclear Power Plants program (B.2.1.34)) and schedules, are determined to be adequate, and no plant-specific aging management program is required.

2. *Cracking due to expansion and reaction with aggregates could occur in inaccessible concrete areas of Group 6 structures. Further evaluation is recommended to determine the need for a plant-specific AMP or plant-specific enhancements to Structures Monitoring AMP, to manage this aging effect. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

<u>Table 3.5.1 Item Number 3.5-1, 050:</u> This aging effect and mechanism, cracking due to expansion and reaction with aggregates, is considered applicable to BFN reinforced concrete structures. The Structures Monitoring program (B.2.1.33) will be used to manage cracking due to expansion and reaction with aggregates in areas of reinforced concrete for Group 6 structures. This includes the concrete in inaccessible areas of Group 6 Structures. The Inspection of Water-Control Structures Associated with Nuclear Power Plants will be used to manage cracking due to expansion and reaction with aggregates in accessible areas of reinforced concrete for Group 6 structures. The Condenser Circulating Water (CCW) conduits are included as part of the evaluation of Group 6 structures as their inspection is being added to the scope of the subsequent licensing renewal inspections. The CCW conduits are completely inaccessible during normal operations. Furthermore, the CCW conduits are constructed in accordance with the same specification and can be evaluated by comparison with the exposed concrete of other Group 6 structures. However, the conduits are inspected from the inside during outages. The Group 6 structures have significant portions of the structures that are accessible that provide indications of reinforced concrete conditions in inaccessible areas.

The BFN structural concrete was constructed to preclude cracking due to this mechanism. The original designs and construction of these structures conformed to ACI 318 (1963 and later revisions) except as noted in licensing documents requiring higher design values / standards. The aggregate in the region of the BFN site is not known for reactive aggregate, including alkali reactive aggregate, and the site has very little evidence of possible aggregate reactivity (only a few aggregate pop-outs have been observed). Despite this, the Structures Monitoring program (B.2.1.33) and the Inspection of Water-Control Structures Associated with Nuclear Power Plants program (B.2.1.34) are being conservatively enhanced to include inspections of concrete areas for aging effects caused by reaction with aggregates.

Based on a sample of available concrete drawings for scoped in structures, the concrete mix designs provide for low permeability by incorporating fly ash and water reducing agents. Concrete fine and coarse aggregates conform to ASTM C33. The cement is primarily Type II Portland cement with small scale concrete being Type I Portland cement. The Portland cement conforms to ASTM C-150.

Cracking associated with expansion due to reaction with aggregates has not been observed on BFN Group 6 concrete structures, as described in operating experience. Nevertheless, the

Structures Monitoring program (B.2.1.33) and Inspection of Water-Control Structures Associated with Nuclear Power Plants program (B.2.1.34) will continue to inspect and monitor Group 6 concrete structures for cracking due to any mechanism. The condition of the accessible and above grade concrete is used as an indicator for the condition of the inaccessible and below grade / water structural components and provides reasonable assurance that degradation of inaccessible structural components will be detected before a loss of an intended function. The same concrete specification was used for all structures at BFN, including the Group 6 structures, such that these results are representative of the expected effects of cracking due to expansion from reaction with aggregates of all structures within the scope of subsequent license renewal. If cracking due to expansion and reaction with aggregates was determined to be significant, pattern cracking would be expected over most of the surfaces of the Group 6 structures continuously exposed to water. This has not occurred.

In addition, significant concrete deformation/loss of material due to concrete expansion has not been detected in Group 6 structures, which have comparatively high exposure to water compared to other reinforced concrete structures at BFN. The Group 6 structures may be used as leading structures to indicate the presence of expansion and reaction with aggregates for the other reinforced concrete structures that are not part of Group 6. Some indication of cracking potentially due to reactive aggregate was noted in the Intake Pumping Station suction well. However, this cracking was determined to not be adverse to the structural integrity of the concrete. No significant concrete deformation (that can be identified by looking for cracking between concrete elements below and above water due to differences in concrete expansion) has been detected for Group 6 structures. The guides for the trash rack screens on the Intake Pumping Station are embedded in the concrete both above and below the water line. During the recent replacement of those trash rack screens (which are located between opposing guides), no binding of the screens with the guides was observed, thereby demonstrating that there has not been any significant expansion of the concrete. This provides objective evidence that cracking associated with expansion due to reaction with aggregates has not yet occurred. Considering the age of BFN, the possibility of occurrence of expansion due to reaction with aggregates in the future is determined to be unlikely. Nevertheless, BFN will continue to look for indications of cracking associated with expansion due to reaction with aggregates.

As described in the current procedure for the inspection of existing structures, when buried reinforced concrete is exposed during excavations, it should be inspected and all defects identified and documented. Additionally, anytime inaccessible concrete due to equipment, environmental conditions, or paneling, becomes accessible, it should be inspected. While a review of operating experience and maintenance rule inspections found no documented cases of degradation of uncovered reinforced concrete, buried concrete is rarely exposed. Interviews with plant personnel indicated inspections of uncovered reinforced concrete have been performed, but these inspections have not been formally documented.

Since cracking due to expansion and reaction with aggregates proceeds at a comparatively slow rate, the required five-year inspection frequency and scope of the Structures Monitoring program (B.2.1.33), supplemented by other inspection programs (Inspection of Water-Control Structures Associated with Nuclear Power Plants program (B.2.1.34)) and schedules, are determined to be adequate, and no plant specific AMP is required. Note that the Structures Monitoring program and the Inspection of Water-Control Structures Associated with Nuclear

Power Plants program are being enhanced for identification of leading indicator structures to receive an augmented inspection each inspection cycle. Augmented inspections will include examination for pattern cracking with darkened crack edges, water ingress, and misalignment inspections. These augmented inspection results will be evaluated by the responsible engineer each inspection cycle to identify changes that could be indicative of aging effects caused by reaction with aggregates. Such indications will be entered into the Corrective Action Program.

3. *Increase in porosity and permeability and loss of strength due to leaching of calcium hydroxide and carbonation could occur in inaccessible areas of concrete elements of Group 6 structures. Further evaluation is recommended to determine the need for if a plant-specific AMP or plant-specific enhancements to Structures Monitoring AMP, to manage these aging effects if leaching is observed in accessible areas that impact intended functions. Acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).*

Table 3.5.1 Item Number 3.5-1, 051: This aging effect and mechanism, increase in porosity and permeability and loss of strength due to leaching of calcium hydroxide and carbonation, is considered applicable to BFN reinforced concrete structures. The Structures Monitoring program (B.2.1.33) will be used to manage the increase in porosity and permeability and loss of strength due to leaching of calcium hydroxide and carbonation in inaccessible areas of Group 6 structures. The Inspection of Water-Control Structures Associated with Nuclear Power Plants program (B.2.1.34) will be used to manage the increase in porosity and permeability and loss of strength due to leaching of calcium hydroxide and carbonation in accessible areas of Group 6 structures. The Condenser Circulating Water (CCW) conduits are included as part of the evaluation of Group 6 structures as their inspection will be added to the scope of the SLR inspections. Furthermore, the CCW conduits are completely inaccessible during normal operations, are constructed in accordance with the same specification, and can be evaluated by comparison to the exposed concrete of other Group 6 structures. However, they are inspected from the inside during outages. The Group 6 structures have significant portions of the structures that are accessible, which can provide indications of reinforced concrete conditions in inaccessible areas.

The same concrete specification was used for all structures at BFN, including the Group 6 structures, such that these results are representative of the expected effects of leaching and carbonation of all structures within the scope of subsequent license renewal. The BFN structural concrete was constructed to minimize these potential effects of leaching of calcium hydroxide and carbonation. The original designs and construction of these structures conformed to ACI 318 (1963 and later revisions) except as noted in licensing documents requiring higher design values / standards. Based on a sample of available concrete drawings for scoped in structures, the concrete mix designs provide for low permeability by incorporating fly ash and water reducing agents. Concrete fine and coarse aggregates conform to ASTM C33. The cement is primarily Type II Portland cement with small scale concrete being Type I Portland cement. The Portland cement conforms to ASTM C-150.

As described in NUREG/CR-5466, Service Life of Concrete, section 5.2.3.3, the rate and extent of carbonation depends on the environmental relative humidity reaching a maximum at 50 percent relative humidity. Diffusion of gaseous carbon dioxide takes place at a rate that is several orders of magnitude more rapidly through air than through water. If the concrete is saturated with water, the amount of carbonation occurring will be negligible. As a result, carbonation is more of a concern in air environments, than in inaccessible soil or raw water environments. In addition, the carbonation rate of penetration slows over time. Therefore, accessible areas can be used as an indicator of reinforced concrete conditions in inaccessible areas for carbonation. The effects of carbonation have not been observed at BFN reinforced concrete structures. The same concrete specification was used for all structures at BFN, such that these results are representative of the expected effects of carbonation of all structures within the scope of subsequent license renewal. Therefore, the effects of carbonation, such as an increase in porosity and permeability, are not expected to occur at the Group 6 structures of BFN.

Groundwater considered aggressive due to low pH or high sulfates could potentially result in chemical attack or leaching of the concrete (NUREG-1557, Table B3). Concrete degradation due to chemical attack or leaching has not been observed at BFN.

Test results for groundwater and raw water samples showed that at a limited number of locations (Monitoring Wells (MW): MW-10, MW-11, MW-13 and MW-17s), the pH limits are below the lower threshold limit for pH of 5.5 per NUREG-1557, Table B3, and therefore qualifies as aggressive. However, for all monitoring wells and raw water tests (e.g., river water), the identified sulfate and chloride levels are substantially lower than the threshold limit of 1500 ppm for sulfates and 500 ppm for chlorides per NUREG-1557, Table B3. This indicates a non-aggressive environment associated with those substances. Therefore, some of the inaccessible below grade reinforced concrete for Group 6 structures is subject to an aggressive environment. However, only the groundwater is considered to be aggressive and only for low pH levels. This is a conservative approach because a further evaluation of the soil was performed, and the soil was found to be non-aggressive. Low pH levels are a concern as a potential initiator of reinforcing steel corrosion (which could be initially detected as cracking and spalling of concrete) as well as deterioration of the concrete. The groundwater at BFN is determined to generally not be aggressive with respect to sulfates or chlorides. Further evaluation of the localized low pH levels on BFN structures is performed below.

Operating experience at BFN, which looks for concrete deterioration due to any mechanism, has not identified an increase in porosity and permeability and loss of strength due to these mechanisms. When inaccessible reinforced concrete is exposed during excavations, removal of equipment, opening locked hatches, removal of large panels, or removal of cladding, it should be inspected and all defects identified and documented per the existing Structures Monitoring program (though buried concrete is rarely exposed). Interviews with plant personnel indicated inspections of uncovered reinforced concrete have been performed, but these inspections have not been formally documented. No reports of defects have been documented for accessible areas of Group 6 structures or from excavations around inaccessible concrete; however, this operating experience also provides objective evidence that (1) the concrete at BFN is not susceptible to an increase in porosity and permeability and loss of strength due to leaching of calcium hydroxide and (2) that the inaccessible below grade reinforced concrete at BFN is not exhibiting reinforcing steel corrosion, which might have been expected considering the low pH levels found in a minority of the groundwater monitoring wells, as explained below.

The low pH levels are not found consistently across the site and were only found in a minority of the wells used for groundwater testing. Of these wells, only wells MW-10 and MW-11 are located near the following Group 6 structures: Intake Pumping Station and CCW Conduits. Both of these monitoring wells are shallow wells and the surrounding wells show acceptable pH levels. Additionally, from a subsequent soil test, the soil was found to be non-aggressive. Therefore, it can be determined that low pH levels are localized, likely transitory, and not general to the site. The Intake Pumping Station is located downstream of MW-11, given a South West groundwater flow. MW-07 and MW 19 are located in the South West direction from MW-11, and would be considered downstream of the groundwater flow. MW-07 and MW-19 are physically much closer to the Intake Pumping Station. Based on the above, MW-07 and MW-19 are considered a much better determination of the groundwater chemistry at the Intake Pumping Station. The groundwater at MW-07 and MW-19 is not aggressive; therefore, the Intake Pumping Station is determined to not be exposed to an aggressive environment. Additionally, much of the Intake Pumping Station structure is exposed to the river water which is non-aggressive. Furthermore, there has been no significant observations of cracks and leaching of the concrete and it can be reasoned that the localized low pH levels have not had negative impacts on the concrete structure.

The CCW conduits cannot be inspected from the exterior. The CCW intake conduits and discharge conduits are completely buried. However, the CCW conduits have been regularly inspected from their interiors during outages and no evidence has been found of concrete degradation. The CCW conduits are filled with water taken from the forebay which is non-aggressive. With no signs of concrete degradation, and the non-aggressive river water in the CCW conduits, the regular inspections will be sufficient to identify defects before they become critical.

The Structures Monitoring program (B.2.1.33) will continue to manage the increase in porosity and permeability and loss of strength due to leaching of calcium hydroxide and carbonation in inaccessible areas of Group 6 structures. The Inspection of Water-Control Structures Associated with Nuclear Power Plants program (B.2.1.34) will continue to manage these aging effects for the accessible areas of Group 6 structures. In addition, BFN will continue to examine exposed portions of the inaccessible concrete when excavated for any reason. Therefore, no additional measures for managing the aging effect of increase in porosity and permeability; loss of strength for concrete are required for inaccessible areas of Group 6 structures. Since the increase in porosity and permeability and loss of strength due to leaching of calcium hydroxide and carbonation proceeds at a comparatively slow rate, the required five-year inspection frequency and scope of the Structures Monitoring program (B.2.1.33), supplemented by any other inspection programs (Inspection of Water-Control Structures Associated with Nuclear Power Plants program (B.2.1.34)) and schedules, are determined to be adequate, and no plant specific aging management program is required.

Further investigation of OE and documentation of activities at BFN to monitor and mitigate the condition of leaching has been performed. The investigation revealed environments conducive to leaching exist at BFN as well as the condition of leaching; however, due to the minimal advancement and levels found and evaluated, the concrete was determined to retain its functional and operational integrity. The Structures Monitoring program (B.2.1.33), supplemented by other programs (Inspection of Water-Control Structures Associated with Nuclear Power Plants program (B.2.1.34)) and schedules, is determined to be adequate to manage the condition (no plant specific AMP is required). However, enhancements are being added to the Structures Monitoring program (B.2.1.33) to ensure adequate monitoring. The enhancements pertain to monitoring for aggressive environmental conditions with the inclusion of an additional implementing requirements for Parameters Monitored or Inspected and Detection of Aging Effects to require indications of groundwater infiltration or through-concrete leakage will be assessed for aging effects. These enhancements are consistent with guidance provided in NUREG-2191 AMP XI.S6, Structures Monitoring.

3.5.2.2.2.4 Cracking Due to Stress Corrosion Cracking, and Loss of Material Due to Pitting and Crevice Corrosion

Cracking due to SSC and loss of material due to pitting and crevice corrosion could occur in (a) Group 7 and 8 SS tank liners exposed to standing water; and (b) SS and aluminum alloy support members; welds; bolted connections; or support anchorage to building structure exposed to air or condensation (see SRP-SLR Sections 3.2.2.2.2, 3.2.2.2.4, 3.2.2.2.8, and 3.2.2.2.10 for background information).

For Group 7 and 8 SS tank liners exposed to standing water, further evaluation is recommended of plant-specific programs to manage these aging effects. The acceptance criteria are described in BTP RLSB-1 (Appendix A.1 of this SRP-SLR).

For SS and aluminum alloy support members; welds; bolted connections; support anchorage to building structure exposed to air or condensation, the plant-specific OE and condition of the SS and aluminum alloy components are evaluated to determine if the plant-specific air or condensation environments are aggressive enough to result in loss of material or cracking after prolonged exposure. The aging effects of loss of material and cracking in SS and aluminum alloy components is not applicable and does not require management if (a) the plant-specific OE does not reveal a history of pitting or crevice corrosion or cracking and (b) a one-time inspection demonstrates that the aging effects are not occurring or that an aging effect is occurring so slowly that it will not affect the intended function of the components during the subsequent period of extended operation. The applicant documents the results of the plant-specific OE review in the SLRA. Visual inspections conducted in accordance with GALL-SLR Report AMP XI.M32, "One-Time Inspection," are an acceptable method to demonstrate that the aging effects are not occurring at a rate that affects the intended function of the components. One-time inspections are conducted between the 50th and 60th year of operation, as recommended by the "detection of aging effects" program element in AMP XI.M32. If loss of material or cracking has occurred and is sufficient to potentially affect the intended function of SS or aluminum alloy support members; welds; bolted connections; or support anchorage to building structure, either: (a) enhancing the applicable AMP (i.e., GALL-SLR Report AMP XI.S3, "ASME Section XI, Subsection IWF," or AMP XI.S6, "Structures Monitoring"); (b) conducting a representative sample inspection consistent with GALL-SLR Report AMP XI.M36, "External Surfaces Monitoring of Mechanical Components;" or (c) developing a plant-specific AMP are acceptable programs to manage loss of material or cracking (as applicable). Tempers have been specifically developed to improve the SCC resistance for some aluminum alloys. Aluminum alloy and temper combinations which are not susceptible to SCC when used in structural support applications include 1xxx series, 3xxx series, 6061-T6x, and 5454-x. For these alloys and tempers, the susceptibility of cracking due to SCC is not applicable. If these alloys or tempers have been used, the SLRA states the specific alloy or temper used for the applicable in-scope components.

<u>Table 3.5.1 Item Number 3.5-1, 052:</u> This Item Number is not applicable to BFN. Group 7 is not credited for BFN; however, three components/areas were screened in for Group 8: Condensate Water Storage Tank Foundations and trenches, Nitrogen Storage Tank Foundation, and CAD System Storage Tank Foundation. These were evaluated, and it was determined that BFN does

not have Group 7 and 8 stainless steel tank liners exposed to standing water, necessitating no further evaluation.

Table 3.5.1 Item Number 3.5-1, 099: This Item Number evaluates aluminum and stainless steel support members, welds, bolted connections, and support anchorage to the structures that are classified as Class 1, 2, 3, or MC and are exposed to an environment of air or condensation. Once component applicability was established, the components were analyzed for the loss of material due to pitting and crevice corrosion and/or cracking due to SSC. It was found that the One-Time Inspection program (B.2.1.20) will be used to manage cracking and loss of material of the stainless steel and aluminum components in the Containment Structure and Component Supports commodity group. A plant-specific OE review was performed, which did not reveal a history of pitting or crevice corrosion or cracking of aluminum or stainless steel support members or connections.

Visual inspections, conducted per the One-Time Inspection program (B.2.1.20), will be performed to confirm that loss of material due to pitting and crevice corrosion or cracking due to SCC are not occurring at a rate that affects the intended function of the components. The one-time inspections will be conducted between the 50th and 60th year of operation. If loss of material or cracking is identified during the one-time inspections and is sufficient to potentially affect the intended function of SS or aluminum alloy support members; welds; bolted connections; or support anchorage to building structure, the condition will be entered into the corrective action program. Depending upon the conditions found, corrective actions will include the actions such as the following: (a) enhancing the ASME Section XI, Subsection IWE program (B.2.1.29) and ASME Section XI, Subsection IWF program (B.2.1.30); (b) determining the extent of condition by conducting a representative sample inspection consistent with the External Surfaces Monitoring of Mechanical Components program (B.2.1.23); or (c) developing a plant-specific AMP to manage loss of material or cracking (as applicable).

Table 3.5.1 Item Number 3.5-1, 100: This Item Number covers the aluminum and stainless steel support members, welds, bolted connections, and support anchorage to building structure that are exposed to an environment of air and condensation and subject to the loss of material due to pitting and crevice corrosion and cracking due to SCC.
